Claim.—A signal box provided with an aperture to admit the finger, and having a diaphragm of paper or other suitable material extended across the inner mouth of the aperture, the position of the diaphragm being such that the signal knob or lever cannot be moved without breaking the paper.

No. 46,543.—JAMES B. CLARK, Plantsville, Conn.—*Tag-making Machine.*—February 28, 1865.—This machine can be described intelligibly in detail only, consisting, as it does, of the combination and arrangement of parts which automatically seize the slip of paper, fold its corners inward, puncture and excise the tag, the whole being operated by a crank-shaft and twofold gearing.

Claim.—First, the combination of the plates *y y* and *t t*, substantially as herein described, for the purposes set forth.

Second, the combination and arrangement of the punch *H* and plate *x*, over which the folds of the tag are made, substantially as described and for the purpose set forth.

No. 46,544.—STEPHEN D. COOK, Lima, Mich., and HENRY J. WEBB, Dexter, Mich.—*Seeding Machine.*—February 28, 1865.—A stationary hopper is provided with a reciprocating rake at its bottom, the rake serving as a measurer and letting the same quantity of seed pass at each stroke into the distributing trough. The trough has also a reciprocating motion derived from its connexion with the wheels, and distributes the seed with regularity.

Claim.—The employment of the rake *R*, in combination with the “shaking and oscillating seed-distributing trough” *T*, operated substantially as and for the purposes specified.

No. 46,545.—JOHN D. CROCKER, Norwich, Conn.—*File-cutting Machine.*—February 28, 1865.—The most important feature of the machine, which embodies the improvements claimed, is a file blank bed or support, susceptible of a rectilinear reciprocating as well as oscillatory movement, the rectilinear movement not being intermitting as in other machines of this character, but constant. For this purpose there is a screw connected to the file bed in the usual manner, one end of which projects beyond the bed so as to form a handle by which the oscillating movement may be imparted to the bed, while the other end carries a bevelled cog wheel, which, as the bed is turned in one or the other direction, gears with one or the other of two similar bevelled gear wheels upon a cross shaft. This shaft constantly revolving in one direction, it follows that the screw will be turned in an opposite direction, and consequently the rectilinear movement of the bed be reversed whenever the bed is turned round so as to bring the gear wheels in contact with each other.

Claim.—First, the combination of the oscillating table which carries the file blanks and gearing, substantially such as described, so that the operation of cutting the teeth or burrs on the blanks may proceed both as the carriage is fed forward and backward, as set forth.

Second, the combination of the contrivance *F* with oscillating bed *A'* and reciprocating bed *A*, substantially as and for the purpose described.

Third, extending one end of the feed screw shaft *B* beyond the end of the bed *A'*, so as to constitute a handle, *B'*, for enabling the operator to adjust the bed *A'* longitudinally or laterally at pleasure, substantially as described.

Fourth, constructing the hammer with a concave face, in combination with a chisel stock, which is susceptible of being adjusted and set at different angles, substantially as described.

Fifth, so constructing a file machine that its file-supporting carriage can be adjusted after it has moved forward, to be fed backward, and during both of said movements the operation of cutting teeth or burrs on the file blanks is performed, substantially as set forth.

Sixth, cutting and setting file teeth or burrs on blanks by means of a machine, which is constructed and operates substantially as herein described.

Seventh, applying the chisel stock guide *J2* to a vertically adjustable slide or support *L*, substantially as described.

Eighth, the chisel stock holder *J2*, constructed to slide and swing, and also to guide and support the chisel, substantially in the manner described.

Ninth, providing for adjusting the chisel to cut toward the operator, both in the forward and backward feed of the file carriage, substantially as and for the purpose described.

No. 46,546.—AUGUSTINE B. CROSBY, Boston, Mass.—*Machine for Amalgamating Gold and Silver.*—February 28, 1865.—This invention consists of a series of boxes with perforated bottoms, and containing amalgamated copper plates. The gold and water are conveyed from these boxes to a box containing a series of frames by means of a conduit. The said frames contain amalgamated copper plates, and are kept constantly in motion by means of suitable machinery.

Claim.—The application and use of copper plate, or plates of any materials, placed at an inclination within the body of quicksilver.

Also, the application of a proportion of two or more of submerged copper or other plates to one slot of the slotted diaphragm, so as to produce an alternate action on each plate of the material passing through.

Also, the combination of *A*, *B*, *C*, *D*, *E*, *F*, and *G*, and of the several figures of the drawing, or any combination of them, for similar purposes.

Also, the application of one or more redivisions of the gold or other metal-bearing material in its passage through the quicksilver, in substantially the manner shown by the drawing.

Also, the application of copper or other metal amalgamated plates, in lattice arrangement, with or without riffles, as shown at *J* and *M* of Fig. 1, substantially the same.

Also, the combination, or any similar one, of the parts shown in the drawings by the letters *J*, *K*, *L*, *M*, *N*, and *O*.

Also, the general combination of all the above described parts, as shown by Fig. 2, or any similar one for the same purpose.

No. 46,547.—FREDERICK DECKER, Ostrander, Ohio.—*Clover Harvester.*—February 28, 1865.—The object of this invention is to provide means for gathering the heads of clover, &c.,

in the field, and it consists in the combination of the several parts identified in the claim, from which and the engraving it will be readily understood.

Claim—The described combination of the knife P, fingers H, stripper F G, and reel L, all constructed and employed as and for the purposes specified.

No. 46,548.—C. G. DIBBLE, Farmington, Iowa.—*Stave Machine*.—February 28, 1865.—This invention relates to that class of stave-making machines in which a curved reciprocating saw is employed for sawing the staves from the blocks, in connexion with a reciprocating carriage upon which the said blocks are secured. The invention consists in a method of feeding up the blocks to the work automatically, so that the staves will all be cut of a uniform thickness throughout without the necessity of stopping the machine to adjust the block for each stave that is cut.

Claim.—First, giving an intermittent feed motion to rollers *c c* for feeding the block up to the work, by means of a spur *s* actuating a gauge wheel B3 on the pinion shaft B', substantially as described.

Second, the combination of a pointed projection *p* on carriage B, with the spurred slide H, substantially as described.

Third, the combination of the spurred feed rollers, applied to head block B2 B2 on carriage B, with the bevel wheels *b' b' b b*, shaft B', and gauge wheel B3, operating substantially as described.

No. 46,549.—CHARLES M. DUPUY, New York, N. Y.—*Manufacture of Iron and Steel directly from the Ore*.—February 28, 1865.—This invention consists in first roasting and desulphurizing the ore by steam or other suitable means, and then heating to about a red heat with the proper amount of carbon in a vessel or chamber which will allow of a sufficient expansion of the gases. Care is taken to exclude the contact of air with the ore during the time the deoxidizing process is going on, and in order to prevent the firing of the ore. After thorough deoxidation the spongy metal is converted into blooms, or when steel is to be made it is heated for a longer time in contact with the carbon.

Claim.—The combination of desulphurizing, &c., and oxidizing as herein set forth, with the process of deoxidizing, substantially and for the purposes specified.

Also, the combination of the desulphurizing and deodorizing and carbonizing processes in the manufacture of steel, as described.

Also, the combination of the desulphurizing and deoxidizing processes with the welding furnace, by which iron is manufactured at a low degree of heat, as set forth.

No. 46,550.—A. P. DURANT and D. M. BUCKLEY, Atlantic, Ohio.—*Cultivator*.—February 28, 1865.—This invention consists in a swinging frame with ploughs attached thereto, placed a little below the stationary frame and in front of the axletree thereof, and also in the manner of adjusting and attaching the said swinging frame.

Claim.—The plough frame B B when arranged under the main frame in front of the axletree, and the power applied directly thereto, and when attached, adjusted and operated in relation to the main frame, substantially as set forth.

No. 46,551.—B. A. EARLE, Philadelphia, Penn.—*Lubricant for Wool*.—February 28, 1865.—This invention consists of borax dissolved in milk, in a proper proportion.

Claim.—The use of a combination of milk and borax as a lubricant.

No. 46,552.—RUDOLPH EICKEMEYER, Yonkers, N. Y.—*Machine for Pouncing and Napping Hat Bodies*.—February 28, 1865.—This machine is automatic. The sandpaper or other rubbing surface has a rising or falling motion in an inclined direction so as to act in a conical form; the former revolves on its axis and also traverses to and fro horizontally; it may also be raised and lowered. The India-rubber cushion allows the rubbing surface to yield and then avoid the wearing of the holes in the hat body where inequalities exist. By turning a disk on its axis it rises and falls upon the screw-thread thereon, and so loosens or tightens the hat body secured to the hooks in another disk; the latter resting upon and rising and falling with the first named disk, but not turning with it.

Claim.—First, attaching the pouncing and rubbing surfaces to a roller or its equivalent, which has a movement upon a track or tracks or pattern, parallel with the longitudinal profile of the rotating block upon which the hat is stretched, substantially as herein described.

Second, so applying and operating the shaft of the rotating hat block and the roller or its equivalent, to which the pouncing or rubbing surface is attached, that the one has a transverse motion relatively to the other, substantially as herein specified.

Third, the interposition of a cushion *l'* of India-rubber or other elastic material between the sandpaper *l* and felt *u* or other pouncing and smoothing material, and the roller J or its equivalent to which such materials are attached, substantially as and for the purpose herein specified.

Fourth, a device for stretching the hat body upon the block, consisting of a system of hooks, all connected with disks G and F or their equivalent, having a movement up and down or lengthwise upon the shaft of the block, substantially as herein specified.

No. 46,553.—**RUDOLPH EICKEMEYER**, Yonkers, N. Y.—*Machine for Stretching Hat Bodies*.—February 28, 1865.—A hat body being stretched upon a conical frame having a ribbed exterior, the frame is elevated by a lever receiving between its ribs the pressure of two series of rollers, and of a ring which binds the body upon the ribbed cone between the two series of rollers, rising with the body from the first to the second series.

Claim.—First, the employment in the process of stretching hats of a skeleton or ribbed and recessed former, substantially such as is herein described.

Second, the pressure ring E in combination with the skeleton or ribbed and recessed former, substantially as and for the purpose herein specified.

Third, the employment, substantially as herein described, in combination with the skeleton or ribbed and recessed former, of pressing rollers K M or their equivalent pressing devices, operating as herein set forth.

Fourth, the combination in a machine for stretching hats of a skeleton or ribbed and recessed former, a pressing ring, and a system of rollers or other equivalent pressing devices, the whole combined and operating substantially as and for the purpose herein specified.

No. 46,554.—**LEWIS FRANCIS**, New York, N. Y.—*Composition for Lining Barrels*.—February 28, 1865.—This invention consists of a composition made as follows: Fifty pounds of glue are soaked in water for five or ten minutes, after which it is removed and allowed to stand five or ten minutes. It is then melted in a steam-kettle, and one hundred pounds of glycerine and fifty pounds of sugar are added, and the whole is boiled for one hour at 200° Fahrenheit.

Claim.—Combining glue and glycerine with or without sugar, to form a new and useful composition, for the purposes specified.

No. 46,555.—**JAMES D. FRARY**, New Britain, Conn.—*Faucet for Oil or other Liquids*.—February 28, 1865.—This invention consists in making the parts A B C of the faucet of cast iron over the plug E. The socket is lined with brass or other non-corrodible metal, or instead the plug may be covered with such metal.

Claim.—As a new and improved article of manufacture a faucet made of iron, having the working surfaces of the orifice and plug made of brass, or brass and iron, in combination with the crooked nozzle c, screw or tinned shank a, substantially as described.

No. 46,556.—**ABRAM J. GIBSON**, Cincinnati, Ohio, and **GEORGE EMERSON**, Newport, Ky.—*Water Cooler and Purifier*.—February 28, 1865.—The water is purified by filtration, and then cooled by being conducted through pipes in the earth which ascend and deliver it near the level of its head. The invention consists in the combination and arrangement of the pipes and faucets.

Claim.—A purifier C, cooler pipes D and E, and pipes B and G, with faucets F H and K, the arrangement and construction in combination as and for the purpose herein set forth.

No. 46,557.—**W. S. GATCHELL**, Peru, Ind.—*Animal Trap*.—February 28, 1865.—This invention consists of two radial rotating platforms, each held in position by separate triggers, but the wires controlling them come together at the bait-hook which forms one of them. Each wire is connected with a rock shaft, and the triggers or detents are withdrawn by the pulling of the bait by the animal, whose resting place is at the centre, upon two wings. Upon the animal falling into a receptacle below, the trap is reset.

Claim.—The combination of the two rotating radial platforms b b operated by means of the wires i i, rock shafts e e and spring triggers c c, and through the pulling of the bait from one hook k.

No. 46,558.—**E. P. GLEASON**, New York, N. Y.—*Flexible Tubing*.—February 28, 1865.—This invention consists in making the framework of flattened wire, wound spirally round a mandrel. This tube or coil is then covered with a braided or warm coating saturated with oil or varnish. Another coating of a narrow strip of leather is then wound spirally over this and oiled or varnished, over which is woven or braided another coat which forms the outside, and which is then oiled or varnished. The mandrel is then withdrawn from the finished tube.

Claim.—First, the spiral framework of flat wire, substantially as described for the purpose specified.

Second, a flexible tubing composed of a spiral framework of flat wire or a flat metal strip and an impervious external covering, or both an internal and external covering, substantially as described.

Third, the lubricating impervious covering of leather, substantially as described.

No. 46,559.—**CARLOS GLIDDEN**, Milwaukee, Wis.—*Hot-blast Pipe*.—February 28, 1865.—This invention consists in enlarging certain parts of the pipe, and placing within such enlarged parts a plate or its equivalent, the air being thus made to pass in a thin stratum in the direction of the arrows, as shown.

Claim.—Making hot-blast pipes substantially as herein set forth.

No. 46,560.—ALEXANDER W. HALL, New York, N. Y.—*Amalgamator*.—February 28, 1865.—This invention consists of a rotating cylinder provided with a door and having a hollow stationary shaft perforated on the lower side. One end of said shaft is connected with a retort containing mercury, and the other dips in water in order that the vapor of mercury which escapes may be condensed. The inside of the rotary cylinder is provided with lifters for the purpose of lifting up and turning over the pulverized quartz contained in said cylinder.

Claim.—An amalgamator consisting of a horizontal rotating cylinder with internal lifters *C C*, a stationary perforated tube or its equivalent, inserted through the hollow journals of the said cylinder for the introduction of the vapor or quicksilver thereto, and a cock or valve *g* to regulate or control the pressure of the vapor within the said cylinder, the whole combined, arranged, and operating substantially as herein specified.

No. 46,561.—A. W. HALL and DANIEL BENTLEY, New York, N. Y.—*Machine for Crushing Quartz*.—February 28, 1865.—This invention consists in applying pressure to the rollers and so constructing the axles that the rollers can rise and fall when required.

Claim.—First, the taper vertical socket *c c* by which the axle or axles of the several rollers are attached to the central vertical shaft in such manner as to permit either roller to rise independently of the others, substantially as herein specified.

Second, applying pressure to the several crushing rollers by means of a lever *c* and nut *d* or their equivalent, applied directly to the central shaft and operating on all the rollers alike, substantially as herein specified.

Third, the spring *f*, applied in combination with the collars *e g*, washer *h*, nut or bearing *d*, and central shaft *A*, substantially as and for the purpose herein specified.

No. 46,562.—PATRICK HAUGHIAN, New York, N. Y.—*Revolving Fire-arm*.—February 28, 1865; antedated August 28, 1864.—This invention relates to the locking dog for securing the cylinder after being rotated, and the novelty consists in employing a swinging bent lever pivoted at the rear of the cylinder and pressed into its appropriate notch in the same by a spring, the disengagement of the said bent locking lever being effected by a pin on the toe of the hammer when being cocked to allow the cylinder to be revolved.

Claim.—First, the arrangement of the cylinder stop lever *C* to work in rear of the cylinder upon a fulcrum pin *c* situated behind the recoil shield and between it and the hammer, substantially as herein specified.

Second, the combination of the so-arranged lever of the elbow form herein described and represented in figures 1 and 2, in combination with the within described arrangement of the spring *i* to operate upon a shoulder *k* above the fulcrum of said lever, substantially as herein set forth.

Third, a spring-sided stop lever or catch, arranged to work in rear of the cylinder and between the recoil shield and the hammer, in combination with a cam on the hammer, in the manner and under a mode of operation substantially as described.

No. 46,563.—A. H. HOOK and JOHN H. DARLINGTON, New York city.—*Skate Feet*.—February 28, 1865.—This invention consists in preparing skate feet for skates of a block of elastic rubber secured by a groove, and so formed as to cling tightly to the skate runner and hold to the blade of the skate by the elasticity of the material.

Claim.—A skate foot made of a block of elastic material so formed as to be attached to and detached from a skate runner, in the manner and for the purposes herein set forth.

No. 46,564.—WM. T. HORROBIN, Biddeford, Me.—*Device for forming Models for Casting*.—February 28, 1865.—This invention consists in supporting the follow-board, on both sides of which the patterns can be secured in and surrounded by a platform on top of a frame, and on which platform the flask is placed. This follow-board is made to fit the opening in the platform accurately, and rests upon parts supported by a lower platform, the height of which can be adjusted by means of a hollow screw beneath. Through this screw and the centre of the lower platform passes a vertical shaft having on its top a long cross-head, the two ends of which, bent upwards at right angles, are pivoted to opposite sides of and sustain between them the follow-board in such a manner as to allow it to be turned either side up, when elevated above the surrounding platform, the vertical shaft being thrust upward by means of a treadle from beneath.

Claim.—First, the swivelled plate *I*, employed substantially as herein described for presenting different patterns or parts of patterns to the flasks.

Second, the combination of the plate *J*, rods *K*, and sliding rod *G*, for supporting the plate *I* in its operating position or elevating it to be reversed.

Third, in combination with the above, the retaining fork *L h*, and groove *g*, for preventing the disturbance of the plate *I*, while in use.

No. 46,565.—M. A. KELLER, Windsor Township, Penn.—*Rake for Harvesters*.—February 28, 1865.—This invention relates to the construction and arrangement of the devices which impart the necessary motions to the rake, and will be understood from the claim and engraving.

Claim.—First, the self-adjusting universal jointed shaft, with its jointed links *r m n* and *q o p*, sliding disks *K K*, constructed, applied, and operating as and for the purpose set forth.

Also, the arrangement, in combination with the stationary case *B*, with its tripper flange *S*, and guide slides *R T*, of the cap and its flanges *I J*, chambered bottom for covering the ratchet wheel *E*, and containing the click spring connecting it to the gearing, all surrounding a central fixed shaft *F*, arising from the bottom of the case *B*, and operated by the bevelled pinion *M*, in the manner and for the purposes specified.

No. 46,566.—JOHN JANN, New Windsor, Md.—*Mowing Machines.*—February 28, 1865.—The main frame is a hollow metallic casing cast in two parts, which are secured together by means of screw bolts and nuts, the joint being water-tight for the protection of the parts located in the interior from dust and moisture. The frame is made in this way for the sake of greater smallness and compactness, and that the most simple gearing may be used. The crank shaft which operates the sickle moves in a plane at right angles to the carrying wheels, and thus serves to impart the desired motion.

Claim.—First, the close vertical casing constituting the main frame to which the tongue *C*, and bearings *b b* of the axle *B'*, are attached, constructed in sections *A A'*, enclosing the gearing, substantially as set forth.

Second, in combination with the above, the gearing *F G I J*, crank shaft *K*, and pitman *N*, the whole being arranged to operate in the manner and for the object set forth.

No. 46,567.—W. E. LOCKWOOD, Philadelphia, Penn.—*Paper Shirt Bosom.*—February 28, 1865.—A shirt bosom made of one or more pieces of paper, or of paper and cloth united, is formed in dies or otherwise, so as to retain a concavo-convex form with respect alike to its length and its width, or an egg-like form.

Claim.—As a new article of manufacture, a shirt bosom made of one or more pieces of paper, or paper and cloth, when made convex in front and concave in the back, for the purpose specified.

No. 46,568.—HENRY LOEWENBERG, New York city.—*Fabric for Hats, Bonnets, &c.*—February 28, 1865.—This invention consists in saturating Canton flannel with liquid silix combined with coloring matter, and subjecting the fabric so prepared to the action of dies, by means of which a suitable appearance may be given to the surface of said fabric.

Claim.—The use of Canton flannel or other textile material treated with the composition of liquid silix, or size mixed with coloring matter, for the purpose of dyeing and stiffening the cloth at the same time, and subjecting to the action of a die or dies, substantially as herein described, for the purpose of producing hats, bonnets, &c., with any desired surface which may be glazed with a varnish either before or after pressure, as set forth.

No. 46,569.—RODNEY H. MATHEWS, Painsville, Ohio.—*Invalid Bedsteads.*—February 28, 1865.—This invention consists in preparing a bed furnished with the usual appliances of sick-beds, with a jointed board-bottom, in such manner that the whole may be folded compactly for convenience of transportation.

Claim.—First, the sleeved apron *J*, of water-proof fabric, constructed and used as described. Second, the frame *A*, jointed as described, and consisting of four sections or parts *a b c*, and *d*, the said sections being rigid transversely, but yielding at the joints longitudinally, as and for the purpose set forth.

Third, the foot blocks *H H'*, and shoulder blocks *I D*, constructed as described, or any equivalent construction, in combination with the slotted plates *e e'* and *f f'*, or their equivalents, for adjusting and securing them therein, as and for the purpose set forth.

Fourth, the use and employment of the triangular handles *D* and *D'*, as herein explained, and for the purpose specified.

Fifth, as a new and improved article of manufacture, the described portable sick-bed and accouching frame, constructed and arranged as stated, and for the purposes set forth.

No. 46,570.—LEONARD MAXWELL, Mitchel, Ind.—*Method of Curing Burns and Scalds.*—February 28, 1865.—This invention consists in applying a thin coating of copal varnish, immediately after the burn.

Claim.—The process of curing burns and scalds by the application of a coating of copal varnish to the burned or scalded parts of the body, substantially as and to the effect described.

No. 46,571.—JOHN McCLELLAND, Washington, D. C.—*Stop Valve.*—February 28, 1865.—The valve is a hollow cone, the hollow being of a diameter greater than the bore of the pipes. The body of the valve is cast upon and within bronze rings which serve for bearings.

Claim.—First, the hollow sliding stop valve open at the bottom, the same being constructed and operating in the manner described for the purposes herein set forth.

Second, in combination therewith, the rings *a*, constructed substantially as described.

Third, in combination with the invention claimed in the first clause, the rings *a*, applied substantially as described.

No. 46,572.—JOHN McCLELLAND, Washington, D. C.—*Street Washer*.—February 28, 1865.—A three-way cock opens upward into the wash tube or laterally for the continuous flow in the horizontal pipe, or opens both, or closes both, at the discretion of the operator. When the ascending current is cut off, the reflux escapes through a small aperture in the plug, to prevent freezing. A plate, secured in position by the cap on the eduction pipe, serves to secure in position the plug, and thus preserve both under the control of the person having the key thereto.

Claim.—First, making the lower end of the street-washer cases pointed or cone-shaped, in the manner herein described, for the purposes set forth.

Second, the three-way cock K, pipe C, and key D, arranged substantially as described.

Third, the small channel *i* in the plug *k*, connecting with the orifice *n* and the outlet *o*, to discharge waste-water, as herein set forth.

Fourth, the lugs *p p* and *q q* and the projections *h h* on the cock K, in combination with the ribs *r r* and the case A, for holding the cock firmly in place.

Fifth, embracing the cap F and the rod D of a street-washer by a single attachment substantially as described.

No. 56,573.—G. W. MITCHELL, St. Louis, Mo.—*Spring Mattress*.—February 28, 1865.—This invention consists in the arrangement of parts by which the flexibility and local elasticity of the mattress are secured. The bottom consists of transverse slats, supporting the spiral springs and attached by longitudinal removable locking bars. The springs form frusta of cones, and support rectangular pieces which are united by an elastic membrane. The said pieces have cones which set into the upper ends of the coiled springs and the pieces are tied by cords to the lower slats, so as to regulate the vertical play of the springs. The padded covering of that portion containing the springs is stuffed on the sides and top.

Claim.—First, the guide cones *d*, in combination with the springs A, caps C, and flexible connections *c*, applied and operating substantially as and for the purpose described.

Second, the flexible connecting pieces E, in connection with the caps C of the springs, applied and operating substantially as and for the purpose specified.

Third, the steady pins *b* and locking bars D, in combination with the preceding.

Fourth, stuffing the mattress on the sides as well as on the top, substantially as and in combination with the preceding.

No. 56,574.—JOHN O. MONTIGNANI, Albany, N. Y.—*Carpenter's Hammer*.—February 28, 1865.—This invention consists of a combined hammer and adze, the claws being made somewhat longer and straighter than the common hammer, to the end of which is attached a steel edge connecting the two claws and forming the adze.

Claim.—The method of constructing a hammer by finishing what is ordinarily a claw end with a steel cutting edge like that of an adze or chisel as described in the above specification.

Also, the construction of the cleft for drawing nails, as shown at E, in combination with the above adze or chisel edge.

No. 56,575.—C. L. MOREHOUSE, Cleveland, Ohio.—*Interlined Under-garment*.—February 28, 1865.—A shirt, jacket, or wrapper is made twofold, and so as to open in several flaps for the insertion of a leather interlining.

Claim.—The garment when provided with a detachable interlining of soft leather as herein set forth, the same being a new article of manufacture.

No. 56,576.—DON J. MOZART, New York, N. Y.—*Escapement for Clocks and Watches*.—February 28, 1865.—The staff of the balance wheel has in it a longitudinal notch, into which the teeth of the scape wheel pass, and which is so formed that the scape wheel communicates to the balance a slight impulse. Extending from the shaft of the hooked detent is an arm upon which is a spring bearing against a projection upon the staff. The spring passes through the shaft of the detent, and is so attached as to form a spring to force against the scape wheel. By the action of the balance wheel in one direction the projection upon the staff is made to release the detent, but on its return the springs permit the projection to go by without moving the arms.

Claim.—First, the hooked detent *h* applied to the scape wheel A for arresting the same, in conjunction with a tripping tooth *c* and pallet *e*, arranged and operating substantially as described.

Second, the detent rest *i*, when applied to a detent which is constructed and operating substantially as described.

Third, forming the detent spring *s'* and tripping spring *s* in one piece, and applying the same to the detent staff *j*, substantially as described.

No. 46,577.—DON J. MOZART, New York, N. Y.—*Calendar Clock*.—February 28, 1865.—The hands which indicate upon the disk plate the day of the week, day of the month, and month of the year, are attached to shafts which are caused to revolve by a spring regulated by an escapement attached to the mechanism of the clock. The calendar indicates the extra day of February in the bisextile year.

Claim.—First, causing the wheel B to release the mouth disk C' once in every revolution of said wheel, by means of a pin *k'* acting upon the escapement E of said disk, substantially as described.

Second, the pivoted, crescent-shaped escapement E, in combination with the pins *p* on a notched disk C, when these parts are arranged and operated substantially as described.

Third, the pinion *b*, cam *b*, and spring slide *s*, in combination with the notched disk C and pall H, substantially as described.

Fourth, the notched disk C, constructed as set forth, in combination with levers *b b'*, having teeth *a a' a''*, and lugs *c c'* formed on them, and which are acted upon by a spring *b2*, substantially as described.

Fifth, operating the day hand D by means of the tripping arm *h3*, pawl *r*, and notched wheel *j* when said arm is attached to and actuates the escapement of the wheel B, substantially as described.

No. 46,578.—JAMES NICHOLS and WILLIAM BATTY, Cincinnati, Ohio.—*Powder for Facing Moulds.*—February 28, 1865.—The invention consists in the use of the hard substance or slag which incrusts the bottom and side ends of gas retorts for facing moulds. The substance is prepared for use by reducing it to an impalpable powder and bolting it through wire gauze.

Claim.—The moulders' "facing" powder composed and prepared in the manner described.

No. 46,579.—C. L. OSBORN, Brooklyn, N. Y.—*Bird Cage.*—February 28, 1865.—This invention consists in a combination of parts by which the cage is secured to its base, and the arrangement of the feed cups so that the bird cannot escape when the cups are removed.

Claim.—First, the combination of curved rest B, rim D, lip E, and hoop F, or their equivalents, operating together to secure a cage to its base.

Second, the arrangement described by which the feed cups are inserted without danger of the escape of the bird when removed.

No. 46,580.—CHARLES R. OTIS, Yonkers, N. Y.—*Hoisting Apparatus.*—February 28, 1865.—The object of this invention is to provide for the temporary stoppage of a revolving drum, to which is attached a rope or chain, from which any load may be suspended, whenever from any cause the said drum revolves too rapidly. The invention consists in so applying a brake and centrifugal or other governor in combination with each other and with the aforesaid drum that while the revolution of the said drum does not exceed a certain velocity the brake will be kept out of operation by the governor, but that when such velocity is exceeded the governor will cause or permit the brake to come into operation, and so stop the revolution of the drum. A safety device is applied at or near the highest point in the hoisting apparatus, for the purpose of stopping the descent of the platform, in case of the breakage of the hoisting rope between the windlass or main drum and the pulley or drum at the top of the apparatus; in which case a safety device applied directly to the platform might fail to operate.

Claim.—First, the combination of a governor and brake with each other and with the drum of a hoisting machine, to operate substantially as herein specified under the circumstances herein set forth.

Second, combining the governor with the loaded lever of the brake by means of a lever *r*, or its equivalent, deriving motion from the governor, and acting as a support under a portion of the said loaded lever while the rotation of the governor does not exceed a certain velocity, but escaping from under the said loaded lever when such velocity is exceeded, substantially as and for the purpose herein described.

Third, applying a safety device at or near the highest point of a hoisting apparatus, to operate substantially as and for the purpose set forth.

No. 46,581.—GEORGE W. PALMER, Brooklyn, N. Y.—*Soda-water Cooler and Draught Pedestal.*—February 28, 1865.—This invention consists in making the case of a soda-water cooler with a door on one side for the admission of ice, and also in constructing a soda-water cooler with two iron plates combined with screw bolts, and having a suitable packing between the edges. The space between the plates is coated with vitrified enamel, and the soda-water passes through it to the draught pipe.

Claim.—First, the opening and door on the side of the refrigerator draught pedestal.

Second, the cooler, made substantially as set forth and for the purpose described.

Third, the coating or lining of soda-water coolers, as herein described.

No. 46,582.—DANIEL H. PAULLINS, Loudonville, Ohio.—*Steam Engine.*—February 28, 1865.—This invention consists in a movable interior cylinder, which is so constructed and sustains such relation with the ingress and egress ports and an external enclosing cylinder that said movable cylinder is adapted to operate as an induction and eduction valve. The interior cylinder is moved by the action of the piston head, which comes in contact with the end of it at each extremity of its stroke, by which means apertures are made to register with apertures formed in the induction pipe, or with a channel formed in the outer cylinder,

through which steam is admitted to and discharged from contact with the piston which moves in the interior cylinder.

Claim.—The movable cylinder E, provided with apertures *e e'* to permit the steam to enter and escape from said cylinder alternately at the respective ends thereof, when said cylinder is moved by the action of its own piston head, substantially as and for the purpose explained.

Second, in combination with the above, the arrangement of the chest G, inlet pipes G' G'', and grooved valve seats F F', when employed in connection with the movable cylinder E.

Third, in combination with the cylinder E, actuated by its own cylinder head as specified, the stationary external cylinder H and escape pipe H', employed in combination with the movable cylinder E, for the purpose of receiving and carrying off the steam after acting upon the piston as stated.

No. 46,583.—JOHN PENNYPACKER, Charlestown, Penn.—*Horse-rake*.—February 28, 1865.—This invention relates to certain devices whereby the teeth of the rake may be readily raised or lowered for the purpose of discharging the load at any desired spot. On the inside of each wheel is a ratchet wheel, and opposite to this ratchet wheel a cam plate is secured to the axle. Near each end is hung a lever, to the inner arm of which a spring plate is attached, the end of one plate lapping over the other, and having attached to it a second plate, which projects upwards through the axle. This plate being forced down causes the lever to engage with the ratchet wheel, thereby tilting the rake. A small lever is forced into a notch in the plate, passing through the axle, and holds the parts engaged. At a proper time the cams disengage the levers from the ratchets, and the rake falls to a working position.

Claim.—First, the cams *h*, constructed and arranged in respect to the levers G and ratchets I substantially as and for the purpose specified.

Second, the notched plate lever Q and plate *s*, in combination with the levers G, substantially as and for the purpose set forth.

No. 46,584.—HIRAM PENSYER, Centralia, Ill.—*Beehive*.—February 28, 1865.—The object of this invention is to secure the hive against the intrusion of moths. The construction of the hive will be understood from the claim and engraving.

Claim.—First, the dark chambers *m m* above the side entrances *e e* to the litter box below, in combination with the said litter box A, constructed with a sliding bottom *f*, all constructed and arranged as and for the purposes described.

Second, the main hive B, with its entrance *q* and dark chamber *r*, in connection with the litter box A, provided with entrances *e e* on each side of entrance *q*, and sliding bottom *f*, when constructed and arranged as and for the purposes described.

No. 46,585.—GEORGE R. PERCY, New York, N. Y.—*Manufacture of Glucose*.—February 28, 1865.—This invention consists in the manufacture of grape sugar from the whey of milk. The whey is put into a suitable vessel and a quantity of albumen added. It is then boiled and strained to separate the impurities; after which it is quickly evaporated and set aside, in order to allow crystals of lactine to be formed. The lactine is then dissolved and sulphuric acid added thereto, and boiled from one to four hours; after which the acid is neutralized with carbonate of potash, and the liquid is filtered through bone black and evaporated to a proper consistency.

Claim.—The obtaining of glucose or grape sugar from the whey of milk or from milk sugar.

No. 46,586.—FRANK P. PFLEGHAR and WILLIAM SHOLLEHORN, New Haven, Conn.—*Tip for Oil Cup*.—February 28, 1865.—This invention consists in casting the tips of oil cans and their thumb rings in one piece and at one operation, coring out the interior the greater portion of the length of the tip, then drilling a hole nearly through a little smaller than the cored hole, and finishing with a small drill.

Claim.—As a new article of manufacture, the herein-described cast metal tip for oil cups.

No. 46,587.—T. K. REED, North Bridgewater, Mass.—*Bag Fastener*.—February 28, 1865.—Two jaws or grippers are hinged together and are made capable of interlocking at the other ends. These are applied to the mouth of a bag, which they fasten. A clasp jaw and locking device are combined with the grippers, so as to prevent their teeth from unclasp- ing when once interlocked.

Claim.—A fastening device for bags having a construction substantially as specified.

No. 46,588.—JOHN RICH, Conway, Mass.—*Spinning Machine*.—February 28, 1865.—The friction feed and rolls delivering spools rise and fall with their frame to and from the twisting devices, the yarn of wool being intermittently gripped and released between the roll and the wheel, and also by friction jaw fingers on the wheel. The twist is thus prevented from running upon the thread while being drawn, so that the part below the fingers receives

its twist, while the roving above is being drawn preparatory to being run down to receive its twist.

Claim.—First, the combination in a tool-spinning frame or machine of the twisting spindle B. ring and traveller E, and a draw-twisting whirl F, with its holding fingers *c d*, substantially as and for the purposes herein described.

Second, the combination with the draw-twisting whirl and its holding fingers *c d* of the holding clamp T and feed roll Q, substantially as and for the purposes described.

Third, the combination with the feed roll of feed pulley R and spring feed arm Z, substantially as and for the purposes described.

Fourth, the combination of the dogs *y* and *z* with the incline on the long upright piece Y and sliding pin H, for the purpose of operating the feed arm Z, substantially in the manner herein described.

Fifth, the use and employment in wool-spinning machines of a friction pad acting intermittently on the pulley of the feed roller for delivering the roving, as and for the purposes set forth.

Sixth, the combination with the clamp T of the mechanism described for operating it at the proper time, substantially as set forth.

Seventh, the hinged dog *z* in combination with the incline on the short upright piece N, as and for the purpose set forth.

Eighth, the adjustable face 7 in combination with the upright piece *z* and hinged dog *z*, or the equivalent thereof, for the purpose stated.

Ninth, the draw-twisting whirl F in combination with the holding or retaining fingers *c d*, constructed and operating as and for the purposes herein described.

Tenth, the combination of mechanism constructed and arranged substantially as above described for drawing and twisting woollen threads simultaneously as herein set forth.

No. 46,589.—WILLIAM SAGE, Berlin, Conn.—*Rowlock*.—February 23, 1865.—This rowlock consists of a bearing plate combined with a chamber over the base of the rowlock. There is employed also a twin bolt placed on one end, or near one end, of the supporting plate.

Claim.—The plate C having a hub D turned up either with or without a screw, or corrugated surface formed thereon, in combination with the chamber in the base of a rowlock, substantially as described.

Second, the employment of a twin bolt E', or its equivalent, in combination with the rowlock plate C, substantially as described.

No. 46,590.—J. B. SHAW, New Haven, Conn.—*Trace Lock*.—February 23, 1865.—This invention consists in making the hook upon the whiffletree double, one part of the hook being stationary and the other loose: the latter is turned back, while the other is passed through the trace, and then locked by turning down the loose part.

Claim.—The herein-described trace lock, constructed substantially as specified.

No. 46,591.—F. SMITH and PETER SWOPE, Tiffin, Ohio.—*Wood-bending Machine*.—February 23, 1865: antedated January 27, 1865.—The object of this invention is to bend wood for wagon felloes, and it consists in a combination of devices for holding the wood to be bent in position, and an expansible block within the pattern which secures the pattern in the machine, and securing the wood on the pattern after being bent by hooks on the bending straps, and an adjustable clamp holder so made that it can be used for greater or less diameter of wheels.

Claim.—First, securing the patterns F in position to receive the strips *g* of wood as they are bent by means of expansible blocks G G, substantially as described.

Second, so applying the pattern holders G G to the frame of the machine that they can be elevated or depressed and held down firmly in place to receive the strip of wood as it is bent, substantially as described.

Third, the bending heads *c c* in combination with the strip *d* and detachable strip *d'*, when used in conjunction with a pattern F and expansible holders F G, substantially as described.

Fourth, the arrangement of the hooks *c e*, strip *d'*, and adjustable clamp *f f'*, in combination with the bending devices described and the movable pattern, substantially in the manner and for the purpose described.

No. 46,592.—WILLIAM B. SNYDER, Lakeville, Conn.—*Spring Balances*.—February 23, 1865.—A spring balance is provided with two sliding scales, one to indicate the weight of apron or basket, and the other its contents.

Claim.—The arrangement of the two sliding indices to weighing balances, in the manner and for the purpose substantially as herein set forth and described.

No. 46,593.—DANIEL E. SOMES, Washington, D. C.—*Cooling and Ventilating Vessels*.—February 23, 1865.—As the water of rivers and the sea at a short distance below the surface is always at a pretty low temperature, a system of pipes is arranged at any convenient

point on a ship's side in contact with the water, into which air is forced for the purpose of cooling it. Its temperature having been reduced in this way, it is conducted wherever it is required in the ship to cool and ventilate the various compartments.

Claim.—First, cooling and ventilating vessels in the manner herein described.

Second, cooling air for the purpose of cooling and ventilating vessels by forcing the air through submerged pipes or their equivalents, substantially as set forth and described.

Third, the forcing of air into ships and other vessels by the motion of such vessel in the water, or by the action of the waves against or around the vessel.

Fourth, affixing to the side of the ship or vessel a device or devices substantially as described, so that the motion of the vessel in the water, or of the water against the vessel, shall produce a blast of air, as described.

Fifth, the devices herein described, or their equivalents, for airing, cooling, and ventilating vessels for carrying grain or other perishable freight.

Sixth, constructing the interior of a vessel for carrying grain or other perishable freight, substantially as described, so that air may be conveyed through said vessel by means of perforated walls or tubes, as set forth, and this whether the air has been previously cooled or not.

No. 46,594.—DANIEL E. SOMES, Washington, D. C.—*Cooling and Condensing Apparatus used in Brewing and Distilling.*—February 28, 1865.—This apparatus consists in the employment of one or more subterranean tanks with reservoir pipes for cooling water for the purpose of cooling worts, beer, or other liquids. A suitable apparatus for condensing and cooling distillates is also employed in connection with the above. A pump propeller screw, or its equivalent, is used to cause a circulation of the water in the apparatus.

Claim.—First, the manufacture and use of coolers and condensers for use in brewing and distilling, constructed and operating substantially as herein set forth and described.

Second, a cooling apparatus for cooling worts, beer, and other similar liquids, composed of one or more subterranean tanks, reservoir pipes, or their equivalents, for cooling water, in combination with suitable apparatus for using the water thus cooled, for the purpose of cooling worts, beer, or similar liquids.

Third, the combination of a subterranean cooling apparatus for cooling water with suitable apparatus for condensing and cooling distillates, substantially as set forth and described.

Fourth, the combination of the subterranean cooling vessels, the apparatus for cooling and condensing liquids or distillates, with a pump propeller screw or other suitable means for causing a circulation of the water in apparatus constructed according to the principles of Fig. 2, as herein set forth and explained.

No. 46,595.—DANIEL E. SOMES, Washington, D. C.—*Cooling Preserving Houses, Packing Houses, Refrigerators, and other similar structures.*—February 28, 1865.—The nature and object of this invention are set forth in the claim.

Claim.—First, the process herein described for the purpose of cooling preserving houses, packing-houses, refrigerators, store-rooms, and similar structures, said processes consisting in using the low temperature of the earth at certain depths below its surface for the purpose of cooling either water or air or both by means of a combination of devices and apparatus substantially such as herein described, or their equivalents.

Second, the process herein described, or any equivalent means, for cooling water, in combination with the process for cooling air, by first compressing it in contact with a cold surface, and then permitting it to expand when used for the purpose of cooling and preserving, as herein set forth and described.

Third, cooling refrigerators and salting tanks in packing-houses and other similar structures by means of a current of cold water or cold brine, as set forth and described.

No. 46,596.—D. E. SOMES, Washington, D. C.—*Mode of Cooling and Ventilating Dwellings, Churches, Hospitals, Theatres, and other Buildings.*—February 28, 1865.—This invention consists in equalizing the temperature of buildings to be occupied by men and animals by means of the cold earth always found at certain depths below the surface. The object of the device is to make the air in the buildings approximate at all seasons the mean annual temperature of the place. This is accomplished, first, by bringing a current of water in the pipes so as first to descend to the cold depths of the earth, and then pass through the buildings to a cooler, or through an adjoining refrigerating chamber; second, in making air pass in tubes through the cold earth, or through water which has been cooled by passing through cold earth. The air may be condensed while in the cooler and then permitted to expand so as to be further cooled. Evaporation also may be used to assist in cooling the air. In winter this system of cooling becomes a mode of warming, which may be aided by the usual means of heating.

Claim.—First, cooling and ventilating dwellings, churches, hospitals, theatres, and other buildings, substantially as herein set forth and described.

Second, the combination of a system of subterranean pipes, tanks, or reservoirs, with a corresponding system of pipes, channels, reservoirs, or their equivalents, in or near the building to be cooled, so as to cool and ventilate, substantially as described.

Third, cooling air by conducting it through or around water pipes, or compressing it in pipes, tanks, or reservoirs, in contact with any cooling medium, and then permitting it to expand so as to cool and ventilate buildings, substantially as described.

Fourth, cooling and equalizing the temperature of buildings by means of refrigerating chamber or chambers with water pipes, or their equivalents, for conveying a current of water, in combination with suitable devices and apparatus for cooling the water, all substantially as set forth.

Fifth, cooling buildings by means of pipes or other channels for water placed in the wall, between the two walls, or in the buildings to be cooled, and connected with a subterranean refrigerating apparatus, as set forth and described.

Sixth, combining with the devices herein described for equalizing the temperature of the earth below its surface, devices for heating or warming such water, so as in cold weather to warm buildings, constructed substantially as herein set forth and described.

Seventh, the construction of iron buildings with tubes, channels, or spaces in the walls, in combination with cooling and warming apparatus, constructed substantially as herein set forth and described.

No. 46, 597.—ANSON P. STEPHENS, Brooklyn, N. Y.—*Percussion Grinder*.—February 28, 1865.—This machine is in fact a quartz-crusher, and is so constructed that the upper and revolving stone moves upon inclines, and at a certain point it drops suddenly, producing the percussion. It combines the two elements of hammering and grinding.

Claim.—The combination of the two grinders, one of which turns upon the other and is raised and permitted to fall at intervals so as to pound and grind the material alternately, substantially as set forth.

Also, the combination of the said two grinders with apertures in the lower grinder for the escape of fine material, substantially as set forth.

No. 46, 598.—JOHN D. STEWART, Baltimore, Md.—*Smoking Pipe*.—February 28, 1865.—An ordinary pipe bowl of wood or metal has fitted to it a stem, in the middle of which is a trap or vertical chamber open at both top and bottom, the former being closed by a plug of wood or metal, and the latter by a bulb-shaped oil receptacle of any material which may be preferred; the stem that leads from the bowl enters the trap at a point considerably above the stem which connects with the mouth piece; the trap is cylindrical in shape.

Claim.—Giving such a shape to the stem B of a tobacco-pipe as to form a trap d in the smoke passage thereof for the purpose herein described.

Also, the openings to the aforesaid trap d, in connection with the movable devices for closing the same, substantially as described and for the purpose herein set forth.

No. 46, 599.—WM. M. THORNTON, Clinton Junction, Wis.—*Lifting Jack*.—February 28, 1865.—The object of this invention is to so construct a lifting jack which is operated by means of a rack and segment, that all the lateral force which is applied to the lifting bar or jack staff shall be resisted by friction rollers instead of by a fixed friction surface, as hitherto; also to provide for shifting the position of a removable lever, by furnishing a constant support for the fulcrum of said lever during its vibration in the act of forcing the jack staff upward.

Claim.—First, the combination of the friction wheels a a, with the jack staff B, which is operated by means of a rack and segment, substantially as described.

Second, the application of friction wheels to the back edge of a jack staff, which has a rack formed on its opposite edge adapted to receive the toothed segment formed on the end of the removable lever C, substantially as described.

Third, the relative arrangement of the bearings f f, and friction wheels a a, on the standards of the jack staff which is operated substantially as described.

No. 46, 600.—M. J. WELLMAN and J. J. GREENOUGH, New York, N. Y.—*Lamp Shade*.—February 28, 1865.—This invention consists in so constructing wire-gauze shades for lamps with scalloped edge as to form springs to hold the shade in place.

Claim.—The shade holder, constructed in the manner and for the purpose herein set forth.

No. 46, 601.—GEORGE W. WILSON, Chelsea, Mass.—*Heating Furnace*.—February 28, 1865.—In this furnace are placed doors at either end of the fire chamber. Between this fire chamber and the outside of the wall are flues heated by radiation and openings, with a chamber over and smaller than the fire chamber; flues from the latter open into the former and the products of combustion circulate through this chamber to the exit pipe. From the space at the sides and the top between the outer wall and the inside arrangement above named, flues pass off to convey heat to any desired point; dampers at the side of the furnace and near the floor can admit air to temper the heat in this space; a small flue controlled by a damper admits air into the fire chamber at about the line of combustion.

Claim.—The combination and arrangement of the fireplace B, ash chamber C, radiator E, descending pipes i i, horizontal flues h h, ascending pipes g g, damper f, and escape flue e, the whole being arranged with respect to the air-heating chamber A, substantially as set forth.

Also, the combination of the air-receiving chamber I, and its vibratory valves *l l*, with the air-heating chamber A. and the fireplace provided with flues, substantially as described, for the escape of the volatile products of combustion.

Also, the arrangement of the air ducts G H H, with the air-receiving chamber I, the air-heating chamber A, the fireplace B, and ash chamber thereof.

No. 46,602.—BARNABAS WOOD, Albany, N. Y.—*Plugging Instrument for the Teeth*.—February 28, 1865.—This instrument being designed for heating a certain fusible filling for the teeth, consists of a bulb composed of some good conductor of heat, as silver, German silver, bronze, or other substance, to one side of which is attached a blade of similar material for communicating heat to and applying the fusible filling, and to the other side of which is attached a tubular handle of glass, porcelain, or other non-conductor of heat.

Claim.—First, the herein-described instrument, consisting of a metallic head, as described, affixed to a tubular shaft, whether of metal or other material, for an instrument for filling teeth, with the herein-mentioned fusible metal filling or other similar material.

Second, the construction of the head A, with a bulb, plate, and neck, as represented.

Third, the formation of the bulb *b*, between the blade *a* and the neck *c*.

Fourth, the combination of the head A and tubular shaft B or E.

Fifth, also the application of the insulating tubular casing D to the tubular shaft B.

No. 46,603.—WARREN N. ABBOTT, assignor to himself and D. B. RICH, Boston, Mass.—*Pipe Coupling*.—February 28, 1865.—This invention consists of a detachable screw coupling, in which the end of the pipe has a screw-nut provided with a flange slipped over it; there is also a washer fitted to the end of the pipe, and both pipe and washer are slightly enlarged by means of a conical plug; a nipple, having a conical end and a thread on the exterior, is screwed into the screw-nut, by which it is drawn tightly together, forming a joint without the use of solder.

Claim.—The within described detachable coupling, in which the end of the pipe is confined between the two portions B and C, in the manner substantially as described.

No. 46,604.—ELIZUR E. CLARK, assignor to F. N. CLARK, New Haven, Conn.—*Machine for Cutting Pasteboard for Boxes*.—February 28, 1865.—This invention consists in the employment of a zig-zag cutter roller, in combination with a feed roller.

Claim.—First, the zig-zag cutter, constructed and arranged in relation to the cutter holder, cutter stock, cutter bar, and main cylinder, so as to operate in the manner and for the purpose described, and whether the same is used in connection with scoring or ordinary cutters, substantially as set forth.

Second, the combination and arrangement for the adjustment and suspension of the upper feed roll B, substantially as set forth and described, and for the purpose specified.

No. 46,605.—HENRY HOWSON, assignor to STUART & PETERSON, Philadelphia, Penn.—*Gas-burning Stoves*.—February 28, 1865.—This invention consists in the arrangement of an annular plate around the casing of the stove just above the fire-pot, pierced with holes, and loosely fitted, so as to rise or fall by the expansion and contraction of heat, without binding; the casing of the stove being also pierced with corresponding holes, so that the annular plate acts as a register; the design of this device being to admit jets of air in upon the inflammable gases in the combustion chamber to supply oxygen to produce a more perfect combustion thereof. There is also in connection a damper with perforations in it, which serves as a door or cover to the opening of the ash-pit.

Claim.—First, an annular perforated plate E, arranged on or forming a part of a round or cylinder stove, at or near the upper end of the fireplace, in combination with an annular perforated plate or register F, when the latter, as well as the register, are so formed and adapted to each other that any difference in the expansion or contraction of the register and plate cannot impair the former or disturb its tendency to fit by its own weight on the plate E.

Second, an inclined plate E, formed by the annular indentation of the stove immediately above the fireplace, in combination with the annular perforated plate or register, as seen in Figs. 4 and 6.

Third, two circular and indented or bevelled surfaces, formed by contracting the body of the stove, in combination with two annular perforated plates, the one above and the other below the point contracted, as seen in Fig. 3.

Fourth, in combination with the ash-box, the bevelled damper I, with its perforations or notches, when the said damper is adapted to the bevelled opening of the ash-pit, and its notches or perforations, substantially as set forth, for the purpose specified.

No. 46,606.—M. KILLACKY, assignor to himself and J. G. ROUSE, Philadelphia, Penn.—*Horse Collar and Hames*.—February 28, 1865.—This invention consists in hames combined with and forming part of the collar; said hames being connected at the top by hinges, and at the bottom by a locking device.

Claim.—The hames A A', combined with and forming part of the collar B B', when the said hames are hinged together at the top and connected together at the bottom by the device herein described, or the equivalent to the same, for the purpose specified.

No. 46,607.—ANTONIO MEUCCI, Richmond, N. Y., assignor to W. E. RIDER, New York, N. Y.—*Mode of Making Wicks*.—February 28, 1865.—This invention consists of a lamp-wick made of paper pulp, and strengthened by means of bobinet or other similar material.

Claim.—The new manufacture of wick and wicking of decomposed vegetable fibre, substantially as herein set forth.

No. 46,608.—E. L. SIMPSON, Bridgeport, Conn., assignor to SIMON STEVENS, New York, N. Y.—*Mode of Preparing India-rubber for the Manufacture of Hose, Belting, Packing, &c.*—February 28, 1865.—A compound of boiled oil and sulphur, in the proportion of a quart of the former to a pound of the latter, is heated till it becomes spongy. This substance, combined with India-rubber, or other similar gum, and subjected to a sufficient regulated heat from steam, acquires those properties required in hose, belting, packing, &c.

Claim.—Preparing India-rubber for mechanical purposes in the manner substantially as herein set forth.

No. 46,609.—E. L. SIMPSON, Bridgeport, Conn., assignor to SIMON STEVENS, New York, N. Y.—*Manufacture of Hard Rubber*.—February 28, 1865.—A certain compound of boiled oil and sulphur, heated to sponginess, is combined with India-rubber in the proportion of two ounces of the former to one pound of the latter, by passing both substances together between warm rolls, and subjecting the resulting compound to steam at 320° Fahrenheit for the space of five hours, more or less. Having cooled, it forms hard rubber.

Claim.—The compound produced by combining the within described vulcanizing compound with India-rubber, and the said compound cured in the manner and for the purpose herein set forth.

No. 46,610.—E. L. SIMPSON, Bridgeport, Conn., assignor to SIMON STEVENS, New York, N. Y.—*Process of Manufacturing India-rubber, &c.*—February 28, 1865.—A preparation of boiled oil and sulphur, heated to sponginess, is mixed with India-rubber, or other similar gum, and with some oxide or carbonate of lead, and any desired coloring matter. This mixture having been subjected to a sufficient degree of regulated heat is rid entirely of the disagreeable odor and deleterious properties of vulcanized rubber.

Claim.—First, the within described compound of vegetable oil and sulphur, prepared substantially as and for the purposes specified.

Second, the manufacture or preparation produced by combining the within described compound with India-rubber, gutta-percha, or other similar gum or gums, substantially as and for the purposes specified.

No. 46,611.—E. L. SIMPSON, Bridgeport, Conn., assignor to SIMON STEVENS, New York, N. Y.—*Water-proof Fabric*.—February 28, 1865.—Upon silk, light or heavy cotton, Canton flannel fabrics, &c., are spread one or more coatings of a certain compound of boiled oil, sulphur, rubber, &c., and, while it is in an adhesive state, flocks or other similar material are sifted over it in excess. The fabric thus coated is passed between pressing rollers. The excess of flocks is then removed by means of a revolving brush. The fabric is then subjected, for twelve hours, more or less, to a temperature of 270° Fahrenheit, or thereabout. It is then ready for use.

Claim.—As a new article of manufacture, coating water-proof fabrics with flocks, when the fabric is first prepared in the manner herein set forth.

No. 46,612.—CHARLES E. SNEIDER, assignor to himself and THOMAS POULTNEY, Baltimore, Md.—*Revolving Fire-arm*.—February 28, 1865.—A small percussion rod passes through the nipple or breech of each of the chambers of the revolving cylinder in the line of the axis thereof, having a slight longitudinal play, and provided with a knot or enlargement at each end. The said percussion rod serves to transmit the blow of the hammer to the central priming of the cartridge, and also to start the cartridge shell forward from its chamber after it has been discharged.

Claim.—First, the pins D passing through the rear part of the cylinder, and provided at their forward ends with heads *d'*, adapted to act as gas checks in the event of gas escaping from the rear of the cartridge.

Second, in combination with the aforesaid pins D, the described construction and relative arrangement of the rear end of the cylinder and the hammer, whereby the pins D, after having been employed for the explosion of the cartridges, are made capable of an additional forward movement to effect the ejection of the exploded shells, as explained.

No. 46,613.—D. H. SOUTHWORTH, New York, N. Y., assignor to himself, BLASE LORILLARD, and CHARLES FARRIS, White Plains, N. Y.—*Telegraph Cable*.—February 28, 1865.—This invention consists in a method of insulating the wires of a cable by means of a piece of gutta-percha, having pins or projections, the several wires being placed in the angles formed by wings and the main body of the gutta-percha piece, and there being enclosed by projections by means of suitable machinery.

Claim.—Enclosing and separately insulating several telegraph wires or conductors in a cable by means of an insulating piece, having pins or flanges, and otherwise constructed, substantially as herein specified.

No. 46,614.—WING H. TABER, assignor to himself and THOMAS H. ABBOTT, Lowell, Mass.—*Bench Plane*.—February 28, 1865.—This invention consists of an adjustable fulcrum screw or bed inserted in the plane stock, and on which the plane irons rest. On the top of the plane irons is a V shaped lever, through one end of which lever, and through the plane irons, passes a screw into the stock. Through the other end of said lever a screw also passes, the end of which rests on the plane irons, thus holding the irons in the throat of the plane stock.

Claim.—The combination of the adjustable bed or bearing G, the screws F and D, and the lever E, the whole being arranged with respect to the plane iron and the stock, substantially as specified.

Also, the arrangement of the adjustable bed G with the fulcrum screw D, the lever E, the screw F, the plane iron B, and its bearing b, arranged at the lower part of the throat a, as described.

No. 46,615.—GEORGE W. BROWN, Galesburg, Ill.—*Seed-planting Machine*.—February 28, 1865.—In this invention the driver's seat moves upon rollers, and is reversible. V-shaped scrapers are operated independently by treadles. A horizontal seed wheel is revolved continuously, both automatically and by a hand lever, by means of a fork so arranged that its forward and backward motions both turn the wheel by increments in the same direction. Both the seed bar and the frame of the machine are adjustable by metal sockets, in order to increase or lessen the distance between the rows.

Claim.—First, in combination with a seed-planting machine, having its seeding devices forward of the centre of the wheels, a movable seat F with wheels f and f² and guides a and a', for the purpose described.

Second, in combination with the operative parts of a seed-planting machine, the metal sockets A, constructed as shown, and arranged for use in combination with the side frames A1 A2, for the purpose of widening and narrowing the machine, in the manner and for the purpose specified herein.

Third, the employment of a corresponding metal socket H and adjustable side parts H1 H2 in combination with the frame A A1 A2, or its equivalent, so that the seed bar shall be shortened or lengthened to correspond with the changes in width of the frame, substantially as herein specified.

Fourth, in a continuously progressing seed-planting machine, wherein the seed-dropping mechanism is operated by an attendant, in contradistinction to automatic dropping, the operating of horizontal seed wheels by hand, so as to make complete revolutions by increments, substantially in the manner and for the purposes herein set forth.

Fifth, in a seed-planting machine the employment of seed-dropping wheel and operating fork, combined and arranged as herein represented and described, so that the movement of the fork in one direction will act on the wheel to turn it to a certain extent in a certain direction, and the movement of the fork in the opposite direction will act on the wheel to turn it to a certain extent in the same direction as before, thus turning the wheel by increments around in one uniform direction by reciprocating movements of the fork, as herein set forth.

Sixth, in such machine holding the drill mechanism at rest by carrying the inclines u beyond the range of the pins T, substantially in the manner and for the purpose herein set forth.

Seventh, in combination with a seed-planting machine, carried on wheels, the employment of two independently-operated scrapers X X2, which are severally forced against and released from the supporting wheels at the will of the operator by means of treadles Y1 Y2, connected and arranged to operate substantially as and for the purpose herein set forth.

No. 46,616.—RUEL ALDEN, East Toledo, Ohio.—*Protecting Trees from Injury while Ploughing*.—March 7, 1865.—This invention consists in providing the outer ends of whiffletrees with elastic rollers, which guide the ends of the whiffletree past the trees without contact, and thus preventing injury to the bark.

Claim.—The employment or use of India-rubber or other elastic substance in the form of rollers or otherwise, applied to one or both ends of a whiffletree, to serve as a cushion or guard to protect, while ploughing, trees from the action of the whiffletrees, substantially as set forth.

No. 46,617.—ETHAN ALLEN, Worcester, Mass.—*Cartridge Retractor for Breech-loading Fire-arms*.—March 7, 1865.—This invention consists in so arranging a link, in connection with the cartridge discharger and the frame of the pistol, that by turning the barrel from its bed it acts upon the discharger and throws the exploded cartridge shell from the barrel.

Claim.—A link F, hung in front of the centre of action of barrel B, in combination with discharger E, substantially as described.

No. 46,618.—WILLIAM ATWOOD, Cape Elizabeth, Me.—*Apparatus for Oridizing Metals*.—March 7, 1865.—This invention consists of a revolving chamber provided with flanges, and open at the end, and communicating with a flue. Said flue communicates with chambers, one of which communicates also with the chimney. The material to be treated is placed in the first-named chamber, which is heated by means of a fire in the furnace. A draught of

air is caused to flow through the said chamber into the flue and the other chamber, and from thence into the chimney. The particles of materials carried over by the draught are caught in the chambers.

Claim.—The invention of a revolving chamber, so constructed as to admit the passage of a constant current of atmospheric air over and through the material to be oxidized while the same is kept in constant motion and exposed to any desirable degree of heat.

No. 46,619.—JAMES C. AYER, Lowell, Mass.—*Process for Desulphurizing and Disintegrating Ores.*—March 7, 1865; antedated January 24, 1865.—This invention consists in subjecting the ore to a high degree of heat, and then suddenly cooling with it an alkaline solution. The ore is then again heated and cooled, and if not sufficiently disintegrated, the operation may be repeated, and so on until the desired effect is obtained.

Claim.—First, the application of treating rock or ores while in the heated state with an alkaline solution, substantially as described, for the purpose of partial disintegration, desulphurization, and oxidation of the same.

Second, the application of re-treating ores which have been heated, substantially as above described, and the same repeated for the complete disintegration, desulphurization, and oxidation of the same.

No. 46,620.—JAMES C. AYER, Lowell, Mass.—*Process for Desulphurizing and Disintegrating Ores.*—March 7, 1865; antedated January 24, 1865.—This invention consists in heating the ore to a high degree of heat and cooling it suddenly with a solution of salt and water. The operation is then repeated, and if the ore is not sufficiently disintegrated, may be repeated until the desired effect is obtained.

Claim.—First, the application of treating rock or ores while in the heated state with a saline solution, substantially as described, for the purpose of partial disintegration, desulphurization, and oxidation of the same.

Second, the application of re-treating ores which have been heated, substantially as above described, and the same repeated, for the complete disintegration, desulphurization, and oxidation of the same.

No. 46,621.—JAMES C. AYER, Lowell, Mass.—*Process for Disintegrating, Desulphurizing, and Oxidizing Ores.*—March 7, 1865; antedated January 24, 1865.—This invention consists in subjecting the ore to a high degree of heat, and while in that condition suddenly cooling it by means of jets of water. When the ore has cooled it is again heated, which further disintegrates it. When heated to a proper point it may again be cooled with water. The above operation may be repeated as often as necessary.

Claim.—First, the application of cooling ore, while in a heated state, with water, substantially as described, for the purposes of partial disintegration, desulphurization, and oxidation of the base metal in the same.

Second, re-treating ores which have been treated substantially as above described and repeating the same for the complete disintegration, desulphurization, and oxidation of the metals in the same.

No. 46,622.—SAMUEL BABBIT, Kokomo, Ind.—*Gaiter Boots.*—March 7, 1865.—This invention consists in dispensing with the use of the ordinary gore or elastic webbing in the manufacture of gaiter boots, and forming that part of the shoe which covers the ankle with an extension, which enlarges the opening to such a degree as to permit the foot to be readily inserted, and which, after the shoe is on the foot, is folded or buckled and fastened against the ankle after the manner of a flap.

Claim.—A gaiter boot constructed with a folding extension C, substantially as and for the purposes set forth.

No. 46,623.—WILLIAM E. BARTON, East Hampton, Conn.—*Attaching Sleigh Bells to Straps.*—March 7, 1865.—This invention is intended to effect the stringing of sleigh bells by attaching them to straps by means of metallic fastenings, capable of being readily taken apart to remove the bells for cleaning or to replace broken parts; also to hold the bell out of contact with the strap.

Claim.—First, the metallic seat, having a recess conforming to the boss of the bell, a hole for the coupling screw to pass, and impinging surfaces on the leather side to keep the seat in place, substantially as described.

Second, in combination, the bell with short boss and screw hole, the metallic seat strap, and coupling screw, substantially as described.

Third, in combination, the coupling screw, flaring washer strap, metallic seat, and bell, substantially as described.

No. 46,624.—J. A. BASSETT and E. L. NORFOLK, Salem, Mass.—*System of Supporting Combustion.*—March 7, 1865.—This invention consists of a furnace provided with a steam boiler. The products of combustion pass through jackets into the flue. A series of pipes communicates at one end with the said boiler, the other end passing out below the fire-box.

Tubes are provided through which super-heated steam passes into the space beneath the fire-box, the air entering through a tube *d* around the sides of a tube *c*.

Claim.—Supporting or effecting combustion in furnaces, stoves, &c., by the introduction of super-heated steam, with or without air, substantially as herein described.

No. 46,625.—BENJAMIN F. BATES and CHARLES R. MACY, New York, N. Y.—*Ordnance and Projectile.*—March 7, 1865.—This invention consists of a sub-calibre projectile, provided with a long stem, or narrow shaft, extending from its rear, and passing through an orifice in the breech of the gun. A washer or sabot of the full calibre of the gun is slipped over the stem or shaft, and resting against the base of the projectile, properly centres it, and receives the propelling force of the charge. The gun is provided with a suitable stuffing box at its rear, to prevent the escape of gas around the projectile.

Claim.—First, a projectile, made with a small head B, a smaller body C, to pass through an aperture in the breech of the gun, and a disk D to fit the bore of the gun, substantially as herein described.

Second, a gun, having guide blocks G G' applied to its breech in the manner described, and employed in connection with a projectile formed with a longitudinal rear extension C, either for the purpose of guiding the latter in a central position, or imparting rotation to the projectile, as herein set forth.

No. 46,626.—WILLIAM N. BATES, Centre Point, Iowa.—*Seeding Machine.*—March 7, 1865.—In this invention a tooth reciprocating agitator is moved in a mitred seed box, by connecting it with a vibrating block and link from a wrist on the driving wheel.

Claim.—The combination and arrangement of parts herein described, consisting of a mitred seed box with a regulating slide C, with its spring inside of the seed box, a gate I, operated by a handle from the exterior, and a toothed reciprocating agitator F, moving on bearings at the upper part of the seed box, with its teeth extending down nearly to the seed aperture, and operated by connection with a vibrating block and a link from a wrist on the driving wheel.

No. 46,627.—EDWIN P. BAUGH, Philadelphia, Penn.—*Bone Mill.*—March 7, 1865.—This invention consists in the peculiar construction and dress of the grinding surfaces, and the made of securing the several sections. Reference to the claim and engraving will define it clearly.

Claim.—First, making the grinding surface of mills for grinding bone and other substances, when the same are of cast metal, in sections or divisions, so that the outer grinding surface shall be composed of vertical sections *b*, surmounted and held in place by a ring *c*, whose periphery is also a grinding surface, substantially as above described.

Second, making the ring L, which serves as a foundation for the lower edges of the grinding surface, separate and distinct from the shell A which surmounts the said outer grinding surface, substantially as above described.

No. 46,628.—A. BELCHAMBER, Ripley, Ohio.—*Harvesting Machine.*—March 7, 1865.—This invention relates to the construction of the flange, to which the rake bars and reel arms are secured. This flange is furnished with sockets, in which the rake bars are firmly secured, while those in which the reel arms are secured are made open, thus allowing the said arms to be pivoted to the flange, so as to rise and fall independently of its motion. The flange is secured to a rotating shaft by a rod which passes through said shaft, while its ends are fitted in bearings which are attached to the flange.

Claim.—The flange I, attached to a rod H at the upper end of the rotating shaft D, and provided with sockets in which the rake bars J are permanently secured, and the reel arms J' secured by pivots or pins *g* in connection with the camway M, all arranged to operate substantially as and for the purpose herein set forth.

No. 46,629.—GEORGE I. BERGEN, Galesburg, Ill.—*Corn Planters.*—March 7, 1865.—This invention consists in making the runners concave in front and slightly descending in the rear, to carry under and cut the stalks. A guide is placed upon either hopper for properly planting the rows. An adjustable rubber cut-off is used in the hopper, of the same size as the seed hole. The seed slide is operated by direct motion of a sliding rod without levers. The seed tube is cast in two parts, which are pivoted together. The hopper is slanting, and may be elevated by a leg above the seed slide.

Claim.—First, the runner D, having a concave edge along its front part, and a slightly descending straight edge from *a'* to *a''*, as shown and described.

Second, uniting the front and rear frames of a corn planter by means of the curved slotted box *f* and bar *g*, in combination with the loose joint *d e*.

Third, a guide for planting, consisting either of two points or a broad plane surface, substantially as set forth.

Fourth, the hopper C, when constructed as herein set forth.

Fifth, the plate *k*, when constructed and used as and for the purposes described.

Sixth, the scrapers H, constructed as described and mounted on the roller I in such a

manner as to automatically remove themselves from contact with the wheels, as and for the purpose set forth.

Seventh, the seed tube E, when constructed as shown and described.

Eighth, the rubber cut-off J, when constructed and operated as herein set forth.

Ninth, the sliding rod K, having the bent arms *t*, and operating in conjunction with the standards *t* and seed slides *o*, as and for the purpose set forth.

Tenth, pivoting the valve *m'* on the removable pin *g*, and having the stem of said valve resting loosely in a notch *o* in the edge of the seed slide outside of the hopper, all arranged and operating as herein described.

No. 46,630.—H. W. BILL, Cuyahoga Falls, Ohio.—*Reaping Machine*.—March 7, 1865.—This invention consists in discharging the grain by means of an elevating and rotating frame, which is operated by a spring pawl arranged on the shaft of said frame, and connected with a hand lever, placed within convenient reach of the attendant.

Claim.—First, removing the grain from the machine and depositing it upon the ground in gavels, by means of the frame F, raised and rotated by one continuous operation substantially as set forth.

Second, the guards H, in connection with the frame F, as and for the purpose set forth.

Third, the bearers *c c*, in connection with the frame F, as and for the purpose set forth.

Fourth, rotating the frame F, by means of the pawl *e* and spring *s*, in combination with the shaft *b* and catches *c c*, substantially as and for the purpose set forth.

No. 46,631.—JOHN BINNEY, Boston, Mass.—*Street Lamps, Lanterns, &c.*—March 7, 1865.—This invention consists in certain devices operating as shields, to protect the light from currents of wind in street lamps, lanterns, &c.

Claim.—First, the construction and arrangement of street lamps or lanterns, or other lamps exposed to winds or currents of air, substantially as herein described.

Second, a lantern or street-lamp cap, composed of a chimney provided with apertures and overhanging bands, in combination with an annular shield, the whole being constructed for operation in the manner and for the purpose set forth.

No. 46,632.—H. BOLTHOFF, Buddington, Iowa.—*Apparatus for Amalgamating Gold and Silver*.—March 7, 1865.—This invention consists of a pan, made with a central conical hub, through which a hollow shaft passes. On the lower part of a spindle which passes through a hollow shaft is keyed a bevel wheel, and on the lower part of the said shaft is also keyed a similar bevel wheel, and into these wheels bevelled pinions gear, by means of which the mullers are rotated in opposite directions. On the upper part of the hollow shaft a square is formed, which is above the conical hub, and on this square is fitted the square portion of a conical hub, which extends down over the hub and is connected with the muller, which is provided on its under face with shoes. A sleeve provided with a slot is fitted over the upper end of the spindle, and a pin passes through said slot and spindle. This pin and openings cause the spindle to rotate the sleeve, while the openings allow the said sleeve to be adjusted by means of a screw.

Claim.—First, the employment or use of the two mullers O K, placed one above the other in the pan B, and arranged in such a manner as to rotate in reverse or opposite directions, substantially as and for the purpose herein set forth.

Second, the arrangement and combination of the central-fixed conical hub C, at the centre of the fan B, spindle E, tubular shaft D, conical hub J' of muller K, and the hollow hub Q of muller O, provided with arms R, fitted on the sleeve M, which is placed on the upper part of the spindle E, with the screw N fitted in it, substantially as and for the purpose described.

No. 46,633.—EDWARD BRAGGINS, Titusville, Penn.—*Apparatus for Distilling Petroleum*.—March 7, 1865.—This invention consists of a retort surrounded with a steam jacket, to which is attached a condenser, surrounded by a water jacket. An air-pump is attached to said condenser, for the purpose of withdrawing the air from it. A water tank is connected with the condenser, and the water jacket by means of pipes.

Claim.—The method described of producing a vacuum in the condenser *k* by water, in the manner described, when done by the aforesaid combination for the purposes set forth.

Also, the combination of the water tank P with the tubes O and N, the condenser *k*, the tube R, and the retort A, with the tubes E F C, when the same are constructed as described and in the aforesaid combination, for the purposes set forth.

No. 46,634.—MARTIN BRIGGS, Rochester, N. Y.—*Safe*.—March 7, 1865.—This improvement consists in placing the lock within a recess formed in the door back from its inner surface, and with the outer plate of the lock exposed, so as to be readily removed whenever desired, and also in a chamber to accommodate the movement of a bar, to which the bolts are attached, formed within the inner flange of the door, and rendered accessible by a hinged plate, or otherwise. By this arrangement the fire-proof material covers one face and three sides of the lock-case; the other face and side alone being exposed.

Claim.—The construction essentially as herein shown, the lock C being secured within the inner side or back of the door, with its back resting through in such a manner as to be readily opened and used in combination with the plates A B and packing D, so that the packing will surround the lock on the outside and ends to protect it, substantially as set forth.

Also, in combination with lock C, plates A B, and packing D, as above described, arranging the bar H and its bolts *g g*, in the inner flange of the door, and rendering them accessible by the chamber *i*, substantially as herein set forth.

No. 46,635.—JOHN BOUGHTON, New York, N. Y.—*Oil Can*.—March 7, 1865.—This improvement consists in placing between the chambers of an oil can and its nozzle a transparent chamber, so that the operator can see the oil rising, and prevent overflow in filling.

Claim.—An oil can or oiler having a transparent chamber applied to or combined with its metallic or opaque body and nozzle, to operate substantially as and for the purpose specified.

No. 46,636.—WILLIAM BUDD and J. L. HUSBAND, Philadelphia, Penn.—*Composition for Lining Oil Barrels*.—March 7, 1865.—This invention consists of drying japan, boiled linseed oil, and roofing cement.

Claim.—The manufacture of the firm elastic, impervious, coating, and the use of the same as herein before substantially set forth.

No. 46,637.—W. E. CHESNEY, Abington, Ill.—*Corn-planter*.—March 7, 1865.—This invention consists in devices for raising the runners, to which the said boxes are attached. The devices are not new in themselves, and the novelty consists in their arrangement and combination.

Claim.—The cams L L and lever M, in combination with the bar K, seed-boxes F F, and springs *jj*, all arranged to operate as herein set forth.

No. 46,638.—M. R. CLAPP, New York, N. Y.—*Pump*.—March 7, 1865.—Concentric in a cylinder is a much shorter and smaller cylinder, in which the piston moves. The space between the two is enclosed by a flange, extending from the ends of the inner to the outer cylinder. External valves in these flange disks are held in place by coiled springs. The piston rod moves horizontally, through one of the large cylinder heads. The water is drawn in between the cylinders to a port beneath. Each thrust of the piston forces the water before it through an opening in the outer cylinder, and the end of the inner cylinder into a valve-box above, and thence through hose and pipe; the vacuum behind the piston causing the valves at that end of the small cylinder to open. The object is to secure a large influx of water when operating the pump as a fire-engine.

Claim.—Inducting the water into the main cylinder B, through openings *f' f'*, which surround, or nearly surround, the cylinder at each end, controlled by valves *G' G'*, as specified, and delivering the water through valves or sets of valves *M' M'*, the several parts being arranged and adapted for joint operations and easy access, substantially as set forth.

No. 46,639.—JAMES J. CLARK, New York, N. Y.—*Receiving Magnet for Telegraphs*.—March 7, 1865.—This invention consists in the substitution for cutters of the stop screws of a revolving wheel, having a roughened edge, by which a loud sound is produced by a very slight motion of the lever of the relay or receiving magnet.

Claim.—The revolving wheel A, with roughened edge, in combination with a telegraph receiving or main magnet, applied in the manner and for the purpose as herein before specified.

No. 46,640.—MOSES M. CLARK, Monroe, N. Y.—*Can for Preserving and Transporting Milk*.—March 7, 1865.—This invention consists in making cans, such as are used by milkmen for carrying milk to market, with double walls, and a filling of pulverized charcoal between the said walls.

Claim.—The filling in of milk cans between the inner and outer covers with pulverized charcoal, as a means of preserving milk, in such manner as to protect the milk from heat.

No. 46,641.—N. D. CLARK, Bentonport, Iowa.—*Gold Washer*.—March 7, 1865; antedated March 3, 1865.—In this machine the pan which receives the dirt to be washed has its bottom filled with perforations punched in opposite directions, so as to leave the "burrs" equally above and below. Fastened to the under side of this pan is a collecting bottom, which receives all substances that pass through the perforations in the pan, and delivers the same at the orifice shown at *d*, where they fall into the next pan, which has cross-curved partitions. In one or more divisions of the pan the mercury is placed, where it is agitated. Both the pans are suspended, so as to be vibrated. The force for vibrating them may be taken from the shaft of the water wheel, the waste-water of which flows over the pan.

Claim.—First, the providing of a separator for the above described purpose, with a series of elastic slips attached to the open end, to serve in separating nuggets from among the stones.

Second, the providing of a separator as above with a second bottom, made hollowing or inclined from the sides inward to some point where there is an opening downwards, to serve in collecting and discharging the dirt at one place.

Third, the providing of the above described separator and gold-pan with sifting or oscillating motion.

Fourth, the double use of the water, first as a propelling force, and then to wash the dirt.

No. 43,642.—J. M. COLLINS, New Bedford, Mass.—*Car Brake*.—March 7, 1865.—This invention relates to a method of attaching the shoes of the brake-heads, and also in attaching the brake-bar to the heads, whereby the shoes are firmly secured to the heads, and at the same time rendered capable of being readily detached, to be replaced by new ones when required, and the brake-bar and fixtures attached to it rendered more durable than those at present constructed.

Claim.—First, the mode of securing the shoes D D to the heads B B, by means of the dovetail projections *c* on the shoes fitted in the dovetail grooves *b* in the heads, when combined with the dovetail plugs E, and the bolts *e*, provided with the dovetail heads *f*, all arranged as set forth.

Second, the cast-iron shoe bar A, when attached or fitted to the heads B B, when constructed in the manner substantially as herein shown and described.

No. 46,643.—EDWARD COYLE, Albany, N. Y.—*Padlock*.—March 7, 1865.—This invention consists in providing a padlock with a series of tumblers having hooks at each side of them, and arranged in such relation with the eye of the shackle that each tumbler, in unlocking the lock, will require to be moved in a certain position relatively to the eye in order to release the shackle, a slight deviation from this position rendering it impossible to withdraw the shackle.

Claim.—The combination of the spring E, with the shackle B, plurality of double-hooked tumblers C, and springs *d*, all constructed, arranged, and operating as and for the purposes specified.

No. 46,644.—C. O. CROSBY, New York N. Y.—*Machine for Making Fish-hooks*.—March 7, 1865.—This invention consists mainly in the combination and arrangement of the several devices for fabricating a fish-hook, in the order in which the different operations are to take place. Thus the first is a device for feeding the wire to the cutter, which latter cuts off a blank; then comes a carrier of peculiar construction and operation, which carries the blank intermittently and successively to devices which form the head, bend the point, cut the barb, point the hook, and finally bend it to the proper shape.

Claim.—First, the combination of an intermittent feeding device with a cutter L, or its equivalent, when both are constructed substantially as herein set forth.

Second, the combination of a carrier, constructed and operating as described, producing intermittently a progressive translating movement of the blank with a cutter L and header B4, or their equivalents, substantially as described.

Third, the combination of a carrier constructed and operating as described, producing intermittently a progressive translating movement of the blank with header B4, and barb cutting instrument P2, or their equivalents, substantially as described.

Fourth, the presser 13, when formed so as to press upon the blank forward to the barb, to bend the blank over the bed P1, on which it rests, and to prevent the barb from curling over, substantially as set forth.

Fifth, the combination of the holder 14, back of the barb cutting instrument, with the presser 13, forward of the barb cutting instrument, substantially as and for the purpose specified.

Sixth, the combination of the holder 14, back of the barb cutting instrument, and the presser 13, forward of the barb cutting instrument, with the block or bed P1 on which the blank rests, substantially as and for the purpose set forth.

Seventh, the combination of the holder 14 back of the barb cutting instrument, the presser 13 forward of the barb cutting instrument, and the bed P1 on which the blank rests, with the barb cutting instrument P2, substantially as described.

Eighth, the combination of a carrier constructed and operating as described, producing intermittently a progressive transitory movement of the blank, with barb cutting instrument P2 and one or more pair of pressing or clipping dies, substantially as specified.

Ninth, the combination of a carrier constructed and operating as described, producing intermittently a progressive transitory movement of the blank, with one or more pair of pressing or clipping dies, barb cutting instrument, cutter L, or its equivalent, and intermittent feeding device, substantially as described.

Tenth, the combination of a carrier constructed and operating as described, producing intermittently a progressive transitory movement of the blank, with one or more pair of pressing or clipping dies, barb cutting instrument P2, and header B4, or their equivalents, substantially as specified.

Eleventh, the combination of a carrier constructed and operating as described, producing intermittently a progressive transitory movement of the blank, with one or more milling devices, substantially as set forth.

Twelfth, the combination of a carrier constructed and operating as described, producing intermittently a progressive translatory movement of the blank, with two or more pair of pressing or clipping dies, substantially as specified.

Thirteenth, the combination of a carrier constructed and operating as described, producing intermittently a progressive translatory movement of the blank, with two or more milling devices S, substantially as described.

Fourteenth, the combination of a carrier constructed and operating as described, producing intermittently a progressive translatory movement of the blank, with a barb cutting instrument and one or more milling devices, substantially as set forth.

Fifteenth, the combination of a carrier constructed and operating as described, producing intermittently a progressive translatory movement of the blank, with a header, barb cutting instrument, and one or more milling devices, substantially as described.

Sixteenth, the combination of a carrier constructed and operating as described, producing intermittently a progressive translatory movement of the blank, with a bender or former T2, substantially as described.

Seventeenth, the combination of a carrier constructed as described, producing intermittently a progressive translatory movement of the blank, with one or more milling devices and a former or bender T2, substantially as specified.

Eighteenth, the combination of a carrier constructed as described, producing intermittently a progressive translatory movement of the blank, with a barb cutting instrument, and bender or former T2, substantially as specified.

Nineteenth, the combination of a carrier constructed and operating as described, producing intermittently a progressive translatory movement of the blank, with a header B4 and barb cutting instrument, substantially as described.

Twentieth, the combination of a carrier constructed and operating as described, producing intermittently a progressive translatory movement of the blank, with a bender T2 and cutting device L, substantially as described.

Twenty-first, the combination of a carrier constructed and operating as described, producing intermittently a progressive translatory movement, with a grooved guide I5, substantially as and for the purpose specified.

Twenty-second, the combination of a carrier constructed and operating as described, producing intermittently a progressive translatory movement of the blank, with a holder c', which grasps and securely holds the blanks during their movement from one instrument to another, substantially as set forth.

Twenty-third, the combination of a carrier constructed and operating as described, producing intermittently a progressive translatory movement of the blank and holder c', which grasps and securely holds the blanks during their movement from one instrument to another, with a bender T2, substantially as described.

Twenty-fourth, the combination in one machine of an intermittent feeding device, cutter L, a carrier constructed and operating as described, header B4, barb cutter P2, pointing devices and bender T2, or other equivalents, in the manner and for the purpose substantially as herein set forth.

Twenty-fifth, the adjusting guide P3 for regulating the depth of the cut, in combination with the barb cutting instrument P, substantially as described.

No. 46,645.—M. B. DODGE, New York, N. Y.—*Apparatus for Gathering Quicksilver*.—March 7, 1865.—This invention consists of a vat, containing a bottom of copper or other metal, which can be amalgamated. The vat is provided with a series of slats, so arranged that they can be removed when desirable. Between each slat and the bottom a space is left, the spaces between said slats and bottom being occupied by an agitator.

Claim.—The slats D inserted into the vat A, so as to have channels a between their lower edges and the bottom of the vat, in combination with an amalgamated bottom B, and with or without an agitator E, constructed and operating substantially as and for the purposes set forth.

Also, imparting to the vat A and to the agitator E a reciprocating motion in opposite directions, as and for the purposes specified.

No. 46,646.—NICHOLAS DOWNES, Syracuse, N. Y.—*Water Filters*.—March 7, 1865.—A vessel of suitable size being provided, an ice dish and a pure water reservoir are arranged to occupy the upper portion thereof, each of these vessels being a semicylinder, and each having a perforated bottom, but the reservoir being deeper than the ice dish. At the bottom of the vessel a semicylindrical channel extends across the bottom, having minute perforations along its sides. A partition between the two vessels at the top descends to this channel at the bottom. All the space below the two vessels at the top, and a narrow space between them and the outer vessel are packed with filtering material. Ice being put into the ice dish, and water poured thereon, the water percolates to the bottom of the outer vessel, and ascends into the reservoir above, where it may be drawn off, or water may be drawn off through the channel at the bottom.

Claim.—The combination of the ice dish, reservoir, partition K, and tube for cleansing with the filtering medium, as and for the purposes set forth.

No. 46,647.—WILLIAM A. DUNCAN, Syracuse, N. Y.—*Machine for Raking and Loading Hay*.—March 7, 1865.—In this machine the rake teeth are fixed loosely in vertical slots in a frame, which is adjustable horizontally. The teeth are held in position by springs, which permit sufficient vertical and horizontal motion to allow them readily to pass obstructions. At the upper end of the machine is a cleaver, so slotted and curved as to readily free the carrying belt from all its load.

Claim.—First, the slotted clearing wedge K, when located in front of the shaft V, and constructed with slots *i i*, projecting over the said shaft, and with an inclined conductor *i*, all as herein shown and described.

Second, the vertical sliding rake teeth H, operating substantially in the manner and for the purpose set forth.

Third, the springs *n*, when constructed as herein shown and described, and employed in combination with the channels L and teeth H, in the manner and for the purposes specified.

Fourth, the combination of the springs *s* and the springs *n* with the teeth H, whereby a yielding horizontal and a yielding vertical play is allowed to the teeth H, substantially in the manner and for the purpose described.

Fifth, the longitudinal adjustment of the rake head *g* to and from the elevator, substantially in the manner and for the purpose set forth.

Sixth, the combination of the slotted clearing wedge K, the curved guard-board *m*, and the vertical sliding rake teeth H, with the endless apron or elevator D, all arranged substantially in the manner and for the purpose described.

No. 46,648.—CALVIN EATON, Webster, N. Y.—*Extension Ladder*.—March 7, 1865.—This invention relates to that class of ladders called extension ladders, and consists in the peculiar construction of a temporary splice to be applied to the top of the ladder.

Claim.—The combination and arrangement of the detachable section or extension B, constructed as set forth with the main ladder, in the manner and for the purposes shown and described.

No. 46,649.—AUGUSTUS ECKERT, Trenton, Ohio.—*Foot Warmer*.—March 7, 1865.—The lamp inside the square box has a metallic chimney, with an opening, glazed in any convenient way. The sides of the chimney are perforated, and to the top is joined an annular plate extending nearly to the sides of the box. Between the said plate and top of the chimney is a narrow passage for the smoke, &c. The top of the box is perforated. In one side of the box and opposite an opening in the chimney is a glazed opening, provided with a shield. The apparatus can be carried by a handle, arranged in any convenient manner.

Claim.—In combination with the casing A and door B the lamp F and chimney G, flaring plate J, horizontal plate K, and channels *j j*, constructed, arranged, and operating as and for the purposes described.

No. 46,650.—HENRY H. ELWELL, South Norwalk, Conn.—March 7, 1865.—This invention consists in a hooked and vibrating plate or cap, which holds the two sections of the latch-bolt together, and a tumbler operated by the key of the lock to force said cap from its hold upon the reversible section, and thus permit the latter to be withdrawn from the case, turned around, and replaced with the bevel in the opposite direction.

Claim.—First, the employment or use of the catch or fastening E, fitted on a pin *q'* of the part C of the side latch, and arranged substantially as shown, to engage with the part C of the latch, for the purpose set forth.

Second, the actuating of the catch or fastening E, by means of the key of the lock through the medium of the tumbler or any equivalent arrangement, substantially as described.

No. 46,651.—LUTHER ERVIN, Brooklyn, N. Y.—*Gas Stove*.—March 7, 1863.—This is a gas heater; the gas is turned on the perforated top of a gas chamber, and over this a corrugated conical cap is suspended from an upright flue, the product of combustion flowing into and around this cap up the flue, and through holes in the side at top, down another flue as far as the cover of the combustion chamber, and thence through the apertures into and up a third flue to the top of stove. The flues are formed by spaces between three cylinders of different diameter; a plate at the top covering the inner flues has perforations over the outer flue.

Claim.—The gas chamber D, provided with a perforated top E, in combination with the air and gas chamber G, all arranged substantially as and for the purposes herein set forth.

Also, the arrangement of the flues F I J, when used in combination with the gas chamber D, and air and gas chamber G, substantially as and for the purposes specified.

No. 46,652.—CHARLES FASOLDT, Albany, N. Y.—*Chronometer Escapement*.—March 7, 1865.—This invention consists in the use of a double scape wheel composed of two wheels of unequal diameter mounted upon the same shaft. The teeth of the smaller of these two wheels strike against the end of a lever which is connected to the balance wheel in the usual manner, and thus give to the balance an impulse sufficient to counteract the effect of friction and the resistance of the air. The teeth of the outer and larger scape wheel strike against two anchor pallets, which swing on the same pivot as the lever, and produce in the scape wheel a positive stop just before the completion of the stroke of the balance in either direction.

It is claimed that the friction between the teeth of the scape wheel and the pallets has no effect on the motion of the train or balance, the pallets acting simply as stops.

Claim.—The pallet *c*, arranged in combination with the pallet lever *c*, wheels *a b*, and balance *f*, in the manner and for the purpose substantially as herein shown and described.

No. 46,653.—SAMUEL W. FOSDICK and A. C. DAKIN, Clinton, Mass.—*Latch for Doors.*—March 7, 1865.—This invention consists of a double elbow lever, on the outer end of the lower horizontal arm of which is a hook, which, by its own gravity, drops into a notch in the catch. At the top of the upright arm of this lever, and at right angles thereto, is another arm running through the door, and having on its outer end a knob, the pulling which raises the hook out of the catch, and allows the door to open.

Claim.—The catch *C*, formed with a horizontal gravitating hooked arm *e*, adapted to catch in the plate *F*, and an upwardly projecting arm provided with a knob *E*, by a direct pull upon which the latch is retracted, all as herein described.

No. 46,654.—HENRY FRANCISCO, Lake Mills, Wis.—*Teeth for Cultivators.*—March 7, 1865.—In this invention the upper part of the teeth are in the form of an eccentric and fastened in the slot of the cultivator beam near the middle of its rear portion. The forward part of the eccentric strikes against a spring or slotted side and a quick sharp stroke passes the eccentric by it, and allows the teeth to swing back and clear the obstacle.

Claim.—First, the eccentric standard to a cultivator tooth, constructed and operated substantially as described.

Second, the slotted slide and set screw, arranged and operated in the manner and for the purpose described.

Third, the combination of the set and set retaining device with the eccentrically hung shank of a cultivator tooth, substantially as and for the purpose described.

No. 46,655.—JOHN FREELAND and DANIEL WARD, New York, N. Y.—*Making Volute Springs.*—March 7, 1865.—This invention consists of a spring formed of a metal plate of suitable dimensions, being cut centrally nearly its whole length, and the two limbs thus formed spread apart or distended and then rolled, whereby a double volute spring is formed.

Claim.—A volute spring composed or formed out of a single plate cut or divided longitudinally nearly its whole length, with the cut portions spread apart and the plate rolled, substantially as herein shown and described.

No. 46,656.—FRANCIS M. GIFFORD, Brant, N. Y.—*Car Couplings.*—March 7, 1865.—This invention relates to a car coupling of that class termed automatic, and will be understood by reference to the claim and engraving.

Claim.—First, the drop bolt or pin *F*, and the link or shackle *D*, in combination with the pivoted bar *H*, and the brace or stay *E*, all arranged in relation with the draw head to operate substantially in the manner as and for the purposes herein set forth.

Second, the pin *E'*, in the rear part of the draw head, when used in connection with a link or shackle *D*, and a brace or stay *E*, substantially as and for the purpose specified.

No. 46,657.—J. H. GIVEX, H. HUTSONPILLER, and CHAS. GILBERT, Des Moines, Iowa.—*Cultivator.*—March 7, 1865.—In this invention the bar upon which the seat rests is jointed, and admits of the seat being turned entirely to one side, so that the driver may walk or ride at will; uprights pivoted to the frame join the inner plough beams at the bottom, and are themselves jointed at the top by a bent metallic bar. The middle of this bar rests upon a lever, the end of which moves over the arc of a circle, and is fastened at any point by a spring and pin.

Claim.—The frame *D* pivoted or attached to the draught pole *A*, as shown in connection with the jointed set bar *O*, angle plates *p*, and the plates *r*, all arranged to admit of the ready elevation of the ploughs, as set forth.

Also, the uprights *H H*, connected at their upper parts to the lever *J*, and connected at their lower parts to the plough standards *F F*, and pivoted to the frame *d*, substantially as shown and described, to admit of the lateral movement of the ploughs *G*, as described.

No. 46,658.—HENRY B. GOODYEAR, New Haven, Conn.—*Bottling Apparatus.*—March 7, 1865.—This invention relates to a machine for filling bottles closed by the stopper, for which a patent was granted to E. Hamilton, January 5, 1864. Wires properly arranged seize the ball stopper and draw it into the neck of the bottle. A check prevents the ball from being drawn entirely through.

Claim.—First, the combination with the wire instrument for seizing and drawing up and forcing internal elastic ball valves into the necks of bottles for the purpose of closing or stopping the same, of a check piece operating in conjunction with said wire instrument, in the manner and for the purpose set forth.

Second, the machine or apparatus herein described for closing bottles by means of internal elastic valves, in the manner shown and set forth.

No. 46,659.—ROBERT A. GOODYEAR, New Haven, Conn.—*Snap Hooks*.—March 7, 1865.—This invention relates to the manufacture of snap hooks, in which, for the purpose of making the hook self-closing, an India-rubber or other spring is used within the hinge socket. The snap bar is cast with a deep recess inside at the point where the pivot runs through it, leaving only a wall or flange on each side to be perforated. The space between them is so large that two drills can be used upon the snap bar at once, and the holes perforated in a short time, to cheapen the manufacture.

Claim.—First, the recessed shank of the closing bar, when constructed for operation substantially in the manner and for the purposes set forth.

Second, as a new article of manufacture, a snap hook, the same consisting of a hook, a recessed hinge or closing bar, and spring, combined in the manner substantially as set forth.

Third, in combination with the recessed hinge bar and hook, a vulcanized India-rubber spring, the whole being constructed and combined in the manner and for the purposes set forth.

No. 46,660.—WILLIAM J. GORDON and EDMOND D. GILBERT, Philadelphia, Penn.—*Machine for Riveting Buttons in Cloth*.—March 7, 1865.—In this machine a hopper contains the buttons and an intermittingly sliding bar, with proper recesses for their accommodation, contains the rivets. A vertical needle passes down through the cloth and through the jaws upon which the cloth is placed; the needle is then arrested, while a sheath which surrounds it passes down beyond its point, grasps the end of the rivet and draws it up through the cloth, its head coming up against the under surface of the jaws, which consist of two thin flat plates abutting against one another with a hole at their juncture large enough to accommodate the sheath; the jaws, rivet, and cloth are then moved forward a certain distance until the head of the rivet is brought to rest upon an anvil directly under the punch. In the meantime a slide has pushed the lowermost one of the buttons out of the hopper and into a slot or chamber cut transversely in the lower end of the punch stock; the stock descends, carrying the button with it, displaces the jaws, and deposits the button on or around the upward projecting end of the rivet, and then the punch within the stock is driven down, by a heavy hammer, upon the end of the rivet, and thus rivets the button upon the cloth.

Claim.—First, in machines for attaching buttons to cloth or other material, feeding the rivet and the button, perforating the material, placing the rivet therein, advancing the cloth and rivet to the button, and uniting them by riveting, by mechanical devices constructed, arranged, and operating as a whole substantially as described.

Second, the needle and its tubular casing T, constructed and operating substantially as described.

Third, the jointed hook Q', with its inclined face 29, for operating the hammer in its connection with the button-riveting machine, substantially as described.

Fourth, the combination of the punch stick K, casing J', punch M, and spring K', constructed, arranged, and operating substantially as described.

Fifth, the button chamber L' in the bottom of the punch stock, substantially as described.

Sixth, the button chamber L' in combination with the centring tube J' constructed with a centring end M', substantially as above described.

Seventh, releasing the rivet from its carriage by the impact thereon of the punch stock, substantially as described.

Eighth, the rivet carriage, constructed substantially as above described.

Ninth, the hopper in combination with the channel V, chamber L', and the feeding slide W, substantially as described.

Tenth, operating the punch stock by means of the upper arm of the lever H, substantially as described.

Eleventh, operating the button feeding slide W by means of its sliding rod X, or its equivalent, and the sliding pin 10, substantially as described.

Twelfth, the combination of the ratchet G, bent lever I 14, and lever H, substantially as described.

Thirteenth, operating the pawl I on the return movement of the lever H, in the manner and by means substantially as described.

Fourteenth, the cross-heads 18 and 19 constructed as described in combination with the standards S S and Q', and cam E, for the purpose described.

Fifteenth, operating the cam by means of the pawl I on the lever B, and the ratchet G on the cam shaft, substantially as described.

Sixteenth, operating the rivet carriage by means of the lever H and lever Y, substantially as described.

No. 46,661.—JOHN GREENWOOD, Rochester, N. Y.—*Machine for Making Barrel Heads*.—March 7, 1865.—The object of this invention is, to cut the heads of barrels in circle form, ready to set in a barrel, and it consists in a circular saw hung on an arbor attached to an adjustable plate, and driven by air power. A set of revolving clamps, between which the blank head is placed, is attached to a swinging frame turning on a pivot under the arbor of the saw, allowing it to swing up to the saw whilst the head is being sawed, and back again when the head is finished, which is effected by foot pressure on a treadle that operates a wedge cam acting upon a spring lever, which also moves up the arbor and clamps the blank head.

Claim.—So arranging the clamp-heads C C' upon the swing-frame B, and combining therewith the sliding shaft D, that the said heads first clamp the boards in place, and then move up to cut the barrel head, substantially as herein set forth.

Also, in combination with the sliding shaft D and clamps C C', the lever E and wedge-cam G, operating substantially as and for the purpose specified.

Also, the combination of the spring *d*, pin *g*, and collar *h*, with the shaft D, provided with the cavity *c*, slot *f*, the whole so arranged as to produce the reaction of said shaft to separate the clamps, and so as not to interfere with the twining of the shaft, substantially as described.

Also, the disk-wheel M mounted on the arm N, and both used in combination with the swing-frame B and piston-wheel O in such a manner that the forward motion of said swing frame will bring the two wheels in contact, and the back motion of the frame will disengage them, substantially as herein specified.

Also, in combination with the subject-matter of the preceding clause, the spring-catch *t*, substantially as described.

Also, the arms S S', in combination with the clamp-heads C C' and swing-frame B, to operate in such a manner that when the swing frame is drawn back the said arms will rest under the clamps to sustain the boards, but when moved forward the clamps will clear from them, substantially as described.

No. 46,662.—C. B. GUY, Lybrand, Iowa.—*Collision Brake*.—March 7, 1865.—The object of this invention is to prevent accidents arising from collisions on railroads, and it consists in the employment or use of a double-inclined truck mounted on wheels and placed in front of the locomotive of a train, the locomotive being connected to the inclined track in such a manner that it will disconnect itself in the event of a collision, and the locomotives and forward cars of the two trains pass up the inclined tracks and lose their momentum in the ascent.

Claim.—A collision brake for railroad cars, composed of a double-inclined truck mounted on wheels and placed in front of a train, and arranged so that the locomotive or front cars of two approaching trains, in the event of a collision, will ascend the inclined tracks and lose their momentum during their ascent, substantially as herein described.

No. 46,663.—EDWARD HACKETT, New York city.—*Passenger Register*.—March 7, 1865.—This invention consists in the employment of a roller, to which an intermittent rotary motion is imparted by connecting it, in a suitable manner, with the hinged step of a street car, omnibus, or other public conveyance, and which is marked on its circumference with a series of figures placed in a spiral groove, to operate with an endless apron, carrying the indicating slide in such a manner that, for each start given the roller by the weight of a passenger acting on the step, the slide is propelled a proportionate distance, and a new figure is brought opposite to an opening in said slide, thus indicating the number of passengers passing in and out of the conveyance, with perfect accuracy.

Claim.—The roller E, provided with a spiral groove *g*, and marked with alternating figures and ciphers placed in a spiral row to operate in combination with the slide *i*, and with the hinged step A, sliding rod B, and weight C, or its equivalent, in the manner and for the purpose substantially as set forth.

No. 46,664.—A. M. HALSTED, Rye, N. Y.—*Horse Hay Fork*.—March 7, 1865.—This invention relates to means for holding the fork in working position, and releasing the same for the discharge of the load. The tines are attached to the shank or handle by a pivot which plays up and down in a slot in the lower end of said shank. A spring catch, attached to the tines and fitting in a notch on the lower end of the shank, holds the tines up to an engagement with a lip further up the shank; but when this catch is withdrawn from the notch the tines slip down on the shank, tilt, and discharge the load.

Claim.—A horse fork provided with a shank C, having an oblong slot *c* for the pivot-bolt *d*, which connects the shank with the tines, to pass through in connection with the catch D in the head B, and the lip or projection *e* on the shank, all arranged to operate in the manner substantially as and for the purpose set forth.

No. 46,665.—WILLIAM A. HANCOCK, Salem, N. J.—*Portable Heater for Liquids*.—March 7, 1865.—This invention consists of two parts, viz., the upper part or boiler for the water, and the lower part, in which the candle or lamp is placed; tubes extend from this lower part up through the boiler, through which the products of combustion pass, whereby the water is heated. The apparatus is so arranged that the heater can slip down in the base, and thus its bulk will be diminished nearly one-half. There are sockets in the bottom for candles, and when A is pushed down into the base these sockets fit neatly into the bottom of the tubes. It has a handle by which to carry it about.

Claim.—The combination of the heater A provided with tubes B and the base C, provided with sockets C', the heater being adapted to slide up and down within the base and retained at any desirable height, substantially as and for the purposes specified.

No. 46,666.—LORENZO D. HAUGHEY, Atlanta, Ill.—*Cultivator*.—March 7, 1865.—In this invention the pole is so pivoted to the axletree that, by moving a lever to the right or

left, the ploughs can be deflected in either direction by changing the course of the bearing wheels.

Claim.—The pivoting of the axle A to the draught-pole D to admit of the lateral movement or adjustment of the ploughs, as set forth.

Also, the semicircular frame C attached to the front side of the axle, in connection with the friction-roller F and bolt or rod G, attached to the draught-pole D, substantially as and for the purpose specified.

No. 46,667.—J. HEALY, South Dansville, N. Y.—*Construction and Hanging of Gates.*—March 7, 1865.—This invention consists of a gate which may be opened from the right or left hand sides, and suspended at different heights above the ground to allow small animals to pass beneath, and which may be lifted off its points of suspension without making any changes in the gate or its posts.

Claim.—The gate above described, constructed and applied substantially as above set forth.

No. 46,668.—HERMAN HAUPT, Cambridge, Mass.—*Pneumatic Drill.*—March 7, 1865.—This invention consists of a cylinder in which steam or air is admitted to work a piston. The piston rod is hollow, passing through stuffing boxes at both ends of the cylinder. The drill rod is passed through the piston rod from either end, and is advanced by a peculiar mechanism as the drill penetrates the rock. The drill cylinder is stationary; the drill rod alone moves forward. The mode of mounting is peculiar, and admits of motion in any direction, while occupying the smallest possible amount of space.

Claim.—The method of and apparatus for drilling rock for mining, tunnelling, and boring purposes, substantially as hereinbefore described.

No. 46,669.—ALBERT H. HOOK, New York, N. Y.—*Apparatus for Folding Paper Collars.*—March 7, 1865.—In this invention an elastic surface is prepared in an inclined position to receive the collar when the knife strikes it upon the line to be folded, and the yielding bed permits an indentation in the collar by which it may be folded. There are guides for holding the collar in place, which are depressed by a cam movement when the knife descends, so that as the knife is lifted by a crank movement the collar falls to give place to another.

Claim.—The elastic folding surface in an inclined position on which the knife acts in folding, as described, in combination with the gauges *m*, substantially as and for the purposes set forth.

No. 46,670.—JAMES L. HOWARD, Hartford, Conn.—*Stove-pipe Damper.*—March 7, 1865.—In this invention the axis of the damper turns on bearings fixed on opposite sides of the pipe; one end is held by a nut. The bearings at other ends have a series of indentations, in which a projection or shoulder of the handle fits, so that the damper may be held in any position. By flexure of pipe the damper may be turned as desired. It is designed chiefly for cars and vessels.

Claim.—First, retaining the dampers of stove-pipes in any desired position by means of the elasticity of the pipe, substantially as above described.

Second, releasing the damper or its axis from the indentations *e*, or other device for holding the damper in place, by shortening the diameter of the pipe in the line of the axis of the damper, substantially as described.

No. 46,671.—FREDERICK M. HOWE, Providence, R. I.—*Breech-loading Fire-arms.*—March 7, 1865.—This invention consists in so combining the hammer of the lock with the latch, which secures the hinged breech piece when in place, that the said latch bolt cannot slide in to permit the breech piece to be closed, unless the hammer be placed at half-cock, or in an equivalent position, so that its striking face shall be so far back as not to touch the cartridge in the act of closing the breech. The lower half of the circumference of the cartridge is embraced by a wing, which lies between the flanch of the cartridge and the rear open end of the barrel, and is mounted to turn on the fulcrum of the hinged breech piece, and set into circular sockets of the breech piece, so that the latter when operated to open the rear end of the barrel shall move some distance without operating the wing, and then act upon it to cause it to draw out the cartridge case sufficiently to admit of readily reaching it with the fingers.

Claim.—In combination with the hinged breech piece so constructing the hammer and the latch bolt, substantially as herein described, that they shall act as a stop to prevent the closing of the breech, unless the hammer be first drawn back, as set forth and for the purpose specified.

Also, the special construction of the wing for drawing out the cartridge cases from the barrel with its flanches fitted to sockets in and combined with the breech piece, as herein described.

Also, making the hinged-swinging breech piece hollow to receive and contain the mechanism of the lock, in combination with the abutting shoulders at the sides to resist the recoil by abutting against corresponding shoulders in the mortise of the surrounding metallic case, as and for the purpose described.

No. 46,672.—W. HUSTON, Wilmington, Del.—*Steam Engine*.—March 7, 1865.—This invention consists in the application of four cylinders, one to each end of two heads, mounted on the ends of two shafts, which are parallel, but not in line with each other, and coupled together by a compound piston rod, moving in suitable guides or grooves in the head in such a manner that each pair of cylinders revolve in a true circle around the shaft to which they are connected; but the pistons of one set of cylinders act concentrically on the shaft of the other set, and rise *vice versa*, and in consequence of the eccentricity of the two divisions of the shaft with reference to each other the two pistons of one shaft are in position to exert their greatest force while the others are passing their dead points. Between the head to which the cylinders are attached and the engine are placed disk valves to control the induction and eduction of steam, and to these are attached levers for reversing the motion of the engine or for stopping it.

Claim.—First, the cylinders E E' E' E'', secured to the ends of heads D D', mounted on eccentric shafts C C', and operating in combination with a common piston rod and pistons F F' F' F'' in the manner and for the purpose substantially as set forth.

Second, the use of the compound piston rod G, constructed as shown in figures 7 and 8.

Third, the disk valves H H', applied in combination with the revolving heads D D' and with the common starting and reversing bar I, in the manner and for the purpose substantially as described.

No. 46,673.—WALTER HYDE, New York, N. Y.—*Well Borer*.—March 7, 1865.—This invention consists in the arrangement of an oscillating lever, which has its fulcrum on a pivot secured in an upright post, and is provided with a roller at or about the middle of its length to operate in combination with the rope to which the borer is suspended, and with a windlass and tappet wheel, so that when the rope, after having been wound around the windlass, is drawn through under the roller in the oscillating lever, and over a pulley in the top of an upright post, any up and down motion imparted to the roller in the oscillating lever produces twice as much motion of the drills; *i. e.*, if the roller be depressed one inch the drill rises two inches, and *vice versa*, and by these means the height of the stroke is doubled.

Claim.—First, the pulley c, arranged in the oscillating lever C, in combination with the drill rope E', pulley g, windlass D, and tappet wheel or cams, constructed and operating substantially as and for the purpose set forth.

Second, the double gear g h, pawl j, or its equivalent, and the hand crank i, applied in combination with the drill rope and cams, substantially as herein described, so that the stroke of the drill can be adjusted and the drill raised or lowered while the machine is running.

Third, the shears I, applied in combination with the platform A and sectional drill rod H, substantially as and for the purposes specified.

Fourth, the use of a double windlass W W' and adjustable stirrup S, in combination with the drill rope E' and bucket rope E'', constructed and operating substantially as and for the purpose described.

No. 46,674.—HECTOR HYVES, New York, N. Y.—*Elastic Fabric*.—March 7, 1865.—The claim and drawings explain the nature of the invention.

Claim.—Making an elastic fabric suitable for bed bottoms and other analogous purposes by means of securing the strands to the frame and lacing them to resemble lattice work by passing the adjacent angles formed by the sinuosities of the cord through thimbles or short sections of India-rubber tubing, as described and represented.

No. 46,675.—JOHN W. INGLE and R. W. WRIGHT, Livingston, Ill.—*Cultivator*.—March 7, 1865.—In this machine a triangular frame is pivoted upon the centre of the draft-axle. On each side two teeth, connected by rods, move forward and backward upon segment bars. Curved levers operated by the driver's feet, and pivoted upon the side of the tongue, move the ploughs laterally. Levers, nearly parallel, and extending also to the driver's seat, lift the ploughs out of the ground.

Claim.—The frame D, attached to the axle A by a pivoted bolt a, and provided with pivoted plough standards H, connected by rods k, the segment bars J K, and levers L L, in combination with the levers G G, attached to the frame D, and draught pole C, all arranged to operate substantially as and for the purpose set forth.

No. 46,676.—JOHN JENNINGS and GEORGE C. SWEET, West Meriden, Conn.—*Screw Plates*.—March 7, 1865.—This improvement consists of a method of holding dies in screw plates by means of two pins running through the plate longitudinally, one on each side, instead of the common square or V-shaped guides, and so arranged as to turn half a revolution on their axis. At one end of the opening in the plate for admitting the dies, these pins are half cut away for a space equal to the length of the ends of the dies; the ends of the dies are grooved in a semicircular manner so as to fit the pins, the latter being turned so that the side cut away presents itself to the end of the die when it is to be inserted in the plate. In turning them back again the dies are held in place.

Claim.—The employment or use of pins C C, fitted in the plate A, and provided with recesses e e, as shown, for the purpose of securing the dies B B', in the plate A, admitting of their ready removal from the plates, as set forth.

No. 46,677.—JAMES L. ROBINSON, Ashburnham, Mass.—*Engine Lathe*.—March 7, 1865.—This invention consists in operating the cutter carrier back and forth from its work by inserting in a transverse groove in the bottom thereof, having in it, longitudinally, a doubly-curved slot, in which is a stud projecting from the nut of the transverse feed screw of the slide rest. When this has traversed nearly the distance, longitudinally, required by the work to be done, the slotted bar comes in contact with, and is stopped by, a dog fastened on the shears, while the continued motion of the rest forces the stud on the said nut, along the inclined or crooked slot in the sliding bar, causing it to give a motion to the cutter carrier outward from the work. An opposite movement of the slide towards the right forces the sliding bar against another dog, which reverses the motion of the cutter carrier and feeds it up to the work for a new cut.

Claim.—First, the method therein giving to the tool stock an automatic motion back and forth at the termini of the stroke of the slide rest by means of the slide *g*, and cam slot *f*, constructed and applied substantially as set forth.

Second, the application of adjustable lugs *l* to the hand wheel *d*, and screw *b*, which serves to operate the tool stock, in combination with a spring stop *k*, constructed and operating substantially as and for the purpose described.

No. 46,678.—O. W. KELLOGG, Ripon, Wis.—*Broom*.—March 7, 1865.—This invention consists in making a broom by securing the handle in the upper and smaller end of a metallic holder or socket, and the brush or other material composing the sweeping surface, in the other end.

Claim.—The broom above described as a new and improved article of manufacture.

No. 46,679.—LUCIUS J. KNOWLES, Warren, Mass.—*Mode of Weaving Buttonholes in Fabrics*.—March 7, 1865.—In this invention instead of weaving one side of each buttonhole, and then the other side entire, as is usual, and instead of using a divided reed for that purpose a single reed is employed, both for the weaving of the buttonhole and solid parts of the webbing, and weaves first a small portion on one side of the buttonhole, then flushes the warps, carrying the weft-thread outside the fabric, to the opposite side of the webbing, and weaves a small portion on the other side of the buttonhole, and so on, alternating from side to side until both sides are woven, thus allowing the reed to beat up the weft while the next succeeding portion may be in the act of being woven. The object of carrying the first and last shoots through the fabric is to secure it and prevent its being easily drawn out of place after the weft threads crossing the outer surface of the fabric may have been cut therefrom; and also that the shoot shall not interfere with the weaving of the weft into either set of warps.

Claim.—Improved mode, substantially as described, of weaving a fabric with buttonholes, the same consisting in weaving alternately of increments of the two marginal portions enclosing the buttonhole and running the weft thread on the outside of the fabric between the weaving of any two consecutive increments, the same being essentially as hereinbefore explained.

Also, in combination with my said improved process or mode of weaving webbing with a buttonhole, the running of the first and last shoots of the wefts of each increment of a marginal portion between the upper and lower sets of warps, the same being for the objects specified.

No. 46,680.—JOHN LAKE, Haydenville, Mass.—*Whip Socket*.—March 7, 1865.—This invention consists of springs along the inner side of the device, to firmly retain therein the whip, and at the bottom of the socket to prevent said bottom from being broken or forced out; the socket being secured to the dash-board by means of springs constituting clamps.

Claim.—First, the springs *B*, placed within the socket, and arranged substantially as and for the purpose set forth.

Second, the plate *C*, with the spring *D* underneath it, arranged with the lower part of the socket to operate substantially as and for the purpose specified.

Third, the securing of the socket to the dash-board by means of the springs *E*, substantially as shown and described.

No. 46,681.—WILLIAM K. LEWIS, Boston, Mass.—*Punch and Die*.—March 7, 1865.—This invention relates to that class of punches and dies used for cutting and pricking studs, caps or covers for tin cases, cans, &c., at one operation, and it consists in the employment of an adjustable pointed needle, passing through the centre of an adjustable and yielding die, so arranged that the die recedes as the plunger advances, and the needle remaining for the time stationary, the cap is cut out and the hole made simultaneously.

Claim.—First, the pricking needle *F*, applied in combination with the yielding centre piece *D*, die *B*, and punch *A*, substantially as and for the purpose set forth.

Second, the combination of the centre piece *D* and needle *F*, separately adjustable in height, and employed in connection with the spring *E*, in the manner and for the purposes explained.

No. 46,682.—THOMAS J. LINTON, Providence, R. I.—*Ice Sandal*.—March 7, 1865.—This invention consists in a sandal stamped out of sheet metal, covering the whole sole of the foot, and provided with a large number of holes, forming barbs like those of a grater, in

combination with ears catching over the heel and sole, the whole being held by leather straps, or other fastening.

Claim.—An ice sandal, stamped or otherwise, produced out of sheet metal, to fit the sole of a tool or shoe, and provided with a grater surface and lugs, and with a suitable fastening by which it can be secured to the foot, substantially as and for the purpose set forth.

No. 46,683.—THOMAS J. LINTON, Providence, R. I.—*Pump*.—March 7, 1865.—The object of this invention is to raise water by atmospheric pressure, made available by withdrawing the air from a reservoir, and thus causing a vacuum. Its novelty consists in the combination and arrangement of the shallow pans, reservoir, induction pipe, spouts, the drop-valve, and the ascension pipe, when by the combustion of hydro-carbon liquid in the pan the water is vaporized, and thereby produces a partial vacuum in the reservoir.

Claim.—First, the shallow pans B B', in combination with the reservoir A, and induction pipe C, constructed substantially as set forth.

Second, the producing a vacuum in the reservoir A by the combined action of hydro-carbon liquid and steam, substantially in the manner set forth.

Third, the arrangement of the water pan B, and hydro-carbon pan B', and reservoir A, whereby the combustion of the hydro-carbon liquid in the pan B' will vaporize the water in the pan B, and thereby produce a partial vacuum in the reservoir, substantially as described.

Fourth, the measuring spouts *d d'*, applied in combination with the pans B B', and closed reservoir A, substantially as specified.

Fifth, the method herein described of igniting the hydro-carbon liquid in the pan B', by igniting a portion of said liquid in the spout and running such ignited liquid into the reservoir A, substantially as set forth.

Sixth, the drop-valve E, in combination with the ascension pipe D, induction pipe C, and reservoir A, all constructed substantially as and for the purpose described.

No. 46,684.—THOMAS J. LUMMRUS, Lynn, Mass.—*Red Ink*.—March 7, 1865.—This invention consists of a composition of rosin, alcohol, distilled water, gum acacia and gum myrrh.

Claim.—The use of a solution of the above named salt in alcohol or other equivalent neutral spirit, as a red writing ink or fluid, substantially as described.

No. 46,685.—F. LUNKENHEIMER, Cincinnati, Ohio.—*Globe Valve Cock*.—March 7, 1865.—In this invention to facilitate the grinding of a globe valve down in its seat, the nut and stuffing box for the valve stem being made of one piece, or rigidly connected as usual, the nut, instead of being provided on its outer surface with a screw-thread, is turned off smooth, and fitted in the socket of the shell, where it is held by a cap, the relaxation of which cap permits the nut to revolve, with the stem, to grind the valve to its seat.

Claim.—A globe valve, in which the nut and stuffing box for the valve stem are made of one piece, or rigidly connected, the same as in an ordinary globe valve, but the nut, instead of being provided on its outer surface with a screw, is turned off smooth, and fitted in the socket of the shell, where it is held by a cap, substantially in the manner and for the purpose set forth.

No. 46,686.—LANSING MARBLE, Vassar, Mich.—*Washing Machine*.—March 7, 1865.—This invention consists in the employment of a cylinder, provided at its periphery with balls or spheres, placed in rows parallel with the axis of the cylinder, in connection with an endless apron and rollers.

Claim.—The cylinder C, provided with the balls or spheres *a* at its periphery, in combination with the endless apron I, arranged in connection with the fixed rollers *e' e'*, all arranged to operate substantially as and for the purpose herein set forth.

No. 46,687.—A. A. MARKS, New York, N. Y.—*Artificial Leg*.—March 7, 1865.—This invention relates to an improvement in the knee joints, and the means employed to hold the leg in position when the knee is bent. The joint is formed by a T-shaped bracket or standard, the upper end of which is fastened to the thigh, and the lower ends have their bearings in oblique side pieces, secured to the sides of the kneepan in such a manner that their centres coincide with its centre. Attached to the rear of the T-shaped piece is a pear-shaped projection, which bears in a socket on the end of a vertical sliding bar, which is surrounded by a spiral spring enclosed in a box, the end of which works on a suitable socket in the interior of the leg, and which has an oscillating motion. When the leg is straightened the spring keeps it in that position, and when bent at right angles it has no tendency to stretch spontaneously.

Claim.—First, the oblique boxes *b*, applied in combination with the gudgeons of the T-shaped bracket D and with the shell of the leg and thigh, in the manner and for the purpose substantially as set forth.

Second, the pear-shaped button *f*, in combination with the spring *d*, oscillating box *g*, and with the bracket D, applied to the thigh and leg, in the manner and for the purpose substantially as described.

No. 46,688.—H. S. MCKEAN, Alleghany, Penn.—*Trough for Raising Dough*.—March 7, 1865.—This invention consists of a box made with tapering sides, and provided with a steam pipe extending around the sides at the bottom. Inside of the box is the bread chest, which is provided with feet, so as to elevate its bottom above the steam pipe. The box is also provided with a thermometer, and also with perforated plates.

Claim.—The employment or use of a box or chest A, provided with a steam pipe B, arranged substantially as shown, in connection with a dough chest C, provided with feet or arranged in any suitable way, so that it may be fitted in A with its bottom above the steam pipe or above the bottom of A, for the purpose of raising dough for baking, as set forth.

Also, in combination with the box or chest A, heated by steam as described, one or more perforated shelves D, for the purpose specified.

No. 46,689.—HENRY MESSER, Roxbury, Mass.—*Hot-air Engine*.—March 7, 1865.—This invention consists in the arrangement of the lower end of the cylinder, the air pump, the fire box, and the feed box, the feed box being placed directly above and in close proximity to the fire box and pump and cylinder, all in the same plane. A chamber is provided around the cylinder in such manner that the air on its passage from the pump to the furnace will pass through it, and thus cool the cylinder and to some extent cool the air. The unoccupied space in the foundation of the engine is employed for generating steam by the utilization of the radiated and conducted caloric. A pump is provided for injecting into the air-tight furnace combustible fluid, to act in conjunction with the solid fuel contained therein, when all the products of combustion are passed through the working cylinder.

Claim.—First, the arrangement in a hot-air engine of the lower part of the cylinder, the air pump, the fire box, and the feed box, substantially as specified.

Second, the arrangement of the conduit around the cylinder, substantially as described, for keeping the upper part of the cylinder cool and utilizing the waste heat.

Third, the employment in the unoccupied space in the foundation *m* of a hot-air engine, for the reception of water, so that steam can be generated by utilization of radiated and conducted caloric, which would otherwise be wasted, substantially as described.

Fourth, in connection with the space in the foundation *m*, the separation of the cylinder therefrom by a casing *a*, substantially as and for the purpose described.

Fifth, dividing the space contained in the foundation *m* of a hot-air engine, by means of the partition *p*, when provided with a flange, as shown, by which a tight joint between the partition and covering plate *n* can be secured, substantially as and for the purpose described.

Sixth, the grate, as constructed, when arranged with reference to passages admitting air, both with or through it, and with provision for discharging the air between the fire pot and its lining, substantially as described.

Seventh, the employment, in combination with cup packing, of springs, by which the cup packing is so held to its place as to operate as designed under pressure.

Eighth, in a hot-air engine a tightly-closed fire box, and, working all the volatile products of combustion through the cylinder, the injection into the fire box, in connexion with ignited solid fuel, of combustible fuel, substantially as described.

No. 46,690.—HENRY MITCHELL, Richmond, Ind.—*Combined Measure, Funnel, and Faucet*.—March 7, 1865.—A funnel is so placed that its top is level with the bottom of the vessel from which the fluid is to be drawn. A pipe descends from the bottom of such vessel to near the bottom of the funnel. Opposite the lower end of this pipe is the eduction pipe or faucet. An opening in the funnel at this level may be brought to coincide with the induction tube, to fill or empty the measure, by simply turning the funnel half round, and bringing its single lateral part into the desired position, as described.

Claim.—The arrangement, construction, and combination of the pipe B, cylinder C, measure D, and faucet H, as herein described and for the purposes set forth.

No. 46,691.—ALBERT MOORE and JAMES A. COLE, Northville, N. Y.—*Mode of Suspending Burners for Lamps*.—March 7, 1865.—This invention consists of a peculiarly-bent wire, operating as a hinge, to allow the burner to be elevated a little and turned over to fill the lamp with oil.

Claim.—First, a temporary hinge for lamp burners, operating substantially in the manner and for the purpose specified.

Second, providing a loop to guide the wick, for the purpose substantially as described.

Third, hinging the spring C to the lower portion of the burner, substantially as shown.

No. 46,692.—G. G. LIVINGSTON MORSE and L. M. HERRICK, Harrison, N. J.—*Knife, Fork, and Spoon Holder*.—March 7, 1865.—This invention consists of a device to be attached to dishes for the purpose of holding the handles of spoons, knives, or forks to prevent them from sliding down and falling into the dishes in which they are used.

Claim.—The combination of the hinged rest A with the clasp B C, constructed and employed as described.

No. 46,693.—ROBERT NAGLER, Brooklyn, N. Y.—*Tobacco Pipe*.—March 7, 1865.—In this invention there is a metallic cup for holding the bowl, a lateral socket into which the

stem is inserted, and another socket projecting downward, into which the stem of a water reservoir is secured. A tube runs from one socket to another, and there is an aperture through the lowest part of the bowl and cup enclosing it, through which the smoke is drawn.

Claim.—The combination of the bracket B, formed separately from and adapted for the reception of the pipe bowl A, the sockets *a b*, tubes *c d*, stem C, and reservoir D, when the said parts are constructed and connected as and for the purposes herein specified.

No. 46,694.—A. W. OLD, Green Oak, Mich.—*Fruit Ladder.*—March 7, 1865.—In this invention the chief feature consists in connecting the two sections by means of adjustable braces, in combination with wheels placed on the lower end of the main ladder, by which means the ladder can be moved from place to place with ease.

Claim.—The two holders A A', in connection with the brace or connecting rod C and the support B, and wheels *d'*, all arranged substantially as and for the purpose specified.

No. 46,695.—JAMES N. PEASE, Panama, N. Y.—*Churn.*—March 7, 1865.—This invention consists of a churn, placed within a frame attached to rockers, the said frame having vertical slots made therein at its upper ends, which allows for the movement of cross-pieces placed horizontally within the said slots. Attached to the main cross-bar is a reciprocating dasher, which receives its movement automatically from the rockers, thus producing an oscillating and reciprocating motion simultaneously.

Claim.—The churn A, placed in a frame B mounted on rockers C C, in combination with the bars F F, arms or levers G G, and bar I attached to dasher-rod H', all arranged and applied to operate in the manner substantially as and for the purpose herein set forth.

No. 46,696.—JACOB PETERSON, Canoga, N. Y.—*Artificial Arm.*—March 7, 1865.—In this invention the wrist joint is constructed of two tubes, one of which has upon it a wide screw thread and fits into the other.

Claim.—First, the use of the flexor cords *fff*, Fig. 1, and the strap F, for the purpose of closing the fingers and thumb, essentially as above described.

Second, the use of the elastic strap *o*, Fig. 4, in combination with the strap F and the flexor cords *fff*, Fig. 1, for the purpose essentially as above described.

Third, the use of the hook and eye marked *p*, Fig. 5, said cross-piece *r*, Fig. 5, in combination with the elastic strap *o*, Fig. 4, and the flexor cords *fff*, and strap F, Fig. 1, and rod or shaft X, Fig. 5, substantially as above described.

Fourth, the wrist joint, constructed essentially as above described, in combination with the flexor cords *fff* and strap F, Fig. 1, as above described.

No. 46,697.—J. PLUMER, Boston, Mass.—*Spring Catch for Door.*—March 7, 1865.—In this invention the catch-bolt passes through the door, its two ends projecting outside thereof, and provided, one of them, with a knob, by which the bolt may be conveniently operated, and the other with a conical head or button for entering the nosing. The bolt is held in position by a ring of India-rubber, which is fitted within a groove formed around the middle of the bolt, and which is thus compressed and forced about half-way through the door in a hole prepared for that purpose.

Claim.—First, the use of rubber in spring catches, when so arranged in reference to the inelastic portion of the catch as to partially or entirely encompass it, and operating by means of its flexibility or bending property in any or all directions.

Second, the combination of the rubber with the catch, as above described, substantially as and for the purposes enumerated.

No. 46,698.—WM. B. POLLOCK, Youngstown, Ohio.—*Hot-blast Pipe.*—March 7, 1865.—This invention consists in providing the trunks with short pipes; the said trunks being divided centrally and longitudinally by a vertical diaphragm which passes from the bottom of the trunks to the top of the short pipes. The trunks are united by the coupling-pipe, and the trunks are also divided vertically and longitudinally by the diaphragms that register with diaphragms in the short pipes. The pipes are made in sections, united at their upper ends, and the diaphragms extend to near the upper ends of said section. Between these sections are secured partitions.

Claim.—First, the combination of the trunks B B' with the sectional pipes C and connecting pipe D, arranged substantially in the manner and for the purpose set forth.

Second, the combination of the trunks, diaphragms, and section pipes, substantially in the manner described, so that an injured or worn tube or section may be singly removed and a new one inserted without stopping the blast longer than merely to make the removal or change of the section.

Third, making the continuous pipes in sections, and so uniting them with the trunks that any one of the several pipes may expand unequally and independently without fracturing the other, having a different expansion, as set forth.

No. 46,699.—R. W. POTTER, New York, N. Y.—*Picture Card Frame.*—March 7, 1865.—This invention consists of a card provided in its centre with a raised frame in such a manner that an ambrotype, daguerreotype, or other photographic picture can be placed in the

cavity at the back of the card and will form the frame for the picture, so as to fully exhibit the same. The centre of the card is cut out to suit the size of the picture, and the border around the hole is embossed.

Claim.—A card frame A B, made in the manner herein shown and described.

Also, cutting and embossing the hole *a* in border B in the card A by one and the same operation, as set forth.

No. 46,700.—ROBERT POTTS, Camden, N. J.—*Process for Treating Navassa Guano.*—March 7, 1865.—This invention consists in spreading the guano on a floor and sprinkling sulphuric acid over it, by means of watering pots or other suitable means. The mass is thus prevented from sticking together, and also from heating, and, after the whole quantity of acid has been added, can be sifted and put into barrels for use.

Claim.—The within described process of making superphosphate of lime from Navassa guano, or all guano containing more than six per cent. of iron and alumina, by sprinkling the requisite quantity of sulphuric acid over the guano in the form of rain, or as near as possible in that form, while the mass is continually agitated, substantially as and for the purpose set forth.

No. 46,701.—WILLIAM PRICE, Cincinnati, Ohio.—*Machine for Washing and Cleaning Clothes.*—March 7, 1865.—This invention consists in a clothes-washer having a combination of arms, horizontal pins extending above and below the arms, operated by a hand lever.

Claim.—The combination of the arms C C with the horizontal pins *d d*, the vertical pins *e e e*, and hand lever D, substantially as and for the purposes herein set forth.

No. 46,702.—JEROME REDDING, Maplewood, Mass., and NATHANIEL W. REDDING, Charlestown, Mass.—*Sand-paper Holder.*—March 7, 1865.—The object of this invention is to provide a device whereby sand-paper and emery-cloth can be firmly held while being employed in smoothing the surface of work. It consists, also, in two pieces of flat metal, or other material, on the face of one of which pieces is placed the paper or cloth, and between the two pieces the same is fastened by thumb screws.

Claim.—First, the employment of two pieces A B of metal, or other suitable material, in connection with a thumb nut and screw for holding and affording a bearing for sand-paper and emery-cloth, substantially as herein described.

Second, the deflected parts *b b* and fingers or prongs *b' b'*, in combination with the guide A' and guide-way B', the whole being employed to facilitate the application of the emery-cloth or sand-paper to the holder, in the manner herein explained.

No. 46,703.—JOSEPH RENSHAW, Michigan City, Ind.—*Tool for Cutting Off Stay and other Bolts.*—March 7, 1865.—This invention consists of a cylinder or tube, the bore of which is made to fit the bolt to be cut. The upper end of this is thinned off from the outside, slit longitudinally in halves, and surrounded by a ring with a set screw, by which it can be clamped upon the bolt. On the lower end of this cylinder is a shoulder, formed by a collar, upon which another shoulder, formed by an interior collar on the surrounding cutter-stock rests, and by which it is guided and supported. This cutter-stock is operated by a lever in the same manner as a ratchet drill. The cutter-bar is pivoted at one end in a slot in the periphery of the stock, and has a cutting spur projecting inward toward the centre, and is fixed in that direction by a screw behind it in the cutter-stock.

Claim.—First, the clasp sleeve for holding the tool to the bolt to be cut, constructed substantially as described.

Second, the combination of the clasp sleeve and the stock I, substantially as described.

No. 46,704.—EDWIN REYNOLDS, Mansfield, Conn.—*Key for Lock.*—March 7, 1865.—This key has two shanks, two handles, and two sets of bits. The shanks are fitted one within the other; the two sets of bits interlock with each other, and, if turned in one direction, both sets may be made effective in elevating the tumblers, or, by turning the inner shank a quarter of a revolution, the bits upon its end may be thrust out beyond the other bits, and thus the two sets be made to operate separately or together and in either direction.

Claim.—A key made with a series of auxiliary bits, interlocking with the main bits, and so as to be capable of rotation and operation therewith in one direction, and independently thereof in the other direction, substantially as set forth.

No. 46,705.—HARVEY A. REYNOLDS, New York, N. Y.—*Velocipede Trotting or Pacing Horse.*—March 7, 1865.—In this invention the horse is mounted on wheels provided with reversed cranks, and the legs of the horse are jointed, which enable it to have the motion of trotting.

Claim.—First, a velocipede trotting or pacing horse, mounted on wheels, and having the axle of the forward or driving wheels provided with reversed cranks, to act on the jointed legs B B, substantially as explained.

Second, the jointed legs B C, connected by rods L, and the latter secured to the stirrups K of the axle of the driving wheels, substantially as and for the purpose specified.

No. 46,706.—WM. ARCHER and CLINTON RICE, New York, N. Y.—*Manufacture of White Lead*.—March 7, 1865.—This invention consists of a close vessel provided with apertures for the admission of vapors of acetic acid, or carbonic acid gas, and an aperture for the escape of such vapors or gases. The said box is provided with a rotary drum, to which the lead is attached, and a brush or scraper which presses against the surface of the drum as it revolves.

Claim.—The continuous or intermittent removal of the white lead from the surface of metallic lead, as fast as desirable, by means of a stationary revolving or reciprocating brush or scraper, applied in combination with a revolving or stationary drum or frame, substantially as described.

No. 46,707.—ESEK C. ROBERTS, Salem, Mich.—*Method of Preserving Fruit, &c.*—March 7, 1865.—This invention consists of chambers provided with double walls, the spaces between said walls being filled with non-conducting material, such as sawdust, &c. The said chambers are surrounded by blocks of ice, cemented together with snow or pounded ice, in the same manner as bricks are united with mortar. The said chambers are provided with several doors leading to small rooms, each room being made colder than the preceding one. In the chamber nearest the large chamber is placed a metallic cylinder, which is filled with ice.

Claim.—First, the herein-described construction of one or more chambers, arranged with an ice-house or fruit-house, and surrounding the same with a poor conductor of heat, as and for the purposes herein set forth.

Second, one or more condensers, constructed as described, and placed within the chamber, as and for the purpose specified.

No. 46,708.—CHARLES E. ROWAN, Brooklyn, N. Y.—*Machine for Hulling, Cleaning, and Polishing Rice*.—March 7, 1865.—The construction and arrangement of the parts are set forth in the claim and engravings.

Claim.—First, the combination of the two concentric cones D and E, provided with open removable frames G, and adjustable endwise in relation to each other, in the manner and for the purposes herein specified.

Second, constructing the rubbing surfaces of steel wires I, set endwise in the frames G, as herein shown and described, so as to admit of setting or repairing the rubbing surfaces by tapping the wires from the back, as explained.

No. 46,709.—CHARLES A. RUFF, Providence, R. I.—*Knife for Opening Tin Cans*.—March 7, 1865; antedated February 23, 1865.—In this device there is projected from the end of the handle, and in line with its axis, a stout metallic stem, with a cutting blade at its end, the latter projecting some half of an inch or thereabouts in advance of a curved guide plate, which, issuing from the same end of the handle, is curved upwards, and has a slot made in its curved portion through which the blade passes, the curved plate thus serving as a support to the blade, a guard to the finger, and a guide to limit the depth of cut. There is also a flange projecting from the plate, into which is tapped a thumb-guide screw, which, sliding against the edge of the can, controls the direction of the cut.

Claim.—A knife provided with a fulcrum to rest or rock on, the tin being cut, constructed, and arranged substantially as described.

No. 46,710.—CYRUS W. SALADEE, Putnam, Ohio.—*Curry-comb*.—March 7, 1865.—This invention consists in providing a curry-comb with an arched back or frame, to which is connected the ordinary handle, placed at right angles with the teeth, and by which is gained the advantage of two separate ways of grasping the comb, viz: First, by grasping the ordinary handle, or when that is not desirable, the comb may be grasped immediately over the top of the frame.

Claim.—The arched frame or back A A A1 A2 of the curry-comb, in combination with the handle C C1, in the manner and for the purpose substantially as shown and described.

No. 46,711.—CYRUS W. SALADEE, Putnam, Ohio.—*Stirrups*.—March 7, 1865.—This invention consists of a cross bar of metal passed through the sides of the stirrup, immediately under the stirrup strap, and there made secure. To this cross bar the top end of the guard is rigidly fastened.

Claim.—The cross bar C, in combination with the guard B and the stirrup A, in the manner and for the purpose substantially as shown and described.

No. 46,712.—CYRUS W. SALADEE, Putnam, Ohio.—*Stirrups*.—March 7, 1865.—This invention consists in attaching to the top of wood stirrups a metallic cap or loop for the purpose of holding together the two sides of the stirrup leather, immediately over the top of the stirrup, in order to retain the same in proper position on the stirrup under all circumstances.

Claim.—The cap A, in combination with the cross bar F and stirrup leather E, in the manner substantially as shown and described.

No. 46,713.—JOSEPH G. SAVAGE, South Reading, Mass.—*Machine for Pulverizing Sand, &c.*—March 7, 1865.—This invention consists in a machine constructed and arranged so as

to sift and pulverize sand by means of a grinding plate, working against a vertical yielding bed and a revolving wire gauge cylinder, by which the sand is efficiently sifted.

Claim.—The machine, constructed and operated substantially as above described, for pulverizing and reducing sand and other material, and sifting the same, as set forth.

No. 46,714.—WILLIAM and COLEMAN SELLERS, Philadelphia, Pa.—*Machines for Rifling Gun Barrels.*—March 7, 1865.—This invention consists in arranging the various mechanical devices in such a manner that the starting of each one of the series of motions or operations necessary to the process of rifling a gun barrel shall be dependent upon the absolute completion of the motion or operation immediately preceding; and so, also, that should any accident prevent the completion of one motion of the series, the operation which ought to succeed it will not take place until the impediment shall have been removed. The machinery which operates the rifling rod is arranged so that should the rod prove to be too heavy for the strength of the rod, the driving mechanism will be disengaged and the machine thereby be stopped. A lubricating or washing device is arranged at the end of the barrel, by means of which jets of oil are forced by a pump, upon the centers as they emerge, so as to wash away the chips.

Claim.—First, arranging the movements of a machine for rifling gun barrels in such a manner that they shall take place in a series or order, the starting of each one of the series being dependent upon the final movement of the previous one of the series, substantially as and for the purpose specified.

Second, stopping the motion of the rifling rod at one end of its stroke, and causing the other movements to take place, as described, while the rifling rod is at rest.

Third, arranging the driving power of the rifling rod in such a manner that it shall be able to perform the work required, but will disconnect itself and drop under a strain too great for the rod to bear with safety.

Fourth, the use of a washing box or boxes, substantially as described and for the purpose specified.

No. 46,715.—G. W. SMITH, North Walsehill Township, Pa.—*Limonene.*—March 7, 1865.—This invention consists of a mixture of spirits of camphor, spirits of turpentine, alcohol, and turp oil.

Claim.—A Limonene composed of the ingredients herein specified, and mixed together, substantially in the manner and about in the proportion set forth.

No. 46,716.—HANNIBAL B. SMITH, Springfield, Mass.—*Side-hill Plough.*—March 7, 1865.—In this plough the mold board is made to turn on pivots, and is secured when in place by the center or beam, which may be moved from side to side. The ploughshare has a point at each end, attached to the beam by means of a pivot, upon which it moves, and is provided with a flange, upon which the beam revolves. The flange is provided with notches to receive a spring catch, which is also provided with a lip, extending under the flange, and serves to steady the share when in the furrow.

Claim.—The combination of the mold board D with the share B, flange beam A, spring catch t, and lip d, or their equivalents, operating substantially as described.

No. 46,717.—E. B. SPAULDING, St. Louis, Mo.—*Machines for Making Heads of Casks.*—March 7, 1865.—This invention consists of two circular heads, so arranged upon lathe mandrels that the stock from which the head is to be cut is placed between the heads and clamped by screwing up the loose mandrel; when the heads are revolved, the heading passes between two adjustable arms, having the tools that cut the head to the desired diameter, and bevelling the edge at the same time. These arms can be changed to cut heads of greater or less diameter by turning a graduating screw, or they can be expanded to work thicker stuff by oscillating a lever that works a shaft, to which, on the opposite sides, are short levers pivoted to the arms.

Claim.—First, the combination in a lathe of the revolving disks or heads I, the vibrating arms carrying tools for cutting out and chamfering the heads of kegs and other work of like character, and the sliding table which carries the arms, substantially as and for the purpose described.

Second, constructing and arranging the chamfering tool stock and the cutting tool stock C, in the order and manner herein shown, upon vibrating arms, constructed and operated so as to be adjustable for different diameters and sizes of work, and for different thicknesses of level, substantially as above described.

No. 46,718.—T. S. SPERRY, New York, N. Y.—*Manufacture of Skirt Wire.*—March 7, 1865.—This invention consists in covering the ordinary skirt wire with fine glass or tinued wax, or of other non-corrosive metal, instead of the usual covering of cotton or other textile fabric.

Claim.—The above-described skirt wire as an article of manufacture, consisting of a close coiled covering of wire, with a non-corrosive surface over a central skirt wire, substantially as described and represented.

No. 46,719.—LEONARD A. SPRAGUE, New York, N. Y.—*Lever Buckle*.—March 6, 1865.—In this invention the lever is composed of a single strip, and secured to the hinge bar by means of staples cut out of the body of the lever. The frame is formed of sheet metal, and the front is bent so as to present a bevelled surface to the front edge of the lever.

Claim.—First, a lever buckle in which the lever is composed of a single strip, and secured to the hinge bar by means of stoppers cut out of the body of the lever, substantially as set forth.

Second, a lever buckle, operating as described, forming the frame of sheet metal, and corrugating or bending the front or impinged bar thereof, so as to present a lever surface to the front edge of the lever, substantially as set forth.

No. 46,720.—JOHN J. SQUIRE, Windsor Locks, Conn.—*Fruit Can*.—March 7, 1865.—This invention consists in making a jar with feet, so that when placed in warm water there may be a free circulation of water under the jar. A recess is made in the neck of the jar, in which the projection of the cover engages, by which means the cover is prevented from turning with the locking bar.

Claim.—First, in jars for preserving fruits, meats, and other substances forming pedestals on the bottom thereof, so as to obtain a free circulation of the heating medium beneath them when they are placed in such medium, in the process of putting them up for market, substantially as described.

Second, also the cover C formed with projections c F F' in the described combination, with the packing ring b and locking bar E, for the purposes set forth.

No. 46,721.—NELSON STAFFORD, Brooklyn, N. Y.—*Lock*.—March 7, 1865.—In this lock a sliding plate to which the bolt is attached carries also a horizontal stem or pintle, upon which are arranged crosswise a number of short rocking levers, which lock the bolt by falling at one end into notches formed in the edge of a stationary flange. To operate the lock a blade key is introduced through a narrow and elongated slot in the case and pressed upon, which depresses the inner ends of the levers and raises their opposite ends up out of the notches in the flange, and then, by an endwise pressure upon the blade key, the sliding plate, bolt, pintle, levers, and the key itself will all move together.

Claim.—First, a series of tumblers swinging in a plane at right angles, or nearly so, to the line of motion of the bolt, and moving with said bolt, in combination with stationary wards, substantially as specified.

Second, the combination of a plate key with a sliding bolt and tumblers when said bolt is moved by an endless motion given to said key, as specified.

Third, the bolt carrying the tumblers and fitted as specified, in combination with the key and stationary ward bar, as set forth.

No. 46,722.—JACOB S. STEINER, St. Louis, Mo.—*Binding Attachment for Sewing Machines*.—March 7, 1865.—In this invention the pressure guide is not only adjustable to or from the edge turners, but also longitudinally to correct the too wide separation of these turners at their point of convergence, when the guide is moved from them to admit thick goods, and thus always securing the requisite pressure of the binding close up to the edge to be bound, whether operating on delicate or heavy fabrics. The guides are adjustable against the edges of the binding to guide it to the binder, and the adjustable guide holds the binding in a vertical position previous to its passing between i and t .

Claim.—First, in combination with the edge turners e e' , the enclosed pressure guide d secured to the adjustable plate B', and arranged and operating substantially in the manner and for the purpose herein set forth.

Second, the spring pressure plate or foot h combined with the tapering edge turners e e' and enclosed pressure guide d , arranged and operating substantially as and for the purpose herein set forth.

Third, the slides m m' and guides i and t combined and arranged substantially in the manner and for the purpose herein set forth.

Fourth, the employment of the adjustable guide w , substantially in the manner and for the purpose herein set forth.

No. 46,723.—A. J. STEVENS, San Francisco, Cal.—*Piston Packing*.—March 7, 1865.—This invention consists in the use of a T-shaped and two L-shaped rings in combination with the head and follower of a steam piston, in such a manner that the three rings are held in position by each other and by the piston heads and follower, and the L-shaped rings project up over the outer edges of the head and follower, and flush with the outer surfaces of the same, for the purpose of securing an increased surface between the packing rings and the cylinder.

Claim.—The arrangement of a T-shaped ring E, two L-shaped rings F, piston head A, and follower D, constructed and operating in the manner and for the purpose substantially as herein shown and described.

No. 46,724.—ROBERT STEWART, Brooklyn, N. Y.—*Apparatus for Filtering Liquids*.—March 7, 1865.—This invention consists of three filtering cylinders fixed upon a rotary shaft,

the filtering cylinders being enclosed in a casing, which is provided with a closely fitting cover. The filtering chambers are filled with bone black, and the liquid to be filtered enters through the hollow part of the shaft and falls upon the disk, which prevents the liquid from collecting at the bottom of the filtering chamber. The filtered liquids collect on the rings and on the side of the casing, and are discharged by the pipe.

Claim.—First, in connection with the filtering chamber G, the construction and arrangement of the central receiving chamber K and hollow shaft adapted to prevent the escape of the vapor and the overflow of the liquid, substantially as set forth.

Second, the distributing disk L arranged and employed substantially in the manner and for the purpose herein described.

No. 46,725.—EMERSON C. STRANGE and GEORGE R. HUNTLEY, Taunton, Mass.—*Boiler Furnace.*—March 7, 1865.—This invention consists in combining a wind wheel with a series of perforated pipes placed in the walls of a furnace and within a case made for the purpose, in such a manner that upon the introduction of steam to the pipes a rotary motion of the wheel is produced, and a mingled current of air and steam is introduced into the furnace, either above or below the grate.

Claim.—First, the combination of a wind wheel with a series of perforated pipes placed in the walls of a furnace, either above or below the grate bars thereof, substantially as and for the purpose above set forth.

Second, the combination of the open casing B provided with perforated pipes leading from a central hub, as described, with doors F for shutting off the supply of atmospheric air, substantially as above set forth.

No. 46,726.—HERMAN STRATER, Jr., Boston, Mass.—*Faucet.*—March 7, 1865.—This invention consists in the construction of a faucet, with a sleeve projecting inward from the cap and around the stem, and a packing of rubber around said sleeve and extending below it, the pressure of water when the faucet is opened packing the rubber tightly around the stem and around the sleeve, and preventing leakage; also in the employment in connection therewith of a metal washer cushioned upon rubber, for the valve upon the screw plug.

Claim.—The arrangement of the sleeve *o o* and the elastic packing *p p* placed within the cap *n n*, as described.

Also, in combination with the above arrangement, the metallic packing furnished with an elastic backing, and operating substantially as described.

Also, the stop *m* for preventing the wear of the metallic washer on its backing, as described.

No. 46,727.—HERMAN STRATER, Jr., Boston, Mass.—*Faucet.*—March 7, 1865.—This invention consists in the construction of a faucet with an air chamber or passage above the outlet and around the screw plug, so that the liquid ejected from the pipe shall tend to create a vacuum, and cause the commingling of the air rushing in and the liquid being discharged from the flame.

Claim.—First, the spaces or chambers to which air has free access around the tube through which the liquid passes in such a manner that when a vacuum, or partial vacuum, is created in the chamber in which the said tube is located by the downward current of the said liquid, the air and liquid will be commingled, substantially as specified.

Second, the combination of the screw plug *h h*, extension tube *d d*, and in spaces or chambers *g g*, arranged and operating with regard to each other substantially as described.

No. 46,728.—HERMAN STRATER, Jr., Boston, Mass.—*Faucet.*—March 7, 1865.—This invention consists in the employment of a hollow screw plug or valve in connection with an extension up into the same of the inner end of the inlet pipe of the faucet, the construction dispensing with the ordinary screw cap and washer, as the in-rushing liquid is deflected, and caused to rush down through the outlet by the inner surface of the screw plug, and will not force up the outer side of the screw upon the screw plug.

Claim.—The arrangement of the travelling socket and extension tube, operating together substantially as described.

No. 46,729.—T. L. STURTEVANT, Boston, Mass.—*Stove.*—March 7, 1865.—This invention consists of a stove provided with an internal air-heating chamber, open at its top, closed at bottom, and communicating at the lower end with the external air by a series of radial tubes, which extend across the space or flue between the chamber and case of the stove. It has also a perforated partition plate extending across the above-mentioned space or flue near the top.

Claim.—A stove provided with an internal heating chamber B, open at its top, closed at its bottom, and communicating at its lower end with the external air by means of a number of radial tubes *b*, which extend across the space or flue *a*, between the chamber B and the case of the stove, substantially as and for the purpose specified.

Also, in combination with the air-heating chamber B, arranged as shown, the perforated plate D, as and for the purpose set forth.

No. 46,730.—DEXTER SYMONDS, Lowell, Mass.—*Lamp*.—March 7, 1865.—This invention consists in the combination of a thin metal jacket, with elongated air openings around the wick tube, and insulated from it by means of a non-conducting plug.

Claim.—The thin metal jacket B formed with elongated air openings *b b* placed on or around the wick tube C, and insulated from the latter by means of a non-conducting plug E, all substantially as and for the purpose herein set forth.

No. 46,731.—E. B. TAYLOR, Natick, Mass.—*Clothes Dryer*.—March 7, 1865.—This invention consists in the employment of jointed frames secured on the outside of a window by hooks and guys; a portion of the frame is made to turn, so that it may readily pass in and out of the window. There are cords on which the clothing is hung.

Claim.—First, the frame B provided with the rope D and applied to the window A, substantially as shown, in connection with a clothes frame F suspended to B, and provided with cords for the purpose specified.

Second, the construction and arrangement of frame F to admit of the revolving of the same and the winding of the clothes upon it, for its ready application to and removal from frame B, substantially as described.

No. 46,732.—J. H. THOMAS and P. P. MAST, Springfield, Ohio.—*Attaching Drill Teeth to Seeding Machines*.—March 7, 1865.—This invention consists in bracing a drill tooth to a drag bar, by means of a separate brace bar, in such a manner as to allow the drill teeth to swing or fold forward without breaking the wooden pin.

Claim.—Bracing a drill tooth or tube to a drag bar, by means of a separate brace bar, in such a manner as to allow the drill tooth to swing or fold forward without breaking the wooden pin, substantially as and for the purpose set forth.

No. 46,733.—WILLIAM R. THOMAS, Catasauqua, Penn.—*Piston Packing*.—March 7, 1865.—This invention consists in providing a double internal ring, fitting between the piston head and follower, and provided with a transverse partition connecting the two sections of the ring together, and extending beyond the outside ring towards the packing rings. This internal ring is combined with two sets of secondary packing rings, which are separated from each other by said partition, and with holes in the piston head and follower, said holes passing through the internal ring, thus allowing the steam that is admitted on either side of the piston to act upon the recording rings and through them upon the outside or packing rings, and forming a tight joint between them and the cylinder.

Claim.—The double shell D E, provided with holes *f* in the outside shell, and with a partition *a* and flange *c*, in combination with holes *d d* in the head and follower of the piston, and with secondary packing rings F and main packing rings G; all constructed and operating in the manner and for the purpose substantially as herein set forth.

No. 46,734.—JESSE G. THOMPSON, Carbondale, Penn.—*Composition for Coating Oil Barrels, and for other purposes*.—March 7, 1865.—This invention consists in a mixture of linseed oil and glue to be applied to the inner surface of oil barrels.

Claim.—Mixing linseed oil with glue as herein described, for the purpose set forth.

No. 46,735.—SARDIS THOMPSON, Monterey, Mass.—*Machine for Cutting the Curd of Cheese*.—March 7, 1865.—This machine consists of an oblong box or case in which is placed a hollow cylinder, open at one end and revolving upon a horizontal axis. In the exterior periphery of the cylinder are grooves containing fleams—knives being also arranged upon the cylinder, beneath which are throats. From the side of the case projects a semi-cylinder or bed-piece, so arranged as to allow the curd to pass between it and the interior surface of the cylinder. On the semi-cylinder are two slides moving in grooves and fitting in the interior surface of the cylinder, to which slides an alternate reciprocating motion is given by means of springs.

Claim.—First, the hollow cylinder with the groove fleams, knives, and throats, in combination with the cams.

Second, the semi-cylinder or bed-piece, with its grooves, slides, springs, and fleams, in combination with the cylinder.

No. 46,736.—HENRY TUBESING, Pittsburg, Penn.—*Flexible Forms for Graining, Printing, &c.*—March 7, 1865.—This invention consists in making the face of the form of gutta-percha and India-rubber, and the body of printers' roller composition. The face is made by coating the mould with a thin solution of gutta-percha and India-rubber. After it is dry the body of the form is made by pouring in the printers' roller composition in solution.

Claim.—Making flexible and elastic forms for printing, graining, &c., of India-rubber or gutta-percha, or a mixture of India-rubber and gutta-percha, with a body or backing of printers' roller composition, (glue and molasses,) substantially as hereinbefore described.

No. 46,737.—D. F. WALKER, Bowling Green, Ky.—*Adjustable Eccentric*.—March 7, 1865.—This invention consists in the use of a grooved sleeve, provided with two wedge-

shaped projections and made to slide in a longitudinal direction on the shaft, which carries the eccentric disk; the said projections operating in combination with the eccentric disk in such manner that, by shifting the sleeve on the shaft, the throw of the eccentric can be regulated at pleasure, without stopping the motion of the shaft on which the eccentric is mounted, or that of the eccentric itself.

Claim.—The sleeve *h*, provided with wedges *g* inclined in opposite directions and fitted to the shaft *A* by feathers *i*, in combination with the disk *B*, furnished with an oblong slot *c*, and fitted to the shaft by notches *d*; all constructed and operated substantially as and for the purpose set forth.

No. 46,738.—C. L. WESTBROOK, New York, N. Y.—*Corn Planter*.—March 7, 1865.—This invention consists in an arrangement of devices indicated in the claim, and will be understood by reference to the engraving.

Claim.—The peculiar A-shaped harrow, or its equivalent, with the ploughshare *F*, the converging covers *l*, the peculiar placing of the share, flexible tube, and coverers, together with the arms *k* and *j* and cross-piece *k*, as attached; the whole constructed and described as and for the uses and purposes herein stated.

No. 46,739.—AMOS WESTCOTT, Syracuse, N. Y.—*Churn*.—March 7, 1865.—In this invention the end of the horizontal dasher-shaft passes through a funnel-shaped box filled with suitable packing, and is secured by a screw passing through from the outside. The crank is detachable, and can be used with either gear or pinion wheel. Air is introduced through an opening in the cover, by a blade of the dasher passing closely over the inner side of the opening, thus creating a draft.

Claim.—First, the use of the funnel-shaped box *T*, figure 5, with the method of packing the same, essentially as above described, in combination with the rectangular bars *H*, the body of the churn, and the shaft and dasher paddles, as above described.

Second, the method of attaching and securing the shaft *I*, figure 3, in the body of the churn, as above described, in combination with the body, rectangular bar, pinion wheel, and shaft, as above described.

Third, the method of introducing air into the body of the churn, essentially as above described, in combination with the shaft and dasher, paddles, body, and rectangular bar, as above described.

No. 46,740.—AMOS WESTCOTT, Syracuse, N. Y.—*Bolts for Doors*.—March 7, 1865.—This invention relates to a mortise bolt operated through the instrumentality of a knob, and otherwise of a construction similar to that patented to the said Westcott June 2, 1857. The knob arbor passes through a horizontal slot in the bolt and carries a small cog wheel at its inner end, which gears with a series of pins projecting from the face of the bolt, and by means of which the bolt is either projected or retracted on turning the knob. In the present instance the shank has a slight end play, and a spiral spring arranged around it, bearing against the escutcheon on one side and a collar upon the arbor, which bears, by virtue of said spring, against the face of the bolt, serves to force a shoulder on said collar into one or the other of two depressions formed in the bolt, one, namely, at each end of the slot, and thus lock the bolt, whether the same be in a projected or retracted position. In order to operate the bolt the knob must be slightly drawn upon until the shoulder has been released from the recess in the bolt.

Claim.—First, the method of fastening the bolt, when the same is thrown out, and also when it is drawn back, substantially as above described.

Second, the use of the spiral spring, or other similar device, in combination with the projection *a*, figure 2, and the holes in the side of the bolt, substantially as and for the purpose above described.

No. 46,741.—JAY WHELOCK, San Francisco, Cal.—*Animal Trap*.—March 7, 1865.—In this invention the trap door, upon which the animal rests in trying to get at the bait, forms one of the radial wings of a revolving wheel. The bait is beyond in a hinged box, which can open. To get at it, the animal must push aside a bar with its nose or feet. In doing so this hinged bar (retained in its normal condition by a spring) acts as a trigger, through a projection on it, passing under the radial trap. When pushed aside, the animal falls in a box below and the trap is reset.

Claim.—The lever *G*, provided with the plate *H* and spring *I*, in combination with the slot *e* in the partition *F*, and the revolving platforms *C*, all arranged in connection with the box or animal receptacle *A*, to operate substantially as and for the purpose specified.

Also, the bait box *E*, connected to the box or animal receptacle *A*, and arranged in relation with the lever *G*, partition *F*, and revolving platforms *C*, substantially as and for the purpose set forth.

No. 46,742.—JOHN H. WHITNEY, Sandisfield, Mass.—*Ox Yoke*.—March 7, 1865.—This invention consists in the application to an ox yoke of a fulcrum and thumb screw, whereby a short or long leverage is given to the bow blocks by the former, and by tightening or loosening the thumb screw the blocks are held in any desired position.

Claim.—The adjustable fulcrum screw *D* and the thumb screw *E*, in combination with the bow slides *H*, as and for the purposes set forth.

No. 46,743.—E. A. WILLIAMS, Columbus, Ohio.—*Sugar-cane Mills*.—March 7, 1865.—This invention consists in so constructing the bottom plate of the machine that the juice expressed from stalks will flow directly off into troughs, said troughs being provided with one or more screens in such manner that the juice flowing into them will be deprived of the cane, trash, &c. Self-adjusting guides, provided with flanges or plates, extend into close proximity with the feed or crushing rollers, in such manner as to prevent the juice from being ejected from the mill by the pressure of said rollers. The central portion of this device is made flexible in order to accommodate itself to the cane which is passing through it.

Claim.—First, the application of one or more screens to the troughs or side conduits of the bottom plate of a cane mill, in such a manner that the juice flowing over the angles formed by the said plate and the troughs into the troughs *b b'* will be deprived of cane trash, substantially as described.

Second, the flaring spring guides J J, in combination with the side fenders G G, substantially as described.

Third, the combination of the bottom plate with side troughs, crushing rollers partly overhanging the troughs and the screens, substantially as and for the purpose set forth.

Fourth, providing for the removal of the cane trash from both ends of the crushing rollers when the top and bottom plates of the mill are brought in close proximity to the ends of said rollers, substantially as described.

Fifth, the arrangement of guides and fenders, as described, or their equivalents, directly over the front trough *b*, substantially as described.

No. 46,744.—HORACE G. WILLIAMS, Hamilton, Iowa.—*Self-rocking Cradle*.—March 7, 1865.—This invention relates to an arrangement for operating a child's cradle and fan at the same time, whereby the use of the hand or foot for that purpose is entirely avoided, and the cradle rendered capable of being rocked with greater or less speed, as may be desired.

Claim.—The operating of a cradle A, and fan if desired, through the medium of a weight F, or an equivalent spring, an ordinary clock movement and rocking pallet bar Q, with its upright R, engaging with the forked bar S of the cradle, in combination with the counterpoise, laterally adjustable, weighted bar T, substantially as described and represented.

No. 46,745.—RILEY P. WILSON, New York, N. Y.—*Roasting and Desulphurizing Ores*.—March 7, 1865.—This invention consists of a series of fixed horizontal clay retorts, arranged in a furnace with a feeder, with flanges made of copper or gun metal. The ore is fed in at the hopper, and moved so as to pass successively through the retorts. A stream of salt water, with steam, enters from a vessel containing salt water. The ore is discharged from the retorts into the amalgamator with stirrers. The waste gases from the retort are also discharged beneath the surface of the water. The steam generated by the hot ore falling into the water rises through a pipe to the retorts.

Claim.—First, fire-clay retorts A, in combination with conveyers C, as a whole or in sections, for the purpose of desulphurizing gold, silver, and other metalliferous bearing ores.

Second, the construction of a furnace in such manner that a series of clay retorts A may be placed in a horizontal position side by side, or one above the other, so that the desulphurized ores may be conveyed back and forth during the process of calcination.

Third, the hollow shaft C, in combination with the retorts A, as shown herein.

Fourth, the flanges or wings K, of the conveyers as adjusted to the shaft, for the use and purpose herein stated.

Fifth, the use and application of copper or gun metal, or its equivalent, both for a sheathing for the shafts of the retorts, as also for the flanges or wings K.

Sixth, the introduction of a jet of steam into the retorts, in combination with the air; also the box or vessel J, containing the salt or brine, substantially for the uses and purposes herein described.

Seventh, the use of a receiving vessel or vat G, in combination with the mullers or stirrers *g*, into which the desulphurized ores collect—said vat being partly filled with water, having a flue or pipe for the egress of the steam into the furnace; a faucet *j*, for the extraction of surplus water; a syphon *i*, for the discharge of the debris or refuse material; and the faucet *h*, for drawing the amalgam.

No. 46,746.—ADAM WORLEY, Saint Paul, Minn.—*Twin Wood Stove*.—March 7, 1865.—In this stove the inner cylinder constitutes the fire chamber; a curved pipe with a flaring mouth opening near the closed top of the cylinder conveys the products of combustion to an annular chamber between the inner and outer casing of a receiver constructed externally like the heater—these products of combustion circulate up and down about the receiver, and pass off at an exit pipe. Air circulates from the floor up through an annular chamber in the heater between the inner cylinder and outer casing; also through the inner cylinder in the receiver. This heated air can be carried by suitable pipes in the top of the heater and receiver to warm upper rooms.

Claim.—First, the convex-concave plate C, and curved or elbow pipe *d*, in combination with the inner or fire cylinder B, substantially in the manner and for the purpose herein described.

Second, the curved or bent partitions *c c* in the receiver, in combination with the inner cylinder *D*, and outer one *A*, substantially in the manner and for the purpose herein described.

Third, the combination of the stove *A* with the receiver *A'*, when used with their interior arrangements as described, substantially in the manner and for the purpose herein set forth.

No. 46,747.—THOMAS H. WORRAL, Manchester, N. H.—*Self-centring Chuck*.—March 7, 1865.—In this device the holding wedge-shaped jaws move with their inner holding edges parallel to each other, and to the centre of the chuck in slots or ways cut in the face, or end of the face-plate, commencing near the periphery, with an inclination towards the centre corresponding to the outer edges of the jaw. A cap-shaped nut or cap having an opening in its centre by being screwed upon the pan-plate impinges against the outer ends of the jaws, and forces them towards the centre, clamping the object to be held firmly between them.

Claim.—The wedge-shaped jaws *b*, and corresponding ways *a*, in combination with the spring slide *d* and cap *B*, constructed and operating substantially as and for the purpose set forth.

No. 46,748.—HENRY ZAHN, New York, N. Y.—*Lamp Shade*.—March 7, 1865.—This invention consists in suspending the metal ring which supports the shade, by means of strap hooks, from the top edge of the chimney of the lamp, so that the said ring will not come in contact with the glass.

Claim.—Suspending the shade of a lamp from the top edge of the cylinder by means of hooks or straps *a*, or by any other equivalent means, substantially as and for the purposes herein shown and described.

No. 46,749.—JOHN AIKEN, assignor to ERASTUS WILKINS, Warner, N. H.—March 7, 1865.—*Churn*.—This invention consists in the employment of two standards attached to the body of a churn, and having placed across the top and near the top thereof a cross-bar fitted loosely in the standards and operated by a lever, having attached thereto, by a swivel-joint, an adjustable connecting rod and dasher. By the movement of the lever backwards and forwards the dasher is thrown up at an angle at one side, and *vice versa*.

Claim.—The combination in a churn of the rocking shaft *B*, vibrating lever *C*, and adjustable connecting rod *D*, attached to the lever by a swivel-joint, and to the dasher by a rigid joint, in the manner and for the purpose above described.

No. 46,750.—SAMUEL C. BISHOP, assignor to the BISHOP GUTTA-PERCHA COMPANY, New York, N. Y.—*Composition for Insulating Telegraph Wires*.—March 7, 1865.—This invention consists in a composition of gutta-percha, paraffine, wheat flour, and resin; or gutta-percha, paraffine, white oxide of zinc, catechu of similar material, and gelatine.

Claim.—A composition for insulating telegraph wire, consisting of gutta-percha or India-rubber and paraffine mixed with either resin and wheat flour, or with a tannate of gelatine and white oxide of zinc, substantially in the manner and about in the proportion herein set forth.

No. 46,751.—CHARLES BRADFIELD, assignor to himself and PAUL SWENSON, Newark, N. J.—*Clothes and Hat Rack*.—March 7, 1865.—This invention consists of a clothes or hat rack in which there are two rails inserted in a metal socket without fastenings, so as to be removable, the hooks being so formed that their shanks fit between the rails, and can be made to slide along between them to any desired position.

Claim.—First, the combination of the escutcheons *b* and *d*, connecting bar *c*, the whole constituting a shank for the attachment of the hook *D*, in the manner explained.

Second, in combination with a hook constructed as above specified, the bars *A B*, and divided sockets *C C*, constructed, arranged, and employed as described.

No. 46,752.—S. W. HAMMON, assignor to himself, JOSEPH H. LINCOLN, S. LINCOLN, and A. P. HAMMON, Montford, Wis.—*Corn Plough*.—March 7, 1865.—In this machine the frame is composed of two semicircular frames, through the centre of which extends the draught pole; the axle is connected to the draught pole by a pivot bolt. The frames turn on the axle by means of toothed segments, worked by a foot lever. The plough points are attached to the standards by a pivot secured by a nut at its rear end, and they can be adjusted at any angle laterally. The front half of the frame carrying the plough is elevated by a hand lever, which operates two toothed segments.

Claim.—First, the two semicircular frames *B C*, applied to the draught pole *D*, in the manner substantially as shown to form the main frame of the machine.

Second, the axle *A*, connected to the draught pole *D*, by the pivot bolt *a'*, in the manner as shown, or in any equivalent way, to operate as herein described.

Third, the toothed segments *C C*, arranged as shown in combination with the shaft *F*, and bar *H*, for the purpose of moving or adjusting the axle *A*, as set forth.

Fourth, the attaching of the ploughs *T*, to the standards *S*, by means of the stems *k*, fitted in bearings *i*, the former being provided with nuts *j*, and all arranged substantially as described.

Fifth, the method of adjusting and holding the frame *k*, by means of the toothed segment *N*, segment bar *M*, and lever *Q*, all arranged substantially as set forth.

No. 46,753.—JONAS HIGBEE, Northport, N. S., assignor to himself and JOSEPH B. DENTON, Newton, N. S.—*Rudders*.—March 7, 1865.—In this invention the rudders are as segments of a circle of 90°, and are suspended where the radii meet at the centre of the circle, if the circle was completed. These turn, one at the bow, another at the stern, on the point of suspension; and the fore and aft rudders, by the action of the water, adjust themselves to each other, and then are operated in the usual manner. The rudders have what are called fins; that is, radial ribs or projections on their surfaces.

Claim.—The hinged segmental rudders B B', provided with fins *a a'*, and applied in combination with the posts C C', in the manner and for the purposes substantially as herein shown and described.

No. 46,754.—SAMUEL HOLT, Newark, N. J., assignor to C. A. BULKLEY, New York, N. Y.—*Loom for Weaving Plush, or Piled Fabric*.—March 7, 1865.—In this invention the loom for weaving two pieces of fabric, connected by an intervening pile, can be operated by power, and the usual Jacquard mechanism dispensed with.

Claim.—First, the levers *k l*, attached to the heddles, as specified, in combination with the tappets *f g h*, and levers *i m n*, to actuate the warps in the manner set forth, for weaving two pieces of cloth with the pile between, substantially as specified.

Second, the arrangement of the wheel *v*, drum *w*, levers *x*, and tappets *y*, for actuating the centre knife *z*, by means of the cord or strap *t*, as specified.

No. 46,755.—JOSIAH KILMER, Barnesville, N. Y., assignor to himself and AUGUST KILMER.—*Plough*.—March 7, 1865.—This invention consists in the application of a regulator, in combination with the drag chain, in such a manner that the position of the chain can be adjusted instantaneously, according to the force required to throw the stalks, &c., under.

Claim.—A regulator R, to be employed in combination with the drag chain C, in the manner and for the purposes set forth.

No. 46,756.—THOMAS J. LOVEGROVE, assignor to himself and HENRY BALDWIN, JR., Philadelphia, Penn.—*Sand Pump for Artesian Well*.—March 7, 1865.—In this invention a barrel is formed with a small interior concentric tube, held in position by a septum at its centre, which divides the barrel into two equal chambers, the interior tube not extending quite to the top or bottom of the barrel. The bottom of the barrel contains a plug, with a trumpet-shaped opening therein. Upon the interior opening of this plug a ball valve is seated, and confined by a circle of pins and projections from the lower end of the small interior tube. The upper end of the barrel has attached to it a rod or handle, by which the barrel is to be raised and lowered; also a flexible tube through which the sand and water are to pass upward. The slack of this tube is arranged in coils, only a small portion of which has to be lifted in operating the pump.

Claim.—First, an air chamber, connected to and vibrated with a sand pump, substantially in the manner described, for the purpose set forth.

Second, a chamber connected to and vibrated with a sand pump, to receive the heaviest portion of the detritus passing through the pump.

Third, the combination with a vibrating sand pump of a flexible and extensible hose or discharge pipe, for the purpose of accommodating the movements of the pipe to those of the pump, without lifting the weight of the pipe at every stroke of the pump.

Fourth, the combination in a sand pump of an air chamber next the valve, with a sand chamber above the air chamber.

Fifth, the combination with a sand pump of a sand chamber, having an induction pipe projecting above its bottom, substantially as described, to relieve the induction valve from the weight of the detritus, as set forth.

Sixth, the combination in a sand pump of an air chamber and conducting pipe with a sand chamber, when so arranged that the eduction pipe of the air chamber forms the induction pipe of the sand chamber.

Seventh, the combination in a sand pump of an air chamber, a valve, a conducting pipe, a sand chamber, and a discharge pipe.

No. 46,757.—THOMAS J. LOVEGROVE, assignor to himself and HENRY BALDWIN, JR., Philadelphia, Penn.—*Rock Drill*.—March 7, 1865.—This invention consists in a rock drill having its cutting edges sloped from the centre to the side, forming a concave edge, and with more cutting edges on one side than the other, so that the stroke of the drill will tend towards one side, and thus make a hole larger than itself. The rock drill has a chamber on its face, bounded by cutting edges, so as to cut lines transverse to the circle described by the drill, and bisecting each other. It has also one cutting edge on one side of its centre, and three or more cutting edges on the opposite side. It is provided with a chamber on its face, surrounded by cutting edges, and a channel leading from the face to the head of the drill, to receive the chips, and remove them as soon as made, so that a clean surface will be constantly presented to the action of the drill. Combined with a perforated rock drill is a flexible and extensible discharge pipe to conduct away the debris and accommodate itself to the vertical movements of the drill; and, combined with the perforated rock drill is a valve, with a flexible discharge pipe.

Claim.—First, a rock drill, having its cutting edges sloped with the centre to the circumference, and with more cutting edges on one side than on the other, so that the stroke of the drill will tend to force the drill to one side, and thus make a hole larger than the drill, substantially in the manner described.

Second, a rock drill having a chamber or concavity in its face, surrounded by polygonal cutting edges, substantially in the manner described, for the purpose set forth.

Third, a rock drill having one cutting edge on one side, three or more cutting edges on the other, substantially in the manner described, for the purpose of cutting both radial and transverse lines as set forth.

Fourth, a rock drill having a chamber on its face, surrounded by cutting edges, substantially as described, and a channel leading therefrom to the head of the drill, for the purpose of cleaning away the chip at every stroke of the drill, and thus leaving a clear surface to operate upon.

Fifth, the combination of a perforated drill with a flexible hose or discharge pipe, substantially as and for the purpose set forth.

Sixth, the combination of a perforated drill, a valve, and a flexible hose, substantially in the manner and for the purpose described.

No. 46,758.—J. C. MORGAN, assignor to WILLIAM A. NIXON and E. S. EVERHARD, Alliance, Ohio.—*Machine for Cutting Keyseats.*—March 7, 1865.—In this device a longitudinally slotted mandrel of suitable size is inserted in the eye of the pulley or wheel to be cut. This mandrel is inserted in a socket, attached to an upright standard or frame, through the lower part of which is the driving wheel shaft, carrying on its inner end a crank which, by means of a connecting rod, operates a vertical saw or cutter, inverted and playing in the slot in the mandrel with its teeth outwards, and which is fed against that portion of the eye to be cut, by means of screws in the upper and lower ends of the mandrel pressing against the back of the saw or cutter.

Claim.—First, chucking the piece of work, while the keyseat is being cut to a slotted mandrel, which may be fixed or movable, substantially as set forth.

Second, providing the mandrel with a slot, substantially as described, so as to allow the saw to pass through it.

Third, the set screws or guides *a' a'*, applied in combination with the socket C, mandrel D, and saw E, substantially as and for the purpose set forth.

Fourth, the knuckle *i*, and shoe *k*, applied in combination with the slide *n*, feed screw *f*, and saw E, substantially as and for the purpose described.

No. 46,759.—S. J. PARMLEE, assignor to PARMLEE PIANO COMPANY.—New Haven, Conn.—*Pianoforte.*—March 7, 1865.—This invention consists of an iron frame, holding the sound-board independent of the outer case, so that it may be readily removed, entire.

Claim.—First, the entire isolation of both the metallic frame and sounding board, in the manner and for the purpose substantially as specified.

Second, combining and uniting the sounding board with the frame, substantially as and for the purpose specified.

No. 46,760.—GEORGE SHOVE, assignor to himself and CHARLES THACHER.—Yarmouth, Mass.—*Cranberry Gatherer.*—March 7, 1865.—This instrument consists of a bottom and two sides, which are provided with fingers that are thrust into the vine below the berries. A duplicate set of fingers rest upon the bottom, which are so arranged that they can be raised while the bottom is pressed upon the ground, and the berries thus stripped from the vines, and deposited in a receptacle provided therefor.

Claim.—The arrangement and combination of the lifting comb B, in the manner substantially as described, with the receiver A, provided with teeth, as explained.

Also, the combination of the partition *b*, with the toothed receiver A, and the lifting comb B, arranged so as to operate together, substantially as described.

Also, the arrangement of the handle of the lifting comb at an inclination as described, with the comb, when such comb is disposed with a toothed receiver, substantially in manner as set forth, the purpose of such arrangement being to cause the comb while being raised upward to be tilted backward so as to discharge the berries into the space in rear of the partition of the receiver.

No. 46,761.—JAMES M. THOMAS, Stoneham, Mass., and SETH D. TRIPP, Lynn, Mass., assignors to S. D. TRIPP, Lynn, Mass.—*Heel Polishing Machine.*—March 7, 1865.—This invention consists in providing two or more grinding or polishing wheels, which slide upon their shaft, and so are brought opposite to the holding devices; and in the application of air for cooling the polishing wheels.

Claim.—First, the rocking plate L, in combination with the supports of the rotating disk J, substantially as above described.

Second, the adjustable arm M, and spring N, in combination with the frame K, which holds the rocking plate, substantially as above described.

Third, operating the disk *J* and its supports *I H* by means of the treadle *C*, and spring *D*, substantially as described.

Fourth, cooling the polishing wheels of machines for polishing the heels of boots and shoes, by application of a blast of air to the same, substantially as and for the purpose above described.

Fifth, the combination in machines for polishing the heels of boots of a grinding and polishing wheel upon the same shaft substantially as above described.

No. 46,762.—TIMOTHY TUFTS, Somerville, Mass., assignor to J. H. W. PAGE, Boston, Mass.—*Repeating Cannon*.—March 7, 1865.—Behind the barrel there is a revolving cylinder, bored radially to contain the charges, and is loaded by hand. It is rotated by a lever, and this same lever operates to release the hammer, fire the piece, and feed automatically the Maynard primer, and also lock the cylinder when in position for firing. Suitable means for vertical and lateral adjustment are attached by a new combination of parts.

Claim.—The combination composed of machinery for imparting to the magazine its intermittent rotary motion—machinery for stopping the magazine when a charge chamber may be brought in line and in communication with the barrel—machinery for releasing at the proper time the stopping mechanism of the magazine, in order to enable the rotation of the magazine to be effected—machinery for elevating the hammer—machinery for holding the hammer at cock—machinery for discharging the hammer, and, finally, machinery for advancing the priming ribbon, and operated by the reciprocating movements of a hand lever or brake, arranged and applied with respect to the stock, substantially as specified.

Also, the application of the stock to the axle and the carriage, by a compound joint (as described) in combination with the vertical and horizontal screws and their blocks, the whole being substantially as and for the purpose specified.

Also, in combination with the barrel, the stock, and the magazine, and the boxes of its journals, a mechanism substantially as described, for moving the said boxes so as to maintain the periphery of the magazine in its proper relation to the breech of the barrel.

No. 46,763.—JOHN G. VALENTINE, assignor to himself and R. H. ISBELL, Naugatuck, Conn.—*Machine for Planing Buttons*.—March 7, 1865.—This invention consists of a revolving cutter head, carrying a series of cutters, in combination with a sliding clamp, the same opening automatically, whenever it reaches the rear end of its stroke, to allow the removal of the button.

Claim.—First, the use of a series of cutters *F F* in a rotary head *E*, to operate in combination with a clamp *G* secured to a reciprocating slide *H*, in the manner and for the the purpose substantially as herein set forth.

Second, the springs *f*, studs *g*, and abutment *h*, applied in combination with the movable jaw of the clamp, and with the reciprocating slide *H*, substantially as and for the purpose described.

No. 46,764.—J. H. WILLIAMSON, assignor to himself and LEVI BEEMER, Branchville, N. J.—*Submerged Pump*.—March 7, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—The tubular post or standard *A*, with the two pump cylinders *B B* permanently attached with valves *b* at their upper parts, in connection with the reciprocating yokes *D D*, provided with the tubular pistons *F F*, having valves *f* at their upper ends; all arranged to operate in the manner substantially as and for the purpose herein set forth.

No. 46,765.—WILLIAM P. ADAMS and HENRY A. ADAMS, Norwich, Conn.—*Radiator for Stoves*.—Reissued March 14, 1865.—This invention consists of two drums communicating with each other by two upright pipes. The main pipe from the stove passes nearly midway between the drums, and from it a pipe communicates with the upper, and another with the lower drum. A direct draft may be had through the main pipe opening and closing the proper damper, or the draft can be made to circulate through the drums and communicating pipes.

Claim.—The two drums *A A'* and pipes *C D E E* and *B*, combined and arranged in connection with the damper *F*, and applied to a stove, to operate in the manner substantially as and for the purpose herein set forth.

No. 46,766.—HIRAM ALLEN, Jr., Wallingford, Conn.—*Churns*.—March 14, 1865.—In this churn there are two sets of beaters, so connected by cog gears that they may be rotated in either direction or in concert. The beaters are provided with oblique flukes for the purpose of more thoroughly operating upon the cream.

Claim.—The combination of flukes *a* and *c* with beaters *B* and *C*, when constructed and arranged substantially as herein set forth, so as to revolve in either the same or opposite directions.

No. 46,767.—LOUIS PAUL ANGENARD, New York, N. Y.—*Method of Coating Glass with Platinum*.—March 14, 1865.—This invention consists in dissolving pure platinum in a mixture of nitric and hydrochloric acids and evaporating the solution to dryness. The salt

thus obtained is reduced to powder and divided into two portions, the first of which is dissolved in oil of lavender, and a small quantity of asphaltum added to the solution; this is brushed over the surface of the glass, and the glass subjected to heat until it assumes a dark red color, when it is allowed to cool and is ready for the second operation. The second portion of the platinum is then dissolved in ether and evaporated to dryness, after which it is dissolved in the oil of lavender and applied to the previous coating, and the glass treated as before.

Claim.—The improved method or process of preparing and applying a solution of platina, as herein before substantially described, as a coating for the surface of glass or other articles for making mirrors and articles for use and ornament, as an improvement on my patent of the 31st January, 1865, for a like purpose.

No. 46,768.—JOHN B. ATWATER, Chicago, Ill.—*Plough.*—March 14, 1865.—In this invention two parallel rotating augers are operated upon shafts turned by cog wheels upon the inside of the rear draught wheels. In the rear of, and in a line with, the auger points are turning shares. The frame carrying the augers and shares is hinged at its rear arched ends to the axle. The whole frame is lifted by a treadle lever.

Claim.—First, the combination of one or more rotating augers with one or more turn ploughs and an adjustable swinging frame B, substantially as described.

Second, the employment of rotating augers upon a frame B that carries the plough A A' and which is hinged at its rear arched ends to the rear supporting axle D, and suspended near its front end from the beam C, substantially as described.

Third, arranging the augers in a line with and over the points of the ploughs when both augers and ploughs are sustained beneath and by a vibrating frame, substantially as described.

No. 46,769.—NELSON H. BARBOUR, Auburn, N. Y.—*Carbonic Acid Engine.*—March 14, 1865.—This invention consists in the use of the expansive force of the vapor or gas derived from the evaporation of liquified carbonic acid and other gases, and retaining the whole or a considerable part of the expanded gas to be again liquified for subsequent use, when the same is done through devices and by a power independent of, and in addition to, that connected with its own expansive force. This is accomplished by having a reservoir on the locomotive, into which the gas is conducted after being exhausted from the cylinders, and in which it is retained until a station is reached where the liquified acid is prepared, when the gas is drawn from the reservoir and liquified by a separate set of machinery.

Claim.—The application of the expansive force of the vapor or gas derived from the evaporation of liquified carbonic acid and other gases, and retaining the whole or a considerable part of the expanded gas to be again liquified for subsequent use, when the same is done through devices and by a power and machinery independent of, or in addition to, that connected with its own expansive force, substantially in the manner shown and described.

No. 46,770.—JOHN A. BASSETT, Salem, Mass.—*Burner for Carburetted Air.*—March 14, 1865.—This invention consists in the application to an ordinary fish-tail burner of a collar or ring fitting around the top of the burner, and projecting a little above it, for the purpose of burning carburetted air, to be used in combination with a carburetter, patented by the applicant.

Claim.—The combination of the burner A with a carburetting apparatus used to produce an illuminating gas in the manner specified; the whole operating together for the purpose substantially as set forth.

No. 46,771.—JOHN A. BASSETT, Salem, Mass.—*Improved Apparatus for Carburetting Air.*—March 14, 1865.—This invention consists of a pump connected with the carburetting vessel by a pipe which extends above the level of the hydro-carbon oil. Around the outlet of the said pipe is arranged a series of concentric perforated partitions, covered on one side with porous woven material. The outer partition is perforated only below the level of the hydro-carbon, and the whole series is covered. The hydro-carbon is contained in the reservoir and is kept at a constant height in the carburetting vessel by means of a pipe and an air tube. The carburetted air is collected in the upper part of the vessel and escapes through an outlet pipe to be burned. The supply of air is regulated by means of a lever and valve operated by the string connected with the upper part of the gas reservoir.

Claim.—First, the general arrangement of the apparatus, consisting of the several parts as shown and specified.

Second, the carburation of air or gases by the use of the concentric perforated cylinders with the fibrous covering, and partially immersed in the hydro-carbon liquid maintained at a uniform height, substantially as shown and described.

Third, the automatic regulation of the quantity of air to be admitted to the carburetter by means of the valve connected with and operated by the holder through the lever and cord, or their equivalents, when used for this purpose, as shown and specified.

No. 46,772.—PHILANDER H. BENEDICT, Syracuse, N. Y.—*Buttons.*—March 14, 1865.—This invention consists in forming the button with an enlarged circular base next to the cloth. A screw passes through the cloth into this shank. The head of this screw is of the

same diameter as the one on the button shank. Both these disks are concave next to the cloth, and the cloth is held by their peripheries.

Claim.—A button constructed with the parts *a b c d e f* and *g*, substantially as described.

No. 46,773.—JOHN BEVAN, New York, N. Y.—*Apparatus for Preventing Water Pipes from Bursting*.—March 14, 1865.—In one or more enlargements of the pipe an elastic ball is placed, and so caged as not to stop the flow; and continuously along the pipe a tube of like material is arranged. This ball and tube, or either of them, being filled with air will yield to the pressure of the water, whether from freezing or the regurgitation occasioned by a fitful flow.

Claim.—First, the elastic or flexible compressible water-tight ball *E*, placed within a suitable chamber *D* provided in a water pipe, substantially as and for the purpose herein specified.

Second, the closed elastic or flexible compressible water proof tube *B*, placed directly within and extending any suitable distance along the passage of water pipe *A*, substantially as and for the purpose herein set forth.

No. 46,774.—GEORGE W. BILLINGS, New York, N. Y.—*Preparation of Cloth and Vegetable Fibre for Bleaching*.—March 14, 1865; antedated February 27, 1865.—This invention consists in subjecting the cloth or fibre to fermentation, in a manner similar to that employed for setting and cleaning flax, hemp, &c., as previously patented to the same inventor.

Claim.—Subjecting the fabric to a fermenting operation previous to bleaching, substantially as and for the purposes specified.

No. 46,775.—DAVID T. BURRELL, Bridgewater, Mass.—*Lamp for Heating Curling-irons*, &c.—March 14, 1865.—At each end of a fluid lamp is a series of devices, so constructed that when the curling or other iron is placed on them, a cover, to which they are attached, is lifted from the wick-tube, extending the whole length of the lamp, the wick being lighted at the same time by the flame of a small burner close in front. When the iron is removed the cover falls.

Claim.—First, an apparatus for heating irons, &c., operating automatically, substantially as described and for the purposes specified.

Second, the arrangement and combination of the main and small wicks *c c* and *e e* and extinguisher *g g*, actuated so as to be raised and lowered by placing the iron or other implement upon or removing it from the apparatus, substantially as described.

No. 46,776.—GEORGE E. BURT, Harvard, Mass.—*Horse Rake*.—March 14, 1865.—This invention consists in so connecting the seat with the levers by which the rake teeth are raised that the weight of the driver assists in tilting the rake. It also consists in the manner of attaching the teeth arms to the cylinders which constitute the head of the rake.

Claim.—First, the combination of the seat *J* with the arms *F F*, and a rake constructed and arranged substantially in the manner specified, so that the weight of the operator will assist in operating the rake, substantially as described and for the purpose set forth.

Second, the arrangement and combination of the arms *D*, the gripe *x*, and cylinder *v*, constructed substantially as described for the purposes set forth.

No. 46,777.—W. J. CHEYNEY, Wallingford, Penn., and E. T. DIETERICH, Philadelphia, Penn.—*Method of Consolidating Coal-dust, Peat, &c.*—March 14, 1865.—An alkaline silicate is mixed with as little alkali as possible with the materials, so as to form a pasty mass, which may be moulded.

Claim.—Consolidating particles of coal, peat, and similar substances, by mixing with the same an aqueous solution of silica, and drying and compressing the same, substantially as specified.

No. 46,778.—DAVID A. CLAY, Pittsfield, Mass.—*Governor*.—March 14, 1865.—This invention consists in providing a sliding yoke, which carries the mitre gears and clutches, by which the motion is communicated to the valve or gate, and combining it with a revolving clutch, that is actuated from the governor in such a manner that the yoke which is acted upon by the revolving clutch, acting through the clutches in the mitre wheel, has a motion endwise, which causes the stationary clutches, or those in the wheels, to separate from the revolving clutch as soon as an adjustment of the valve or gate has been effected, and thus the fluctuations common to this class of governors are sought to be avoided.

Claim.—First, communicating to the clutches, acted upon by a revolving clutch, a movement endwise, substantially as specified, so that said clutches will separate from the revolving clutch so soon as an adjustment of the cut-off, valve, or other regulating mechanism, has been effected as specified.

Second, the gears *m m o* and clutches *h q r*, in combination with a yoke *l*, moving endwise, in substantially the manner and for the purposes set forth.

Third, communicating to the yoke *l* an endwise movement by means of the nut and screw, actuated substantially as specified.

No. 46,779.—BENJAMIN COLE, Brooklyn, N. Y.—*Money Safe*.—March 14, 1865.—This invention consists of a reciprocating beam, so arranged that in dropping a piece of money through the aperture provided for the purpose, it is registered and shown by an index on the outside of the box.

Claim.—First, the application to a money safe of a reciprocating beam E, or other equivalent device, carrying on one end a penny or other coin or device, and operating in combination with the receiving spout B, and with one or more supplementary openings C, in the manner and for the purpose substantially as set forth.

Second, in combination with a money safe, the registering apparatus F, constructed substantially as described, so as to be operated by the act of introducing money, in the manner and for the purposes specified.

No. 46,780.—MOSES G. CRANE, Boston, Mass.—*File-cutting Machine*.—March 14, 1865.—In this machine there are arranged upon a table three circular cutting disks which bear upon the round file blank at three nearly opposite points on the circumference, being held up to it by strong springs; each disk also is free to rotate upon its own axis, and is set at such an angle of inclination that, as the blank which passes up between them from below is rotated, each of the three, sinking into its surface, will gradually draw the blank upwards until a spiral thread will be thrown up, reaching continuously from one end of the blank to the other.

Claim.—The manufacture of curvilinear surfaced files, with teeth which have the direction of screw threads, when these are thrown up as burrs from the surface of the file blanks and continuously and spirally around the same to substantially a uniform distance therefrom.

Also, in a file-cutting machine, the combination and arrangement of mechanism, substantially as described.

Also, the employment, in connection with a file blank cutter, of a gauge in such manner as to regulate the depth of the cut by contact with the uncut surface of the blank, and so as not to interfere with the burr or tooth raised by the cut, substantially as and for the purpose described.

Also, making such gauge adjustable with respect to the edge of the cutter, substantially as and for the purpose specified.

No. 46,781.—J. C. CRISMAR, Omaha City, Nebraska Territory.—*Sugar-cane Press*.—March 14, 1865.—This invention relates to an arrangement of the press box and plunger, whereby the contents of the said press box, after being subjected to the requisite pressure, may be emptied of the "cheese" or refuse with the greatest facility.

Claim.—The rising and falling frame C, in connection with the press box, composed of two parts I H, in combination with the fixed or stationary plunger J and shaft or windlass F, all arranged to operate substantially as and for the purpose herein set forth.

No. 46,782.—O. A. DAILEY, Washington, D. C.—*Boxes for Hats and Bonnets*.—March 14, 1865.—This invention consists of a box made of ribs of metal or other suitable material, and covered with leather or cloth, the same being cylindrical or semi-cylindrical and arched at the top, so as to resist lateral and vertical pressure in the most effective manner.

Claim.—As a new article of manufacture, a box for hats or bonnets constructed with arched ribs or strips, as herein described.

No. 46,783.—J. H. DOUGHTY, New York, N. Y.—*Blacking Box*.—March 14, 1865.—This invention consists in a blacking box or receiver, provided with a chamber or well, in which a plunger moves in such a manner that when the said well is filled with blacking by the action of the plunger a sufficient supply of blacking can be forced up above the bottom of the box at any moment.

Claim.—First, the employment of an elevator or driver C in combination with a receptacle for holding blacking, substantially as and for the purpose set forth.

Second, the well B, applied to a blacking box A, and provided with an elevator C, substantially as and for the purpose set forth.

Third, the pedestal D, in combination with the box A, well B, and elevator C, constructed and operating substantially as and for the purpose described.

No. 46,784.—SPENCER B. DRIGGS, New York, N. Y.—*Running Gear of Railroad Cars*.—March 14, 1865.—The principal object of this invention is to enable railway trains to be run at the highest practicable speed with the same safety as at ordinary speed, and without the enormous increase of wear and tear of track and rolling stock which results from a high rate of speed with the running gear at present in use. It consists in a system of running gear and car connections whereby this desirable result is sought to be obtained.

Claim.—First, a compound flexible car truck, composed, substantially as herein described, of a main truck and one or more flexibly attached guide trucks, the wheels of the main truck supporting the weight, or the greater portion thereof, and the wheels of the guide truck or trucks serving to keep those of the main truck parallel with the track, as herein set forth.

Second, supporting the connected ends of two railway cars upon one flexible truck having supporting wheels and guide wheels, substantially as herein specified.

Third, the arrangement of a single supporting axle and pair of wheels, and a vertical coupling pin for connecting two cars, with the axis of the said pin in the same plane with the axis of the wheels and midway between the two wheels, substantially as herein described.

Fourth, the connection of the ends of two railway cars with each other and with one supporting truck by means of one pin, substantially as herein set forth.

Fifth, suspending the ends of two connected railway cars from one truck by means of chains, links, wire ropes, or other flexible connections attached to the cars at the extremities of the sides thereof, substantially as herein described.

Sixth, the connection of the supporting truck and guide truck or trucks of what is termed a flexible truck for railway cars by means of springs, by which a portion of the weight received by the main truck is transferred to the guide truck or trucks, substantially as herein specified.

Seventh, in combination with a truck for supporting the ends of two railway cars, the rollers *h h'* attached to the car bodies, and receiving between them the transoms of the truck, substantially as herein described.

No. 46,785.—BENJAMIN F. DUNNING, Galesburg, Ill.—*Hay and Cotton Press*.—March 14, 1865.—This invention consists mainly in deriving the power used for the purpose of pressing with great force hay, cotton, wool, &c., from the falling of a heavy wedge between a suitable pair of followers, provided with friction rollers, and working in hay or cotton press boxes. The hay or cotton is pressed in successive sheets until the bale is completed, instead of applying the pressure to the whole bulk of the material. The feed arrangement admits of the hay or cotton being partially compressed, and then fed in sheets of certain required dimensions into the press boxes, so that sufficient material for one sheet receives, through the follower, the pressure of the fallen wedge, and, as the wedge rises and falls for another stroke, another sheet is fed into the press box in time for the second stroke, and so on until the desired number of sheets needed to form a bale are packed.

Claim.—First, the wedge *I* falling between followers *C C*, substantially in the manner and for the purposes specified.

Second, applying the pressure to the hay, &c., in successive sheets, when the sheets are fed in automatically, by means of a falling weight, or its equivalent, substantially as specified.

Third, the combination and arrangement of wheel *N*, swivel lever *Q*, dog *x*, thimble *R*, and shaft *O*, substantially in the manner and for the purposes described.

Fourth, the combination and arrangement of cap *K*, dog *t*, ratchet lever *L*, and levers *S T* and *U*, substantially in the manner and for the purposes specified.

Fifth, the feed rollers *E* and knives *i i*, constructed, arranged, and operating substantially in the manner and for the purposes specified.

Sixth, the triggers *J J*, when so constructed and arranged as to release the wedge so soon as it shall have given one revolution to the feed rollers, substantially in the manner and for the purposes specified.

No. 46,786.—JETHRO J. GRIFFITH, Philadelphia, Penn.—*Machine for Heading Dentists' Pins*.—March 14, 1865.—This invention consists in the employment of a double cam in connection with a system of levers and friction rollers, by means of which pressure is applied through a plunger to the pins to be headed. A friction wheel is kept in contact with the surface of the cam by means of a spring or weight. Two gripping jaws are used, one which is stationary, and the other is fastened to a sliding piece, which is moved by one of the levers.

Claim.—The combination of the double cam *E*, the levers *F* and *O*, with their adjustable auxiliary levers and friction rollers, (or the described or other equivalents for the adjustable parts,) the sliding piece *N*, and jaws *M M'*, in the manner and for the purpose substantially as described.

No. 46,787.—J. C. S. FITSPATRICK, Kalamazoo, Mich.—*Time Indicator for Railroad Trains*.—March 14, 1865.—This invention consists of a time table composed of a series of dials with movable hands, one such dial being provided for every train, so that the indicators for each train designated shall be permanent and not requiring adjustment, except when changes are made in the time of starting. Combined with the above is a cipher for the purpose of indicating the suspensions of running of a train.

Claim.—First, a time table, consisting of a series of dials with movable hands, having one such dial for every train, so that the indicators for each train designated shall be permanent and not require adjustment except when changes are made in the time of starting, as herein above set forth.

Second, in combination with a time reporter, arranged as above specified, the employment of a cipher, in the manner above described, to indicate the suspensions of running of a train.

No. 46,788.—E. N. FOOTE, New England Village, Mass.—*Miniature Locket*.—March 14, 1865.—This invention consists of a locket in which is produced in miniature an imitation of a photographic album, with spaces for photographic and other pictures; the leaves or re-

ceptacles for the pictures and the outer sides of the locket being so attached to the body thereof as to be capable of opening wide to expose the picture to view.

Claim.—First, the photographic locket A, constructed and operated substantially as above described.

Second, securing the covers of the locket to the extensions *a a*, respectively, of the part D, of its back, substantially as above described.

Third, making the inner plate E of the back of the locket convex and rigid, and hanging the leaves I thereto at different elevations on its convexity, substantially as and for the purpose above described.

46,789.—PERRY G. GARDINER, New York, N. Y.—*Quartz Crusher*.—March 14, 1865.—This invention consists in the combination of a stationary mortar or kettle, of a partly spherical form in the interior, with a spherical concentric ball operated by a diagonal shaft connected by means of an arm and forked joint and bush, with a vertical driving shaft. The ball, mortar, or basin is combined with the vertical hollow shaft, so that ores that are pulverized are carried down continuously, without intervals for charging or discharging, the falling ores being equally distributed on all sides of the ball and basin.

Claim.—First, the manner of combining and arranging a stationary mortar or kettle, of a partly spherical interior form, with a spherical concentric ball operated by a diagonal shaft *d* connected with a vertical driving shaft by the arm *F* and the forked joint and bush *g g'*, operating in the manner and for the purposes described.

Second, combining and arranging the vertical hollow shaft *E* with the ball and basin or mortar *D C*, whereby the ores to be pulverized are carried down continuously, without intervals for charging and discharging, and so as to distribute the falling ores equally on all sides of the ball and basin.

Third, the peculiar form and structure, in two equal parts, of the cover or lid *K*, by which it can be placed over the kettle without disturbing the operating parts, and made to revolve with the shaft, and arranged upon the trough *I*, as described.

Fourth, the form and arrangement of the movable trough *I*, having its sides of unequal height, and its trough perforated and adapted and adjusted to the rim of the basin below and the revolving lid above, one to be used with or without water, as described.

46,790.—WILLIAM GASKILL, Cincinnati, Ohio.—*Hemming Gauge for Sewing Machines*.—March 14, 1865.—This invention consists in the employment of an adjustable perforated and shouldered tongue, which is adapted to rise and fall with the pressure foot of a sewing machine, in combination with an adjustable shouldered plate for the purpose of accurately gauging and neatly flattening the hem at the point and in the act of stitching.

Claim.—First, the adjustable perforated and shouldered tongue *D*, adapted to rise and fall with the pressure foot of a sewing machine, in combination with the adjustable shouldered plate *A*, for the purpose of accurately gaging and neatly flattening the hem at the point and in the act of stitching, as set forth.

Second, the parts *A a B C c c' c'' D d E F f f'* and *F*, combined and co-operating in the manner stated.

46,791.—ORED GILDER, Kinsman, Ohio.—*Automatic Ratchet and Pawl*.—March 14, 1865.—The object of this invention is to prevent reverse motion of the shaft in sewing and other machines. It consists of an automatic ratchet and pawl, so arranged that, while the wheel to which the pawl is connected revolves in the proper direction, the pawl does not interfere with its motion; but the instant the wheel commences to turn in a contrary direction the pawl is made to engage with its ratchet, and the reverse motion prevented.

Claim.—The pivot *C*, the lever or break bar *E*, and break roller *F*, when the same are constructed as described in the aforesaid combination for the purposes set forth.

46,792.—J. H. GOULD, Cincinnati, Ohio.—*Blacksmith's Forge*.—March 14, 1865.—This invention consists of a sprinkling apparatus connected with a water tank in such a manner that water can be sprinkled at pleasure upon a forge fire for the purpose of economizing fuel, and of keeping the fire in good condition.

Claim.—First, the combination with a forge of the sprinkling apparatus *O* connected with a water tank *g*, or its equivalent, arranged and operated substantially as and for the purpose described.

Second, the combination of the sprinkling apparatus *O*, with the escape pipe of a water-back or water-tuyere of a forge arranged and operated substantially as and for the purpose above set forth.

No. 46,793.—C. E. GRAY, New York, N. Y.—*Rendering Apparatus*.—March 14, 1865.—This invention consists of a digester, with a man hole at the top and an aperture at the bottom, the said digester being so arranged that there shall be a space left under it in order that the contents may be withdrawn from the aperture. The space under the digester communicates with the fire chamber *h* by means of a flue. Directly over the fire box is placed a receiver communicating with the digester by means of pipes. The receiver is provided with a coil at its bottom, the said coil communicating with a refrigerating coil, by means of which the lard may be cooled.

Claim.—First, rendering fatty matter under pressure generated in the digester containing the fat by the direct application of heat thereto.

Second, the combination of the digester with a heating chamber or furnace for the purpose of generating steam therein to render the fatty substance contained in the tank, substantially in the manner described.

Third, the combination of the receiver H with steam generating digester, so arranged in connection with said digester as to receive the melted fat therefrom, and so that the heat of the furnace used to generate the steam in the digester is accessible thereto for the supplemental operation of refining.

Fourth, refining and purifying the rendered fat in a reservoir arranged in connection with the digester and filled with a coil of pipe so arranged in said reservoir and connected to said digester as to receive the steam therefrom and return the condensed water there, substantially in the manner described.

Fifth, deodorizing the gases generated in rendering the fat or driven off in refining and purifying it by passing said gases through a deodorizing chamber, substantially in the manner described.

No. 46,794.—J. GREEN, Rochester, N. Y.—*Apparatus for Deodorizing Petroleum, Benzole, &c.*—March 14, 1865.—This invention consists of an air-tight receiver provided with a man hole. It is also provided with an air inlet and oil inlet, and an outlet by which the deodorized oil is discharged. On the top of the receiver is an exhaust pump. Within the receiver is an oil tank made in two compartments, which are separated by two perforated partitions. Over one of the partitions is a slide provided with similar perforations, by means of which communication may be cut off between the two chambers. In the upper chamber is situated a coiled pipe, by means of which the oil is heated. The lower chamber contains an agitator, and it is also provided with an outlet tube. At the top, opening into the receiver and in the top of the upper chamber, is an inlet opening from the receiver into the tank.

Claim.—The process of removing the existing gas of petroleum, benzole, naphtha, and other hydrocarbon liquids in vacuo, by means of the receiver A, tank B, and pump C, arranged and operating substantially as and for the purpose herein set forth.

Also, forming the tank into two compartments D D', separated by the partitions E G and slide H, provided respectively with the holes and perforations h h' i, the whole arranged, combined, and operating substantially as and for the purpose herein specified.

Also, the agitator K in combination with the vacuum tank B, receiver A, and exhaust pump C, arranged and operating substantially as herein specified.

No. 46,795.—THOMAS HANSBROW and B. B. REDDING, Sacramento, Cal.—*Hydrostatic Engine.*—March 14, 1865.—This invention consists in the application of air cushions to the cylinders of water pressure engines in such a manner that the water pressing against the piston is prevented from acting as a solid, and the engine is enabled to turn its centre easily and without jar. To accomplish this a small cylinder is applied to each end of the induction passage, which at its lower end communicates with such passage, and at the opposite end is supplied with a valve, which is closed and controlled by a spring in such a way that as the piston recedes from either end of the cylinder the valve opens and admits a quantity of air, and upon the piston being returned to that end of the cylinder it acts as a cushion, and also aids in expelling the water therefrom.

Claim.—First, the application of cushions to the cylinder of a water pressure engine, substantially as and for the purpose set forth.

Second, the air valves e applied in combination with the air cylinders I and main cylinder A, in the manner and for the purpose substantially as set forth.

Third, the vibratory beam M in combination with the rod m, adjustable tappets b, valves F K, and ports a' b b', in the cylinder A, all constructed and operating in the manner and for the purpose substantially as specified.

No. 46,796.—HORACE HARRIS, Newark, N. J.—*Harness Snap.*—March 14, 1865; antedated March 1, 1865.—This invention consists in the mode of attaching the spring. The hook is made with lips thrown up at the sides. The rear end of the spring is corrugated and placed in the recess; the lips are then riveted down, holding the spring in position.

Claim.—The mode herein described of preparing the back end of the spring D, to be attached to the hook E, substantially in the manner specified.

No. 46,797.—L. M. HARRIS, Mattawan, Mich.—*Pruning Hook.*—March 14, 1865.—In this invention a crescent-shaped knife fastened to a slide works against a hook rigidly affixed to its staff.

Claim.—First, the use of a hook b, which is secured rigidly to its shaft a, in combination with a knife c, which slides upon the shaft a, and is moved upward in the act of cutting, substantially as described.

Second, the movable crescent-shaped knife c formed on a slide d, in combination with the hook b, which is secured rigidly to its shaft, substantially as described.

No. 46,798.—JOHN G. and H. T. HENDERSON, Salem, Iowa.—*Hand Loom*.—March 14, 1865.—The claim and drawing define the nature of the invention.

Claim.—First, so arranging a flexible strap that as the lay comes forward it will be drawn alternately from one side of the picker staff to the other, and as the lay goes back will throw the picker staff around and throw the shuttle back and forth as required, substantially as described.

Second, the combination of the shaft *f f*, ratchet *g*, and its pawl rod *r*, pins *i i i*, treadles *h h*, and stop *u*, for the purpose of elevating the upper shed as the lay comes forward, and retaining it until the shuttle is thrown, and the depressers *b b* placed on the swords for the purpose of taking the remaining treadles down as the lay goes backward, substantially as described.

No. 46,799.—ELIAS HOLLINGER, New Haven, Ind.—*Fence*.—March 14, 1865.—This invention consists in a mode of fastening the braces of the fence. The braces are applied singly to the ends and centres of the panels by means of links, battens, slots, and keys, and at the bottom they are fastened with pins.

Claim.—The braces *B B* applied singly to the ends and centres of the panels and secured by means of tanks *A A*, battens *a a*, slots *c c*, keys *d d*, and pins *e e*, all arranged as herein specified.

No. 46,800.—CHARLES W. ISBELL, New York, N. Y.—*Steam Engine*.—March 14, 1865.—This invention consists in the arrangement of two vibrating pistons, which are placed within a sector-shaped cylinder having an interposed induction chamber common to both, in which valves are placed. The vibratory motion of the piston is transferred to the main shaft of the engine, which is located centrally between the two by means of cranks and connecting rods in such a manner as to give a continuous rotary motion to the shaft, from which power is taken to propel any other machinery.

Claim.—First, the two sector-shaped cylinders *A A* arranged side by side, in corresponding positions on opposite sides of a central plane, in which is arranged the axis of a crank shaft common to both, and with their vibrating pistons connected with a common crank on the side shaft, substantially as herein specified.

Second, in combination with the within described arrangement of two sector-shaped cylinders, vibrating pistons, and crank shaft, the interposed induction chamber common to both cylinders, substantially as herein described.

No. 46,801.—ALFRED IVORS, New York, N. Y.—*Globe for Fish*.—March 14, 1865.—The object of this invention is to supply fresh water without danger of overflowing the reservoir. It is attained by the use of a double chambered pipe entering the bottom, the interior pipe acting for the supply, and the outer pipe discharging the water. By means of valves the supply and discharge are kept equal.

Claim.—First, the supply pipe *g* and escape pipe *f*, constructed as specified, in combination with the overflow pipe *h* passing away from the pipe *f* and rising to the height of the water in said globe or vessel, as and for the purposes set forth.

Second, the pan *c* and pipe *d*, fitted as specified, in combination with the globe or vessel to contain fishes, for the purposes and as specified.

Third, a globe or other vessel arranged substantially as specified, so that the water may be maintained at a given height or caused to flow over the outside of said vessel, as set forth.

No. 46,802.—DAVID L. JAKES, Hudson, Mich.—*Store Lantern*.—March 14, 1865.—This invention consists in the combination of certain devices so arranged as to give out light, and also to warm the feet or other parts of the body.

Claim.—The whole device substantially as set forth.

No. 46,803.—J. H. JONES, Ironton, Ohio.—*Railroad Chair*.—March 14, 1865.—This invention relates to a mode of constructing a railroad chair, and has for its object to secure the ends of the rails so as to prevent their rising under the weight of the cars, and thereby avoid any battering of the ends of the rails, which it is very expensive to repair.

Claim.—Constructing the chair of two longitudinal parts *B B*, one of which *B* extends up to the under side of the upper parts or tread *d* of the rails *A A*, and the other *B* extending up to the upper surface of the rails, both parts being provided with bases *a*, and so formed as to grasp the lower parts of the rails, in combination with the clamps *C* and bolts *D*, all arranged substantially as and for the purpose herein set forth.

No. 46,804.—XAVIER KARCHESKI, Bellville, New Jersey.—*Method of Preparing Colors from Aniline*.—March 14, 1865.—This invention consists in treating any white base of which the paint is to be made with gelatinous solutions before the application of the aniline solution. The white base is mixed with starch water, and to this is added a solution of tannic acid, and after these are thoroughly mixed the aniline solution is added.

Claim.—The application of gelatinous or fatty solution, vegetable or animal, such as starch, tannic acid, milk or glue, etc., in preparing paints from aniline.

No. 46,805.—W. H. KIMBALL, Lynn, Mass.—*Shanking Machine*.—March 14, 1865.—This invention consists in the arrangement of an angular knife, or cutter, in connection with feed-rolls and a guide in such a manner as to cut shoe-shanking of uniform width and triangular in section.

Claim.—The combination of the feed-rolls, angular knife and guide, when arranged to operate together, substantially as set forth.

No. 46,806.—GUIDO KUSTEL, Dayton, Nevada.—*Concentrating Table for Ore*.—March 14, 1865.—A strong frame carries two rollers on which is an endless apron. The frame may be adjusted to any desired inclination by means of an arm and set screws. One of the rollers is made to revolve by means of a wheel and screw, so as to cause the apron to revolve. The ore is to be fed on one side of the apron as it moves by a trough and openings. Water is distributed over the ore by pipes and faucets. The water washes off the lighter portions of the ore, and they fall into a box. The heavier matters are carried forward by the apron, or by the strong jet of water are carried into a box.

Claim.—First, the construction and use of a concentrating table, moving horizontally, and capable of having its inclination varied, when arranged in the manner and for the purpose substantially as specified.

Second, a horizontal moving concentrating table in combination with the feeding pipes or openings, m , m' and m'' , and the water tanks P , P' and P'' , as well as the water pipe n 3, or their equivalent, the whole being arranged and operated in the manner and for the purpose substantially as specified.

No. 46,807.—NICHOLAS D. LE PELLEY, Cleveland, Ohio.—*Rudder*.—March 14, 1865.—This invention relates to two or more blades with valves in the water passages between the blades.

Claim.—A rudder constructed with two or more blades having water passages between them and valves, all arranged to operate in the manner substantially as and for the purpose set forth.

No. 46,808.—W. R. MAFFIT, Wilkesbarre, Penn.—*Joints for Pipes*.—March 14, 1865.—The object of this invention is to supersede the old method for making joints in pipes by the use of a wooden ring, prepared by proper machinery out of one solid piece if the ring is small, or out of a number of sections or staves when the ring is large, and applied to the spigot end of the pipe in such a manner that by the expansion or swelling of the wood in the bell a tight joint is produced; and, furthermore, the compressibility of the wood allows the pipe to assume an angular position, or a position deviating from a right line, without producing leakage; or, if desired, the inner surface of the wooden ring may be more or less convex, to give the pipes a still better chance to assume an angular position.

Claim.—Connecting pipes in the manner and by the means described.

No. 46,809.—BENJAMIN G. MARTIN, Philadelphia, Penn.—*Mode of Obtaining Extracts*.—March 14, 1865.—This invention consists of a mash tub, provided with a tube which passes through a fire-box placed under the said mash tub. Within said tub there is a tank and casing, being perforated to the length of the top of the latter. The tank is surrounded by a jacket extending above the perforations, and is closed at the top and open at the bottom. In the bottom of the tub is a flat case into which steam can be admitted. The tank is provided with a hollow cover through which a current of water is kept constantly circulating. The cover has an opening in the centre provided with a suitable cover, and through the opening extends a conical chamber perforated and connected with a pipe through which hot water can be admitted. The tank may be raised out of the tub by means of ropes.

Claim.—First, separating the particles of a material of which a decoction is to be made by introducing into a body of the said material a current or currents of air, for the purpose specified.

Second, the perforated casing E , with its jacket E' , combined with the tub A , and operating substantially as and for the purpose specified.

Third, the condensing casing or cover F combined with a mash tub A , substantially as and for the purpose set forth.

Fourth, the fermenting vat I , with its false bottom k , and pipes m , m , or their equivalents.

No. 46,810.—DAVID McCURDY, Ottawa, Ohio.—*Churn Dasher*.—March 14, 1865.—This invention consists in having the dasher perforated with a series of oblique holes, a certain number of which incline from the under surface of the dasher upward toward the dasher staff, the remaining holes inclining in a reverse direction.

Claim.—The cap C of an inverted funnel shape or an approximate form, when used in combination with a dasher provided with inclined openings a , b , as and for the purpose specified.

No. 46,811.—WM. C. MCGILL, Cincinnati, Ohio.—*Windlass*.—March 14, 1865.—To the common windlass or grooved barrel there are attached a divider and a check pawl, which devices are designed to prevent the cable from fouling or its ends from overlapping.

Claim.—First, the divider *D d*, formed and adapted to operate substantially as set forth. Second, in the described combination the grooved drum or barrel *A a* and divider *D d*, as and for the purpose specified.

Third, the combination of the divider *D d* and check pawl *E*, substantially as set forth.

No. 46,812.—*W. MOREHEAD*, Parkersburg, West Va.—*Extension Ladder.*—March 14, 1865.—This invention consists of a triangular ladder provided with guide ways through which a sliding ladder may be rapidly raised to its full or to any desired height, retained there firmly, and lowered with equal speed and security.

Claim.—The combination of the triangular ladder *A*, the sliding ladder *B*, the guides *k k*, and the latch *E*, constructed, arranged, and operating in the manner specified.

No. 46,813.—*J. MOULTON*, Boston, Mass.—*Drilling Machine.*—March 14, 1865.—This invention consists in the method of constructing the cutting edge of the drill, having for its object a more complete disintegration of the material to be cut than has been possible by the use of an ordinary drill, and also insuring its uniform wear at both centre and edges; and also in causing an intermittent rotary motion to be given to the drill shaft. With the drilling mechanism is combined a pumping apparatus, so that water or other liquid can be ejected from the well by means of the up and down motion of the drill itself.

Claim.—First, constructing the cutting surface of the drill, with teeth arranged with regard to it and each other, as described, and for the purpose specified.

Second, the arrangement of devices for giving an intermittent rotary motion to the drill, operating as herein above described.

Third, combining with the drilling mechanism a pumping apparatus, operated by the head of the drill shaft itself, as described.

Fourth, giving the intermittent rotary motion to the drill shaft *u u* by devices inside of the tube or stock *o* as the latter is alternately lifted and depressed, "the drill shaft rising and falling within the stock."

No. 46,814.—*M. D. MYERS*, Ilion, Ill.—*Horse Hay Rake.*—March 14, 1865.—This invention consists in placing the spring bolt or catch which holds the forks from tilting within the crotch of the bail.

Claim.—Placing the spring bolt *G*, or its equivalent, within the crotch *D*, as and for the purpose specified.

No. 46,815.—*CHARLES L. NOE*, Bergen Point, N. J.—*Drill.*—March 14, 1865.—The object of this invention is to automatically effect the turning of a drill in operation by the act of raising the sinker bar or hammer for the repetition of the blows by which the drilling operation is performed; and the invention consists in a mode of combining the drill or tool, or the stock thereof, with the sinker bar or hammer by means of a system of spiral grooves, whereby as the sinker bar is lifted it will turn the tool, or when the tool becomes imbedded in rock a short up-and-down motion of the sinker bar will completely free the tool.

Claim.—The tool or tool stock *A*, in combination with the sinker bar or hammer *C* and its interior arrangement of parts *b b* and *c c*, operating substantially as and for the purpose herein described.

No. 46,816.—*J. W. NORCROSS*, Middletown, Conn.—*Rowlock.*—March 14, 1865.—This invention consists in pivoting a rowlock to a plate so that no part of the joint will extend beneath the surface of the gunwale rail and necessitate the cutting away of the wood thereof; also, in applying wings to the rowlock, to be used for "wash-stroke" boats.

Claim.—First, pivoting a rowlock to a plate *A*, by means of a horizontally-turning joint, in such manner as to obviate the necessity of cutting away the gunwale rail to apply the rowlock, substantially as described.

Second, the use of wings or shutters in combination with a rowlock and the wash stroke of a boat, substantially as described.

Third, forming the wings *F* upon the horns of the rowlock, substantially as described.

Fourth, applying the spring *e e* directly to and beneath the plate *A* of the rowlock, substantially as described.

No. 46,817.—*DANIEL F. PACKER*, Redding, Conn.—*Soap.*—March 14, 1865.—This soap is composed of water, Glauber's salt, fresh burnt lime, alum, and crystal sal soda. These ingredients are boiled and then allowed to stand a certain time. The composition is then used to saponify grease, &c.

Claim.—A soap made and compounded substantially as above described.

No. 46,818.—*JOHN A. PATTERSON*, Statelick, Penn.—*Tubes for Caves in Oil or Other Wells.*—March 14, 1865.—The object of this invention is to adjust tubing to slips or caves in oil or other wells. Its novelty consists in the combination of an adjustable tube, elastic bands, springs, staves, and a tapered pin and collar.

Claim.—The adjustable tube *A*, elastic bands *B B*, in combination with the springs *SSS*, in the manner and for the purpose set forth.

Also, the follower or staves *1 2 3 4* in combination with the tapered pin and collar, in the manner and for the purpose set forth.

No. 46,819.—**JOHN M. PERKIN** and **MARK H. HOUSE**, Cleveland Ohio.—*Lamp*.—March 14, 1865.—This invention consists in attaching a toothed wheel to the end of the shaft which controls the wick and a segment of the collar of the lamp with holes, so that in unscrewing the burner from the reservoir the flame of the candle is necessarily extinguished, the object being to prevent explosion in filling the lamp.

Claim.—The wheel A and segment B, when arranged as specified, or their equivalent.

No. 46,820.—**LOUIS PLANER**, New York, N. Y.—*Machine for Cutting Tobacco*.—March 14, 1865.—This invention consists in the combination of a slotted crank working the feed roller, with a reversible pawl, and a piston head working in the pressing box.

Claim.—The combination of the slotted crank T, the connecting rod X, feed wheel M, nut T, feed lever N, reversible pawl P, fixed screw and piston rod I, with its piston head H, tobacco box A, and cutter B, arranged and operating substantially as and for the purposes herein described.

No. 46,821.—**BERNARD REGAN**, Miamisburg, Ohio.—*Grain Drill*.—March 14, 1865.—In this invention the seed box is provided with a winged feed wheel, having collars occupying recesses in the ends of the seed box, so as to be flush with the inner surface thereof.

Claim.—The provision in the seed box A of a scalloped or winged feed wheel B, having collars D occupying recesses *a* in the ends of the seed box, so as to be flush with the inner surfaces thereof, substantially as and for the purpose set forth.

No. 46,822.—**J. RENSHAW**, Michigan City, Ind.—*Vise*.—March 14, 1865.—This invention consists in attaching to the face of the back jaw of the vise a segment-shaped bar, with the curved side against the jaw, and held thereto by being pivoted to a thin band of steel, which, passing over said jaw and down in the rear thereof, is hooked over a bead or projection formed thereon for that purpose.

Claim.—The adjustable vise chop, above described, consisting of the rocking plate and the steel clamp or holder *f*, in combination with the bead *j* of the back jaw of the vise, substantially as above set forth.

No. 46,823.—**M. J. RICE** and **W. H. MILLEN**, Boston, Mass.—*Journal Box*.—March 14, 1865.—This invention consists in the peculiar construction and arrangement of the lower half of the journal box with reference to an oil reservoir, and lubricating passages connected therewith.

Claim.—The combination of the oil reservoir *e*, movable bearing *b*, and oil passages *k*, arranged with respect to each other substantially as specified.

No. 46,824.—**HENRY SEARL**, Rochester, N. Y.—*Oil Ejector*.—March 14, 1865.—This invention consists in providing a reservoir which is placed near the bottom of the well, and is provided with a valve at its lower extremity. Communicating with the top of this reservoir is a pipe which conveys the steam from the top of the well. Leading into the reservoir, and extending nearly to the bottom thereof, is another pipe which has a valve in its lower end and within the reservoir. Above the surface of the ground are arranged cocks by which steam is admitted and forced down to the reservoir, which closes the valve in the lower end thereof and opens the one in the lower end of the ejection pipe and allows the oil contained in the reservoir to escape and be forced to the surface, when the steam is shut off and allowed to condense in the reservoir; the valve is then raised by the pressure of the atmosphere, and the reservoir is filled preparatory to a repetition of the operation. By opening two of the cocks and admitting steam, a current will be established through the instrument, and the well and its contents be heated to some extent, dependent upon the temperature of the steam well.

Claim.—First, the arrangement of the receiving chamber G in an oil well, or other deep well, when said chamber is connected with the surface or mouth of the well by means of the steam pipe H and the eduction pipe J, and when said receiving chamber is supplied with the induction valve T, and the eduction pipe J is supplied with a suitable valve S, all substantially in the manner and for the purpose herein set forth, but not intended to be understood as making any specific claim to the induction valve T in said pumping apparatus.

Second, the arrangement of the cocks M N O P and Q, in combination with the pipes H L and J, all operating in the manner and for the purpose substantially as herein described and represented.

No. 46,825.—**JOHN C. SHACKLETON** and **GEORGE SHACKLETON**, Lawrence, Mass.—*Steam Trap*.—March 14, 1865.—The object of this invention is to keep the water-discharge valve always immersed in water and below the float, and to admit of the operating of the air valve in the trap by means of the expansion of a copper rod. Its novelty consists in the combination and arrangement of the bottom of the steam trap of unequal height with the water-discharge valve, a float expansion rod, spring water discharge pipe, guide tube, and air valve.

Claim.—First, the bottom of steam traps of unequal height, so as to admit of a well at

one end and a water-discharge valve therein, so that the said valve shall remain immersed in the water of condensation while it is closed, substantially as described.

Second, the combination and arrangement of the air valve in the trap with the rod H and spring j, and causing the same to be operated by the expansion of the rod H and by the spring j, substantially as above described.

Third, the arrangement of the water-discharge pipe F, in combination with the guide tube g for guiding the valve E and the float C, substantially as above described.

Fourth, the arrangement of the water charge valve below the place of the float substantially as above described.

No. 46,826.—H. D. SMITH, New York, N. Y.—*Preparing Chewing Tobacco*.—March 14, 1865.—This invention consists in taking a quantity of fine-cut tobacco and encasing it in tobacco leaves, after which it is compressed into a solid sheet, the inside of which is composed of cut tobacco, and the outside, or coating, of tobacco leaves. It is then cut up into small pieces and put up in packages for use.

Claim.—A tobacco pellet or chew, made out of tobacco, incased and compressed between tobacco leaves, or their equivalent, as a new article of manufacture.

No. 46,827.—E. G. SQUIRES, Lima, N. Y.—*Apparatus for Training the Muscles in Writing*.—March 14, 1865.—This invention consists of a box, on which is a brass plate, with grooves in it, made in easy curves, in which a stile is guided, while the fingers and hands are held in specified positions.

Claim.—First, the combination of the form, consisting of the rods F G H and S, the spring thimbles X X, the roller P, and the balls R R, Fig. 1, with the grooved plate B, Fig. 1, and stile c c, Fig. 1, all operating in the manner and for the purpose substantially as herein described and represented.

Second, the combination of bars D H and G G and K K, Fig. 2, with the plates L and C, Fig. 2, the cog wheels M and N, Fig. 2 and the dials C and D, Fig. 1, all operating in the manner and for the purpose substantially as herein described and represented.

Third, the hinged plate f and point P, Fig. 3, in combination with the wires R R and T T, Fig. 3, to form a stile, substantially as herein described and represented.

No. 46,828.—EDWARD STABLER, Sandy Springs, Md.—*Magazine Fire-arm*.—March 14, 1865.—This invention is designed to check the feed of cartridges from the magazine to the chamber, when it is desired to use the arm as a simple breech-loader, supplied by hand. It is applicable only to that class of repeating arms which have the magazine in the stock, and the breech-pin or carrier pivoted so as to swing vertically, and it consists in the application of a stop or latch to the swinging breech-pin or carrier, so as to limit its oscillation to the point at which the communication is not opened between the magazine and the carrier.

Claim.—First, limiting or arresting the movement of the carrier block of a magazine gun at any desired point, for the purpose of converting the arm into a single loader, substantially as described.

Second, the stop b, or its equivalent, in combination with the carrier block of a magazine fire-arm, operating as and for the purpose herein set forth.

No. 46,829.—E. S. STEPHENS and H. E. GREEN, Pawtucket, R. I.—*Machine for Printing Yarn*.—March 14, 1865.—This invention consists in running the yarn to be printed between two fluted rollers, one of which is adjustable by means of set screws. These rollers are supplied with color by means of other rollers supplied from troughs properly arranged.

Claim.—The fluted rollers B B', in combination with color rollers J J' and distributing rollers L L', or their equivalents, constructed and operating substantially as herein set forth, for the purpose of printing yarn simultaneously on both sides.

No. 46,830.—G. STONE and J. P. BULLOCK, Beloit, Wis.—*Harvester*.—March 14, 1865.—This invention relates to the specific arrangement of means for raising and lowering the cutting apparatus, as explained by the claim.

Claim.—First, the curved arms G J, bell crank lever F b, and links C H, constructed as herein described, in combination with the caster wheels K L M N, crank shaft F I, and bar C, all arranged and employed in the manner and for the purposes specified.

Second, in combination with the above, the lever P, notched bar Q, shaft T, provided with the crank k and connecting rods O U, all arranged in connection with the main frame A and cutter or finger bar C, to operate as and for the purpose specified.

No. 46,831.—JAMES B. TALMADGE, Winsted, Conn.—*Apparatus for Railroad Car*.—March 14, 1865.—On top of a car a circular box, with which two mouth pieces of flaring shape are connected tangentially, holds a wind wheel moved by the draught caused by motion of the cars. In openings on opposite sides of the box are doors having a reciprocating motion by means of a connecting rod. From the wheel a shaft leads to a fan wheel in a box inside the car at one corner and near the roof. Air is drawn from the car into the box through a circular opening on top about the shaft, and forced out through an aperture in front of the box.

Claim.—First, producing a current and circulation of air in a railroad car by means of a fan wheel or blower, driven by a wind wheel on the outside, in the manner and for the purpose substantially as set forth.

Second, the self-adjusting apparatus, consisting of the upper box B and its wind wheel, its doors and vanes, and of the lower box D with its fan, constructed and combined substantially as above described.

Third, the method, substantially as above described, of constructing and operating the doors of the circular box O and the vanes which are connected thereto, so that they are automatic in their action.

No. 46,832.—T. B. THORPE, New York, N. Y.—*Combined Knife and Fork.*—March 14, 1865.—This invention consists of a combined pocket knife and fork, the handle being arranged in two parts, one holding the knife, the other the fork, so as to be disconnected and used separately. When combined the parts are held together by two hooks upon the knife part entering corresponding slots in the fork, and sliding sufficiently in a horizontal direction to take hold upon the edge of the slots on the inside of the fork handle. Shoulders are made upon the fork so as to shut against the back of the hooks to prevent disconnecting.

Claim.—A combined pocket knife and fork provided with separate parts or handles A B, having respectively hook projections E and slots F at their inner sides, in combination with notches c in the fork plate a, so arranged when the fork is closed to fit over or receive the hook projections F, and prevent the casual detachment of the parts, substantially as described.

No. 46,833.—EISELL TOTMAN, Columbus, Pa.—*Sawing Machine.*—March 14, 1865.—This invention consists in so arranging the parts of a sawing machine as that the optional use of either a circular or reciprocating saw can be had for sawing logs and sticks of wood transversely with the grain, into blocks or stove lengths, and that it can be driven by any convenient power.

Claim.—The sawing machine hereinbefore described, consisting of the frame A, shaft C, pulleys N P, swinging frame Q, crank wheel H, pitman I, and saws R L, constructed and arranged as specified.

No. 46,834.—F. L. TRIPP, Prescott, Wis.—*Wagon Brake.*—March 14, 1865.—This invention consists in arranging the parts in such a manner that the wheels, when the wagon is backed, will be automatically relieved from the brake, the latter at the same time operating perfectly when the wagon is descending an eminence.

Claim.—The bar F and shoe or brake levers G G, connected with the rod I, in combination with the pawls J, and ratchets K, all arranged and applied to the wagon, substantially as and for the purpose herein set forth.

No. 46,835.—DON CARLOS TURNER, Madison, Wis.—*Machine for rushing Sugar-cane.*—March 14, 1865.—The nature and object of this invention will be understood from the claim and engraving.

Claim.—First, the stirrup L suspended from the fixed bearing of the upper roller, and sustaining the lower rollers in place in the act of pressing, and allowing them a free motion, and so arranged as to bind the rollers together, so as to confine the strain principally to the middle of the frame, substantially as herein set forth.

Second, in combination with the stirrup L, the yoke K and rollers C D and B, substantially as and for the purposes specified.

Third, in combination with the yoke K, provided with the rounded bearings d d, and with the rollers C B D the boxes I I, provided with transverse grooves c c, resting on said bearings of the yoke, the whole so arranged that the yoke is allowed to vibrate to open or close the rollers, and so that either one end or the other of the lower rollers may be depressed more than the opposite end, to allow any inequality to pass through, substantially as herein set forth.

Fourth, the spring s and block h, in combination with the yoke K and rollers C B D, arranged and operating substantially as described.

No. 46,836.—THOMAS VAN WAGONER, Newark, New Jersey.—*Skate.*—March 14, 1865.—This invention consists in the combination of a screw with a tightening nut holding together the bars at the middle thereof. Placed between the bed and runner at the ends of said bars there are two clamps on each side extending through slots on opposite sides of the heel of the skate and of the ball, respectively.

Claim.—The combination of the screw g and nut h with the bars C D, arms c c d d, slots a and claws i i i, constructed as described, and employed for securing the skate at the front and heel simultaneously, as explained.

No. 46,837.—ENOCH WAITE, South Natick, Mass.—*Manufacture of Felted Fabrics.*—March 14, 1865.—This invention consists of a fabric composed of two separate sheets of felt connected together by a water-proof cement, and having a backing of India-rubber or similar material.

Claim.—The improved felt fabric, made of a backing and two sheets of felt, cemented together and arranged substantially as specified.

No. 46,838.—GEORGE I. WASHBURN, Worcester, Mass.—*Differential Lever.*—March 14, 1865.—The object of this invention is to provide a method of transmitting power, especially in cases of slotting or punching, where it is desirable to have an intermittent action at the will of the operator, and to any required extent, without stopping the driving machinery in the intervals.

Claim.—So constructing a combined lever A A' that it may, by the projection of its parts, form a state of equilibrium, be made to communicate a reciprocating motion to a plunger or other mechanical appliance.

No. 46,839.—JOHN R. WHITTEMORE, Chicopee Falls, Mass.—*Straw Cutter.*—March 14, 1865.—This straw cutter is so constructed that the various parts of the castings can be put together without the use of machinery in fitting the parts together. The invention also relates to an arrangement of the parts of which the machine is composed.

Claim.—First, the combination of the knife C, mouthpiece B, shaft E, bolt *a*, key *c*, and piece F, when constructed, arranged, and operating substantially as described.

Second, securing the mouthpiece B to the hopper A by the pieces D D D, as described.

No. 46,840.—J. F. WILD, New York city.—*Button.*—March 14, 1865.—The shank passing through the cloth enters a large disk, the edges of which are turned from the cloth; a smaller disk, having a slot from its centre to its circumference to embrace and slide upon the shank, is let into the first gliding under a small head in the end of the shank. This small disk is concave on its under side, and is released to remove the button by pressing upon its convex side, and thus springing its edge out.

Claim.—The disks D E, and shank B, for fastening buttons, substantially as herein shown and described.

Also, the use of the disk C, in combination with the above parts, substantially as and for the purpose herein shown and described.

No. 46,841.—W. DEWEES WOOD, McKeesport, Penn.—*Furnace for Finishing Steel Iron.*—March 14, 1865.—The heating chamber in this invention is constructed with a perforated cover and floor, so arranged in relation to the fire chamber and flues that the fire and heated air shall enter the chamber through these openings in the cover and floor, at various points above and below the level of the sheets of iron placed therein. The rails for supporting the sheets of iron are raised above the level of the floor.

Claim.—Constructing the heating chamber with a perforated cover and floor, so arranged relatively to the fire chamber and flues as that the fire and heated air shall enter the chamber through these openings in the cover and floor, at various points above and below the level of the sheets of iron placed therein, substantially as and for the purposes hereinbefore described.

Also, in combination with the perforated floor of the heating chamber, the rails *t t*, raised above the level of the floor for supporting the sheets of iron.

No. 46,842.—ALFRED ARNOLD, assignor to himself, H. B. STANTON and D. C. EATON, North Englewood, N. J.—*Fastening Railroad Rails.*—March 14, 1865.—This invention consists of a screw so constructed as to be adapted to railroad rails to hold the same firmly to the ties and sleepers, and having but one point in its revolution to free the rails and admit of their removal.

Claim.—A screw with a head suitably adapted to railroad rails, to hold the rails firmly to their ties or sleepers, and which has but one point in the revolution to free the rails and admit of their removal, substantially as herein described and for the purposes herein specified.

No. 46,843.—JOHN G. BAKER, assignor by mesne assignment to HENRY DISSTON.—Philadelphia, Penn.—*Saw Grinding Machine.*—March 14, 1865.—This invention consists in the employment of a disk wheel and a casing adapted to receive and retain the saw blades, combined with a grindstone, to which a lateral vibrating motion is imparted by means of an arrangement of suitable mechanism.

Claim.—The disk wheel C, and casing B, adapted to the reception and retention of the saw blades, in combination with a grindstone, to which a lateral vibrating motion is imparted through the medium of the devices herein described, or the equivalents to the same, for the purpose specified.

No. 46,844.—CHARLES E. FOSTER, Philadelphia, Penn., assignor to the ROCK DRILL MANUFACTURING AND MINING COMPANY of Pennsylvania.—*Well-boring Apparatus.*—March 14, 1865.—This invention consists of a rock drill or cutter, combined with a series of tubes, in such a manner that a drill may be operated without the necessity of moving the tubes, and so that the detritus will be raised into and discharged from the tubes at any desired point.

Claim.—First, the drill or cutter G, combined with the tubes B, and operating substantially as described.

Second, the casing A, and tube B, in combination with the casing C, its cutter, rod, and valve, the whole being constructed and operating substantially as and for the purposes specified.

No. 46,845.—JOHN GEORGE, assignor to himself and HENRY HAGUE, Jackson, Mich.—*Brick Machine*.—March 14, 1865.—This invention consists in the use of an elastic pressure armor blade, attached to the lower part of the rotary shaft in the mud mill, in a frame operated by a cam in the shaft and a weight attached to the carriage, together with friction rollers applied to the frame, and fitted in guides.

Claim.—First, the elastic or yielding blade or arm G, attached to the rotary shaft F, substantially as and for the purpose herein set forth.

Second, the frame or carriage J, operated by the cam C on the shaft F, and the weight L, attached to the frame or carriage, substantially as and for the purpose specified.

Third, the friction rollers e, applied to the frame or carriage J, and fitted in guides K, substantially as and for the purpose set forth.

No. 46,846.—STEPHEN W. GOODYEAR, assignor to CHARLES PARKER, Meriden, Conn.—*Screw-cutting Machines*.—March 14, 1865.—This invention consists of a metallic disk notched at intervals on its perimeter to the depth of half the diameter of the screw blank, which operates in conjunction with a vibrating jaw, having a similar notch for gripping the blank and a covering or guard plate for preventing any displacement of the blank while lying in the notch of the disk, and passing from the conducting ways to the gripping jaw. The disk has an alternating, revolving motion, bringing the blanks successively around the jaw, which are grasped by the latter near the head and held by it firmly up against the disk, while the cutting or nicking tool is performing its operation.

Claim.—First, the combination of the rotating grooved cylinder with a fixed covering plate which bears horizontally upon the shanks of the blanks but endwise against their heads, and with a movable covering plate, for the purposes and in the manner substantially as described, thus forming a conveying tool.

Second, the combination of the cylinder with the movable jaw, forming together a vise, in which the blank may be rigidly held for such operations as nicking, or a journal in which the blank may be located for threading, &c., thus forming a holding tool.

Third, the combination of a cylinder, such substantially as is herein described, as having its fixed and movable covering plates with the curved feeding slide trough, whereby, without the use of the usual system of grippers, &c., the blank may be conveyed to the place where it is to be operated on, as set forth.

No. 46,847.—W. D. HALL, assignor to THE QUINNIPIACK COMPANY, Hamden, Conn.—*Manure*.—March 14, 1865.—This invention consists in drying and grinding the shells, claws, and other refuse parts of lobsters, by means of which a manure suitable for transportation is obtained.

Claim.—Preparing concentrated artificial manure from lobster refuse by desiccation and pulverization, substantially as herein described.

No. 46,848.—THOMAS HAWTHORNE, assignor to DUDSON & BROTHERS, Philadelphia, Penn.—*Circular Knitting Machine*.—March 14, 1865.—The claim designates the new features which are designed to be applied to circular machines only, the object claimed being the facility for using a greater number of thread than in the ordinary circular machine.

Claim.—First, the radially arranged levers C, to each of which is permanently secured a self-acting needle e, in combination with the annular plate D, its zig-zag edge, and the presser wheels I, the whole being arranged and operating as set forth.

Second, the combination of the said vibrating levers and self-acting needles with a serrated presser wheel, and the said annular plate with its zig-zag edge for the purpose specified.

No. 46,849.—HENRY HOWSON, Philadelphia, Penn., assignor to the ROCK-DRILL MANUFACTURING AND MINING COMPANY, Penn.—*Well-boring Apparatus, &c.*—March 14, 1865.—This invention consists in the use of cams in combination with certain arresting devices for controlling the downward velocity and force of well-boring rods, and thereby preventing the injurious jars and lateral strains to which they are subjected when of great length and weight.

Claim.—The use substantially in the manner described of cams or eccentrics in combination with the arresting devices herein described, or the equivalents to the same, for controlling the downward velocity and force of well-boring rods.

No. 46,850.—JOHN L. LAY, Buffalo, N. Y., assignor to himself and W. W. W. WOOD, Philadelphia, Penn., assignors to D. McKAY, East Boston, Mass.—*Apparatus for Operating Torpedoes, &c.*—March 14, 1865.—This invention consists of a long spur, connected by an universal joint to the side of a small steam launch or picket boat, and controlled by a capstan and tackle, the spur having at the outer end a socket for carrying the shell or torpedo, which,

when submerged, can be released from the socket by lanyards, the torpedo being exploded after its release from the socket, and after the boat with its spur has been backed to a safe distance. This apparatus was used in destroying the Albemarle.

Claim.—First, the pipe C, arranged to receive and to act as a guide for the shell in combination with a stem or rod for pushing the shell through the said pipe, all substantially as set forth.

Second, the plate or socket D, and straps E, secured to the vessel, and arranged for the reception and retention of the end of the pipe C, substantially as described.

Third, the internal pipe I, adapted to the reception of the operating bar K, and arranged for attachment to and withdrawal from pipe C, substantially as described for the purpose specified.

No. 46,851.—W. W. W. WOOD, Philadelphia, Penn., and JOHN L. LAY, United States navy, assignors to DONALD MCKAY, East Boston, Mass.—*Picket Boat and Apparatus for Discharging Torpedoes.*—March 14, 1865.—This invention consists of a pipe connected to a vessel near the bows, and arranged for the reception and guidance of the torpedo, which is pushed through the pipe by means of an operating rod, released from the latter after the shell has been projected outwards from the vessel.

Claim.—First, the spar D, connected to a boat, and controlled by tackle, substantially as described, in combination with the within described socket or its equivalent, for carrying and retaining a submarine shell or torpedo.

Second, the socket composed of the tube *d*, its chamber *e*, and plate I, the whole being constructed and arranged for the reception of the torpedo, substantially as set forth.

Third, the projection K of torpedo passing through an opening in the plate I, and the retaining and releasing pin *m*, and lanyard *t*, the whole being arranged and operating substantially as described.

Fourth, the arms *n*, cords *n'* of the socket and lanyard *p*, arranged in respect to the projection *f* of the torpedo, substantially as and for the purpose set forth.

No. 46,852.—WM. W. W. WOOD and JOHN L. LAY, Buffalo, N. Y., assignors to DONALD MCKAY, East Boston, Mass.—*Apparatus for Carrying and Exploding Submarine Torpedoes.*—This invention consists of a spar for holding at the end a torpedo, a sleeve for the reception of the spar, and a shaft or trunnion attached to the sleeve, the whole being applied to a vessel, and the spar being controlled by ropes or chains, so that it can be made to carry a torpedo outwards from the vessel, submerge the same, and be drawn back prior to the explosion of the torpedo.

Claim.—First, the spar B, sleeve C, and its shaft D, constructed and applied to a vessel, substantially as and for the purpose herein set forth.

Second, the guide *d*, chains or ropes G and F, in combination with the said spar B, and movable sleeve C, the whole being arranged and operating substantially as described.

No. 46,853.—WM. W. W. WOOD, Philadelphia, Penn., and JOHN L. LAY, Buffalo, N. Y., assignors to DONALD MCKAY, East Boston, Mass.—*Apparatus for Operating Submarine Shells or Torpedoes.*—March 14, 1865.—In this invention the shell is exploded by a cord. The length of the end is determined by the distance from the gun of the point above which the explosion is to be made. The shell on reaching this point is at full stretch and extension, and is the means of the explosion. The torpedo consists of a double shaft, a hollow exterior, containing a rod. This shaft turns on a ball and socket joint. The shaft is embraced by a supporting sleeve, which latter is the means of directing or pointing the shaft. A chamber or vessel is used to contain the torpedo, cord, &c.

Claim.—First, the combination of the operating bar H, the internal sliding rod I2, and the jaws herein described, or other equivalent retaining or releasing devices, the whole being arranged and operating substantially as described for the purpose specified.

Second, the packing 13, secured to the internal rod I2, and fitting to the interior of the operating rod I3, as and for the purpose set forth.

Third, the casing 14, arranged on the end of the operating bar H, for the reception of the shell 15, as and for the purpose herein set forth.

Fourth, the combination, substantially as described, of the operating bar H, with a cord 23, so arranged and so connected with the shell and appliances for igniting the charge in the same that the bar as it approaches the limit of its inward movement shall be the cause of exploding the shell.

Fifth, the chamber 22, combined with the casing 14, and arranged for the reception of the discharging cord 23, as set forth.

Sixth, the two driving shafts F and P', with their chain bands, the chains Q and G, and the operating bar H, the whole being constructed, arranged, and operating substantially as set forth.

Seventh, the click wheel L'', operated from one of the driving shafts, and arranged to control the clutches on the said shafts, as set forth.

Eighth, the sliding blocks I and V', caused to traverse in guides by the aid of screws, substantially in the manner and for the purpose described.

Ninth, the sleeve T, adapted to the operating bar H, and combined with the mechanism herein described, or the equivalent to the same, whereby the said sleeve can be turned in a vertical or horizontal plane, as herein set forth.

Tenth, the said sleeve T, in combination with the slides and guides, and operating screws herein described, or the equivalent to the same, whereby the sleeve can be moved to and fro horizontally.

Eleventh, the adjustable stop of the steam cylinder, in combination with the sleeve T, and the system of levers, chains, and pulleys herein described, or the equivalent to the same, whereby the said sleeve can be raised and lowered, and its downward motion limited, as set forth.

Twelfth, the combination of the said movable sleeve T, the operating bar H, and the ball and socket joint, the whole being constructed and arranged for joint action, substantially as set forth.

Thirteenth, the combination of the said sleeve T, its friction rollers V V, and the operating bar, the whole being arranged and operating substantially as and for the purpose described.

Fourteenth, the arresting plate 2, in combination with the operating bar H, and its internal rod 12, the said plate being arranged to operate in conjunction with the appliances herein described, or the equivalents to the same, substantially as and for the purpose herein set forth.

No. 46,854.—E. C. GILLETTE, Richfield, British Columbia.—*Improvement in Augers.*—March 14, 1865.—This invention consists of a cam sleeve in combination with a slotted shaft, and a flat notched shank of an auger, so that the shank of the auger will slide into the long slot in the shaft, through the cam sleeve, which is then turned so that it will catch into the notches in the flat shank of the auger, and hold it fast in the shaft.

Claim.—The cam sleeve C, in combination with the slotted shaft C, and with the flat notched shank D of the auger, constructed and operating in the manner and for the purpose substantially as set forth.

No. 46,855.—LAZARUS MORGENTHAU, Duchy of Baden.—*Manufacture of Cigars, Cigarettes, &c.*—March 14, 1865.—This invention consists in saturating the filling of cigars with an extract of pine needles and pine twigs, and also in removing the nicotine from tobacco to be smoked.

Claim.—As a new article of manufacture, the fichtennadel cigars above described, the tobacco being partially filled with preparations derived from shoots of the pine tree, substantially in the manner and with the effect herein set forth.

Also, the fichtennadel preparations herein described, adapted for use in the manufacture of cigars, in the manner and for the purpose herein set forth.

No. 46,856.—PIERRE ETIENNE PROUST, Paris, France.—*Method of Lubricating Machinery.*—March 14, 1865.—This invention consists in the use of grease and water for the purpose of lubricating journals or axle-boxes. The axle-box is provided with a cup containing water, the water being supplied to the axle by means of a wick and wick tube. The oil is supplied in the ordinary manner.

Claim.—The method, substantially as herein described, of lubricating journals, consisting of the simultaneous application of water and grease, as set forth.

No. 46,857.—ANSON BURCHARD, Livingstonville, N. Y.—*Machine for Pulling Flax.*—March 14, 1865.—This invention consists of a small frame mounted on wheels, that serve as fulcrum. The frame is armed with two rows of teeth, one fixed and the other movable. A bar is pushed forward after the flax is pulled, in order to clean the teeth of the flax.

Claim.—A frame mounted on wheels, which form a fulcrum for the frame to vibrate on, which frame is armed with a series of stationary teeth, in combination with a series of traversing teeth, arranged to operate substantially as described, for the purpose set forth.

Also, in combination with the devices above claimed, the clearing pan for removing the flax from between the teeth after it is pulled.

No. 46,858.—W. B. DODDS, assignor to himself and N. MCNEALE, Cincinnati, Ohio.—*Lock.*—March 14, 1865.—In this lock the movement of the bolt is effected by the direct action of a series of rotating tumblers, such as are common to many permutation locks. To this end, a bar pivoted at one end to the bolt carries at the other end a projecting tooth, which, when the tumblers are arranged in a certain position, falls into the notch or gate thereof. When in this condition, by turning the spindle, the toothed bar will be drawn upon by the tumblers, and the bolt will thus be projected outwards, and by turning still further the tooth will ride up out of the gate and rest with its point upon the periphery of the series, in doing which a notch on the upper surface of the toothed bar will embrace a permanent stub projecting from the lock plate, and thus render the bolt immovable until the tumblers shall have been so arranged as to permit the tooth to again fall into the gate.

Claim.—First, the method of operating and detaining the bolt by means of the dog pivoted thereto, the bit of the dog engaging the detent stump when the bolt is thrown, substantially as described and represented.

Second, the method of operating and adjusting the disc tumblers by the application to each of a disc or annular armed plate provided with a pin, which latter projects through the hole in its appropriate tumbler and engages with the arm of the annular plate appertaining to the tumbler next in series, substantially as described.

Third, the washer interposed between the tumblers in the series and prevented from rotating by the tooth which engages in the slot in the socket, substantially as and for the purpose described.

No. 46,559.—JACOB LEBRAU, Cincinnati, Ohio.—*Moulder's Table*.—March 14, 1865.—This invention consists in supplying the follow board with a permanent central foot or fulcrum upon which to turn or cant it, and removable checks or legs by which it is held in a horizontal position while the mould is being made. When that is finished and the pattern withdrawn the checks are removed, and the follow board is allowed to be turned or tipped in any direction for the purpose of smoothing or dusting the mould, the flask being prevented from slipping on the board by pins inserted therein.

Claim.—The rolling or tipping table for moulders' flasks, constructed and operating substantially as and for the purposes set forth.

No. 46,560.—J. MOULTON, Boston, Mass.—*Elastic Packing for the exterior of Pumps in deep Oil Wells*.—March 14, 1865.—An elastic tube embraces the pump barrel, and its upper end being flaring expands under the pressure of water from above, and is thus pressed into the irregularities of the shaft.

Claim.—The packing elastic material one or more made to embrace the exterior of the tube and having a flaring flange or cup as described adapted to expand into the inequalities and crevices of the shaft or well under the pressure of the superincumbent water and its or their own elasticity substantially as described.

No. 46,561.—EDWARD OSMOND, Cincinnati, Ohio.—*Burner for Gas Stoves*.—March 14, 1865.—The gas entering at the bottom of a tapering or contracted tube, mixes with atmospheric air, entering through perforations near the base, and, flowing up to the top, is ignited. The top of the tube may be further contracted by a circular flange or ledge inside.

Claim.—The heating gas burner formed of the tapering or contracted tube B C, applied to the service nozzle a, in the manner set forth.

No. 46,562.—JOSEPH NOTTINGHAM SMITH, Jersey City, N. J.—*Faucet*.—March 14, 1865.—The barrel is of ordinary form a horizontal portion of its length, and vertical at its eduction end. A supplemental tube fitting outside the vertical tube carries a plug within it to close the port. When this outer tube is lowered the liquid flows within the outer tube and around the plug. A lever is hinged to the faucet at its bend, and, when perpendicular, holds the side extensions of the outer tube by means of two lateral pins passing into slots in said extension; but when this lever is inclined forward its pins pass out of such slots to permit the descent of the plug and the flow of the liquid.

Claim.—Closing the faucet by a valve or stopper shutting upward in its orifice, substantially as and for the purpose herein specified.

Also, the inclosing spout or discharge tube D, arranged and applied substantially as and for the purpose herein set forth.

Also, the combination of the handle G, with or without a spring o, in combination with the slotted ears H H of the discharge tube D, substantially as and for the purpose herein described.

Also, the vent aperture i in combination with the valve c and discharge tube D, for the purpose specified.

No. 46,563.—J. N. SMITH, Jersey City, N. J.—*Machine for Raking and Loading Hay*.—March 14, 1865.—In this machine the teeth of the rake are so arranged that the hay is gathered inward from each side towards the back part of the rake, when it is caught by teeth upon an endless belt and carried to the upper part of the machine, where it is discharged into the wagon. The rake is drawn flat upon the ground by bars pivoted both to the axle and a bar passing through the rear end of the teeth. The bars to which the teeth of the endless apron are attached are wholly underneath the belt. Devices are attached to the front and rear of the machine for securing it to the wagon, and supporting it when at rest.

Claim.—Pivoting the draught hooks I I to the rear of the elevator frame so as to produce the necessary length of the draught line to insure freedom of motion, as set forth.

Also, the swinging frame L with its lever K, whereby the draught hooks may be detached from the wagon or cart, and the elevator is retained and supported in its upward position after being detached, substantially as and for the purpose herein specified.

Also, the construction and arrangement of the side rake teeth Q R S, substantially as and for the purpose herein specified.

Also, the combination of the inwardly-gathering side rake teeth Q R S, and the elevating teeth P P, constructed and arranged substantially as and for the purpose herein set forth.

Also, the arrangement of the rake, so as to be drawn flat on the ground, by the freely-vi-

brating or double-pivoted draught bars N N, drawing the rake teeth by the rear ends thereof, substantially as herein set forth.

Also, the concavely curved under surfaces of the rake teeth, together with the projecting heels *u u* behind their pivot shaft *n*, for the purpose set forth.

Also, constructing the elevator with its rake heads *e e e* inside of, and its teeth *f f f* projecting through, the endless apron D, substantially as and for the purposes herein specified.

No. 46,864.—R. ROBINSON, New York, N. Y.—*Closing Bottles*.—March 14, 1865.—This invention consists in forming the neck of a bottle in the shape of an inverted frustum of a cone. The stopper consists of a valve formed of a circular piece of India-rubber, held between two metal plates, the lower part of the neck forming the valve-seat. The valve is held close to the seat by means of a V-shaped spring. The bottle is opened by pressing the stopper inward, which is effected by means of a cap.

Claim.—The valve or stopper B, with the spring C attached to it, in connection with the conical neck A of the bottle, substantially as described.

Also, the cap D, provided with the frame or projection E, or its equivalent, for pressing in the valve or stopper B, and serving as a guide for the escaping liquid, substantially as described.

No. 46,865.—ALFRED WEED, assignor to himself and LEWIS J. BIRD, Boston, Mass.—*Machine for Cutting Files*.—March 14, 1865.—The nature and object of this invention is explained by the claim.

Claim.—First, supporting the blank by a roller, so constructed and arranged as to be susceptible of a lateral movement or play, and so as to keep the top surface of the blank always horizontal and present the whole width to the chisel, as set forth.

Second, the combination of an elastic pad or bunter attached to the cutter-arm, with an adjustable stop, so operating together that while preventing the variation in the force of the blow, as the file is being fed along, the depth of the cut may be regulated at pleasure, substantially as described.

Third, the method herein described of holding and feeding the file blank by means of a feed mandrel or shaft, carrying the one end of the blank in a central socket and a bed, or the equivalent thereof, for the support of the other end or of any part thereof intermediate between the two ends, in combination with a pressure pad or lever for holding the blank on the support, substantially as set forth.

Fourth, in combination with a feed mandrel or shaft holding one end of the file blank, a roller bed and a pressure pad for supporting and holding the other end, or any part thereof intermediate between the two ends.

Fifth, the construction and arrangement of the roller *u*, shell *w*, and ball-shaft *v*, as described.

No. 46,866.—ISAAC SUTVAN, assignor to BARTON H. JENKS, Bridesburg, Penn.—*Breech-loading Fire-arm*.—March 14, 1865.—This invention consists of a pivoted rolling breech-block, containing within it the hammer, which is cocked by the act of drawing back the said breech-block. A thumb latch, by which the breech is opened, serves to lock it firmly against the recoil of the discharge, and by the peculiar relation of its under surface to the upper part of the hammer, over which it vibrates, prevents the hammer from falling until the breech-block is securely locked in place.

Claim.—First, the combination of a vibrating breech-piece and a vibrating latch and hammer, when said vibrating latch and hammer are both placed in a fork or recess in the movable breech-piece.

Second, the safety device of locking the latch brace by means of the projection or inclined planes on the top of the hammer acting on the under surface of the latch in its forward movement, thus securely locking the breech before the hammer can explode the cartridge.

Third, the action of the latch upon the trigger and hammer when the breech is open, preventing any forward movement of either before the breech is closed, and relieving itself from the top of the trigger, substantially as described.

No. 46,867.—AUGUSTINE I. AMBLER, Chicago, Ill.—*Friction Wheels and Oil Chamber*.—March 21, 1865; antedated March 10, 1865.—This invention is applicable to railroad car brakes and other machinery to which power is transmitted through the medium of a friction wheel, an oil chamber being arranged in such a manner that the former will always be kept in a perfect state of lubrication.

Claim.—First, the wheel C, combined and arranged with the bushing or collar B upon a shaft A, in such a manner as to form a friction clutch and anvil chamber, substantially as set forth.

Second, in combination with the male and female parts of the clutch, the feather and groove *a b*, spring G, nut P, when used with a friction wheel C, substantially as and for the purpose specified.

Third, the bi-conical spiral-grooved heads I placed on the shaft A, in combination with the friction wheel C, for the purpose specified.

No. 46,868.—HAMLIN BABCOCK, New York, N. Y.—*Thread and Needle Box*.—March 21, 1865.—In this invention a spool upon which the thread is wound is hollow, to contain the needles, thimble, and other articles. The ends contain cushions to receive the pins laterally, and the wax is held to the inside of the top by a dovetail form or other means of attachment.

Claim.—A thread and needle box for soldiers and travellers, constructed of a hollow spool, adapted to having thread wound upon its exterior, and to contain thimble, needles, buttons, or other articles, substantially as above described.

No. 46,869.—W. P. PARKER, Grand Rapids, Mich.—*Grain Binder*.—March 21, 1865; antedated March 6, 1865.—This invention relates to the devices employed for tying the knot in the sheaf band, and will be understood from the claim and engraving.

Claim.—The revolving and longitudinally moving tube A, provided with the hook *h*, the sliding tube F, and the rod G, provided with the hook *l*, in connection with the shield E, or its equivalent, all arranged to operate in the manner and for the purposes herein set forth.

Also, the sector D, connected with the tube A by a cord C, or by gearing, in connection with the bar *m*, provided with the curve *n* and the pivoted bar H, and the spirally-slotted hub B and pin *d*, all arranged as shown for operating the tubes A F and rod G as described.

No. 46,870.—JAMES P. BAXTER, Portland, Maine.—*Smoking Pipe*.—March 21, 1865.—In this invention a diaphragm composed of one or more pieces of metal is placed below the smoke passage, in the bowl of a tobacco pipe, so arranged in relation to each other, or the inner surface of the bowl, as to form a chamber for the retention of air, &c. Beneath the diaphragm is a large chamber to catch the nicotine and saliva. This chamber is stopped at the bottom by a screw plug; a straight passage connects this chamber with the mouth-piece. The interior of the bowl above the diaphragm is connected with this passage by a short oblique tube. The mouth-piece can be detached and used as a cigar-holder.

Claim.—First, a diaphragm or septum placed below the smoke passage in the bowl of a tobacco pipe.

Second, a diaphragm composed of one or more pieces of metal or other suitable material, so arranged in relation to each other, or the inner surface of the pipe, as to form a concavity for the retention of air or any material which may have a cooling effect on the contents of the pipe.

Third, the channels *e f*, in combination with the diaphragm D, in the bowl A, and with the stem C, constructed and operating substantially as and for the purpose described.

Fourth, the diaphragm or septum, as described, with the plug, as described.

No. 46,871.—JAMES BOLTON, Chicago, Ill.—*Tuck-creasing Device for Sewing Machines*.—March 21, 1865.—In this invention the device is held to the table and the moving portion of the marking device is hinged to the stationary part, also adjustably connected to the presser, which has a positive vertical motion for gripping and releasing the cloth, and carries with it the hinged arm of the marker, and so effects the creasing. When the creases are to be far apart, this arm, on account of the change in the leverage, rises higher, and so tends to relieve the cloth from the greater drag consequent on the increased breadth of fabric between the needle and the creaser.

Claim.—First, the tuck marker A, for use with a sewing machine, made and operated substantially as above described.

Second, marking parallel lines for tucks, or for seaming, or for perforating material on a sewing machine, by means of a marker which is operated by a presser bar having a positive vertical motion, substantially as above described.

No. 46,872.—ALONZO T. BOON and WM. W. SPAULDING, Galesburg, Ill.—*Mop*.—March 21, 1865; antedated February 1, 1865.—This invention consists in the combination of a rod and cross-bed with a set screw for grasping the spiral springs which stretch across the folds of the cloth.

Claim.—The rod B, with cross rod C, and heads H H, the handle D, with crop rod E and set screw I, and spiral springs F F, when their parts are arranged as specified in combination with the handle A, for the purpose set forth.

No. 46,873.—CHARLES BRANDENBURG, New York, N. Y.—*Composition for Preserving Wood and Coating Oil Barrels*.—March 21, 1865.—In this invention linseed oil is boiled with black oxide of manganese, and combined with a compound of plumbago, hydraulic cement, and plaster of Paris, and with a solution of rubber in benzine or naphtha.

Claim.—The within described compound for preserving wood and coating barrels and other vessels.

No. 46,874.—E. K. BRECKENRIDGE, Meriden, Conn.—*Window Springs*.—March 21, 1865.—This device consists of an L-shaped lever, on the end of the main arm of which is the knob or thumb piece. Projecting laterally from the elbow, and on each side thereof, is a small journal. The upturned portion of the short arm forms the hook. Fastened to the jamb is a plate cast with two lugs, one on each side of a slot, for the reception of the journals,

while the main arm passes horizontally through said slot, the hook passing through another transverse slot in the upper end of the plate. A spring, secured by passing under a yoke cast on the back side of the plate for that purpose, presses upon a ledge or projection on the short arm of the lever and holds it in its place.

Claim.—The combination of the plate A, latch B, and spring D, constructed as described to operate in the manner specified.

No. 46,875.—WM. BRUCKNER, San Francisco, Cal.—*Process for Refining Amalgam.*—March 21, 1865.—This invention consists in treating the impure amalgam with chloride of copper, the latter being obtained by roasting copper ores with iron pyrites and salt.

Claim.—The application and use of bichloride of copper or its equivalent, together with iron pyrites and salt, without reference to the exact proportion of each ingredient, in the manner and for the purpose herein described.

No. 46,876.—D. W. BRYAN, Chicago, Ill.—*Grain Conveyer.*—March 21, 1865.—This invention consists of a succession of cups or brackets arranged in the form of an endless apron; the shafts passing through and fastening the ends of each bucket are provided with rollers that run upon trucks or guides.

Claim.—First, the combination of the metallic buckets I, the endless chains D D, and pulleys A A, arranged and operating substantially as and for the purposes herein set forth and shown.

Second, the combination and arrangement of the metallic buckets I, the shafts C, the endless chains D D, the friction wheels F, and trucks G, operating as and for the purposes specified and shown.

No. 46,877.—MARVIN S. and J. R. CADWELL, Dexter, Mich.—*Seeding Machine.*—March 21, 1865.—This invention relates to a revolving hollow cylinder, in which the seed is placed. There are holes along the cylinder through which the seed falls upon a plate placed a little distance outside of the holes. In this manner the seed is scattered broadly.

Claim.—The employment of the revolving seed box D, in combination with the gage plates *m m m m*, and distributing plates P P P P, substantially in the manner and for the purposes as herein specified.

Second, the arrangement of plates P on a revolving box, substantially in the manner and for the purpose described.

Third, the arrangement of the revolving box, constructed and operating as described, in rear of the axle, for the purpose set forth.

No. 46,878.—WM. F. CHANNING, Providence, R. I.—*Marine Railway.*—March 21, 1865.—This invention consists of a railway the termini of which extend a sufficient distance into the water to enable a ship to float into or out of a tank supported upon a car, running upon said railway, by which means a vessel may be withdrawn from one lake, basin, or river, and after overland transportation be floated into another body of water at the opposite end of the railway.

Claim.—The employment of a water support or caisson in the manner and for the purposes described for the overland transportation of vessels between navigable waters.

Also, the combination of a water tank or basin for floating a vessel, with a railway car truck or trucks.

Also, in a marine railway a compound or multiple railway track having parallel rails so disposed that each rail, excepting the two outer rails, may serve as a part of a track at each side thereof, in the manner and for the purposes herein described.

Also, the combination of a multiple or compound track with a dock or docks at one or both extremities of a marine railway, for transportation of vessels from one body of water to another as herein described.

Also, the vertically moving terminal section of the track as herein described, constructed and arranged to operate in connection with elevating, supporting, and lowering apparatus and with the water support or caisson to receive and discharge the vessel substantially as set forth.

No. 46,879.—SOLOMON CHAPIN, Cincinnati, Ohio.—*Sofa Bed and Crib.*—March 21, 1865.—This invention consists in the combination of a sofa and drawer so arranged that it can be used as a bed for two persons, and a portion of the bed bottom turned up vertically; the drawer under the sofa and the vertical portion of the bed bottom serves as a side to the bed, forming a child's crib.

Claim.—The combination of the several parts as described for the purposes set forth.

No. 46,880.—EDGAR CHIPMAN, New York, N. Y.—*Churns.*—March 21, 1865.—This invention consists in putting ledges on the guides or ways of a rocking churn, and connecting the churn to the ways by cords to prevent longitudinal slipping, also in using a tubular dasher that may be filled with warm water.

Claim.—The rockers B in combination with the ledges or cleats *b'* on the ways or guides C C, to prevent any lateral movement of the churn on the ways or guides, as set forth.

Second, the cords or chains D D applied to the churn, and the cross-bar E of the ways or guides, to prevent longitudinal slipping of the churn on the ways or guides, as specified.

Third, the tubular fixed dasher E, when used in connection with a rocking or oscillating churn, substantially as and for the purpose specified.

No. 46,881.—J. R. and C. B. CLARK, Mount Pleasant, Iowa.—*Fence*.—March 21, 1865.—This invention consists in providing the upper part of the fence with a roller or a series of rollers, arranged in a line with each other, so as to be continuous all around the fence, or the whole length of the same, and prevent a depredating animal from obtaining a foothold at the top of the fence in attempting to jump the latter.

Claim.—A roller or series of rollers applied to a fence substantially as and for the purpose herein set forth.

No. 46,882.—T. J. COLLIER, Canonsburg, Penn.—*Carpet Stretcher*.—March 21, 1865.—This invention consists in constructing an implement for stretching and straightening carpets preparatory to securing them to a floor by means of a friction surface, and in the use of which no injury is done to the fabric.

Claim.—The carpet stretcher above shown constructed to operate by friction substantially as above described.

No. 46,883.—MARTIN COLTON, Sardinia, N. Y.—*Flood Gates for Mill-dams*.—March 21, 1865.—This invention consists in placing and using centrally in a mill-dam a flume or frame work, in which is arranged a hinged waste-gate connected with a weighted lever or working beam, so that the said working beam will exactly balance the gate and hold it shut at an angle of about 45°, when the water in the dam is at a proper or safe height, and which will yield and allow the gate to open and discharge the water, when the water rises above the point indicated as the point of safety, and when the water falls below said point the working beam will overcome the pressure of the water upon the gate and close it, thus making a self-acting flood gate.

Claim.—A self-acting safety flood gate composed of the gate C, working beams F, and connecting rods I, placed and used in a flume B, for the purposes and substantially as herein described.

No. 46,884.—SAMUEL N. CUSHING, Waltham, Mass.—*Railway Gates*.—March 21, 1865.—This invention consists in a means of closing railroad crossing gates, either across the roads or track, as may be desired. The operation will be understood from the claim and engraving.

Claim.—The combination for operating the gates arranged with respect to the roadway and railway as described, the same consisting in the arms, the impelling rods, the carriage or its equivalent, and in the carriage windlass and ropes or a mechanism for moving the carriage in manner as explained, the whole being applied to a frame erected at the crossing or junction of the roadway and railway and so as to separate and be capable of being operated substantially as specified.

No. 46,885.—M. J. DANZIGER, New York, N. Y.—*Cigarettes*.—March 21, 1865.—This invention consists in forming the lip or mouthpiece of a cigarette of a roll of the refuse stems of the tobacco.

Claim.—Forming the mouthpiece of a cigarette of stocks or stems of tobacco in the manner and for the purpose described.

No. 46,886.—ADAM DICKEY, Cincinnati, Ohio.—*Knapsack Supporter*.—March 21, 1865.—This invention consists in a method of relieving the soldier of the backward pulling upon the shoulders caused by the knapsack. The device is composed of what is termed the saddle, consisting of a band of metal grasping the hip bone and of two standards capable of being fixed at any given adjustment.

Claim.—The knapsack supporter composed of the parts D E E', and their described or equivalent accessories, substantially as set forth.

No. 46,887.—TIMOTHY EARLE, Valley Falls, Smithfield, R. I.—*Preserve Jar*.—March 21, 1865.—This invention consists of a ring, the interior diameter of which is the same as the exterior diameter of the neck of the jar. The jar is provided with a lid of the same diameter as the neck, and a packing ring is inserted between the lid and the neck, and the ring is slipped over the lid. The lid is then clamped on.

Claim.—The use of the detached ring C in combination with the cover and neck of a preserve jar, substantially as described.

No. 46,888.—JONAS EBERHARDT, Philadelphia, Penn.—*Producing Coloring Matter for Dyers*.—March 21, 1865.—This invention consists in treating phenic acid with about an equal weight of nitric, nitrous, sulphonitrous, or other equivalent acid, and, after complete reaction has taken place, pouring the resulting compounds into a large volume of water, when the coloring matter will be precipitated. The colors provided will be yellow, brown, gray or other shades, according to the strength of the acid used.

Claim.—The "phenico" described, as a new article of manufacture for the use of dyers.

No. 46,889.—CHARLES H. EGGLESTON, Marshall, Mich.—*Seeding Machine*.—March 21, 1865.—This invention consists of the seed slide working in combination with the brush, and is furnished with a covering guard plate. This guard plate works upon a spring placed beneath it, and when pressed by a kernel that is caught yields and forms an inclined plane upon which the seed passes back free from the slide.

Claim.—The employment of the seed slide *s* and brush slide *K*, when connected together substantially as described, in combination with the spring *M* and guard plate *N*, as and for the purposes specified.

No. 46,890.—DAVID ELDRIDGE, Philadelphia, Penn.—*Fly Wheel*.—March 21, 1865.—This invention consists in arranging a fly wheel on the driving shaft, or on an independent shaft, and connecting it with a wheel or pulley on a driven shaft in such manner as to give a greater velocity to the fly wheel than that given to the driving wheel, for the purpose of increasing the momentum of the former beyond what it would have if arranged in the usual manner, and consequently running it at a lower velocity than it attains by the method claimed.

Claim.—The combination of the flanged wheel *B*, fly wheel *D*, pulley *F* and *G*, belts *J* and *K*, and treadle *H*, or its equivalent, arranged to operate substantially as described.

No. 46,891.—JULIUS FELDMAN, New York, N. Y.—*Bolts for Doors and Shutters*.—March 21, 1865.—In this invention the bolt is moved back and forth by a rack and pinion, the pinion having upon its upper side a ratchet, and coiled around it a spring. A lever is attached to the pinion, which, being moved in the direction against the coiled spring, bolts the door, and the bolt is prevented from moving back by a pawl which engages the ratchet teeth. When it is desired to unbolt the door the pawl is raised out of the ratchet teeth by a thumb slide, and the spring forces the pinion around, drawing the bolt back.

Claim.—The application to a slide bolt for doors, shutters, &c., of a pinion ratchet, spring, and pawl, to operate in the manner substantially as and for the purpose herein set forth.

No. 46,892.—JOHN S. FERGUSON, Poughkeepsie, N. Y.—*Jacquard for Weaving Three-ply Fabrics*.—March 21, 1865.—The object of this invention is to divide the harness into three equal parts equal to one of the sections of the two-ply now in use, and having the same tie-up, without increasing either the surface or number of cards to a greater extent than the increased number of sections due to the three-ply above the two. The knotted cards are given an inward, outward, and middle position to enable the trap board to select the proper ones. The middle trap board has two sets of combs for each row of tail cords, the saw cuts facing each other. The front and rear trap boards have two horizontal movements forward and one backward in three consecutive picks.

Claim.—First, the mode herein described of arranging the needles and inserting the cords through them, for the purpose of giving to the cords the three positions above described.

Second, the mode herein described of constructing the middle trap board and the use and motions of the rods or bars placed above them, for the purposes substantially as set forth.

Third, giving to the front and rear trap boards the motions herein described, for the purposes specified above.

Fourth, tying the harness in three equal and uniform parts in looms for weaving three-ply goods, as above specified.

No. 46,893.—JOSEPH G. FULLER, Brooklyn, N. Y.—*Engine for Preparing Paper Stock*.—March 21, 1865.—This invention consists of a revolving wheel composed of ranges of teeth alternating with a rough or abrading surface that draw the fibre from a hopper, tear up and rub the same, and also bring the fibre down into a washing vat, in which is a concave range of teeth that act to tear apart any fibres that are sufficiently long to reach from the said stationary concave range of teeth to the revolving teeth.

Claim.—A revolving wheel, composed of teeth in sections, with stone intermediate or other rough material, in combination with a hopper containing the vegetable material, to be operated on as set forth.

Also, in combination with the said revolving wheel of alternate teeth and roughened surface, the stationary concave of teeth in a trough *a*, as and for the purposes specified.

No. 46,894.—J. L. GILBERT, Boston, Mass.—*Coal and Ash Sifter*.—March 21, 1865.—This invention consists of a box provided with a spout and flange fitted over a proper receptacle for the ashes. Inside the box is a reciprocating screen hung on wires, the said screen being provided with a sieve inclined sufficiently to discharge the coarse coal, cinders, &c., into the spout, and on top the box is hopper provided with a cover.

Claim.—The box *B*, provided with a spout *C* and flange *a* and fitted over a proper ash receptacle *A*, in connection with a reciprocating screen *D* placed within *B* and having an inclined sieve *e* to discharge into spout *C*, and with the hopper *E* upon the box *B*, all arranged substantially as described.

Also, suspending the screen *D* upon parallel guide rods *c e* to admit of the ready working of the screen, as set forth.

No. 46,895.—H. G. GILES, Troy, N. Y.—*Base-burning Stove*.—March 21, 1865; antedated September 21, 1865.—In this invention apertures in the sides of the fire pot and near its top communicate with hollow radial bars which extend from a central ring to the side of the pot and through perforations in the sides of the bars. A passage is thus made for the flow of external air into the chamber of combustion. In front of this chamber in the outer case are mica windows. From indentations or open pockets in the sides of the stove tubes pass up to a hot-air chamber in the top of the stove; thence the heat can be distributed at pleasure.

Claim.—First, the combination of apertures *e* in the fire pot of a base-burning stove communicating with hollow radial bars *b* provided with openings in the sides and mica windows *d d d*, arranged and operating substantially as and for the purposes set forth.

Second, the air pipes *g g* in combination with the openings *f f*, air chamber *h*, reservoir *C*, and cylinder *A*, arranged and operating substantially as and for the purposes set forth.

No. 46,896.—ISAAC GOODSPEED, Norwich, Conn., and GURDON S. GOODSPEED, Providence, R. I.—*Spinning Roller*.—March 21, 1865; antedated March 8, 1865.—The claim sufficiently defines the nature of the invention.

Claim.—A roll for drawing, roving, or spinning machinery, constructed with a surface of cork applied with its flaws or interstices parallel with the axis and compressed and turned, as herein before described.

No. 46,897.—FRANCIS L. HAGADORN, Brooklyn, N. Y.—*Transparent Sign for Street Lamps*.—March 21, 1865.—This invention is fully explained by the claim.

Claim.—The application of printed lettering, or its equivalent, to the glass plates of street lamps, or their equivalents, in combination with paper, which performs with the said glass plates the function of ground glass, substantially in the manner and for the purpose herein set forth.

No. 46,898.—NELSON HAMMOND, Tioga, Penn.—*Regulating Ventilator*.—March 21, 1865.—In a tube set in a metallic reservoir containing mercury or oil is a piston, to which is attached a rod or arm passing through a slot in a lever and held tightly, so as to move the lever when it is moved by the action of heat on the substance in the reservoir. Motion is communicated from this lever by a series of rods and arms to windows or registers.

Claim.—First, adapting both the bar *B'* and the weight *J*, to be adjusted longitudinally upon the lever *C*, to maintain a uniform effect of the weight while varying the extent to which the ventilator will be moved by a given motion of the piston.

Second, in combination with the close vessel *A*, the piston *B*, arm *B'*, when connected to the lever *C* in the manner described, so as to permit the said arm or bar *B'* to be adjusted vertically upon the lever to adjust it to the height of the fluid or the position of the ventilator, the whole constituting a thermal medium for regulating ventilators, substantially as set forth.

Third, in combination with the lever *C*, operated as described, the rod *G* and cord *G'*, for raising and lowering the sashes *F F'*, as explained.

Fourth, in combination with the aforesaid lever *C* and the close vessel *A*, cylinder *A'* and piston *B*, the levers *H* and rods *h*, for transmitting motion from the sashes of one window to those of the other or others, substantially as specified.

Fifth, the combination of the vertical slots *e* with the weight *J* and piston *B*, for restricting the motion of the lever *C* to the operating end thereof while the ventilator is being opened or closed, and permitting the fulcrum end of the lever to move after the operating end has reached the extremity of its movement, substantially as and for the purposes set forth.

No. 46,899.—CHARLES A. HARDY, Pittsburg, Pa.—*Still for Oils, &c.*—March 21, 1865.—This invention consists of a still divided into two compartments by a horizontal partition. Both compartments communicate by means of a tube with a supply tank, from which the oil is introduced to the still. The two compartments communicate with each other by means of a pipe which is provided with gauge cocks, or the communication between the compartments may be effected by means of an aperture in a partition closed by a valve which is operated by a float. The liquid is first allowed to flow into the upper compartment, and the most volatile portion distilled over, escaping through the head *D* and pipe *D'*. The remaining liquid is then let into where the final distillation is effected, the products escaping through suitable pipes.

Claim.—The arrangement and combination of parts in the diaphragm still, consisting of the float valves *m p* and *k g* governing the inlets to the upper and lower compartments *B* and *C*, respectively, and the heads *D E* communicating with the separate escape pipes *D' E'*, as described and represented.

No. 46,900.—J. O. HARRIS, Ottawa, Ill.—*Window Sash Supporter*.—March 21, 1865.—In this invention the sash is prevented from being moved by a rack attached to one side, gearing into a pinion on a shaft in the jamb, adjoining which, on the same shaft, is another notched pinion, into which a lever or pawl, with a square tooth or dog, catches and prevents

the two from turning. By turning a cam in front of the lever by means of a key, the lever, with the dog, is thrown backwards against a spring and out of gear with the notched pinion, which allows the two to turn and the windlass to be raised or lowered.

Claim.—The combination and arrangement of the two ratchet wheels, lever pawl and spring aforesaid, with the tumbler *g h i*, operated by a removable key, substantially as and for the purposes shown and described.

No. 46,901.—JOHN O. HARRIS, Reading, Pa.—*Lamp Burners*.—March 21, 1865.—This invention consists in the combination of two concentric cups placed in reversed positions, one within the other, so that the air to support combustion will enter the burner at the top and descend therein before rising to the flame, thus protecting the flame from sudden lateral drafts of air, and adapting the lamp to burn without a chimney.

Claim.—The combination of the jackets *D D'*, intermediate space *d*, apertures *d'* and tube *E*, the whole being employed in connection with a wick tube *C*, in the manner and for the purposes herein set forth.

No. 46,902.—JAMES HAWKINS, Braddock's Field, Pa.—*Submarine Safety Mouthpiece*.—March 21, 1865.—This apparatus consists of a forked or divided elastic tube reaching to the surface of the water, combined with a T-shaped mouthpiece.

Claim.—The T-shaped piece *A* provided with a mouthpiece *a*, flexible tubes *d d'*, and valves *e e'*, and applied to the face of a diver, substantially as and for the purpose set forth.

No. 46,903.—L. HOLLOWAY, Gilroy, Cal.—*Gang Plough*.—March 21, 1865.—In this invention the plough frame is connected with a truck by means of a link joint, which, in connection with adjustable rods, enables the driver to hold the frame at variable heights parallel with the ground.

Claim.—The link joint *I*, in combination with the adjustable rods *h i*, lever *J*, plough frame *H*, and truck *A*, constructed and operating in the manner and for the purpose substantially as herein shown and described.

No. 46,904.—JOHN HOOVER, Manchester, Md.—*Doubletree for Carriages*.—March 21, 1865.—This invention consists of two elastic cross-levers operating on an elliptical spring connected with two front levers and two side or draft irons connecting with the elastic singletrees, the object being to prevent the breaking of the traces or harness by a sudden forward movement of the horses.

Claim.—The elastic double and singletrees, when arranged, constructed, and combined, as herein described and set forth.

No. 46,905.—H. UPTON HOOVER, Macomb, Ill.—*Band Cutter and Feeder for Threshing Machine*.—March 21, 1865.—In this invention a series of metallic rakes, arranged upon endless aprons, carry the thread along rollers to a circular knife that cuts the bands. A vibrating table distributes the grain upon a series of vibrating forks or fringes arranged over a second endless apron. This endless apron carries the grain to the thresher.

Claim.—First, in combination with the rollers *c c* and frame *A*, the revolving smooth or sickle-edged knife *E*, substantially as described and for the purpose set forth.

Second, the *L L*, constructed and operated substantially as described.

Third, the vibrating table *N*, substantially described and for the purpose set forth.

Fourth, in combination with the vibrating table *N*, the vibrating fork or fingers *Q*, substantially as described and for the purpose set forth.

Fifth, the combination of the revolving knife *E*, rakes *L*, vibrating table *N*, vibrating fork or fingers *Q*, constructed and operated substantially as described.

No. 46,906.—W. W. HORTON, Freeport, Ill.—*Method of Transporting Oil*.—March 21, 1865.—This invention consists of a system of stationary tanks for receiving and storing oil, and movable tanks for conveying it from one receiving tank to another. The tank at the well is so arranged above the movable tanks that the oil may be readily run from it into the said movable tanks. The tank at its other end is below the level of the movable tanks, in order to receive the oil therefrom.

Claim.—First, oil tanks, both stationary and movable, constructed and operating as and for the purpose herein set forth.

Second, the method or process herein described for storing and transporting oil in bulk, substantially as set forth.

No. 46,907.—R. HUMPHREY, Unionville, Conn.—*Spoon*.—March 21, 1865.—This spoon is struck up out of sheet tin; the portion of the metal which constitutes the stem, in order to strengthen that point, being bent around so as to give to the reverse side the appearance of a narrow trough, while at the points of junction of the stem with the bowl and with the broad part of the handle the plate is swagged up so as to form bosses or protuberances for the purpose of further strengthening those points.

Claim.—A spoon or fork handle provided with a projection *d* at the juncture of its widest part with its stem, and with a similar projection at its juncture with the bowl, substantially as described.

No. 46,908.—W. W. HUSE, Brooklyn, N. Y.—*Machine for Cutting Tobacco*.—March 21, 1865.—This invention consists in the combination of a non-rotating feeding screw, a rotating nut mounted thereon provided with a ratchet wheel, and also in an adjustable cam plate for determining the extent of the feed motion.

Claim.—The combination, substantially as herein described, of the non-rotating feeding screw, the rotating nut, mounted thereon, and provided with a ratchet wheel, the vibrating pawl or ratchet hand, and the adjustable cam plate for determining the extent of feed motion which shall be imparted to the ratchet wheel, for the purpose specified.

No. 46,909.—GEORGE N. JENNINGS, Virginia City, N. T.—*Process for Separating Gold and Silver from Mineral and Earthy Substances*.—March 21, 1865.—This invention consists in mixing the crushed ore with ashes and powdered charcoal, the mass being moistened with dilute acid. Alkali and mineral salts are sometimes added in solution. The mass is then exposed to a gentle heat, after which it is roasted and thrown, while hot, into dilute acid. The mixture is then allowed to settle for a short time, when the liquor and chloride of silver are drawn off. The solid portion is mixed with water several times and allowed to settle, the water and chloride being drawn off after each operation. The chloride of silver is then collected and reduced in the ordinary way. The matter remaining in the first vessel is treated with a solution of sulphate of soda and potassia, carbonate of soda, and sulphate of copper, salt and acid being applied to the mass before they are put into the solutions, and heat is then applied for the purpose of amalgamation.

Claim.—First, the process herein substantially described, for the purpose set forth.

Second, the use of ashes and charcoal as a flux in reducing quartz and other rock for separating gold and silver and other metals therefrom, substantially in the manner above described.

Third, the amalgamating solution, composed substantially as above described.

No. 46,910.—C. KUPFERIE and J. H. WARD, Cincinnati, Ohio.—*Steam Whistle*.—March 21, 1865.—This invention consists in the arrangement of two or more apertures of different size, formed in the lower end of the bell, in such a manner that different sounds are produced by the action of the steam issuing from the whistle. This is accomplished by supporting strips, which form a portion of the bell extending between the round apertures, and are secured into the bowl of the whistle, which connects it with the steam supply-pipe, so that the centre of the bell is kept perfectly free, and no central gearing is required.

Claim.—First, the bell *C*, constructed with supporting strips *d e*, dispensing with a central support, and forming a plurality of apertures *f g*, substantially as and for the purposes herein described.

Second, the shoulder *b*, of the plug *B*, and segmental annular spaces *c*, produced thereby between said plug and the bowl, substantially as and for the purpose set forth.

No. 46,911.—T. S. LAMBERT, Peekskill, N. Y.—*Letter Envelope*.—March 21, 1865.—This invention consists in having a flap or separate piece containing the postage stamp to be attached by gum to the ordinary sheet of paper on which the letter is written.

Claim.—Constructing a letter tab or flap, substantially as shown and described.

No. 46,912.—HENRY S. LAWSON, Baltimore, Md.—*Winders for Oyster Dredges*.—March 21, 1865.—In this invention the crank shaft and reel shaft are so arranged as to allow of the one reel being used to operate the dredge from the bow of the vessel, and the other reel being used to operate the dredge from the stern of the vessel, the entire force moving the crank shaft being thrown upon the one reel.

Claim.—The arrangement of the reel shaft and reels with the crank shaft and cranks, the whole being constructed and susceptible of being operated as herein set forth.

No. 46,913.—PETER LEAR, Melford, Mass.—*Ventilator*.—March 21, 1865.—This apparatus is intended to be placed on a chimney top, and consists of a wind wheel at the bottom, by which it is revolved, composed of V-shaped flanges or wings to catch the wind; this wheel is surmounted by an inverted cone-shaped case, which terminates at the bottom in a vertical pipe, passing down through the wind wheel into the chimney flue; arranged radially inside this cone-shaped case are a number of flanges, fastened to the side of the case, and extending halfway to the centre; on the inner edges of these flanges rests a circular plate for deflecting the air; on the top of the cone-shaped case, supported by stanchions at intervals, is a dome-shaped weather cap. A spindle extends down through the centre of the entire apparatus, and is supported at either extremity by a suitable step; on this spindle the apparatus revolves.

Claim.—The combination as well as the arrangement of the wind wheel *B*, the conduit *A*, the inverted conical case *D*, and its series of radial flanges *b b*, the whole being applied to a spindle *C*, substantially as and so as to operate as herein before explained.

Also, the combination as well as the arrangement of the wind wheel *B*, the conduit *A*, the inverted conical case *D*, the series of radial flanges *b b*, and the deflector *E*, the whole being applied to a spindle *C*, substantially as and so as to operate as herein before specified.

Also, the combination as well as the arrangement of the wind wheel B, the conduit A, the inverted conical case D, the series of radial flanges *b b*, and the weather cap F, the whole being applied to a spindle C, substantially as and so as to operate as hereinbefore described.

Also, the combination as well as the arrangement of the wind wheel B, the conduit A, the inverted conical case D, the series of radial flanges or wings *b b*, the deflector E, and the weather cap F, the whole being applied to a spindle C, substantially as and so as to operate as herein before set forth.

No. 46,914.—CHARLES LEAVITT, Cleveland, Ohio.—*Lock-key Guard*.—March 21, 1865.—This invention relates to an adjustable, portable device, by which the key is prevented from being turned in the lock on the outside. The guard is suspended on a stem of the inside handle, and is formed of a strip of metal in the shape of a loop at one end, so that it can be placed in the bow of the key when the door is locked. The escutcheon and key holes are arranged on each side of the door in an angular position to each other.

Claim.—The guard D, in combination with the lock-key, and the escutcheon and key holes at right angles to each other, as and for the purpose set forth.

No. 46,915.—SAMUEL LENHER and HALLAM H. SPENCER, Philadelphia, Penn.—*Apparatus for Washing Paper Stuff*.—March 21, 1865.—This invention consists of the stuff tub, containing the agitators, and provided with an opening through which the stuff flows. Beneath this opening is an endless band of wire gauze moving over the drums; directly above this endless band is placed a tank, provided with roses, by means of which the stuff on the band is washed. The waste water passes through the sieves into the tank, and the stuff passes on and falls into the box.

Claim.—First, the application of jets of water forcibly impelled against the stuff produced from refuse newspapers and waste paper in the manner hereinbefore described, for the purpose of separating from said stuff the coloring matters and carbonaceous particles of ink and other fine impurities and retaining the fibrous pulp on sieves, whether the latter be rectangular circular arranged as an endless band, or in any other form whatsoever, and whether the same be made of wire gauze or muslin, or any other textile fabric.

Second, the application of the above process, substantially as set forth, for the removal of dust and other like fine impurities from rag stuffs and other fibrous stuffs used in the manufacture of paper.

No. 46,916.—JAMES A. LITTLE, Danville, Ind.—*Fruit Gatherer*.—March 21, 1865.—In this device rake teeth are arranged upon the outer edge of a semicircular board, and a knife runs around midway of the teeth. The handle of the gatherer can be extended in length, by pins and guide bands.

Claim.—First, the raking device A B, employed substantially in the manner and for the purpose herein explained.

Second, the knives D F, employed as accessories to the fingers A, in detaching the fruit, as set forth.

Third, the extension rod C C', in connection with the fruit gatherer as described, to adapt the device for gathering fruit from different heights.

No. 46,917.—LEWIS H. LITTLE, Copake, N. Y.—*Coffee Pot*.—March 21, 1865.—This invention consists in placing a body of conical-shape centrally within a coffee pot so as to leave an annular space between the base of the cone and the inner sides of the pot. The object is to prevent the sediment or grounds rising into the upper part when the coffee is poured out.

Claim.—Placing a cone within a coffee pot, for the purpose and in the manner substantially as above described.

46,918.—WM. H. LOOMIS, Fairfield, Iowa.—*Chaff and Straw Stacker*.—March 21, 1865.—This invention consists in placing removable wings, perforated with armholes, upon the sides of the elevators carrying the straw and chaff from threshing machines.

Claim.—First, a stacker, which is so constructed as to receive the straw and chaff from a threshing machine upon an elevator, and within chambers which are closed at their sides, substantially as described.

Second, the removable wings C C, in combination with a trunk which is adapted for receiving the straw directly from a straw carrier of a threshing machine, substantially as described.

Third, the armholes D D, through the wings C C, arranged substantially as and for the purpose described.

No. 46,919.—JAMES E. MADIGAN, Beloit, Wis.—*Apparatus for Bolting Flour*.—March 21, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—First, the bolting apparatus, herein described, consisting of the cylinder A, blast pipe G, air chest C, series of internal perforated pipes *b b b*, conducting pipe *g*, and external perforated pipe *d*, all combined and operating in the manner and for the purpose specified.

Second, so mounting the pipe *d* that it may be turned by a crank *i*, or other suitable means to deliver the blast at any angle desired.

No. 46,920.—JOSEPH MARTIN, New Oxford, Penn.—*Farm Gate*.—March 21, 1865.—This invention consists in so constructing a gate that it can be opened or closed in one direction by a person while riding in a vehicle or on horseback, as well as by a person on foot, by the application of cords and pulleys, said gate being latched when opened or closed.

Claim.—The automatic closing gate, which opens only in one direction, constructed with the several parts as described, so that it can be opened by a person approaching it from either side, and also latched open and unlatched, substantially as set forth and described.

No. 46,921.—THOMAS MAYOR, Pawtucket, R. I.—*Flyer for Roving Frames*.—March 21, 1865.—The object of this invention is to increase, as may be desired, the amount of friction on the yarn, in order to keep it from unwinding at the mouth of the tube, while at the same time it is drawn over a perfectly smooth surface, and thereby not likely to be broken in its passage.

Claim.—The combination of two or more lateral orifices in the neck of the flyer as described, at unequal distances from the mouth of the delivery tube with the said delivery tube, for the purposes specified.

No. 46,922.—RUTGER B. MILLER, Utica, N. Y.—*Manufacture from the Fibres of Epilobium*.—March 21, 1865.—This invention consists in making wicking, batting, and other articles, from the fibres of the plant epilobium. These fibres may be used alone, or combined with other fibres.

Claim.—The utilization of the fibre of the epilobium plant for the manufacture of the articles above enumerated, and for all articles to which it is applicable, as a substitute for the cotton fibre.

No. 46,923.—ADOLPH MILLOCHAN, New York, N. Y.—*Apparatus for Distilling Petroleum, &c.*—March 21, 1865.—This invention consists of two concentric cylinders for holding the oil, provided with escape pipes, which communicate with the coils in the condenser. The oil is supplied by means of the pipes.

Claim.—The distillation of heavy and light oils jointly to produce a burning oil by means of a second still within the main still for petroleum and similar oils, substantially as specified.

No. 46,924.—ALFRED MONNIER, Philadelphia, Penn.—*Process for Purifying Metallic Oxides*.—March 21, 1865.—This invention consists in first calcining the hydrated oxides, and then boiling them with a solution of caustic potassa or soda, or their equivalents. The insoluble portion is then separated by filtration, and to it is added a quantity of dilute hydrochloric or other acid to dissolve the caustic or carbonate of lime. The oxides thus treated are then calcined with the sulphuric acid or its equivalent, after which they are washed with water to remove the sulphate of magnesia. To remove the silica, the oxides thus treated are then calcined with caustic potash or soda, after which the whole mass is washed with water and boiled with dilute hydrochloric acid.

Claim.—The treatment of metallic oxides for their purification, substantially as set forth.

No. 46,925.—GEORGE M. MOWBRAY, Titusville, Penn.—*Oil Ejector*.—March 21, 1865.—This invention consists in the employment of a coupling, at the ends of the seed-bag, or other packing device, to which coupling the eduction pipe is secured, and through which the induction pipe passes, a stuffing box being provided to make a tight joint around it. By this arrangement the discharge nozzle may be adjusted from the surface, without disturbing the seed-bag or other packing, or removing the pipe from the bell.

Claim.—The coupling D, when combined with a stuffing box E, so constructed that while one pipe is fixed another may be moved in the stuffing box without disturbing the seed-bag or other packing, substantially as herein described and for the purpose set forth.

No. 46,926.—JOHN NAUGLE, Mooresville, Ind.—*Hand Cultivator*.—March 21, 1865.—This invention consists of a double-bladed hoe, made square upon one side, and pointed upon the other; it is firmly riveted to a short shank, by which it is screwed securely to the handle.

Claim.—As a new article of manufacture, the herein described hand cultivator, when constructed substantially as set forth.

No. 46,927.—MARCUS ORMSBEE, New York, N. Y.—*Washing Photographic Prints*.—March 21, 1865.—This invention consists in placing photographs between folds of India-rubber, through which a stream of water is passed, while they undergo the pressure of the elastic rollers.

Claim.—First, the elastic yielding rollers C C journaled within the frame D D', in the manner explained and employed in the process of washing photographic prints, substantially as set forth.

Second, in combination with the above, the elastic or impervious cloth A, to contain the prints between its folds and receive the direct pressure of the rollers, as and for the purpose described.

No. 46,928.—M. S. ORTON, Galesburg, Ind.—*Hand Corn Planter*.—March 21, 1865.—In this invention a perforated plate is made to revolve over the perforated bottom of the planter by means of an inclined rod working in a lip upon the plate, at the same time that the inserters are opened and shut. Upon the pivot through the centre of the movable plate are arranged bent arms that sweep the seed over the holes at each revolution.

Claim.—The perforated plate B, operated substantially as shown, in combination with the perforated bottom *b* of case A, and seed spouts E, arranged to open and close through the movement of the plate B, substantially as and for the purpose set forth.

Further, the arms *m* applied to the pin *l* of plate B when used in combination with the spouts E, and all arranged to operate in the manner substantially as and for the purpose specified.

No. 46,929.—SAMUEL N. PAGE, Salona, Penn.—*Harvesting Machine*.—March 21, 1865.—This invention consists in arranging two crank wheels upon one and the same shaft, one on either end, with the pinion which receives motion directly from the drive wheel placed between them; the drive wheel is moved on its shaft to or away from the pinion for throwing in or out of gear by an arrangement of levers.

Claim.—First, in combination with the driving wheel A, adapted for adjustment upon its shaft in the manner explained, the crank wheels D D' fixed upon one and the same rotating shaft *d*, the latter carrying a pinion *d'* to receive motion from the driving wheel A, as set forth.

Second, in combination with the above parts, the lever H and rack H' *h'*, constructed, arranged, and employed substantially in the manner and for the purposes herein described and represented.

No. 46,930.—SAMUEL N. PAGE, Salona, Penn.—*Raking Attachment to Harvester*.—March 21, 1865.—This invention relates to the devices employed for communicating the necessary motions to a vibrating sweep rake, which devices are identified by the claim.

Claim.—The combination of the slotted bar L and crank arm L', the latter carrying a wrist pin *l*, which actuates said bar L for the purpose of operating the rake I, in the manner explained.

No. 46,931.—F. S. PEASE, Buffalo, N. Y.—*Oil Ejector*.—March 21, 1865.—In this invention the principal feature consists in closing the bottom of the bell tube in which the ejector is located below the delivery of the steam by a valve. This valve is annular in form, and its internal diameter is made to fit snugly but work freely upon the steam pipe which passes through it, and when the instrument is in operation the valve rises from its seat and allows the fluid to pass up to be ejected, but upon shutting off the steam it immediately falls to its seat and prevents the oil from running out of the instrument, thus facilitating the starting of the operation.

Claim.—In oil ejectors closing the well tube below the place of delivery of the currents of air or other fluids or liquids by means of a valve, substantially as described.

No. 46,932.—HORATIO O. PERRY, Buffalo, N. Y.—*Variable Cut-off Valve Gear for Steam Engines*.—March 21, 1865.—This invention consists in constructing the tappets by which the cut-off valve is raised in two separate and independent parts, so that in their movement by the lifting tappets which are on the rock shaft one is free to descend while the other is ascending, thus allowing each tappet to remain in constant contact with the one lifted. In combination with these tappets a tripping device is so arranged as to relieve the tappets, which can be done at any desired point in the stroke of the piston, thus allowing steam to follow the piston through any desired portion of its stroke.

Claim.—First, the combination with the rocking steam toes having a motion coincident (or nearly so) with the piston of two independent steam lifting toes acting upon one valve stem in such a manner that as one ascends the other will descend, by which construction and the operation of an appropriate adjustable tripping device the steam may be cut off at any required part of the stroke.

Second, in the combination with the independent steam lifting toes E' of the spring catches G and spring bolt J, and adjustable tripping cams H, operating for the purposes and substantially as described.

No. 46,933.—JOHN G. PERRY, South Kingston, R. I.—*Mowing Machine*.—March 21, 1865.—This invention consists in connecting the cutting apparatus with the main frame by means of a supplementary frame and vertically sliding plate, supported by the tubular axle of the inner supporting wheel and the front inner corner of the main frame in such a manner as to bring the cutters in line with the tubular axle, and in giving motion to the cutters by means of an escapement wheel, rock shaft, a pitman passing through the tubular axle, and a vibrating lever.

Claim.—First, the arrangement of the escapement wheel X, rocker shaft V, and connecting rod P, in combination with the stationary tubular axle K, substantially as herein set forth and for the purpose specified.

Second, the arrangement of the frame D and sliding plate I, having the standard *a* and lever O attached to it, in combination with the tubular axle K, substantially as herein described and for the purposes set forth.

No. 46,934.—JOHN G. PERRY, South Kingston, R. I.—*Stove-pipe Elbow*.—March 21, 1865.—This invention consists of a cast metal skeleton frame, the interstices being filled or lined on the inside with pieces of sheet metal or suitable mineral substance.

Claim.—First, making a cast metal stove-pipe elbow frame by leaving openings through its surface, substantially as herein described and for the purposes set forth.

Second, closing the opening through the sides of a cast metal stove-pipe elbow frame with a piece or pieces of sheet metal, or any suitable mineral substance, substantially as herein described and for the purposes specified.

No. 46,935.—WILLIAM H. PERRY and WALLACE WORDSWORTH, Los Angeles, Cal.—*Washing Machine*.—March 21, 1865.—This invention consists in forming the tub in two chambers, one in which the clothes are washed, and a lower one into which the sediment enters, which sediment can be drawn off at any time by an extra faucet.

Claim.—Providing a washing machine with a chamber M to receive the water after it has been expressed from the clothes and retain the sediment, substantially as described.

No. 46,936.—GEORGE K. PETERSON, San Francisco, Cal.—*Quartz Crushers*.—March 21, 1865; antedated March 3, 1865.—This invention consists in the arrangement of two vibrating plates, secured in a framing so that the surfaces of the plates shall rub together and thereby perform the crushing. The two plates are provided with journals at their upper corners, fitted to work in the side of the frame or boxes on the frame. Near the lower edges of the crushers are placed journals, which are provided with boxes connected by rods furnished with nuts to adjust the plates. To one of the plates there is attached a rod which connects the plate to the crank that vibrates the plates when the machine is operated.

Claim.—The crushing plates A A', connected and arranged to operate substantially as described for the purpose set forth.

Also, the mode described of connecting the journals K K of the plates A A', or such an equivalent device as will enable the operator to lengthen or shorten the rods which connect the journals K K.

No. 46,937.—NORMAN PLATT, St. Louis, Mo.—*Plough*.—March 21, 1865.—In this plough the land side extends forward to form the colter, which is slightly convex on its edge, starting from the point upward at an angle of about forty-five degrees, and gradually curving more nearly to a horizontal line.

Claim.—The combination of the frame *b*, plate *a*, and colter *a'*, the several parts being constructed and arranged as and for the purpose set forth.

No. 46,938.—A. D. PUFFER, Somerville, Mass.—*Sirup Valves*.—March 21, 1865.—In this invention the connection with the sirup vessel is effected by having the interior enlargement packed next the aperture, and by pressing the external washer up by means of a screw collar. Vent is admitted to the upper part of the nozzle to facilitate the flow through a tube which runs within the vessel, and thence upward to the air, protected and concealed in its whole course.

Claim.—The shouldered, hollow screw plug, with its packing, the washers *d*, the screw collar *e*, and the screw thread on the valve case body, when arranged with a sirup valve or faucet, substantially as shown and specified.

Also, conducting the air tube, which facilitates the emptying of the measuring chamber, through the passage of the valve case, substantially as and for the purpose described.

No. 46,939.—A. D. PUFFER, Somerville, Mass.—*Grate Bars*.—March 21, 1865.—This invention consists of a bar recessed on the top, the reversed side being arched underneath, and the edges of the bars being sharpened or bevelled.

Claim.—In a recessed bar, the reversed arched form given to the bifurcated portion thereof, for the purpose described.

Also, sharpening or bevelling the surfaces of the bar upon which the coal is supported into thin edges, for the purpose set forth.

Also, the radiating braces *h*, substantially as shown and described.

No. 46,940.—A. PUTNAM, Jr., Chester, Vt.—*Tobacco Hooks*.—March 21, 1865.—In this invention the hook differs in a slight degree from clothespins, tongs for lighting pipes, &c. The improvement consists in turning the ends inward and making them sharp, so that they will penetrate the stem of the plant. They are made of wire, and cross each other twice, so that by compressing the middle the plant is released. The bow end may be hooked upon a nail or other support.

Claim.—The tobacco hook, constructed and operated substantially as above described, as a new article of manufacture.

No. 46,941.—WILLIAM E. REYNOLDS, Chicago, Ill.—*Heat Radiator for Stoves*.—March 21, 1865.—This invention consists of a drum with two vertical tubes extending from side to side, one nearly, and the other quite, to the bottom. The tubes are closed at the bottom and open at the top. Perforations in the side of the drum admit air to the lower parts of the tubes. The heat and products of combustion entering the drum at the bottom circulate up and down through the passage formed by the tubes to the exit pipes.

Claim.—An air heating drum or radiator, formed or composed of tubes *a a'* arranged within a cylinder or drum, so as to form flues or draft passages *e f h* around the tubes, the latter being perforated at their lower ends for the admission of cold air, and open at their upper ends for the escape of the heated air, substantially as shown and described.

No. 46,942.—WILLIAM E. RICHARDSON, Chicago, Ill.—*Machine for Cutting Meat*.—March 21, 1865.—A circular saw is used for cutting the meat, and in order to prevent the meat from pressing against the saw spreaders are affixed upon each side upon which the meat rests while being cut. These spreaders separate as the carriage bearing the meat is moved forward, keeping the meat from contact with the sides of the saw.

Claim.—The employment of a circular saw for cutting meat or other like substances, in combination with contrivances for spreading said substances during the operation of sawing, and keeping its surfaces from forcible contact with the sides of the saw, substantially as described.

No. 46,943.—MORITZ RINO, Williamsburg, N. Y.—*Manufacture of Vinegar*.—March 21, 1865.—This invention consists in the use of tannin, to precipitate the gluten in the beer, or other material from which the wash used in the quick process is made.

Claim.—The manufacture of vinegar by the quick process directly from the natural unmanufactured or unrefined vegetable produce which contains starch or saccharine matter, or both starch and saccharine matter, substantially in the manner herein described.

No. 46,944.—J. M. ROSE, New York, N. Y.—*Frames for Gathering Skirts*.—March 21, 1865.—In this invention a metal or other spring zone is made adjustable, one end to slide upon another, with a gauge to indicate the measure that the zone may be reset when removed from the person. On the exterior is a groove to receive an elastic cord that confines the upper edge of the skirt, and retains the plaits and gathers when formed. A series of clasps fit down upon the zone, clasping the convexity of the groove inside and binding the plait or gather outside during the basting process.

Claim.—First, the frame for gathering and plaiting the skirts of dresses, constructed and operated substantially as above described.

Second, in combination with the frame, the elastic cord B, or any equivalent means of holding the plaits and gathers of a skirt in place, substantially as above described.

Third, the clamp D, one or more in combination with the said frame for the purpose of holding the skirt thereon, constructed and applied substantially as above described.

No. 46,945.—THOMAS ROWE, Brooklyn, N. Y.—*Apparatus for Triturating and Heating Linseed*.—March 21, 1865.—In this invention, after the seed has been triturated sufficiently, it is raked down upon a chauffer pan, which has a steam jacket. Here it is agitated by a stirrer rotating on a vertical arbor.

Claim.—The combined arrangement of the chauffer pan E, heated by steam or other means, and the platform D of the triturating apparatus, in the manner and for the purpose substantially as herein shown and described.

No. 46,946.—RICHARD SCHAAP, Jr., Brooklyn, N. Y.—*Combined Shovel and Ash Sifter*.—March 21, 1865.—This invention consists of a combined shovel and ash sifter, composed of a shovel blade perforated and provided with a perforated sliding plate beneath, by which the perforations in the shovel blade can be closed at pleasure, and a sifter or solid bottomed shovel produced at will.

Claim.—A combined shovel and ash sifter, composed of a shovel blade perforated and provided with a perforated sliding plate, substantially as herein set forth.

No. 46,947.—FREDERICK H. SCHROEDER, Bushnell, Ill.—*Hopper for Grain Separators*.—March 21, 1865.—This invention consists in placing adjustable feed rollers under the opening in the hopper, to secure an even distribution of grains upon the sieves.

Claim.—The employment of the rollers D and E in combination with the seed hopper A, when arranged and operating substantially as and for the purposes set forth.

No. 46,948.—CHARLES SEARS, Monmouth county, N. J., and TAPPEN TOWNSEND, King's county, N. Y.—*Buckles*.—March 21, 1865.—This invention consists in making a double acting lever for buckles, attaching the same to the buckle frame, and having a concave strap-bearing surface.

Claim.—First, a double acting lever for buckles.

Second, a concave strap-bearing surface upon buckle frames.

Third, making and attaching the double lever to the buckle frame, in form and manner substantially as described.

Fourth, the combination of the double acting lever with buckle frames, thus making buckles with double acting levers, substantially as described.

No. 46,949.—ALEXANDER SHILAND, West Troy, N. Y.—*Drills*.—March 21, 1865.—This invention consists of a drill head working within a cylinder, and made to rotate automatically through the agency of a spiral bar working between parallel bars. Segments or grooves are arranged within said cylinder, which receives an upward and downward motion in any desired manner.

Claim.—The combination of the tube A with the inner shaft B, having the spiral part C acting between parallel bars, segments, or grooves; these parts, or their equivalents, arranged and operating as and for the purpose set forth.

No. 46,950.—DANIEL E. SOMES, Washington, D. C.—*Cooling, Drying, and Ventilating Granaries and other Buildings*.—March 21, 1865.—This invention consists in constructing granaries with means for cooling the air to be used in ventilating them, and also in the arrangement of ventilating flues, or channels, so that the air can permeate the grain in the bulk and so that the cooling and drying can be carried on at all times without removing the grain from the building.

Claim.—First, constructing granaries and similar buildings with bins or apartments containing air passages, flues, or channels, so as to furnish means for cooling and ventilating them, substantially as set forth.

Second, cooling and ventilating granaries or buildings for storing grain by means of air compressed and dried, substantially as herein set forth and described.

Third, cooling the air for ventilating granaries by means of subterranean coolers, as set forth and described.

Fourth, in combination with devices for cooling and introducing air into granaries, suitable channels for carrying off any moisture that may be deposited, so as to prevent its coming in contact with the grain.

Fifth, drying air to be used in ventilating granaries by means of hygrometric or absorbent materials, as set forth.

Sixth, in combination with multiple walls, any or all of the devices herein described for cooling and ventilating granaries and other similar buildings.

Seventh, constructing bins or apartments for grain or other materials to be injured by being kept in a close chamber, with a system of cooling and ventilating devices, substantially as herein set forth and described.

No. 46,951.—REUBEN SPARKS, Buffalo, N. Y.—*Machine for Sharpening Saws*.—March 21, 1865.—This invention consists of a circular stone or other grinding wheel of suitable shape, on a driving mandrel, mounted upon a platform in which are grooves containing sliding bars parallel with the axis of the shaft of said stone. Across these bars and pivoted thereto is another bar, attached in such a manner that it can be placed at any desired angle, horizontally, to the saw. This bar acts as a guide to a circular table, having a groove in its lower surface into which the guide-bar fits, and along which the table slides with the saw centered upon it in the proper position for the teeth to be presented to the grinding surface.

Claim.—The combination of the grinding wheel B, sliding saw-table C, or C', and adjustable guide-bar D, for the purposes and substantially as set forth.

No. 46,952.—N. STARBUCK, Wilmington, Ohio.—*Churn Dasher*.—March 21, 1865.—This invention consists in a churn dash placed loosely on its staff, so that it may rotate thereon under the action or resistance of the cream while being operated or worked up and down therein.

Claim.—The knob B, or an equivalent support on the lower end of the rod or staff B', in connection with a rod C, passing through the rod or staff and a groove, c, or equivalent pins or projections on the upper surface of the dash, all arranged to operate in the manner substantially as and for the purpose set forth.

No. 46,953.—LE ROY S. STARRET, Newburyport, Mass.—*Butter Worker*.—March 21, 1865.—This invention consists in the employment of an oblong box provided at each side above its upper edge with a rail, between which rails and the top of the box there is placed a shaft or bar, having a lever, attached to which is suspended a pressure plate, all being arranged in such a manner as to admit of the work being performed expeditiously.

Claim.—The box A, provided with the rails B B, in combination with the shaft or bar C, with lever D attached, and the latter having the plunger F connected to it, all being arranged to operate in the manner substantially as and for the purpose herein set forth.

No. 46,954.—GEORGE STOVEL, Chicago, Ill.—*Gate*.—March 21, 1865.—This invention consists in hanging a horizontally-swinging gate at such a distance from the ground that the opening and closing thereof will not be impeded by the snow upon the ground, and em-

plying in combination therewith a vertically adjustable gate, for the purpose of closing the space between the lower part of the swinging gate and the ground.

Claim.—The combination and arrangement of the swinging gate A B with the vertically adjustable gate E, operating substantially as and for the purposes herein specified and shown.

No. 46,955.—A. W. TODD, Chicago, Ill.—*Machine for Winding Sewing Machine Bobbins.*—March 21, 1865.—In this invention either the shuttle-bobbin or disk-bobbin can be filled with thread by the machine. The traversing thread-guide is adjustable to vary the length of traverse. The frame carrying the spindle is hinged to allow the shifting of the graduated cone pulley when a different sized thread is to be wound. The small pinion on the main shaft may be shifted laterally and out of gear for the purpose of stopping the motion of the thread-guide.

Claim.—The combination and arrangement of all the parts of the machine, as and for the purpose described.

No. 46,956.—JOHN TREADWAY, Haverstraw, N. Y.—*Molding and Pressing Brick.*—March 21, 1865.—This invention consists in a weighted lever, in combination with a rock shaft and its arms and a cam lever, operated by a crank to force out the moulds from under the grating, which operation cuts off the clay, and to prevent the machine from being broken in case a hard substance should happen to get partly in the moulds and partly in the grating. It also consists in a platen with two standards, with cross grooves to receive a wedge-key, in combination with the connecting rod adapted to slide between the said standards.

Claim.—In that part of the above-described machinery for driving out the moulds, the weighted lever, in combination with the rock shaft and its arms, or the equivalents thereof, and the cam lever operated by the crank, substantially as described and for the purpose set forth.

Also, the platen with its two standards, with cross grooves to receive the wedge-key, in combination with the connecting rod, adapted to slide between the said standards, and provided with projecting pins adapted to slide in longitudinal grooves in the standards, as and for the purpose described.

No. 46,957.—JOANNA B. TRIBBLE, Middleborough, Mass.—*Composition for Preventing Disease in Vegetables.*—March 21, 1865.—This invention consists of wood ashes, slacked lime, sulphur, and chloride of sodium.

Claim.—The said composition, made and for use substantially as specified.

No. 46,958.—THOMAS TRIPP, Chicago, Ill.—*Car Coupling.*—March 21, 1865.—This invention consists in a mode of constructing the draw head of the coupling, and in an arrangement therewith of the coupling link and hooks whereby the coupling of the cars may be effected automatically, while at the same time the coupling is adapted to connecting together cars of different heights, and permits a free and sufficient lateral motion when moving round a curve.

Claim.—First, providing the drawhead A with the vertical slot S, constructed, arranged, and operating as and for the purposes specified and shown.

Second, the combination of the drawhead A and link D, constructed, arranged, and operating substantially as and for the purposes shown and described.

Third, the combination and arrangement of the drawhead A, hook B, and link D, constructed and operating as and for the purposes delineated and set forth.

Fourth, the combination of the drawhead A, hook B, and spring C, arranged and operating as and for the purposes shown and described.

No. 46,959.—LUTHER C. WALKER, Baltimore, Md.—*Tobacco Pipe.*—March 21, 1865.—In this invention the bowl, immediately in rear of the cavity for tobacco, is a cylindrical vertical chamber, the bottom of which is closed by a hollow bulb for nicotine. Two small passages lead from the tobacco cavity to this chamber, converging as they approach it; this chamber is connected with the mouth-piece by a single passage; the opening in the mouth-piece is on the top, and in said mouth-piece there is also a small cavity for nicotine.

Claim.—First, the converging apertures *a a* in combination with the chamber C and channel *b*, the whole being arranged as set forth.

Second, forming a pipe stem with chamber *b* opening at the upper side of the stem, as at *b'*, instead of at the end, substantially as described.

Third, providing the mouth-piece of a pipe stem with a cavity *b2*, in the manner and for the purpose explained.

No. 46,960.—THEODORE WALLIS and THOMAS WITBECK, Scipio, N. Y.—*Hand Shears or Nippers.*—March 21, 1865.—This invention consists in pivoting the short arms of two levers reaching to the opposite shear blade, while the toothed segmental fulcrum attached to the levers play in corresponding toothed racks on the end of the adjoining shear blade.

Claim.—The toothed segmental fulcrumed levers B, in combination with the shears, and attached thereto and operating thereby the stirrups, all constructed as herein described.

No. 46,961.—PHILIP WALTER, New York, N. Y.—*Waterfall Head-dresses for Ladies*.—March 21, 1865.—The stuffing or pad is arranged in the desired form, and enveloped in a suitable sack. Horse-hair of suitable length is arranged and doubled, and secured at the doubled part to the upper inner side of the sack, and then carried upward and bent downward outside, and carried inward and upward again and secured to the lower part of the inner side of the pad.

Claim.—First, the use, in the manufacture of waterfalls, of strands of horse-hair C doubled up at the upper edge of the pillow or stuffing and secured to the same by binding *a b c d*, substantially as and for the purpose set forth.

Second, in combination with the above, the employment in waterfalls of stuffing enclosed in a case of gauze or other textile material, substantially as and for the purpose described.

No. 46,962.—THOMAS S. WILES, Troy, N. Y.—*Neck-tie*.—March 21, 1865.—This invention consists in the construction and arrangement of a neck-tie with a loop to receive the ends of the said tie attached thereto in a durable manner, and each so combined with a collar for gentlemen's wear as to allow an expansion of the parts thereof for laundrying purposes.

Claim.—First, the neck-tie B, with the loop C, attached to the collar A, the said tie being susceptible of expansion for laundrying, all arranged and combined in the manner substantially as and for the purposes herein described and set forth.

Second, the employment of the loop C, arranged and combined with the neck-tie B at the upper edge thereof, in the manner substantially as and for the purposes herein described and set forth.

No. 46,963.—ABRAM WING, Mayville, N. Y.—*Dressing Mill Stone*.—March 21, 1865.—This invention will be understood by referring to the claim and engraving.

Claim.—The described method of dressing mill stones, consisting of the narrowed lands *a*, extending in full height to the eye C, in combination with the tangential and intermediate inclined furrows *b* and *e e*, widened toward the eye, and gradually narrowing outward to the periphery of the stone, substantially as and for the purposes herein specified.

No. 46,964.—ORSON H. WOODWORTH, Columbia City, Ind.—*Fence*.—March 21, 1865.—This invention consists in the application to a fence of two posts, one permanent, the other movable, placed through a slotted brace, and wedged together in such a manner that, by withdrawing the said wedges, the fence can be readily taken down and put up at pleasure.

Claim.—The combination and arrangement of the permanent jaw *o*, the movable jaw *i*, the block *m*, and the keys *n n*, substantially as described and shown.

No. 46,965.—GEORGE WRIGHT, Washington, D. C.—*Time Fuse for Explosive Shells*.—March 21, 1865.—This invention consists in placing a straight time fuse column within a longitudinal groove or recess in the side of the shell, and communicating with the interior explosive charge of the shell at its forward extremity. The fuse is graduated and punctured when ready for use in the same manner as the Bowman fuse.

Claim.—The longitudinal time fuse B, constructed and located substantially as described for the purpose set forth.

No. 46,966.—A. BECKMAN, assignor to THEODORE and CHARLES WENZEL, New York, N. Y.—*Sawing Machine*.—March 21, 1865.—The object of this invention is to saw curved stuff; and it consists in attaching a rack to a radius bar which is operated by a crank on a shaft, upon which is a pinion gearing into the rack, so that by turning the crank the radius bar is allowed to describe a curved line.

Claim.—The rack C, in combination with the pinion G and strap D, placed on the vertical shaft E, and all arranged with the radius bar B, to operate in the manner as and for the purpose herein set forth.

No. 46,967.—EDWARD CROFT, assignor to BENEDICT AND BURNHAM MANUFACTURING COMPANY, Waterbury, Conn.—*Machine for making Beaded Wire*.—March 21, 1865.—This invention consists of a pair of rolls, each with a semicircular groove winding spirally around it so as to form in appearance a series of adjoining grooves. It also consists in gradually increasing both the width and pitch of the groove from one end to the other, so that the wire entered upon the rolls and on a line and parallel with their axis will be caught by the groove of least pitch and be gradually drawn through and rolled until it emerges from the other end of the rolls in a finished state.

Claim.—First, a machine for producing beaded wire, having a connected series of gradually increasing semicircular grooves adapted to act successively upon the beads, in the manner herein described.

Second, the helical graduated grooves *h h'* in the peripheries of the rollers B B', revolving in the same direction, and operating substantially as and for the purpose set forth.

No. 46,968.—CHARLES E. FOSTER, assignor by mesne assignment to GEORGE O. EVANS and W. S. HASSEL, Philadelphia, Penn.—*Boring Wells*.—March 21, 1865.—This invention

consists in the drill rod being turned partly round at intervals without being manipulated by an attendant.

Claim.—First, the movable plate G in combination with the dogs J J, or their equivalents, when combined and operating substantially as described, for the purpose specified.

Second, the shaft H, with its worm *i* and pinion *h* and stationary rack *m*, in combination with the plate G, the whole being arranged and operating substantially as set forth.

No. 46,969.—F. GROVES, assignor to CHARLES A. DIEHL, New Oxford, Penn.—*Cane-juice Evaporator.*—March 21, 1865.—This invention consists of a series of pans placed one above the other over a furnace. A pipe passing through the furnace is connected with the highest pan, so that the juice can be delivered to the said pan in a boiling condition. The juice is allowed to flow from this pan into the next one below it, and the evaporation is finished in the lowest pan of the series. The fire door is so arranged in combination with other doors, as to regulate the heat and cause the scum to flow into the scum boxes.

Claim.—First, the combination and arrangement of heating pipe *c* through the furnace with a series of pans, one above the other, substantially as described.

Second, the arrangement of the oblong pans H H, &c., with openings on alternate sides, so as to keep the juice flowing briskly as it is evaporated.

Third, the fire door *o o*, in combination with doors A and A A, so as to regulate the fires and throw off the scum, as described.

No. 46,970.—A. W. HALL, New York, N. Y., assignor to BENJAMIN W. ROBINSON, South Reading, Mass., and CHARLES W. CLARK, Brooklyn, N. Y.—*Device for Moving Churn Dasher.*—March 21, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—First, the employment or use in a churn, provided with a rising and falling dasher, of a spring attached to the dasher rod, and a plurality of hooks, applied to any suitable fixture, to admit of the suspension of the spring at different lengths, substantially as and for the purpose specified.

Second, the graduating of the spring, or lengthening and shortening the same, in connection with one or more hooks or points of suspension, substantially as and for the purpose set forth.

No. 46,971.—ORANGE B. HUBBARD, assignor to himself, LYMAN S. SMITH, and LUCAS J. McMASTERS, Lowell, Mass.—*Loom.*—March 21, 1865.—The object of this invention is to ease the blow of the shuttle, and therefore avoid the consequent damage to the picker and its staff, and the liability to upset and tangle the yarn on the shuttle bobbin. The spring H, as arranged, relieves the blow, and is susceptible of adjustment higher or lower, or to or from the staff, by means of the screws or inclines.

Claim.—The combination and arrangement of the adjustable spring H, the clasp I I, and picker staff E, substantially as herein set forth and for the purpose specified.

Also, the method of adjusting the spring H, substantially as herein set forth and for the purpose specified.

No. 46,972.—ALLEN PARTRIDGE, assignor to himself and BUTTERFIELD & HAVEN, Boston, Mass.—*Mallet.*—March 21, 1865.—This invention consists in making a mallet by pressing raw-hide together in thickness enough to make the required size of a mallet; a rod is then inserted centrally through the hide, on which are iron plates that hold the hide firmly between them by means of a nut and screw.

Claim.—As a new article of manufacture, the mallet, constructed substantially as herein described.

No. 46,973.—SAMUEL R. PERCY and WALTER S. WELLS, assignors to GEORGE R. PERCY and WALTER S. WELLS, New York, N. Y.—*Process for Obtaining the Condensed Extract of Hops.*—March 21, 1865.—In this invention the hops are placed in an air-tight vessel, and the air then exhausted; warm or cold water is then introduced, which should be kept heated by the admission of steam, and the hops allowed to steep for two or three hours, the heat being about the temperature of boiling water in vacuo. A small quantity of alkali or alkaline salt should be added to the water. When the hops are sufficiently steeped, a vacuum is formed in a vessel or receiver, connected with the steeping vessel, and the extract thereby drawn off without exposure to the air. This operation is repeated as often as necessary, and the extract then concentrated with or without the addition of saccharine matter.

Claim.—First, the process of making a condensed extract of hops by a continuous vacuum and exhaustion, whether with or without the addition of alkali or alkaline salts, molasses, saccharine matter, or the extracted liquor of grain, or with or without the addition of one or all of these, such process being vastly superior to any other, and contains the fine aroma of the hops, which is entirely lost and dissipated when made in the open air.

Second, the use of steam in the steeping vessel to exhaust the properties and virtues of the hops.

Third, the use of alkali or alkaline salts in the water or steam used in extracting the essential qualities of the hops, as it tends to make the resin of the hops more soluble, and also counteracts the acid in the molasses or other saccharine matter.

Fourth, the process of coating or covering the inner surface of the vacuum condensing pan with any oily or fatty substance to prevent burning, &c.

Fifth, the commingling of a sufficient quantity of molasses, saccharine matter, or the extracted liquor of grain, whether malted or not, to the watery extract of hops.

No. 46,974.—IRA C. PRATT, assignor to J. M. CAMPBELL, D. MOOBERY, E. EMERSON, and H. REEVES, Morton, Ind.—*Sulky Gang Plough*.—March 21, 1865.—In this invention one or more ploughs are attached directly to the rear of the draught pole. An oblique bar is fastened to the rear of the draught pole, and serves for carrying other ploughs. This bar is adjustable by rods and nuts, so as to increase or lessen the distance between the ploughs. A lever with a cam working over the axle carries the draught pole with the bar and all the ploughs.

Claim.—First, attaching one or more ploughs E, direct to the draught pole C, when the latter is connected to the main frame A, and all arranged to operate as and for the purpose set forth.

Second, the oblique bar D, attached to the rear part of the draught pole C, and having a plough E secured to it, and arranged as shown, so as to be capable of being adjusted substantially as and for the purpose specified.

Third, the lever H, with cam I attached, arranged and applied to the draught pole to operate in relation with the axle *a* of frame A, and for the purposes specified.

No. 46,975.—C. G. REINHOLD, assignor to himself and JOHN F. SHARRETS, assigns to themselves, and CLIFFORD ARICK, Milton, Penn.—*Asphaltic Cement*.—March 21, 1865.—This invention consists in boiling coal tar until it will form when cold a hard tough mass; it is then mixed with pulverized brick, plaster, clay, Roman cement, plumbago, marble, or similar substance, and run into moulds while hot.

Claim.—First, the use of distilled or inspissated coal tar, secured by the process of boiling, which when compounded with a calcareous earth, while hot, may be reduced to lumps or loaves of cement, substantially as and in the manner and for the purposes described.

Second, combining with these pulverized earths plumbago for the purpose of uniting the same when combined with inspissated coal tar, reducible to lumps or loaves of cement when cold, substantially as and in the manner and for the purpose described.

Third, combining with these pulverized earths, pebble stones, sand, crushed stone, granite, or other concreted earthy matter, for the purpose of uniting the same when combined with distilled or inspissated coal tar, reducible to slabs or blocks of stone when cold, substantially as and for the purpose described.

Fourth, combining with these pulverized earths, pebbles, sand, crushed stone, or other concreted earthy matter, as described, plumbago or other analogous substance, for the purpose of uniting the same when combined with inspissated coal tar, reducible to slabs or blocks of stone when cold, substantially as and for the purpose described.

Fifth, as an article of manufacture, trade, or commerce, the said "asphaltic cement," compounded and manufactured as described, when reduced to lumps or loaves, as set forth.

Sixth, as an article of manufacture, trade, and commerce, the said "asphaltic stones," compounded and manufactured as described, when reduced to any desired form and size, substantially as and for the purpose described.

No. 46,976.—WARREN A. SIMONDS, assignor to himself and S. INGERSOLL LOVETT, Boston, Mass.—*Apparatus for Carburetting Air*.—March 21, 1865.—This invention consists of a vessel for containing the hydro-carbon liquid, the said vessel communicating with a carburetting vessel, by means of the pipes, which consists of a close box of any shape, divided by a partition into two compartments, said partition extending nearly to the bottom of the box. Each compartment is provided with partitions of wire gauze. The hydro-carbon liquid enters through the pipes, and the air is forced into one compartment through a pipe, and flows through the box. The blast is produced by means of a dry meter or pump, or other suitable means.

Claim.—First, the arrangement and combination of the reservoir generator air pump and force pump with the pipes connecting the same, substantially as described.

Second, in combination for the purpose of constituting a carburetting apparatus suitable to steamboats, ships, &c., the reservoir generator air pump, or dry meter and receiver, or their equivalents, substantially as described.

Third, the combination of the receiver generator air pump reservoir and force pump, or their equivalents, substantially as described.

Fourth, the process of throwing back or returning the unabsorbed portion of the fluid employed to the head or upper reservoir, without exposing it to the air, and therefore without loss of vapor or material by means substantially as described.

Fifth, in combination the use of pipes connecting the reservoir to equalize the atmospheric pressure in all of them, substantially as described.

Sixth, as new the combination of reservoirs to be used as distributors, generators, and receivers, as above described.

Seventh, the pump in connection with the receiver and distributor, as above described in specifications, substantially as described.

Eighth, as new the combination of gearing and pumps in the direct production of gas, substantially as described.

No. 46,977.—DAVID WILLIAMSON, assignor to MOORE'S PATENT FIRE ARM COMPANY, Brooklyn, N. Y.—*Breech-loading Fire-arms*.—March 21, 1865.—This invention is designed as an improvement on the patent of D. Moore, of December 3, 1861, in which a movement of the trigger-guard lever slides down transversely a key-block, and then withdraws longitudinally the breech-block, and it consists in pivoting the lever to the breech-block, instead of to the stock, and connecting it to the key-block by a shifting fulcrum, and also in so applying a spring to the same as to assist both in opening and in closing the breech.

Claim.—First, the combination of the breech-blocks *d* and *e*, and lever *h* having a changeable fulcrum and actuating the said blocks *d* and *e*, substantially as specified.

Second, the spring *l* and the toe *n*, or its equivalent, in combination with the lever *h*, and breech blocks *d* and *e*, as specified.

No. 46,978.—THOMAS EDWARD VICKERS, Sheffield, England.—*Manufacture of Ordnance*.—March 21, 1865.—This invention consists in reheating the gun after it has been bored out, in an annealing furnace, and cooling the same while yet in the furnace, by passing a current of water through the bore.

Claim.—Reheating gun blocks, made from cast steel or other metal or alloy, either cast or wrought, and cooling the same while in the annealing furnace, in the manner described.

No. 46,979.—FREDERICK OLDFIELD WARD, London, England.—*Process of Liberating Potash or Soda from Alkaline Silicate*.—March 21, 1865.—This invention consists in mixing with the silicate to be treated, fluoride of calcium and earthy material; the earthy material being in excess of the silicate, and the silicate in excess of the fluoride of calcium. This mixture is fritted at proper heat, and the frit is treated with water to dissolve the soluble contents.

Claim.—First, the mode of producing or liberating potash or soda or both, as the case may be, from natural alkaliferous silicates, substantially as herein before described.

Second, the employment of fluoride of calcium in conjunction with earthy material, or mixture of earthy material, to act with the aid of heat on natural alkaliferous silicates, so as to produce or liberate therefrom potash or soda, or both, as the case may be, substantially as herein before described.

Third, the extraction by water of the soluble alkaline contents of calcined produce or frit, obtained when liberating alkali from alkaliferous silicates, and distinguished by the double character that it contains both alkaline matter and fluorine.

Fourth, the application of insoluble residuum, obtained when liberating alkali from alkaliferous silicates, and characterized by its containing as one of its ingredients fluorine, in the manufacture of manure, of hydraulic current, or of puzzolana, at the operator's choice, substantially as herein before described.

No. 46,980.—JOHN P. ALLEN, Richmond, Ind.—*School Desk and Seat*.—March 28, 1865.—This invention consists in the construction of two or more double school desks and seats, by means of an iron frame or leg at each end, also a support for the shelf and desk.

Claim.—In the construction of school furniture, the piece *A*, so constructed as to constitute a leg or support for the seat *E*, and also a support, as well as a means of attachment, for the bookshelf or bottom *g* of the book box, substantially as set forth.

No. 46,981.—EDWARD H. ASHCROFT, Lynn, Mass.—*Ratchet Drill*.—March 28, 1865.—This invention consists of a combination in a ratchet drill of a stock made of one solid piece, the upper part of which is hollow, and which forms a female screw to receive the male screw formed on the lower end of the feed mandrel, and of a cap or nut through which the said feed mandrel passes, screwed on top of the stock, which cap serves as a stuffing box and guide to said mandrel.

Claim.—A ratchet drill having a removable extending screw, which works, when the tool is in use, in an opposite direction to the drill, making the drill in one piece between the movable cap and the drill socket.

No. 46,982.—GEORGE ASMUS, Houghton, Mich.—*Writing Tablet*.—March 28, 1865.—This invention consists of a tablet with a roll of paper at one end and a slotted holder at the other, through which the paper is passed and torn off as it is used.

Claim.—A combined writing tablet, ruler and paper cutter, constructed as described, as a new article of manufacture.

No. 46,983.—G. W. BAKER, New York, N. Y.—*Treating Ores*.—March 28, 1865.—The object of this invention is to collect copper and other metals, or the salts of such metals,

from roasted pyritous ores. The heat required may be the waste heat from the roasting process. A shaft conveys the vapors and gases, composed of sulphurous acid, carbonic acid, and other products, from the roasting furnace; on the top of said shaft are placed leaden tanks containing roasted ore. In another tank are placed cobble stones, over which water is made to trickle from a pipe; the water in its descent dissolves the fumes of sulphurous acid from a flue, and the process is repeated until the water in the tank is sufficiently saturated, when the acid solution is poured over the roasted ore in tanks, and will, aided by the heat from the flue, dissolve out oxide of copper, iron, &c. The copper may then be recovered or saved in any of the usual modes.

Claim.—First, the utilization of waste heat and vapors created in the treatment of pyrites containing the precious metals, in the manner substantially as and for the purposes set forth.

Second, the forming of sulphurous acid, substantially as described, for the purpose of treating the calcined ores, whether containing only the baser metals, or the baser metals with gold and silver.

Third, the use of sulphurous acid, thus formed, in treating the calcined ores, for the purpose of converting the insoluble oxides into soluble sulphates, especially copper, as described.

Fourth, the method of obtaining a highly concentrated solution of the baser metals by lixiviating with the acid and submitting the weaker solution, obtained by lixiviating with water, to the acidulating process, as set forth.

No. 46,984.—G. W. BAKER, New York, N. Y.—*Roasting and Desulphurizing Ores.*—March 28, 1865.—This invention consists in roasting ore in an oven or furnace in which the ore and heated gases enter at the top and leave at the lower part. The fireplace is separated from the oven or retort, and one fireplace may serve several retorts. Over the fireplace is a steam boiler, the steam from which enters with the products of combustion to effect the roasting. The apparatus consists of a fireplace, steam boiler, and retorts. The steam and hot gases enter at the top by flues, and leave near the bottom by orifices and a flue.

Claim.—First, a reverberating retort, constructed and operating substantially as herein described.

Second, the use of steam as a blast to carry forward the vapors evolved from the ore, and surround the latter with a constantly changing atmosphere.

Third, the blast-chamber A, boiler B, arranged relatively with the fire-chamber C, substantially as shown, when said parts, thus arranged, are used in connection with a hot air pipe K leading from the ash pit of the fire-chamber into the flue I, which forms a communication between fire-chamber C and one or more reverberating retorts H, for the purpose herein set forth.

Fourth, the coil D, in combination with the boiler B, hot air chamber E, flues g, and steam coil F, all arranged to operate substantially as and for the purpose specified.

Fifth, the annular passages L at the lower parts of the retorts, arranged as shown, to communicate with the smoke-stack to form reverberating retorts.

Sixth, the conical feeders M, arranged or applied to the retorts, substantially as and for the purpose herein set forth.

No. 46,985.—FRANKLIN BALL, Cleona, Iowa.—*Gate.*—March 28, 1865.—This invention consists in constructing the gate in such a manner that it will be balanced, or nearly so, on its hinges, open and close laterally like an ordinary hinged gate, and at the same time be capable of being opened by elevating or raising it vertically.

Claim.—A gate, constructed substantially as described, or in any equivalent way, so as to be capable of being opened and closed by raising or lowering it in a vertical plane, when said gate is hung so as to swing, and open and close laterally, substantially as described.

Also, the bar D pivoted to post B, grooved at its under side to receive the upper ends of the pickets d.

No. 46,986.—JONATHAN BALL, Elmira, N. Y.—*Mouth-piece for Cigars.*—March 28, 1865.—In this invention a wooden tip, with a cylindrical end and a conical front, is joined to the cigar by a piece of paper fitting into a shoulder upon the tip.

Claim.—The wooden mouth-piece herein described, constructed with a cylindrical end b and a conical front c, as specified.

No. 46,987.—THOMAS J. BARRON, Brooklyn, N. Y.—*Mode of Preparing Inflammable Liquids so as to Prevent Accidents.*—March 28, 1865.—This invention consists in making inflammable and explosive oils and liquids so as to prevent accidents, by mixing with them some coloring matter, as aniline for red, Prussian blue for blue, alkanet and the like, so that such liquids may not be used by mistake, instead of the heavier, more explosive liquids which these resemble, as usually prepared.

Claim.—Giving to explosive and inflammable oils and fluids, used for illuminating and other purposes, a bright, distinct color, to plainly distinguish them from other oils and fluids, substantially as and for the purposes set forth.

No. 46,988.—JULIUS BAUR, New York, N. Y.—*Process for Lining Barrels for Holding Oils, &c.*—March 28, 1865.—This invention consists in treating oil barrels and other vessels with a boiling solution of silicate of soda or potash, of a strength of from 13° to 15° Baumé. The barrel or other article may then be treated with a warm solution of sulphate of iron or similar metallic salt.

Claim.—First, the above described process, substantially as set forth, of lining or coating barrels and other articles designed to contain petroleum, benzine, oil, ground lead or paint, and other similar substances.

Second, the above described process, substantially as set forth, of lining or coating barrels and other articles designed to hold alcohol, wines, whiskey, and other substances which contain water.

Third, the above described process of lining or coating barrels or other receptacle designed to contain any of the herein before referred to articles, when the soluble glass employed in such process is dried thoroughly into the substance of the barrel or other receptacle, substantially as set forth.

Fourth, the employment of soluble glass, whether alone or in union with other matters, to impregnate, or, as it were, petriify, any article which is designed to be secured against leakage or evaporation.

No. 46,989.—JOHN BAVIER, Newark, N. J.—*Tobacco Smoke Purifier.*—March 28, 1865.—This invention consists of a bowl the centre of which is raised so as to almost touch the flat top plate; in the said top plate between the sides of the pipe and the upward projection in the bowl is a series of perforations; in the top of the upward projection is a small hole through which the smoke is drawn into the stem.

Claim.—A detached smoke purifier constructed substantially in the manner and for the purpose herein above specified.

No. 46,990.—JNO. B. BENTON, New York N. Y.—*Water Meter.*—March 28, 1865; antedated March 12, 1865.—In this invention the water being admitted at one side of a reservoir flows through a number of apertures of equal size in a transverse perpendicular plate, and thence descends through a pipe to a receptacle at the base, and outward through a pipe, the mouth of which opens downward; all except the flow through one of the above-named apertures, which enters a suitable tube, and thence falls into a meter intermediate between the top and bottom receptacles. This meter retains the water until it rises to the top of a siphon placed therein when the siphon empties the meter into the lower receptacle; within this meter a float-valve rises with the water and momentarily checks the flow into the meter. An arm ascending from the lever carrying the float touches any suitable projection of a registering index. In the lower receptacle is arranged a valve for the outflowing pipe. This valve is attached to the upper side of a rod, the other end of which is hinged to the opposite side of the receptacle. This arm is lifted to close the valve by means of a float on the end of a rod which ascends from this transverse rod; there being a case exterior to the apparatus thus far described, which exterior case constitutes an air chamber whenever the outflow at the base is interrupted, from any cause, and, as soon as the accumulating waters rise to this float, the outflow of water is wholly stopped, and attention to the needed repairs is thus at once demanded.

Claim.—Constructing a meter substantially as described to divide the entire flow of water in given proportions and measure only a portion of the water which passes through the machine.

Also, the employment, in combination with the measuring reservoir, of a siphon arranged to operate as specified and automatically discharge the contents of the reservoir, as set forth.

No. 46,991.—CHARLES H. BRIGHTLY, Philadelphia, Penn.—*Slide Valves.*—March 28, 1865.—This invention consists in the arrangement of the valve with reference to the raised valve seat, through the sides of which steam is admitted to, and exhausted from, the cylinder. The valve is constructed in two parts, screws being provided to adjust the parts, so that as the seat wears away the valve may be adjusted to the reduced size of the seat. The arrangement also includes a screw which is tapped into one side of the valve, and is made to extend through the exhaust port, and press against the opposite side of the valve, and prevent the pressure from causing undue friction.

Claim.—First, the arrangement of the port box D, box valve B B, and brace E, substantially as and for the purposes herein described.

Second, the arrangement of the port box D, box valve B B, screws *h h*, and screw-threaded brace E, substantially as herein described.

Third, the manner herein described of arranging the adjusting screws *h h*, with the valve B B, and port box D, for the purpose set forth.

No. 46,992.—HENRY A. CLUM, Rochester, N. Y.—*Balance.*—March 28, 1865.—This invention consists in the use of mercury by its progressive displacement, either alone or in combination with a spiral spring for the weighing of commodities.

Claim.—The use of a spiral spring in combination with the plunger and mercury in order to impart increased capacity to scales capable of determining light weights, substantially as herein set forth.

No. 46,993.—SAMUEL COLAHAM, Cleveland, Ohio.—*Machine for Cutting and Preparing Hay for Baling*.—March 28, 1865.—This invention relates to a method of cutting and compressing hay or straw and discharging the same from the machine ready for baling by one continuous operation. Below a hopper supported on a frame are arranged two cylinders, underneath which is a cutter-head, the shaft of which passes through heads in each end, and to these heads is attached a hoop or circular plate, which forms the cutter-head. Secured to the said head is also a blade or cutter extending beyond the periphery of the cutter-head. In the lower part of the machine is an endless apron, and at the side of the frame is a guide, to direct the pressed hay from the cylinders to the carrier.

Claim.—First, the cylinders F and F', in combination with cutter-head H and blade J, when arranged as and for the purpose set forth.

Second, the carrier or apron P and guide H, in combination with the cutter-head and hopper, as and for the purpose set forth.

No. 46,994.—L. O. COLVIN, Philadelphia, Penn.—*Cow Milker*.—March 28, 1865.—This invention consists in having a separate pump or exhauster for each teat, operated simultaneously by a single lever, and yet working independently of each other.

Claim.—The employment or use, in a device for milking cows, of a series of pumps, one for each teat of the cow, arranged in such a manner as to be operated simultaneously by a single lever, and still work independently of each other, substantially as and for the purpose herein set forth.

Also, providing the pump aforesaid with check valves provided with openings, in such a manner as to admit of the ready withdrawal of the teats from their tubes, and still cause the latter to hug or retain the former to a necessary degree, as described.

Also, the combination of the pumps, pump valves, milk receptacle, and discharge spout, all arranged to operate in the manner substantially as and for the purpose specified.

No. 46,995.—CICERO COMSTOCK, Milwaukee, Wis.—*Rotary Spader*.—March 28, 1865.—In this invention steel spades are fastened firmly into horizontal bars, that are secured by lugs to the driving wheels. By the forward motion of the machine and the rotation of the main wheels, controlled in a measure by a stationary cam, the teeth with their bars are moved around with the wheels, entering the earth nearly vertically. A spring over the cam receives the bars as they fall back heavily after being lifted from the earth. Curved bars are so arranged that when a certain amount of pressure exists by reason of obstacles in the way of the spades, the bars with their teeth fold back and pass the obstacles.

Claim.—First, the curved tine or tooth, widest at the point, with notch on the concave side of the head to embrace the fork-bar and stirrup, or clamp, and sharpened at the point by being bevelled on the concave side, substantially as herein recited.

Second, securing the tooth or tine to the fork-bar by the stirrup or clamp and key, as herein recited.

Third, the combination of the fork-bar, clamp, key, and tine or tooth, having the notch, as and for the purpose herein set forth.

Fourth, securing by casting the lugs on the ends of the fork-bars, to which to hang the friction roller or wheels.

Fifth, casting the handles or cranks on the fork-bars, as and for the purposes described.

Sixth, such a location on the handles or cranks on the fork-bars, in reference to the main wheels, that when the main wheels are keyed in place shall secure the forks in position, as herein named.

Seventh, driving the keys which secure the main wheels to the axles towards the centre of the machine, so that the hubs of the cams bearing against the heads of the keys will prevent the keys from loosening or coming out.

Eighth, the arrangement of the collars and sockets set forth, for excluding the dirt from the interior of the cam hubs.

Ninth, alternating the tines, as and for the purposes set forth.

Tenth, the spring on or near the back part of the cam, for the purposes recited.

Eleventh, making that portion of the central part of the cam which governs the action of the forks in the ground a separate piece, so that the same may be replaced as herein stated.

Twelfth, the construction and arrangement of the links and levers for actuating the movable section of the cam, and permitting the same to be self-actuating, as herein described.

No. 46,996.—ROWLAND CROMELIEN, Washington, D. C.—*Saw*.—March 28, 1865.—This saw is intended for cutting standing timber, and consists of three narrow-toothed blades bolted together, but so as to be readily separated when the teeth require sharpening. The blades are each somewhat thinner upon the back edge than upon the cutting or toothed edge, and the three when screwed together are attached to the thick edge of a solid wedge-shaped, backing blade.

Claim.—The arrangement and combination of three saw blades, with their teeth filed and arranged at any angle required, and fastened firmly to a wedge or V-shaped back, as herein described and for the purposes set forth.

No. 46,997.—JAMES M. CROMWELL, New York, N. Y.—*Dancing Toy*.—March 28, 1865.—This invention consists of an automaton figure suspended by fine wires and moved by clock-work, in such manner as to produce a dancing movement.

Claim.—First, the employment or use of the lever C, with arm D attached, in connection with one or more rods E, suspended to D, and figures F suspended to E, substantially as and for the purpose specified.

Second, the employment or use of a clock movement in combination with the figures, when the latter are operated from the former, in the manner substantially as set forth.

Third, the adjustable prongs or arms *i i*, in combination with the lever C, for the purpose of controlling or regulating the vibration of the latter, for the purpose specified.

No. 46,998.—S. M. DAVIES, Chicago, Ill.—*Engine Head Light*.—March 28, 1865.—This invention consists in the employment of semi-cones and frustra of cones in locomotive head-light lamps, to prevent the swashing of the oil by the motion of the engine.

Claim.—First, the use and employment of the semi-cones D D D D, for the purpose and in the manner described.

Second, the use and the employment of the semi-frustra of cones H H H H, in the manner and for the purpose described.

Third, the combination of semi-cones D D D D with the semi-frustra of cones H H H H, in the manner and for the purpose described.

No. 46,999.—J. H. DOUGHTY, New York, N. Y.—*Clothes Dryer*.—March 28, 1865.—This invention consists in the combination of a bracket and radiating folding arms, arranged so that the arms are expanded or folded on a horizontal line.

Claim.—In combination with the bracket A, constructed as herein shown and described, the radial arms B B, pivoted within the said bracket, so as to be expanded or folded together in a horizontal line, as specified.

No. 47,000.—SAMUEL B. EDSON, Kokoma, Ind.—*Horse Collar*.—March 28, 1865.—The object of this invention is to facilitate the putting on and taking off a horse collar. It is first separated at its top part; above this is arranged a locking clasp, which cannot be unloosed unless the left-hand point underneath is pressed downward, so as to permit the opposite one to be pushed sideways between it and the clasp. This permits the unloosing of the clasp.

Claim.—As an article of manufacture, the horse collar A, in combination with the locking clasp *c d*, the whole constructed and operated substantially as described.

No. 47,001.—DANIEL R. ERDMANN, Philadelphia, Penn.—*Boring Drill*.—March 28, 1865.—This invention consists of a drill having projections arranged in respect to the cutting edge so that the drill may be always maintained in a central position in the bore of the well, and cannot be jammed therein.

Claim.—The within described drill, having projections *d d* arranged in respect to the cutting edge of the said drill, as and for the purpose set forth.

No. 47,002.—RANSOM FARR, Chesterfield, N. H.—*Connection for Water Pipes*.—March 28, 1865.—In this invention the pipe is formed by bringing together two grooved surfaces and thus forming a channel of the capacity of the grooves; the ends of such united pieces are taperingly narrowed, and thus when driven into a socket of corresponding form, a lateral band is made, the socket flaring in two directions, whether continuously or at angles; another section of pipe is clamped together in like manner, while the two pipes thus formed are at the same time united in the same socket.

Claim.—Connecting the sections of a water pipe together with a single connecting piece or casting laterally as well as longitudinally, substantially as described.

No. 46,003.—ALFRED FELLOWS, Maquoketa, Iowa.—*Propulsion of Steamboat*.—March 28, 1865.—This invention consists of a central water way in which the propeller runs by means of an endless chain applied to the fore part of the boat. The boat is steered by a plurality of rudders, centrally upon their shafts, within or opposite the water way.

Claim.—First, the application of endless propelling chains to the fore part of a boat constructed with a central water way, substantially as and for the purpose herein set forth.

Second, in combination with a boat of the construction specified, a plurality of rudders hung centrally upon their shafts and mounted within or opposite to the water way, substantially as and for the purposes set forth.

No. 47,004.—CHARLES L. FISHER, Chelsea, Mass.—*Connection of the Gaff to the Mast of Navigable Vessels*.—March 28, 1865.—In this invention the pressure of the gaff is on each side of the ring or strap, whereby the said ring or strap is more readily moved up or down on the mast, the pressure at the sides slackening the ring or strap forward on the mast.

Claim.—Improved mode of attaching a gaff to the mast of a vessel, the same being substantially in manner and so as to operate as and for the purposes set forth.

No. 47,005.—LEMUEL S. FITHIAN, Rahway, N. J.—*Traction Wheels for Rotary Ploughs*.—March 28, 1865.—This invention consists in increasing the traction or adhesive power of a wheel for propelling carriages, without materially augmenting its weight, and at the same time to prevent the circumference of the wheel from sinking so deeply into the ground as to diminish its propelling force.

Claim.—First, a traction wheel or drum which is provided with bevelled slats or bars extending obliquely across it, and operating substantially as described.

Second, securing the slats of a ground propeller to the radial spokes of three or more wheels, which are constructed and braced substantially as described.

Third, the employment of metal face plates *e e* in combination with the bevelled and obliquely arranged slats *g*, substantially as described.

No. 47,006.—EDWARD FITZKI, Philadelphia, Penn.—*Ice Sandal*.—March 28, 1865.—This invention consists of an ice sandal made in two parts, which are connected by a slotted plate and spring bar in such a manner that it can be lengthened in order to attach it to a boot or shoe, and that it will be kept in place by a small cap in front and a heel pin behind.

Claim.—First, an ice sandal made of two parts connected together by a slotted plate and springs, substantially as and for the purpose described.

Second, the revolving longitudinally adjustable rods *ff'*, with points *g*, in combination with the sandal *A*, constructed and operating substantially as and for the purpose set forth.

Third, making the creeper rods *ff'* adjustable by means of buttons *i i*, or their equivalents, substantially as and for the purpose specified.

Fourth, the cam *m*, in combination with the creeper rods *ff'* and sandal *A*, constructed and operating substantially as and for the purpose set forth.

No. 47,007.—FREDERIC G. FORD, Washington, D. C.—*Caster for Furniture*.—March 28, 1865.—This invention consists of a socket driven into the leg of the furniture. The socket has a female screw formed in it and a circular recess on the flange; the caster wheel is connected by a screw that acts as a pivot and enters the socket; the head or swivel of the caster has a projecting ring that enters the circular recess and keeps the parts in place.

Claim.—The socket or tube *B*, with its circular recess *a a* in the disk, and its corresponding projecting ring *c c*, on the swivel *C*, in combination with the fastening screw *D*, which forms the pivot, for the purposes herein set forth.

No. 47,008.—JOSEPH FOWLER and F. M. BACON, Watertown, Wis.—*Hanging Cultivator Teeth*.—March 28, 1865.—This invention consists in retaining the cultivator tooth by friction against a quadrant bearing, so that the tooth can be in a vertical or in an inclined position and will yield to obstacles without injury to the tooth. The pin holding the upper end of the tooth acts as a wedge, confining it sufficiently for passing through the soil.

Claim.—Retaining the cultivator tooth by friction against a quadrant bearing substantially as specified, so that the said tooth can be in a vertical or in an inclined position and will yield to obstacles without injury to the tooth, as specified.

No. 47,009.—JOSEPH FOWLER and F. M. BACON, Watertown, Wis.—*Seeding Machine*.—March 28, 1865.—This invention consists in a peculiar device for increasing or diminishing the size of the seed cells, which is done by means of two bars worked simultaneously by a lever. The bars to which blocks are secured are moved in opposite directions at the same time, thus opening and closing the cells.

Claim.—The slide *g*, moving in the supports *h*, in combination with the blocks 2 and 3, bars 4 and 5, and lever *i*, to regulate the size of the seed cells, in the manner and for the purposes set forth.

No. 47,010.—B. D. GODFREY, Milford, Mass.—*Boots and Shoes*.—March 28, 1865.—This invention is a boot or shoe in which the welt, or that part of the sole which makes the layer next to the vamp, is so cut and applied that it constitutes a guard or fender for the vamp all around the front part of the boot or shoe.

Claim.—A boot or shoe having a construction substantially as herein described.

No. 47,011.—W. R. GREENLEAF, Buffalo, N. Y.—*Oil Ejector*.—March 28, 1865.—This invention consists in the application of a shield to the induction or oil receiving pipe of an oil ejector, by which the gas confined or held in the oil is separated therefrom, and prevented from entering said induction pipe through the action of the excess of the specific gravity of the liquid over that of the gas.

Claim.—The application and use of the conical cup or vessel *B*, or its equivalent device, to the induction pipe or opening of a pump, ejector, or other instruments for raising liquids from wells or reservoirs, by which a perfect separation is effected of any gas which the well may contain from the liquid being raised and the gas thus prevented from entering said pump or ejectors, substantially as set forth.

No. 47,012.—CONRAD HAGEN and FRANK AURNKAMMER, New York, N. Y.—*Hydrogen Lamp*.—March 28, 1865.—This invention consists of a glass jar upon which is secured a top

provided with a screw cap; from the centre of this cap rises a case provided with a plug to which is attached an arm. The thick end of the plug opposite the platinum sponge is pierced with an angular channel, so arranged that when the arm is depressed it communicates with the channel in the cap and allows the gas to escape. The arm has attached to it a rod with a piece of zinc on one end, and the rod operates in such a manner that when the arm is depressed the zinc is lowered into the acid and water.

Claim.—The application of the arm *b* in combination with the plug *E*, block of zinc *H*, lever *G*, and spring plug *f*, all constructed and operating substantially as and for the purpose herein shown and described.

Also, making the sponge adjustable toward and from the discharging end of the plug, as set forth.

No. 47,013.—HENRY HAINES, Farley, Iowa.—*Machine for Cutting Sheaf Bands.*—March 28, 1865.—In this invention an endless belt of hooked knives revolves at right angles to the endless belt forming the straw carrier. As the sheaf passes along its carrier, these hooked knives pass through it and cut the bands.

Claim.—The endless carrier in combination with the endless belt of knives, said parts being placed within a suitable frame connected with the threshing machine, all arranged to operate in the manner substantially as and for the purpose herein set forth.

No. 47,014.—ADOLPH HAMMER, New York, N. Y.—*Process for Brewing.*—March 28, 1865.—This invention consists in forming one or more heating chambers in a mash tun by means of perforated diaphragms; the heat being conveyed to the heating chamber by means of an oblique pipe. The malt is contained in a chamber below.

Claim.—First, heating the mash in brewers' tuns by means of one or more chambers arranged above the chamber containing the mash, substantially as described, when the heated current or fluid passes down into the mash and heats the same gradually to the desired temperature, while the said malt is compelled to float.

Second, the oblique pipe or pipes *E*, applied in combination with the heating chamber *D*, substantially as and for the purpose described.

No. 47,015.—JOHN W. HARD, Decorah, Iowa.—*Car Axles.*—March 28, 1865.—This invention consists in the arrangement of a mulley ratchet in the interior of the coupling to operate in combination with two spring dogs, one in each of the inner ends of the two half axles, so that when the wheels are moving in a rectilinear portion of the track, both half axles revolve simultaneously like a solid axle; but if the wheels move on a curve, the inner wheel lags sufficiently to prevent undue injury to the track. An annular reservoir is arranged in the coupling, communicating by radiating channels with the inner ends of the half axles, and by a suitable hole in the exterior of the coupling, so that a sufficiency of oil can always be introduced.

Claim.—First, the spring dogs *b b'*, and scalloped recesses *a a'*, in combination with the half axles *A A'*, and half couplings *C C'*, constructed and operating substantially as and for the purpose set forth.

Second, the annular oil reservoir *d* and radiating chambers *e*, in combination with the half axles and couplings, constructed and operating substantially as and for the purpose described.

Third, the circular grooves *h h'* near the outer ends of the half couplings, applied and operating substantially as and for the purpose specified.

Fourth, the wings *i* projecting from the peripheries of the half couplings, substantially as and for the purpose set forth.

No. 47,016.—JOHN HARPER, Salem, Iowa.—*Corn Cultivator.*—March 28, 1865.—This machine is composed of a frame hinged upon the tongue so as to be easily lifted by means of a lever working under a cross-bar. To the front end of the lever is attached a rope which extends under the tongue to the driver's seat, by means of which the four ploughs can readily be raised vertically at pleasure. The frame can also be adjusted upon segmental guide rods from one hole to another.

Claim.—First, the frame *F F*, adjustable on the segmental guide rods *C C*, as specified.

Second, the manner in which the front shovels are attached to the bar *B*, turning them to or from the corn as may be required, in combination with the lever *L*, substantially as and for the purposes set forth.

No. 47,017.—JOHN HARPER, Hillsborough, Iowa.—*Cultivator.*—March 28, 1865.—In this machine there is an arrangement of old devices for the purpose of producing a convenient implement, the ploughs being operated laterally by the feet of the driver.

Claim.—The slotted shovel standards *P*, in combination with the lever *L*, rope *O S*, and stirrup *V*, the several parts being constructed, arranged, and operating as and for the purpose set forth.

No. 47,018.—WM. HAWKINS, Birmingham, Conn.—*Skate.*—March 28, 1865.—This invention consists in so constructing and arranging together the sliding heel-clamp and the

skate stock, that the slide shall be held down in its bearings by the stock of the skate instead of being retained in its proper horizontal position by the screw rod, as heretofore.

Claim.—So constructing a skate that the sliding heel-clamp shall be held or retained vertically within the seat or bearing formed for it in the stock independently of the set screw, as and for the purpose substantially set forth.

No. 47,019.—JOHN HENRY HILDEBRANDT, Brooklyn, N. Y.—*Wood-splitting Machine.*—March 28, 1865.—This invention consists in providing in a wood-splitting machine a conductor so made that the bottom inclines enough to allow the blocks of wood to pass to the knife by their own gravity; the knife works horizontally by means of a crank and pitman, and the blocks of wood are prevented from sliding down below the knife by reason of the split wood below being held in place and fed out, by a device that is operated by a cam on the main shaft giving motion to a pitman that is attached to levers and shafts upon which are pinions that separate the feeders.

Claim.—First, the combination of the conductor G through which the blocks descend by their own gravity, and the inclined plane knife F, constructed and arranged to operate as specified.

Second, the feeder H constructed substantially as herein specified, and operating in combination with the conductor G and knife F, in the manner and for the purpose described.

No. 47,020.—D. H. ISEMINGER, Heyworth, Ill.—*Sorghum Evaporator.*—March 28, 1865.—This invention relates to a device for evaporating sorghum, and it consists in a means employed for treating the juice preparatory to its entering the evaporating pan for the purpose of economizing in time.

Claim.—First, the combining of the register G with the pipe L and furnace C, all arranged substantially as and for the purposes set forth.

Second, in combination with the furnace C and pan H, the longitudinally-divided pan J, divided flues B B and dampers D D, all arranged and operated as described.

No. 47,021.—Cancelled.

No. 47,022.—G. W. JENNINGS, Boston, Mass.—*Hand Mowing Machine.*—March 28, 1865.—This invention relates to the arrangement of mechanism for operating the cutters in a hand mowing machine, and will be understood by reference to the claim and engraving.

Claim.—The internal teeth *d*, of the wheel B, the pinion D, and bevel gears E, F, G, in connection with the crank-pin *g*, of shaft H, and the slotted lug *i* on the sickle bar L, all arranged to operate in the manner substantially as and for the purpose set forth.

Also the caps C C, on or over the wheels B B, with the finger bar M and handles D attached thereto, substantially as described.

No. 47,023.—ALBERT D. JUDD, New Haven, Conn.—*Attaching Ornamental Heads to Picture Nails.*—March 28, 1865.—This invention consists in making a collar upon the nail a short distance from the end to which the head is to be attached and about midway between the collar and said end, two lugs. An oblong opening is made in the ornamental head to admit the end of the nail and the lugs. The surfaces of the inside of the head are inclined like the threads of a screw, so that after the nail is driven into its place, by slipping the ornamental head upon it, over the lugs, and turning it, it is screwed up and held tight between the collar and the lugs, and may be taken off and the nail drawn out again.

Claim.—Attaching the ornamental head to a picture nail or other article, by means of the disk *d*, collar *b*, and lug or lugs *c*, as specified.

No. 27,024.—GIDEON KING, Eminence, Ky.—*Wheat Drill.*—March 28, 1865.—This invention consists in attaching a drill to a common plough. The drill is so constructed that a row or drill of grain is deposited simultaneously with every furrow ploughed.

Claim.—First, the drill-board E, in combination with the plough, as specified.

Second, the feed frame O, in combination with the drill-board E, as and for the purpose set forth.

Third, the shaft *q*, for connecting the drill-board E to the plough beam, as and for the purpose described.

Fourth, attaching the drill-board E to the forward end of the plough beam by means of the propelling rods A and *e* and staple *c*, as and for the purpose specified.

Fifth, the feed nut V, in combination with the drill-board E and wheel I, when constructed as and for the purpose set forth.

Sixth, the adjustable wedge in the heel of the drill-board E, and in combination therewith, as and for the purpose specified.

Seventh, the adjustment of the wheel I upon the shaft J, in combination with the drill-board E, as and for the purpose described.

Eighth, the stopper Y and temper screw X', in combination with the feed nut V, as specified.

Ninth, attaching the drill-board E to the heel of the plough by means of the curved rod K, as and for the purposes set forth.

Tenth, the adjustable plate S at the rear end of the drill-board E, for the purpose described.

Eleventh, depositing the seed between the last furrow ploughed and the furrow being ploughed, as herein specified, by means of the drill-board E.

No. 47,025.—WERNER KROEGER, Milwaukee, Wis.—*Vessel for Boiling*.—March 28, 1865.—This invention consists in applying a band or casing of copper to that part of tin boilers, coffee pots, &c., which is exposed to the fire.

Claim.—The copper band B, applied in the manner described to tin vessels used for heating or boiling, for the purpose explained.

No. 47,026.—BENJAMIN P. LAMASON and SIDNEY D. KING, Alexandria, Va.—*Signal Tower*.—March 28, 1865.—This invention consists in an arrangement of vertical screws for elevating and depressing the signal tower, for which letters patent were granted in 1864. The said vertical screws work in nuts placed in cross-bars connecting the opposite and parallel system of levers which compose said tower, so that as the said cross-bars are forced upward or downward by the action of the vertical screw, the system of "lazy tongs" are opened or closed, and the tower thus raised or lowered.

Claim.—First, the short arms N N, the bolster I, when constructed and used in the manner and for the purpose herein described.

Second, in combination with the above, and with the vertical iron screws C C C C, the spur wheels D D D D, pinion wheel E, vertical shaft F, and bevel gear wheels H H, arranged and operating substantially as and for the purpose herein specified.

No. 47,027.—ADAM W. LOUTH, Philadelphia, Penn.—*Apparatus for Treating Offal, &c.*—March 28, 1865.—This invention consists of an oblong building with a flat roof, from one side of which an inclined plane extends to the ground. At one side of the building is a smaller building, at one end of which is an oven heated by means of a fireplace, the communication between the oven and the building being effected by means of doors. The opposite end of smaller building is closed by doors. At the end of the larger building near the oven are two flues, the former having a fireplace at its lower end and communicating with an opening in the smaller building and with the oven. Through the top of the smaller building projects the lower ends of two boilers, each boiler being provided with stirrers. In the lower part of the boiler is a tube, closed by a throttle valve, the lower end of the tube being closed by a movable gate. The bottom of the boiler is also closed by a gate.

Claim.—First, one or more boilers, H and H', with their gates or doors, in combination with the building B, oven D, chimney G, and its fireplace, the whole being arranged substantially as described, so that the fumes generated by the treatment of the offal shall, before escaping to the air, be thoroughly burned and disinfected.

Second, the closed building B, with its trucks M and N, in combination with one or more boilers, H and H', and the oven D.

Third, the boilers H, combined with the reservoir J and the steam-pipes *ff'* and *g*, or their equivalents, arranged substantially as set forth, so that the fat rising to the surface of the water in the boiler shall be discharged into the reservoir.

Fourth, the tank K, with the discharge pipe *i*, arranged in respect to the building B and boiler H substantially as specified.

Fifth, the truck N, with its tilting frame *o* and trays *q*, constructed and operating substantially as and for the purpose set forth.

No. 47,028.—ROBERT McMURRAY and JAMES S. TOPHAM, Washington, D. C.—*Saddle Valise*.—March 28, 1865.—This invention consists in a cylindrical valise to fit close behind the saddle, made without any seams exposed to rain, and riveted together so as to dispense with stitching. It is also provided with springs to keep it in proper shape, and a moulded cover to exclude the rain.

Claim.—The springs F, in combination with a cylindrical saddle valise, constructed and arranged substantially as described.

No. 47,029.—IVES W. MCGAFFEY, Chicago, Ill.—*Combined Planter and Cultivator*.—March 28, 1865.—This invention consists in the arrangement of certain devices for dropping corn and other seeds, combined and operated in connection with a cultivator, having its teeth and standards adjustable so that they can be set at a proper angle for opening a furrow or for covering the seed when used for planting, and readjusted to any desired position for cultivating.

Claim.—First, the slotted braces C c, in combination with the beam A and handles B, for the purpose of adjusting the latter, as set forth.

Second, the reversible bevelled blocks K, J, and G, when arranged to operate in combination with the beam A and plough standard, for the purpose of adjusting the latter, as described.

Third, the hinged division plate X, arranged to operate in connection with the seed hopper, as and for the purpose set forth.

Fourth, the adjustable spring P, in combination with the seed plate L, when constructed and arranged to operate substantially as herein described.

Fifth, the combination of rod I, plate and spring P, arranged to operate as and for the purpose set forth.

No. 47,030.—GEORGE MILSOM, HENRY SPENDELOW, and G. V. WATSON, Buffalo, N. Y.—*Apparatus for Leveling Grain in a Vessel's Hold*.—March 28, 1865.—This invention consists of a series of shovels, attached to an extensible bar or rod, in the means of attaching to the rod its operating rope or chain, and in leading the rope to a windlass so placed that a stevedore in the hold, who has the surface of the grain under his inspection, may suspend or direct the action of the shovels, as the inequalities of the surface of the grain may require.

Claim.—First, connecting a number of scoops or shovels, A, together by an inflexible extensible rod or stretchers, C, for the purposes and substantially as described.

Second, connecting the rope or chains C', by which motion is given to the scoops or shovels, A, to the connecting rod or stretcher C, at points between the end scoops or shovels, substantially as and for the purposes set forth.

Third, a reversible scoop or shovel, Fig. VIII, constructed and operating on the rod as and for the purposes set forth.

Fourth, a double-acting scoop or shovel, Fig. XI, constructed and operating on the rod, as and for the purposes set forth.

Fifth, the combination of the windlass barrels F and changing levers I, so located and connected that a person or persons stationed in the hold of a vessel where the grain is, and having full view of the moving scoops or shovels, shall also have control of said windlass, barrels, and shovels, to regulate and control the movements thereof, substantially as set forth.

No. 47,031.—JOHN ROBERT MOORE, Brooklyn, N. Y.—*Coupling Tool for Drilling*.—March 28, 1865.—This invention consists in screwing the reduced end of a shaft into the enlarged end of another shaft, the former having a collar upon it just back of a screw, and the outer surface of the latter having a thread cut upon it. A sleeve surrounds the two ends thus screwed together, and is screwed upon the external screw of the latter shaft until an internal flange at the opposite end is forced up against the collar on the former.

Claim.—The improved mode of coupling, substantially as described.

No. 47,032.—WM. MOREHOUSE, Buffalo, N. Y.—*Buck-saw Frame*.—March 28, 1865.—This invention consists in a bow-shaped frame with metal clips at the centre of the top of the frame, through which passes a screw rod, and on the top of the frame is a nut working on the screw rod, the other end of which is firmly fastened to the cross or strain-bar, so that by turning the thumb-nut down upon the frame, it causes the bar to be drawn up on the frame and the saw to be strained.

Claim.—First, the combination of the parts A B, clips d d, screw-rod F, and screw nuts g, or their equivalents, substantially as described.

Second, a sliding bar, D, for effecting the straining of the saw-blade of a buck-saw, substantially as described.

No. 47,033.—JOHN L. NICOLAI, Chicago, Ill.—*Automatic Track Layer*.—March 28, 1865; antedated March 10, 1865.—This invention consists in making a road of planks arranged at right angles with the direction of the road, upon which a track is laid in sections, so that each plank, with the section of track thereon, may be readily taken up from the rear of the vehicle and deposited in front thereof, thus forming a continuous track laid upon a plank road for a vehicle to pass over, by using only planks enough to form a track of the length of the vehicle.

Claim.—First, the endless belts G, provided with hooks or their equivalents, in combination with a vehicle to be used upon a track, constructed substantially as described, and operating substantially as and for the purposes described.

Second, in combination with the above, the elastic arms b, d, and e, or their equivalent, operating as herein set forth.

Third, the combination and arrangement of the endless belts G, the wheels F and E, with the drums C D and truck-wheels A, operating in the manner shown and described.

Fourth, providing the wheels F with the pins f, when used in combination with the planks L, provided with the pins r, or the hinged pins p, arranged and operating as and for the purposes shown and specified.

Fifth, the arrangement of the springs m with the pins r r, the flanks operating as and for the purposes herein described.

Sixth, the combination of the belts G, provided with hooks, as aforesaid, with the planks D, provided with the pins l, all arranged and operating as and for the purposes specified.

Seventh, the combination and arrangement of the wedge-shaped point e with the depression n and pins o o, as and for the purposes set forth.

Eighth, the manner of constructing a truck herein shown, whereby the same is made removable by sections, as and for the purposes shown.

Ninth, taking up said sections of the track from the rear of the machine and depositing them in front thereof, by an automatic mechanism attached to a vehicle moving over said track, substantially as herein shown and set forth.

No. 47,034.—F. S. PEASE, Buffalo, N. Y.—*Oil Ejector*.—March 28, 1865.—This invention consists in the arrangement of an air pump with an air receiver and an exhausted receiver, in connection with a pipe leading to a chamber in the bottom of an oil well, by

which means the chamber is caused to be filled and emptied alternately by the same body of air, which is forced into it by the pressure of the air in the reservoir for that purpose, and is withdrawn again by the exhausted receiver through the action of the air pump, thus using the same body of air over and over, and causing the oil to be ejected by its pulsative action.

Claim.—First, raising oil or other liquids from wells and other deep places by intermittent pulsative action, or repeated vibration of a confined body of air or other fluid, substantially as herein set forth.

Second, the arrangement, substantially as herein shown and described, of a double acting air pump, and a compressed air chamber, and an exhausted receiver, in combination with an air conducting pipe *e*, communicating with a well tube.

Third, the arrangement of the valve chamber *A'*, at or near the bottom of a well tube, either within the same or connected therewith, with an upper and lower valve, each opening upward, the upper valve communicating with the chamber *A'* by means of a tube *m*, substantially as described.

Fourth, the valves *g n* of the valve chamber *A'*, operated by means of the vibrations of a column of air, alternately filling the chamber with air and exhausting the same, for the purpose of raising oil and other liquids from deep wells, substantially as described.

No. 47,035.—EBENEZER PENFIELD, Oberlin, Ohio.—*Medical Compound.*—March 28, 1865.—This invention consists in extracting the resinous and gummy substances from flax by steeping it in water, in a large vat, for two or three days, heating the water for part of the time. The flax is then removed and the extract is boiled down to the proper consistency, and the product obtained is used as a medicine for various diseases.

Claim.—The use for medical purposes of an extract of flax, prepared substantially in the manner herein set forth.

No. 47,036.—S. B. PHELPS and C. A. SLACK, Norwich, Vt.—*Hoisting Machine.*—March 28, 1865.—This invention consists in having a crank attached to screw shafts, and by revolving it for awhile in one direction and next turning it for a similar period in an opposite direction, there will be produced, by means of the screws, the levers, pawls, and ratchets, a continuous rotation of the windlass in one direction.

Claim.—The combination of the windlass *A'*, the ratchets *D D'*, pawls *E E'*, the levers *C C'*, the sliders *F F'*, the screws *G G'*, the screw boxes *H H'*, or their equivalents, and the gears for connecting the shaft, the whole being arranged and applied to the frame *B* and its projections *O O'*, and so as to operate together, substantially as specified.

Also, the combination of the two pawl trippers *R R'*, or their mechanical equivalents, with the said windlass, its ratchets, pawls, levers, sliders, screws, and the connecting gears thereof, the whole being arranged in manner and so as to operate substantially as set forth.

No. 47,037.—JOHN W. PHILLIPS, Randolph Center, Wis.—*Wool Presses.*—March 28, 1865.—This invention consists in a device for firmly packing fleeces of wool by means of a box capable of being folded out flat, in which condition the wool is placed upon it. The several parts are then folded together, forming a box in which the wool is compressed.

Claim.—First, the combination and arrangement of the side pieces *A*, provided with the hooks *X* and springs *S*, the centre piece *C*, and the end pieces *B*, provided with the strips *b*, when constructed and operating substantially as and for the purpose specified and set forth.

Second, the combination and arrangement of the side pieces *A*, provided with the hooks *X* and springs *S*, the centre piece *C*, and the end pieces *B*, when constructed and operating substantially as described.

No. 47,038.—S. SAFFORD PUTNAM, Dorchester, Mass.—*Washing Machine.*—March 28, 1865.—This invention consists of a revolving box, with a number of slots arranged to form a continuous rubbing surface and a chamber between them and the sides of the box, into which the water passes as the box is revolved.

Claim.—The receptacle *A*, with its slats *d* so arranged as to form a continuous rubbing surface and a chamber *F*, substantially as set forth for the purpose specified.

No. 47,039.—LEWIS REESE, Rolling Prairie, Ind.—*Wind Wheel.*—March 28, 1865.—The object of this invention is to so combine the parts that a uniform motion of the wind wheel shall be maintained, irrespective of the fluctuation of the wind's force. Its novelty consists in the combination and arrangement of the radial arms, friction blocks, friction plate upon the wind wheel, the swinging lever, weight, and shaft of the wind wheel.

Claim.—The combination and arrangement of the radial arms *H H* and the friction blocks *K K*, so as to operate in conjunction with a friction ring or plate *G* upon the wind wheel *A*, substantially in the manner and for the purpose herein set forth.

Also, the combination of a swinging lever *O* and attached cord and weight *P*, with the rear end of the sliding shaft *B* of the wind wheel *A*, when arranged substantially in the manner and for the purpose herein set forth.

No. 47,040.—WILLIAM B. RICHARDS, New York, N. Y.—*Method of Preventing the Corrosion or Staining of the Surface of Glass.*—March 28, 1865.—This invention consists in

applying calcined plaster to the surface of the glass before packing. The plaster may be used in the form of powder or applied as a paste in a thin coating of the glass.

Claim.—The mode herein specified of protecting the surface of glass, after it has been manufactured, from corrosion and staining, as set forth.

No. 47,041.—JOHN A. ROBINSON, Pittston, Penn.—*Coal Screen*.—March 28, 1865.—This invention consists of a square or oblong frame in which are set two screens, one above the other, at about an angle of forty-five degrees. The upper screen is made with every alternate bar capable of a lateral motion. By these means the distance between the bars is made less or greater at pleasure, and the coal is sifted more or less fine in consequence. The bars of the lower screen on which the coal falls, after being sifted by the top ones, are immovable, and much closer together than those of the upper screen.

Claim.—The employment or use of screens A B, arranged substantially as shown and described, for the purpose of screening coal in its discharge to the cracker and grading screen, as set forth.

Also, constructing the upper screen A with movable or adjustable bars, arranged to operate substantially as herein described.

No. 47,042.—WILLIAM F. RUNDALL, Genoa, N. Y.—*Hay Fork*.—March 28, 1865.—This invention consists in an arrangement of devices for attaching the fork to the handle, and will be readily understood from the claim and engraving.

Claim.—The ferule D fitted on the handle C and provided with an end *a*, which projects beyond the end of the handle, and has a square hole *b* made in it, in connection with the key or wedge E and screw on the tang B of the fork, all arranged substantially as and for the purpose specified.

No. 47,043.—CYRUS W. SALADEE, Putnam, Ohio.—*Machine for Making Earthenware*.—March 28, 1865.—This invention consists chiefly in forming earthenware by forcing the clay through a crevice in a revolving hollow plunger, so as to form the vessel in the space between the exterior of the plunger and the enclosing mould.

Claim.—First constructing a machine in the manner described, or its equivalent, so as to form earthenware without the necessity of weighing or measuring the clay.

Second, the hollow forming plunger B, or its equivalent, constructed and operating in the manner and for the purpose described.

Third, the feeding cylinder A, or its equivalent, constructed and operating in the manner and for the purposes described.

Fourth, the moulds C when constructed and operating so as to open in halves vertically, as described.

Fifth, the vent pin Q, or its equivalent, constructed and operating as described.

Sixth, the mould table D, or its equivalent, constructed and operating as described.

Seventh, attaching the lining Z to the lap edges of the mould when the lining is composed of woollen or other non-elastic fabric, and closely conforms to the shape of the mould, in the manner and for the purposes specified.

Eighth, the mode described, or its equivalent, of producing letters or designs upon the earthenware.

No. 47,044.—A. SELOVER, Brooklyn, Ohio.—*Fruit Gatherer*.—March 28, 1865.—This device consists of a framework of wire secured to the end of a long pole or handle. The framework is constructed in the form of jaws, which are operated by a spring and cord, and the fruit is conducted into a basket by means of a flexible tube.

Claim.—A fruit gatherer constructed and operating as herein set forth.

No. 47,045.—CHARLES J. SHEPARD, Brooklyn, N. Y.—*Cooking Range*.—March 28, 1865.—In this invention, from the fire pot in the centre, the heat, &c., may pass nearly directly to the exit flues, or by closing the dampers under the top plates flanged under the inner sides, so as to make several passage ways and around the ovens to exit pipes, by opening dampers over the tops of the spaces between the ovens the drafts may flow, and also by the sides of the ovens; diaphragms in these spaces make double passages; the exit flues are on the back of the range, and so disposed as not to interfere with the oven space. In the top of range is a series of shallow ovens to hold cooked food, &c.; between them are spaces connected with the double plate top, whence a pipe leads to the chimney.

Claim.—First, the use or employment of flanged sectional top plates L, for the purpose specified.

Second, the flue division or diaphragm J, arranged as shown for the purpose set forth.

Third, the back flue H, operating substantially as described for the purpose set forth.

Fourth, the use or employment of the top ovens N, for the purpose specified.

Fifth, in combination with the flue division or diaphragm J the slide valve, for the purpose specified.

Sixth, the interior flue bricking K, at the outer ends of the range, for the purpose specified.

No. 47,046.—CORNELIUS H. SMITH, Rock Island, Ill.—*Placer Mining*.—March 28, 1865.—This invention consists in forcing water through pipes or hose by means of a steam engine or other power, so as to convey the water to the placer and throw it in a strong jet against the bank of earth, for the purpose of washing and tearing it up. When it is an object to save water, the stream which runs off from the placer is collected in a pond, and after settling is used over again as often as necessary.

Claim.—First, washing metalliferous earths and ores by currents of water forced by steam pumps or mechanical power and delivered in jets in contact with the earth or ores.

Second, forcing water by pumps or other mechanical means for washing earths and ores, under such a system of water pipes and return channels that the water is returned to its reservoir for repeated use, substantially as set forth.

No. 47,047.—ORLANDO SPARGUE, Fulton, Ill.—*Beehives*.—March 28, 1865.—This invention consists in the use of corncobs as a lining for the hive.

Claim.—The use of corncobs as a lining or covering for or in connection with beehives, substantially as and for the purpose set forth.

No. 47,048.—ARNOLD F. STEELE, Crossingville, Penn.—*Pole Propeller*.—March 28, 1865.—This propeller works by poles or rods against the bottom, in shallow water navigation. The invention consists in the combination of an eccentric wheel and bars, which operate the propelling rods.

Claim.—The levers K K H H, and the propellers S S W W, in combination with the eccentric wheel C, and the connecting rods E F, when the same are constructed in the aforesaid combination for the purposes set forth.

No. 47,049.—PHILO P. STEWART, Troy, N Y.—*Fire Pot for Stoves, Furnaces, &c.*—March 28, 1865.—This invention consists in the employment of horizontal sections or layers for fire pots of stoves, furnaces, &c.; said layers being made of cast iron, or any other desirable material, with horizontal air chambers between them, communicating with vertical air chambers, and thence with the fire chamber by means of small tubes, through which and by means of which atmospheric air is admitted to the fire, at the sides thereof and above the surface, to aid in the more perfect combustion of the fuel and gases.

Claim.—The employment of a fire pot, constructed, arranged and combined in the manner substantially as and for the purposes herein described and set forth.

No. 47,050.—THOMAS STOCKTON, North Chenango, Pa.—*Apparatus for raising Dough*.—March 28, 1865.—This invention consists of a water-tight, covered vessel, of tin or other suitable material, with a perforated shelf across the centre. The receptacles containing the dough are placed upon this perforated shelf, and then covered with a cloth to prevent the condensation of moisture upon the surface of the dough. Warm water is then poured into the lower part of the vessel, after which it is closed by means of a cover.

Claim.—The employment of a hot water holder A, in combination with the dough receptacles C, supported by rods B, above the level of the water, substantially in the manner and for the purpose herein shown and described.

No. 47,051.—ELI THAYER, Worcester, Mass.—*Automatic Steam Pump*.—March 28, 1865.—This invention consists in combining a coil of pipe, in which steam is generated, with a hollow cylinder or tube, in such a manner that the steam enters the cylinder, and being condensed therein, forms a vacuum into which water rushes through a valve in the induction pipe, and fills or nearly fills the cylinder, when steam is admitted above the water, and forces it out through the eduction valve and pipe to any desired location. The coil is supplied with water from the cylinder through a valve placed in the connecting pipe.

Claim.—The combination of the coil or heater K, including the globe valve H, and the check valve I, with the main tube A, and the other valves and pipes connected with it, for the purposes and in the manner above described.

No. 47,052.—ELI THAYER, Worcester, Mass.—*Grate Bars for Boilers*.—March 28, 1865.—The object of this invention is to cause the circulation of water through the grate bars of boilers of steam engines, and to be enabled to blow through them in sections, if desired, with the full pressure of the boilers, so as to cleanse the grate bars from any foreign substance not removed by the usual circulation. It consists in connecting the grate bars with the boiler through pipes, in combination with cocks.

Claim.—The hollow grate bars, connected with the boiler through the pipes *b b'* and *c c'*, and adapted to be cleansed by the aid of the cocks 1 2 3, arranged in the manner substantially as herein described.

No. 47,053.—ELI THAYER, Worcester, Mass.—*Steam Generator*.—March 28, 1865.—This invention consists in the arrangement of a series of tubes, which form the grate upon which the fuel rests, and the supply pipes which supply them with water, and carry off the steam generated therein. To accomplish this, a pipe is attached to the boiler below the water line,

which is provided with a stop-cock and valve for the purpose of regulating the amount of water to be admitted to the grate, and another is attached to the opposite end of the tubes constituting the grate, which communicates with the steam space of the boiler, through which the steam generated in the grate is conveyed thereto.

Claim.—The arrangement of the several parts herein described, viz: the stop cock *g*, the check valve *c*, the vent cock *h*, the tube or pipe constituting the grate, including its connections both with the boiler and the vent cock *h*, and the screen which covers and protects the grate, in the manner and for the purposes above described.

No. 47,054.—ELI THAYER, Worcester, Mass.—*Steam Generator.*—March 28, 1865.—This invention consists in so arranging a number of coils of pipe, graduated as to size of pipe, and each coil independent of the other, but each connected with the boiler in such manner that the heat from the boiler may pass around each in succession for the purpose of generating steam in them separately. These coils are connected to the boiler at both their extremities, and by shutting off the communication with the steam space of the boiler and allowing the communication with the water space to remain open, the current is reversed, and any deposit that may have taken place is forced out of the coil into the boiler. It further consists in providing a metallic false bottom to cover the inner surface or bottom of the boiler, by means of which all the water which comes in contact with the heating surface is immediately converted into steam and forced into the steam chamber. This false bottom is made to fit as closely as possible to the bottom of the boiler, so that only a very thin film of water can get between the two, and this is instantly flashed into steam, which causes the false bottom to rise a very short distance from the boiler, and this admits another small quantity of water to pass between the two, and thus the operation is repeated.

Claim.—First, the method of clearing the coils of sediment by reversing the steam in them.

Second, the false bottom or movable plate *D*, to be used in the manner and for the purposes described.

No. 47,055.—J. H. THOMAS and P. P. MAST, Springfield, Ohio.—*Cultivators.*—March 28, 1865.—In this invention the plough beams are suspended by hangers from the tops of two standards pivoted upon the axletree. An adjustable stop upon the side of a bar crossing the hangers prevents the plough from hitting the corn. A supplementary tooth is employed when required, by inserting the tooth shaft in journals upon front of plough beams.

Claim.—First, swinging the suspenders *I I* from the top of the standards *G G*, for the purpose set forth.

Second, the combination of plates *H H*, suspenders *I I*, and standards *G G*, as described and for the purpose set forth.

Third, so pivoting the rock-shaft *O*, from which the beams *E* are suspended as that, when the handle *a* is turned up and thrown forward, it shall remain in that position, and thus keep the plough suspended without the use of any catch or other device, substantially as set forth.

Fourth, the adjustable stop *k*, in combination with the adjustable stretcher *K* and suspenders *I I*, substantially as set forth.

Fifth, the shaft and journals *j j*, in combination with the braces *f* and drag bars *F F*, whereby the supplemental tooth may be readily attached, maintained in position, and allowed to swing backward when the wooden pin *c* is broken, substantially as described and set forth.

No. 47,056.—HOWARD TILDEN, Philadelphia, Penn.—*Flour Sifter.*—March 28, 1865.—This invention consists of a box with a hopper formed in the interior, below which is a shaft to which are attached India-rubber strips to act as brushes to sweep the flour over the semi-circular sieve and force it through to the lower part of the box.

Claim.—The combination of the equi-quadrilateral shaft *C* or its equivalent, having on two or more of its corners the rubber strips *i i*, or their equivalent, with the sieve *B* and the box *A*, substantially as described and for the purposes set forth.

No. 47,057.—A. R. TREADWAY and S. R. WARNER, New Haven, Ct.—*Valve for Steam Pipes.*—March 28, 1865.—This invention consists in placing a plate or valve seat diagonally across the pipe upon which the valve is placed, which is opened and closed in the usual manner. This valve, instead of being rigidly attached to its rod as is usual, is jointed to it in such a manner that, as the steam in the pipes forward of it condenses, and the water caused by condensation flows back against it, it is pressed up from its seat and the water is allowed to pass it and flow into any receptacle that may be provided for it, and thus the injurious effects of freezing are avoided.

Claim.—The hinged valve *C* combined with an inclined seat *B*, so as to operate substantially as and for the purpose specified.

No. 47,058.—JOSEPH TREVOR, Lockport, N. Y.—*Combined Desk and Work Table.*—March 28, 1865.—This invention consists in the combination of a writing desk and table, which latter also contains the pendent bag or flexible receptacle to fit the article for a lady's use. This article of furniture is made to fold up so that it may occupy a small space when placed away out of use.

Claim.—As a new article of manufacture, a convertible desk and work table, consisting of the pivoted cross frames A A', falling top B, pivoted slat D, and flexible bag G, arranged and combined substantially as described.

No. 47,059.—BARNETT B. WHALEY, Brooklyn, N. Y.—*Flask Pins.*—March 28, 1865.—This invention consists in constructing the steady-pin or dowell of two separate parts, the plate or flange secured by screws to the flask, and the pin and means of securing and adjusting it to said plate. The end of this pin is widened out in one direction, and made wedge-shaped, one surface of which corresponds to the inclined bottom of a bed or recess made in the plate to receive it. In this recess it is secured by means of a set screw passing through a slot in the pin, and into a female screw in the plate. By this means the pin can be adjusted towards or from the side of the flask to which it is secured, to suit the eye in the corresponding part.

Claim.—An adjustable flask pin constructed with two inclined planes so arranged that, by moving one of the planes upon the other, the spindle of the pin can be adjusted to fit its socket in the manner and for the purposes set forth.

No. 47,060.—WILLIAM A. WHEELER, New York, N. Y.—*Operating Parts of a Fountain Inkstand.*—March 28, 1865.—This invention consists in making a button on the end of the pressure screw of a fountain inkstand, so as to withdraw an elastic diaphragm, as well as press upon it.

Claim.—The use of a diaphragm made of two thicknesses as described, for fountain inkstands, in combination with the double-headed button *h i* and screw *n*, and cap plate *p*, arranged and operating in the manner and for the purposes herein before set forth.

No. 47,061.—FREDERICK R. WILLIS, Waltham, Mass.—*Skate Sharpener.*—March 28, 1865.—This device consists of a short file secured between two plates, and having its edges either plain or rounded. At one end of the file is a projection or tram with a curved polished end to be used as a burnisher. The device may be adjusted to skate irons of different thicknesses.

Claim.—A file for sharpening skate iron, having either adjustable or fixed guides and provided with a burnisher, substantially as herein described and for the purpose specified.

No. 47,062.—BENJAMIN WRIGHT, Hudson, Mich.—*Washing Machine.*—March 28, 1865.—This invention consists in the combination of the rubbing device with adjustable arms, so that the rubber may be lifted from the tub, and a latch to hold it in a certain position.

Claim.—The rubber *c*, the arms *G*, the adjustable latch *j*, and the thumb screws *o*, the whole constructed and arranged substantially as herein set forth.

No. 47,063.—NATHAN L. ENGLISH, Hartland Four Corners, Vt., assignor to himself and JOSEPH F. LADD, New York, N. Y.—*Photographic Printing Frame.*—March 28, 1865.—This invention consists in attaching springs, having hooks on their ends, to the back of the pressure boards, and in dispensing with the outer frame.

Claim.—The combination of clamps formed by hoops or clasps hinged to the ends of springs with a printing board or pad, substantially as and for the purposes herein set forth.

No. 42,064.—RANSOM GREENE, assignor to JOSEPH BRIGGS, New York, N. Y.—*Wool Press.*—March 28, 1865.—This invention consists in a series of hinged plates to fold and press the wool, in combination with a mechanism for locking the press during the operation of bundling, and a device for holding the bundling strings.

Claim.—The hinged top piece, in combination with the folding sides, ends, and bottom, substantially as described and specified.

No. 47,065.—A. W. HALL, assignor to B. W. ROBINSON and S. P. CHAPIN, New York, N. Y.—*Universal Timepiece.*—March 28, 1865.—This invention consists of an ordinary clock, having upon its face a supplementary dial, which is divided into circles, each of which is marked with the name of a place and hours, and minutes, and which are so arranged that when the hour and minute hand indicate a certain time on the ordinary dial, the corresponding time at any other place can be read off the dial or ascertained by a slight addition or subtraction. When the clock is carried to any other place than that for which it is calculated, a supplementary minute hand is used to indicate the time.

Claim.—First, the employment or use of the dial of a clock or watch of two or more compound or double circles marked with different places, the two parts of each circle containing respectively the figures for the hour and minute hands calculated and arranged to correspond with the longitude of the places named on the circles, substantially as herein specified, for the purpose of allowing the ordinary hands of the clock or watch to keep the accurate time at different localities.

Second, making the circles of different colors, substantially as herein described, to aid the eye in tracing any given circle to any portion of the dial.

Third, the use of a supplementary adjustable minute hand, in combination with the supplementary dial arranged on the face of the clock or watch, substantially in the manner and for the purpose shown and described.

Fourth, so constructing the supplementary hand attached to and revolving with the ordinary minute hand that it can be turned or adjusted as described without interfering with the ordinary minute hand, or with the movement of the timepiece, as described.

Fifth, placing upon the different circles the names of other places than those for which the circles are calculated, at the same time naming the variations of said additional places from the circle, as and for the purpose set forth.

No. 47,066.—JOEL and HENRY R. LEE, assignors to themselves and W. C. CALKINS, Galesburg, Ill.—*Mop*.—March 28, 1865.—This invention consists in the combination of the handle with a head piece, stirrup, forked ferrule, and rods.

Claim.—First, the forked ferrule A and the rods B B, substantially as and for the purpose specified.

Second, the handle C, spring D, head-piece E, and stirrup F, in combination with the forked ferrule A and rods B B, substantially as and for the purpose specified.

No. 47,067.—A. Y. McDONALD, assignor to himself and JOHN MORRISON, Dubuque, Iowa.—*Wrench*.—March 28, 1865.—This invention consists in making in the movable standard or bar, against which the screw operating the movable jaw abuts, a hole or mortise, a little longer than the width of the shank which it surrounds, so as to allow a small bolt on the outer lower edge of said mortise to be shifted and placed in any one of a number of holes in the edge of said shank; and also in making the socket in said standard of an oblong shape, so as to allow the screw which abuts therein to assume any desired angle thereto, to prevent it from being bent or strained.

Claim.—The elongated slot *d* in the bar G, in combination with the screw E, sliding jaw D, projection *f* on bar G, spring H, of spiral or other form, and the holes *g* in the shank A, substantially as and for the purpose set forth.

No. 47,068.—ANTONI MEUCCI, Clinton, N. Y., assignor to WILLIAM E. RIDER, New York, N. Y.—*Process for removing Mineral, Gummy, and Resinous Substances from Vegetable Fibre*.—March 28, 1865.—This invention consists in treating the fibre with gases generated by the action of nitro-muriatic acid upon carbonate of lime, iron, or equivalent material. The fibre is placed in a vat with a perforated false bottom, and the gases allowed to enter from the generator; after the dry fibre has been subjected to the action of the gas for a proper length of time, the flow of gas is stopped and water poured upon the fibre, and the gas again allowed to enter the vat. The fibre is then removed, steamed, and treated with caustic alkali, or with a composition of caustic alkali and oil.

Claim.—The improved process of treating a vegetable material by treating it first in a dry state with gaseous substances produced by the action of nitro-muriatic acid upon carbonate of lime and iron, or their equivalents; second, in a wet state, with the same substances; and third, with a caustic alkali, substantially as set forth.

Also, the process of treating the vegetable material which has been subjected to the first two operations above recited with a mixture of caustic alkali and oil, substantially as set forth.

No. 47,069.—JOHN W. MILLETT, Albany, N. Y., assignor to J. A. SUMNER.—*Construction of Paper Boxes*.—March 28, 1865.—The object of this invention is to construct cylindrical paper boxes so that the sides, bottom, and top may be cut from one piece of paper without waste. It is accomplished by a zig-zag cut along the centre of a strip of paper; the zig-zag portions forming the top and bottom when pasted together.

Claim.—First, the method, substantially as described, of constructing the body and top of a paper box from one piece of paper without waste, as herein set forth.

Second, the method of stiffening the ends of a paper box made out of one strip of paper, substantially as described.

No. 47,070.—SILAS SAFFORD PUTNAM and LUCIUS H. DWELLEY, Dorchester, Mass., assignors to S. S. PUTNAM & Co., Brooklyn, N. Y.—*Machine for Making Nails for Horse-shoes*.—March 28, 1865.—This invention is designed as an improvement in the machine described in the patent granted to Mr. Roberts, September 1, 1863, and consists, first, in an arrangement of mechanism for operating the heavy drop hammer used for swaging the shoe; secondly, in an arrangement of devices for holding the shoe in place upon the die or anvil, and for enabling the hammer in its descent to displace the same so as to leave the whole surface of the shoe exposed to its action; thirdly, a reservoir arranged adjacent to the die and certain devices by means of which the shoe and anvil may be flooded with water; and fourthly, an arrangement of devices for forcing the finished shoe up off the die or anvil.

Claim.—The drawing levers *c d e f*, in combination with the movable patterns *h i j k*, operating substantially as set forth.

Also, the levers or jaws *c d e f*, arranged in pairs, the patterns *h i j k*, the motion of which toward or from the nail rod is controlled by the wedges *o p* and springs *m*, or other suitable mechanical device, in combination with the cut-off Q R, or its equivalent, operating substantially as set forth.

Also, placing the ends of one pair of levers in advance of the ends of the other pair, and drawing them all simultaneously over the iron, substantially as set forth, for the purpose specified.

Also, in horse-shoe nail machines the use of movable patterns or formers, operating substantially as set forth, for the purpose described.

No. 47,071.—ANDREW J. ROBERTS, Boston, Mass., assignor to BENJAMIN F. BROWN, Dorchester, Mass.—*Machine for Making Horse-shoes*.—March 28, 1865; antedated March 13, 1865.—In this machine the device for drawing and shaping the nail consists of four small rollers attached to the ends of four horizontal bars, whose opposite ends are connected to the end of a reciprocating rod or pitman; the rollers, one for each side of the nail, being arranged in pairs, and so that one pair will be sufficiently in advance of the other to prevent interference. Each bar bears against and is guided by a pattern placed behind it, which cause the rollers, as they are drawn along over the projecting end of the nail rod, to impart to the metal the proper form, while at each successive forward movement of the roller jaws the patterns are set up, or forced nearer together so as to more and more reduce the diameter of the nail, by means of wedges which are gradually forced in behind the patterns by certain devices arranged for that purpose.

Claim.—First, the use of the heavy drop hammer *i* for hammering the top of the shoe, arranged and operated by means of the devices hereinabove described.

Second, holding, covering and uncovering the shoe, for the purpose specified, by means of the projecting piece *x* of vertical bar *w*, and plates *z z*, arranged together and operated by the downward movement of the hammer *i*, substantially as herein described.

Third, flooding the shoe with cooling liquid before taking it from the machine, substantially in the manner and by the devices described, the same consisting in surrounding the mould block with the reservoir *h'* filled, or nearly filled, with water or other suitable cooling liquid, which liquid is flowed at the proper times upon the shoe by means of the plunger *i'*, all arranged and operated substantially as described.

Fourth, the arrangement of devices for raising and lowering the punches *c' c'*, for the purpose specified, the same consisting of the wheel block *e*, connecting and projecting arms *f' f'* and rods *g' g'*, operating together substantially as described.

No. 47,072.—JAMES E. THORPE, Providence, R. I., assignor to himself and FRANCIS D. RIDDER, Boston, Mass.—*Valve for Steam Engine*.—March 28, 1865.—This invention consists in providing a curved valve and seat, the valve having two chambers with a partition between them, said partitions being of sufficient width to cover the eduction passage, so that each chamber acts as an exhaust passage for their respective ends of the cylinder.

Claim.—Providing the valve with a single curved seat and a single corresponding bearing therefor, and with two chambers and a partition arranged in the valve, as described, and three ports leading from the seat, and with the area or width of the bearing surface of the partition greater than the mouth of the central port, the whole being substantially as hereinbefore described.

No. 47,073.—S. R. WARNER, assignor to himself and A. R. TREADWAY, New Haven, Conn.—*Valve for Steam Pipe*.—March 28, 1865.—This invention consists in constructing the valve plate or seat so that it may lie diagonally across the pipe in an elliptical form and inclined sufficiently to allow the gate or valve to be opened within the circumference of the pipe.

Claim.—Constructing a valve plate, as described, so that it may be set in pipes in the manner and for the purpose specified.

No. 47,074.—EDOUARD ANDRIES, Schaerbeek, Belgium.—*Filter*.—March 28, 1865; patented in Belgium, February 20, 1864.—In this invention the filter is to be submerged. Its outer and inner walls are perforated, having several strata of filtering media between; the water is drawn from near the bottom of the filter, where a sponge protects the mouth of the tube through which it is drawn; a cup beneath this sponge receiving the sediment.

Claim.—The specific combination of the filtering media, arranged in layers, as set forth, the sponge at the end of the suction pipe and the receptacle below the sponge for retaining the impurities.

No. 47,075.—THOMAS RIDER, Valparaiso, Chili.—*Pump*.—March 28, 1865.—In this invention a "mud-box" is formed around and below the foot valve for the purpose of withholding from the valve chamber such heavy and gross particles of matter as may ascend in the induction pipe, and into which such matters may descend by gravitation to be subsequently removed at discretion by the operator.

Claim.—The mud-box *E*, applied in combination with the suction pipe *D*, and foot valve *a*, in the manner and for the purpose as substantially set forth.

No. 47,076.—JOHN SMITH, Wentworth Road, &c., Great Britain.—*Fusible Plug for Boiler*.—March 28, 1865; patented in England, April 14, 1863.—This invention consists in recesses or grooves formed in the fusible plug, whereby to increase the power of the fusible

metal to resist shearing, and an arrangement of the parts so that a portion of the device may remain attached to the boiler when the part containing the fusible metal is removed.

Claim.—First, the construction of fusible plugs, with recesses or grooves, for the purpose of increasing the power of the fusible metal to resist shearing, substantially as described.

Second, the construction of fusible plugs, with an additional part which may remain screwed into or otherwise attached to the boiler, when the part containing the fusible metal is removed, as described.

No. 47,077.—FRANCIS WILLIAM WEBB, Monks Chippenhall, Crewe, England.—*Construction of Fagots.*—March 28, 1865.—This invention is fully set forth in the claim.

Claim.—Forming piles for the manufacture of steel-faced rails by the combination of old rails, puddle bars, and facing slabs of cast steel, the semi-crystalline puddle bars being interposed between the fibrous old rails and the crystalline steel slabs, so as to combine the materials of these two by a material which partakes of the nature of each, substantially as described.

Also, forming the piles for the manufacture of steel-faced rails by the combination of iron bars with facing slabs of cast steel provided with intermediate projections on their inner surfaces for the purpose of facilitating the welding of the steel to the iron, substantially as set forth.

No. 47,078.—CLIFFORD ARICK, St. Clairsville, Ohio.—*Packing Projectiles for Rifled Ordnance.*—March 28, 1865.—In this invention a metallic sabot is provided with an annular flange or sleeve, which fits upon a tapering recess at the rear of the projectile, having a square shoulder to limit the forward wedging of the annular flange; and the rear of the sabot is formed into a concave disk, to be flattened and expanded by the action of the charge, as the annular sleeve is driven forward on the base of the projectile.

Claim.—The annular key *a'*, in combination with an expanding disk *a*, constructed, applied, and operated substantially as and for the purpose set forth.

+ No. 47,079.—CHARLES H. AMIDON, Greenfield, Mass.—*Wringing Machine.*—April 4, 1865.—This invention consists in the employment of an endless chain, in combination with a pulley wheel and gear wheels attached to the shafts of the rollers so that the rollers are propelled by the chain.

Claim.—The endless chain *S*, in combination with the wheels *P P'*, and wheel *R*, with the rollers *D* and *B*, substantially as and for the purpose specified.

No. 47,080.—L. L. ARNOLD, New York city.—*Cigarette.*—April 4, 1865.—This invention consists in inserting in the end of a cigarette a quill to serve as a mouthpiece for holding it firmly between the teeth.

Claim.—First, as a new article of manufacture, a cigarette constructed and combined in the manner described.

Second, the method herein described of making the same.

No. 47,081.—THOMAS ATKINS, Cincinnati, Ohio.—*Cabinet Organ or Harmonium.*—April 4, 1865.—This invention consists in so arranging the stops or swells, with regard to a common lifting bar, as to admit of their being operated by the foot or knee.

Claim.—So arranging the stops or swells of an organ or harmonium with regard to a common lifting piece *F*, operated by a foot or knee pedal, as that they may all, or any one, two, or more of them, be opened or closed by said pedal, without raising the hands from the keys, substantially as herein described.

No. 47,082.—ROBERT BARTHOLOW, Cincinnati, Ohio.—*Manufacture of Blacking, &c.*—April 4, 1865.—This invention consists in heating petroleum with sulphuric acid until the petroleum is blackened or carbonized. Bone black is then added, and the mixture heated until the ingredients are thoroughly incorporated. As the mixture cools pyroligneous acid, wheat flour, molasses, and gum arabic are added and the whole incorporated together.

Claim.—The manufacture, compounding, and preparation of a new and improved kind of oil blacking, for leather, boots, shoes, harness, and other articles manufactured in whole or in part of leather, composed of the ingredients above named, and manufactured, compounded, and prepared in the manner and for the purposes substantially as set forth at large above.

Also, as a new manufacture, oil blacking for leather and other articles, made by combining petroleum or any of its products, or other hydro-carbon oils, treated substantially as hereinbefore set forth, with any suitable acids, oxides, gums, or resins, substantially in the manner specified.

No. 47,083.—ROBERT BARTHOLOW, Cincinnati, Ohio.—*Oil for Paint.*—April 4, 1865.—This invention consists in heating petroleum with a mixture of sulphuric and nitric acid until flames of nitrous acid are given off, after which it may be mixed with white lead, &c., in the same manner as linseed oil.

Claim.—The manufacture and preparation of a new and improved kind of oil for mixing

and compounding with white lead, zinc, white and other mineral paints and pigments, in lieu of linseed oil and other paint oils, and for other purposes, composed of the ingredients above named, and compounded, manufactured, and prepared in the manner and for the purposes substantially as set forth above.

No. 47,084.—ROBERT BARTHOLOW, Cincinnati, Ohio.—*Process of Preparing Petroleum for the Manufacture of Paints, &c.*—April 4, 1865.—This invention consists in treating the petroleum with sulphuric or nitric acid, and adding to this a solution of glue in acetic acid. To the oil thus prepared, white lead, zinc white, and various colors are added as may be desired.

Claim.—The manufacture, compounding, and preparation of paints for common purposes, of various colors and shades of color, and embracing all colors and shades of color, from crude petroleum and refined petroleum, in combination with sulphuric acid, nitric acid, acetic acid, common glue, dry white lead, otherwise known as carbonate of lead, dry white zinc, otherwise known as oxide of zinc, and other white pigments and pigments of various colors, combined in the proportions and in the manner substantially as set forth above.

No. 47,085.—JOHN BLAKENEY, Philadelphia, Penn.—*Machine for Securing Soles to Boots and Shoes.*—April 4, 1865.—This invention relates to a mode of attaching soles to the welts of boots. It chiefly consists in a screw rod, with its internal wire, and a nut composed of two or more arms, operating upon the screw rod, and in two or more cutters, &c.; the whole being in combination with other devices designated in the claim.

Claim.—First, the screw rod *I* and its internal wire *x*, and the nut, composed of its arms *G* and *G'*, or their equivalents, in combination with the system of gear wheels herein described, or the equivalent to the same, whereby the said screw rod is caused to revolve at a faster speed than the nut, for the purpose specified.

Second, two or more cutters 4 and 7 arranged in the projection *m* of the rocking frame, in respect to the wire *x*, in combination with the slotted plates 10, or their equivalents, for adjusting the said cutters, as set forth.

Third, the support 24, adapted to the last, in combination with the movable plate *Y*, and the devices herein described, or the equivalent to the same, whereby the said support can be adjusted vertically and laterally in the manner described.

Fourth, the combination of the plate *Y*, adjustable plate 14, rocking frame 19, adjustable support 24, and sliding support 15; the whole being arranged and operating substantially as and for the purpose herein set forth.

No. 47,086.—J. BLAIR BOWDITCH, New Haven, Conn.—*Spring Bed Bottom.*—April 4, 1865.—This invention consists in the employment of short elastic slats, one at each end, being placed under the common spring slats, forming an elastic bottom.

Claim.—The combination of the slats *B B* with the wooden springs *D D*, as herein described, for the purpose specified.

No. 47,087.—CHARLES H. BUCKALEW, Jersey City, N. J.—*Lamp Cone.*—April 4, 1865.—This invention consists in the construction of lamp cones, with a metallic base and a bifurcated connecting arch, with a filling or dome of glass blown or cast within the said frame.

Claim.—The construction of the cone frame with a metallic base and bifurcated connecting arch, with a filling or dome of glass blown or cast within the said frame, substantially as herein described and represented.

No. 47,088.—JOHN W. COCHRAN, New York, N. Y.—*Breech-loading Fire-arm.*—April 4, 1865.—In this invention a pivoted breech block, hollowed out or concave at its under side, is rigidly connected with the trigger-guard lever, so as to be raised as a lever is depressed, whereby the chamber is opened beneath, so as to be loaded at the under side of the arm.

Claim.—First, so constructing and applying a breech block, having a movement such as is herein described, as to provide for the insertion of the cartridge into the barrel from the under side of the stock of a fire-arm, substantially as herein specified.

Second, providing a cavity *c*, substantially as herein described, in the under side of such a breech block for the reception of the cartridge when the gun is in the inverted position shown in Fig. 3, whereby the movement of the said block, which is necessary for the insertion of the cartridge into the chamber of the barrel, is greatly reduced, and the discharged cartridge shells are steadied while being withdrawn from the barrel.

Third, the construction and arrangement of the rear end of the breech-operating lever *e*, substantially as herein described, whereby an opening between the said end of the breech block and the stock is avoided.

No. 47,089.—J. W. COLWELL, Macedonia, Ohio.—*Railroad Switch.*—April 4, 1865.—This invention consists of a switch so constructed that the cars will be guided upon the main track at either end, in case the switch is not shifted to the proper position.

Claim.—First, the guards *C C' d d'* and guard rails *D D'*, in combination with the switch rails, when arranged as and for the purpose set forth.

Second, placing the main track A A' on a tangent with, and at the junction of, the side track B B, in combination with the guards and guard rails, substantially as and for the purpose specified.

No. 47,090.—WILLIAM H. CONVERSE, New Castle, Me.—*Harrow and Roller Combined*.—April 4, 1865.—This invention consists in combining a harrow with a roller, and arranging the former in such a manner that it may be readily cleaned from weeds and trash which may engage or become entangled in its teeth, and also be capable of yielding to conform to the inequalities of surface over which it may pass.

Claim.—The harrow E fitted in or to the frame A, substantially as shown, in combination with the bent bar F, provided with the plate G, and a rear part *g*, having a relative position with the harrow teeth *c*, as described, the sides *f f* of F being fitted loosely on the harrow shaft D, and bar F, and harrow E, connected by a spring H, the above parts being applied to the frame A of a roller C, and all arranged to operate substantially as set forth.

No. 46,091.—DAVID T. CROSS, Cincinnati, Ohio.—*Railroad Car Brake*.—April 4, 1865.—This invention relates to that class of railroad car brakes which are adapted to operate continuously on an entire train, and consists in a provision for equalizing the rubber action throughout the train, and for bringing the rubbers in the rear portion of the train immediately and effectively into service.

Claim.—The self-acting pawl K and its described or equivalent accessories, for the object set forth.

No. 47,092.—JOHN M. DAILEY, New York, N. Y.—*Trunk Stay*.—April 4, 1865.—This invention consists in the use of one or more curved bars, or plates, moving upon suitable guiding pins in the cover and body of a trunk or case, and in the combination with an ordinary hinge of a plate, free to slide in grooves, having the direction of a curve, the centre of which is at the turning point of the hinge.

Claim.—The use of one or more curved bars or plates moving upon suitable guiding pins in the cover and body of a trunk or other case, arranged and operating substantially as herein described and for the purpose specified.

Also, the combination with an ordinary hinge of the curved bar *h*, arranged together and operating substantially as and for the purpose specified.

No. 47,093.—WILLIAM DISHBROW, San Francisco, Cal.—*School Seat and Desk*.—April 4, 1865.—This invention consists in combining on a part of a school desk grooved bars, to which is attached a sliding seat, with legs which have rollers upon their extremities, so that the seat can pass under the desk and out in front of it.

Claim.—The arrangement of the grooved bars K and sliding seat M, with the standards E and desk A, in the manner herein shown and described.

No. 47,094.—M. B. DODGE, New York, N. Y.—*Desulphurizing Ores*.—April 4, 1865.—This invention consists in mixing the pulverized ore with common salt, and subjecting it to the action of steam in a close box with a perforated false bottom, by which means the ore and salt are thoroughly incorporated without saturation with water, (which would render the mass difficult to handle,) by automatic mechanical devices.

Claim.—Mixing the ore and salt in a dry state and afterward steaming them within a close vessel in a perforated bottom.

No. 47,095.—WILLIAM FOSTER DODGE, New York, N. Y.—*Pump Piston*.—April 4, 1865.—In this invention the piston is a cylinder of more than usual length, having slots or perforations in its sides and a valve near its bottom. Exterior to the cylinder is a flexible tube, held in position by suitable devices. This flexible exterior part is to be pressed out against the pump cylinder by the weight of the water in and above the piston.

Claim.—First, the expanding band D, in combination with the shell A, having a series of openings through which the pressure of the column of water or other fluid acts against the interior of the said band, substantially as and for the purpose herein specified.

Second, a piston, composed of a hollow shell A, having openings *a* in its sides and a valve seat and valve at or near its bottom, and a surrounding band of leather or other soft, elastic, or flexible material confined to the said shell between the said openings, by means of rings *c c*, the whole combined substantially as and for the purpose herein specified.

No. 47,096.—PHILIP ELY, New York city.—*Protector for Baskets*.—April 4, 1865.—This invention consists in the application to a basket of a metallic frame, adjustable vertically and circumferentially by means of a series of holes in the former direction, and by slots in the latter, whereby the frame is adapted to either a large or a small basket.

Claim.—A metallic frame, adjustable or otherwise, applied to baskets in the manner substantially as and for the purpose herein set forth.

No. 47,097.—SAMUEL D. FALES, Central Falls, Smithfield, R. I.—*Screw Steam Valve Cock*.—April 4, 1865.—The annular valve seat has a V-shaped groove upon its face, and the valve has a corresponding ring to turn these in.

Claim.—Constructing the valve and valve seat for a steam or water valve cock, in the manner substantially as described, for the purposes specified.

No. 47,098.—REMY FIEGEL, Montgomery county, Pa.—*Railroad Draught Bar*.—April 4, 1865.—This invention consists of several series of springs confined within the cast-iron boxes, constructed to slide the one within the other during the action of the draught rod, which passes through and keeps the boxes together, and the springs between the boxes. The whole is supported and secured firmly between two cross beams of the platform of the car, so as to operate in combination with a buffer E, rigidly fixed to the said cross beams or their equivalent, and with the usual bolt and shackle.

Claim.—The boxes A A', springs B B' B' B' B', rod C, bolt F, and shackle G, in combination with a buffer E, rigidly fixed to the platform of a car, the whole being constructed, arranged, and applied so as to operate together, substantially as described and set forth, for the purposes specified.

No. 47,099.—HENRY FURNEL, Huntington, N. Y.—*Remedy for Disease in Trees*.—April 4, 1865.—This invention consists in a composition of whale oil, soap, sulphur, oxide of iron, wood ashes, soot, and lampblack.

Claim.—The combination of the hereinbefore-mentioned ingredients, for the purpose set forth, substantially in the proportions described.

No. 47,100.—E. P. FURLONG and E. M. LANG, Westbrook, Me.—*Mode of Rendering Wick Incombustible*.—April 4, 1865.—This invention consists in saturating the wicks with a mixture of alum, plumbago, and water.

Claim.—First, a wick rendered incombustible by saturation or coating, substantially as described.

Second, saturating or coating a wick to prevent its combustion, substantially as described.

Third, rendering a wick incombustible by saturation in plumbago, or its equivalents, as described.

No. 47,101.—JOHN W. HAINES, Somerville, Mass.—*Silvering Glass Pitchers*.—April 4, 1865.—This invention consists in the method of forming the walls of pitchers, &c., to be silvered. A quantity of glass, in a semi-fluid state, is attached to the mouth of a pitcher or other article, and the air exhausted from the vessel, which causes the glass to expand and form a hollow shell within the vessel, leaving a space between it and the wall of the said vessel.

Claim.—The dropping on of the hot glass on the outside rim of the pitcher, and by means of suction with the mouth, expanding the solid piece of hot glass into oval shape, producing two compartments as above described.

No. 47,102.—D. FRANK HARTFORD, Boston, Mass.—*Screw-driver and Tweezers*.—April 4, 1865.—This invention consists in combining with a screw-driver a pair of tweezers, so connected by means of a sleeve which is made to slide upon the shank of the screw-driver, as to pass the points of the tweezers out beyond the end of the screw-driver when the tweezers are being used, or back when the screw-driver is being used; a coiled spring around the shank of the screw-driver, inside of the handle, forces the tweezers outward, and when they are forced backward by the thumb and finger against the spring, a small thumb-spring catches in a notch in the screw-driver shank and holds them back. It is designed for watchmakers' use.

Claim.—First, the wires *k k*, and pin *j*, or their equivalents, in combination with the tweezers and screw-driver, substantially as and for the purpose described.

Second, throwing the points of the tweezers beyond the point of the screw-driver, by means of the spring, &c., substantially as set forth and for the purpose described.

Third, the spring lever *l*, to operate substantially as described, in combination with the tweezers, the indentation *n*, and shoulder *m*, for the purpose described.

No. 47,103.—EDMUND A. YATES, Wilmington, Del.—*Machine for Cleaning Sheet Iron*.—April 4, 1865.—This machine consists of a series of feed rollers, which pass the sheet between a series of revolving brushes and another pair of flat brushes, which have a reciprocating motion across the top and bottom surface of the sheet, upon which, meanwhile, jets of water are forced through small tubes for that purpose. The sheet then passes between two elastic squeezing rollers, which deprive it of a great proportion of the moisture, and then passed over a furnace, which completes the drying process.

Claim.—First, cleansing sheets of metal by scrubbing and washing them, and preventing them being oxidized thereby by immediately afterward subjecting said sheets to heat, and thus causing all moisture to be evaporated from their surfaces, substantially as described.

Second, the combination of the squeezing rollers E E, and a heater for quickly drying the sheets, substantially as described.

Third, the rotary brushes C C, in combination with the reciprocating brushes D D, and feed rollers, all arranged substantially as and for the purpose specified.

Fourth, the water tubes H, in combination with the brushes and feed rollers, arranged to operate as set forth.

Fifth, the heater I, when used in combination with the brushes and feed rollers, and arranged to operate in connection therewith, for the purpose described.

No. 47,104.—HENRY HEITMAN, Brooklyn, N. Y., and JOHN RADICAN, New York, N. Y.—*Screw Windlass and Capstan*.—April 4, 1865.—This invention consists in a combination of two sets of gear wheels, for a variation of speed and power; also, in the combination of the capstan barrel with toothed wheels, pawls, and stationary locks on the bed plate, so that by a change of pawls the capstan and windlass may more readily be connected or disconnected.

Claim.—First, the gear wheels V V, applied in combination with the gear wheel D, worm wheels L L, capstan E, and windlass I I, substantially in the manner as herein set forth, so that the capstan can be readily connected or disconnected from the windlasses, and a more or less powerful force can be exerted, according to the work to be accomplished.

Second, the combination of the capstan barrel E, pawls G G G, and toothed wheel D, with pawls F F, and with stationary locks in the bed plate B, substantially as described, so that by a simple change of the pawls F and G, the capstan barrel can be used independently or in connection with the parts to which motion is imparted by the gear wheel D.

No. 47,105.—GEORGE F. HASSENPLUG and GEORGE BARNHART, Green township, Ohio.—*Cultivator*.—April 4, 1865.—In this invention the frame is of a horse-shoe shape, and of one piece of bent timber. The plough standards are adjustable, and swing back upon hinges when the wooden pin is broken by any obstacle. The handles are also adjustable.

Claim.—The frame *a c*, when constructed as described, in combination with the plough standards *b b b b*, the same being attached as specified.

No. 47,106.—W. P. L. HERR, Brooklyn, N. Y.—*Instrument for Cutting Potato Seedlings*.—April 4, 1865.—This invention consists of a hollow spoon, scoop, or cutter, with a metallic or wooden handle, to which the spoon is attached, either rigidly or so as to be capable of motion. The instrument is used to cut out seedlings from potatoes, and also to shape them into half balls or other desired forms.

Claim.—A scoop or cutter constructed substantially as shown in Fig. 2, for the purposes herein described.

No. 47,107.—JAMES H. HOFFMAN, New York, N. Y.—*Manufacture of Sweat-proof Paper Collar*.—April 4, 1865.—This invention consists in applying to the paper a coating of the following composition: Ten pounds of "blanc fix," one pound of isinglass, and one pound of white wax, dissolved in alcohol. The paper after being dried is run through a sizing machine, to harden and smooth the surface. A thin coating of bleached shellac dissolved in alcohol is then applied, and the paper again passed through a sizing machine. The paper is then passed through a fluting machine, and receives the finish desired.

Claim.—The manufacture of sweat-proof paper collar, with the composition substantially as described, applied in the manner substantially set forth.

No. 47,108.—EDWARD P. HOWLAND, Worcester, Mass.—*Car Coupling*.—April 4, 1865.—This invention relates to the peculiar construction of a drop-bar or weighted coupling bolt, and to an arrangement of certain springs, by which a slide block is operated, which supports the drop-bar previous to the application thereto of the link.

Claim.—The drop-bar B, made in shape substantially as herein described, having a pin *c* and shoulder *o* near its lower end, and when part of the same is made with wrought iron, with metal cast around it, substantially as and for the purpose set forth.

No. 47,109.—W. F. KEELER, La Salle, Ind.—*Governor*.—April 4, 1865.—This invention consists in providing a metallic case with vertical sides and a flat bottom, closed at all points except at the centre, through which at the top the shaft passes, and near its outer edge, where it is perforated, to allow the mercury gauge to be inserted. At the bottom of the metallic case a piston plate is fitted, which is operated by a rod extending down from the governor. The case above the piston is filled with mercury, and this communicates with the mercury in the gauge, so that the speed of the water increases, and the governor bells expand. An upward movement is imparted to the piston, and a portion of the mercury contained in the case is forced into the gauge, which is graduated upon the outside, and thus the speed of the water is indicated, as well as regulated. When a diminution of the speed occurs, the weight of the column of mercury in the gauge operates upon that in the case, and that upon the piston, and thus through its connection with the governor, causes it to return it to its normal condition.

Claim.—First, combining with the balls and connecting arm of an ordinary governor for regulating and measuring the speed of a steam engine, or other machine, a column of mercury *k*, resting upon a disk or movable bottom in the case in which the mercury is enclosed, substantially as above described.

Second, the combination of the mercury gauge O with the closed case G, the movable disk I, and the shaft B, substantially as above described.

Third, the combination of the movable disk I and shaft B with the closed case G, for containing mercury, substantially as described.

Fourth, balancing or controlling the centrifugal force of the balls, or other rotating apparatus of a governor for regulating speed in machinery, by means of the weight of a column of mercury rising within a gauge O upon the stationary frame, as herein described.

No. 47,110.—WILLIAM KINNARD and J. B. DREHER, Cleveland, Ohio.—*Melodeons*.—April 4, 1865.—This invention consists in the mode of producing a swell by means of a spring door, to which the treadles are connected, so as to operate the swell and bellows at one time.

Claim.—First, hanging the door or panel to the case in combination with the treadles, substantially as and for the purpose described.

Second, the arm G and rod H, in combination with the levers I and J and swell, substantially as and for the purpose described.

Third, the hinged panel A, treadles B, in combination with the arm G, rod H, and levers I J, substantially as and for the purpose described.

No. 47,111.—HIRAM KIPE, Thornbury, Penn.—*Stove-pipe Damper*.—April 4, 1865.—This invention consists in a stove pipe in which a wind wheel, moved by ascending products of combustion, operates a spindle, to which, outside of the pipe, is attached a ball governor. From an arm extending from the top of the spindle motion is communicated to a throttle-valve in the pipe.

Claim.—Combining with an ordinary stove pipe a wind wheel T, a spindle d, and ball governor Q, for operating a throttle-valve V, substantially as above described.

No. 47,112.—ROBERT KRAUSE, New York.—*Mattress*.—April 4, 1865.—Within an ordinary frame for the reception of a mattress is arranged at the upper end a second movable frame of about the same depth, and of a little less width, but of only one-third the length, more or less. The stuffing of this secondary frame is separate from that of the main frame. Through the centre of the top piece of the secondary frame passes a screw, by means of which it can be raised to any desired height with its stuffing, and thus made to take the place of pillows.

Claim.—The application of a movable partial frame, adjusted by a screw, and held in position by spring tongues to any common mattress frame and spring bottom, by means of which frame, screw, and spring tongues any spring-bed mattress can be turned into a comfortable bed, without the aid of cushions and pillows, as herein described.

No. 47,113.—WILLIAM J. LEWIS, Pittsburg, Penn.—*Manufacture of Bolts*.—April 4, 1865.—This invention consists in enlarging that portion of the cylindrical blank or section by a round rod, of which it is designed to form the head and neck of the bolt by upsetting the same in a cylindrical die, after which the blank is conveyed to other dies, which form the square neck by lateral compression, and which at the same time maintain the blank firmly, while the thread is being formed by a heading punch in the usual manner.

Claim.—Making bolts with square necks from old iron, by first staving up or enlarging that part of the rod intended for the neck previous to the formation of the square, and subsequently squaring that part by compression or otherwise, without regard to the nature of the tools used for that purpose.

No. 47,114.—JOHN A. LIEB and JOHN SCHMADEL, Newark, N. J.—*Roller Cleat for Trunks*.—April 4, 1865.—This invention consists in the arrangement of mortises or cavities in the cleat of a trunk, in combination with rollers, the axles of which have their bearings in the side of said mortises, in such a manner that the rollers can be secured to the cleat without the use of metal brackets.

Claim.—As an improved article of manufacture, the trunk cleat A, provided with rollers b b, inserted in mortises a a, all as herein specified.

No. 47,115.—IRA E. LOUGHBOROUGH, Pittsford, N. Y.—*Heel and Toe Plate for Boots and Shoes*.—April 4, 1865.—This invention consists in the construction of a metallic heel and toe plates for boots and shoes, with several lips projecting inward from the upper edge of the plate, one or more of said lips being provided with a point or spear, which is forced into the heel.

Claim.—The external plate b, when provided with projecting lips c and points e, it being secured to the boot by the clumping lift or lifts f, which are nailed on within the encircling rim of the plate, the edge of the lifts being entirely protected from wear by the said rim or flanges.

No. 47,116.—G. C. MARTEN, Cleveland, Ohio.—*Watches*.—April 4, 1865.—This invention consists in a main spring barrel, composed of two parts, one inside the other, the outer barrel being rigidly connected to the main gear wheel, and the inner barrel carrying the

winding arbor, the main spring, and maintaining ratchets. Upon each of the barrels is a stop, arranged in such a position that when the spring is wound up the inner barrel turns independently of the outer, until the two stops come in contact, when both revolve as one. Should the main spring break, the inner barrel flies back, until it nearly completes a full revolution, thus expending the force of the spring, and preventing injury to the mechanism of the watch.

Claim.—A main spring barrel, constructed of an outer barrel B, and an inner barrel C, which are provided with stops *d e*, and combined with the main spring, winding arbor, and retaining power, in the manner and for the purpose substantially as herein set forth.

No. 47,117.—W. T. MERSERAU, Newark, N. J.—*Furniture Caster*.—April 4, 1865.—In this invention the balls of this caster have on two opposite points projecting trunnions, which take in a groove within the side of the containing cylinder, and thus the ball has a circular horizontal movement.

Claim.—The ball or roller B, provided with the journals *b*, when the same shall be constructed as shown, for the purpose specified.

Second, in combination with the same the base A, ring C, and collars *d d2*, when the same shall be combined substantially as shown, for the purpose set forth.

No. 47,118.—J. A. MILLER, New York, N. Y.—*Boiler Furnace*.—April 4, 1865.—In this invention, through chambers on either side of the furnace and horizontal openings slanting inwardly, are passages for air to flow into the back part of the combustion chamber, and above the fuel. Nearly in the centre of the furnace is the fire bridge. The furnace door is lined, the inner plate having lateral oblique openings, and the outer a damper. To the lower hinge of this door, which is hollow, is attached an air pipe, connected with a blowing apparatus; the pintle and socket are made with openings like a cock, and so arranged that a passage for air to blow across the mouth of the furnace is opened by opening the door, and closed by shutting it.

Claim.—First, the slits or openings *a a* in combination with the horizontal passages E in the side walls of the fire chamber, and with the ducts D in communication with the ash pit, substantially as and for the purpose herein specified.

Second, giving the openings *a a* an inward horizontal inclination toward the bridge wall or rear of the fire chamber, substantially as and for the purpose herein specified.

Third, the pier G, and side openings *c c* over the fire bridge, in combination with a system of stilt or openings *a a* for the admission of air through the side walls of the fire chamber, substantially as and for the purpose herein specified.

Fourth, the laterally oblique arrangement of the perforations *g g* in the back or inner screen I of the fire door, substantially as and for the purpose herein specified.

Fifth, the hollow hinge *h i* in combination with one or more openings *m n* in the door or fire front, and with a pipe *j* for the introduction of air from a blowing apparatus, whereby a current or currents of cold air are discharged in thin sheets across the open doorway, substantially as and for the purpose herein specified.

No. 47,119.—IVON B. MILLER and WM. H. MILLER, Philadelphia, Penn.—*Manufacture of Packing for Pistons*.—April 4, 1865.—This invention consists of a fibrous tube, filled with a composition of powdered soapstone, resin, or plumbago, or filled with fibrous material saturated thoroughly with such substances. The covering may be put on by brading, and may be strengthened by wrapping the wire.

Claim.—First, the application of dry powdered substances to the fibrous material for the manufacture of packing in the manner above described, or any other substantially the same, and which will produce the intended effect.

Second, the fibrous braided cover as applied to packing, in the manner and for the purpose above described, or any other substantially the same, and which will produce the intended effect.

Third, the application of powdered substance to the fibre before it is made into yarn, as above described, or any other substantially the same, and which will produce the intended effect.

Fourth, the use of the cover made of one kind of fibre and the inside or filling made of another kind, without the use of powdered substance, as above described, or any other substantially the same, which will produce the intended effect.

No. 47,120.—JOHN D. METS, Dubuque, Iowa.—*Construction of Albums*.—April 4, 1865.—Thick leaves of photograph albums are connected preparatory to being bound into loose form by narrow strips of leather, cloth, or other material, pasted along the edges of the leaves longitudinally, to which strips the filling boards which give the requisite degree of stiffness to the leaves are connected by means of some thin facing material pasted over the filling boards, and extending a short distance over the aforesaid strips.

Claim.—Connecting together the leaves of books by means of strips of leather, cloth, or the equivalents thereof, applied substantially as described.

No. 47,121.—CLARK MILLS, Washington, D. C.—*Mode of Taking Casts from the Face of Living Persons*.—April 4, 1865.—This invention consists in placing the person in an upright position, and spreading the plaster in a thin layer over the face, so that it can be broken off by the mere working of the muscles; the pieces are joined and strengthened to form the mould.

Claim.—The mode of process herein described.

No. 47,122.—ALBERT MORTON, South New Market, N. H.—*Valves for Steam Engines*.—April 4, 1865.—This invention consists in providing two port covers, one at each end of the main valve, the two being connected together by a rod or rods, and combined with a cross-head and screw-rod, in such a manner that, by turning the rod, these port covers are adjusted and the steam is cut off at any desired point of the stroke. The covers or cut-offs work upon the same seat as the main valve, and cover or uncover the several induction ports of the engine, and by turning the screw-rod so as to entirely prevent the ingress of steam to the cylinder, or allow it free passage, during the full stroke of the piston.

Claim.—The use of two port covers C C', one at each end of the valve, and connected together by a rod or rods, or their equivalents, in combination with the cross-head D and regulating rod g, constructed and operating substantially as and for the purpose set forth.

No. 47,123.—OWEN E. MOSHER, New York, N. Y.—*Refrigerator*.—April 4, 1865.—This invention consists in the addition to a refrigerator of a water tank, from which, through the refrigerator, cooled water can be drawn from outside. It consists also of an ice chamber, a trough, and water tank.

Claim.—The combination of the ice chamber B, trough C, and water tank D, when the said parts are constructed and arranged in the manner and for the purposes herein specified.

No. 47,124.—GEORGE C. PAINE, San Francisco, Cal.—*Baling Press*.—April 4, 1865.—This invention consists in the use of a toggle applied to a hay press in such manner as to afford an efficient mechanism for operating the follower and compressing the hay, &c.; also in the arrangement of fastenings for the side and top doors of the press, whereby the same may be readily opened and shut.

Claim.—First, the peculiar arrangement and construction of the double toggle levers connected with the follower D, in combination with the chain or ropes s s, pulley H H, and friction rollers g', whereby the shaft and wheel are located on the outside of the vertical press box, for the purposes described.

Second, the levers I N and bars n n, connected together and applied to the top K of the press box, as shown, in combination with the catches L L, all arranged substantially as and for the purpose herein set forth.

Third, the loops or catches R R applied to the shafts p p, connected at their upper ends by the rod q and cranks r r, and arranged relatively with the sides O O, substantially as and for the purposes herein set forth.

Fourth, the connection of the pintles of the hinges of the side doors O O by means of the pulleys P P and cross-chain Q, substantially as and for the purpose specified.

No. 47,125.—JAMES PERKINS and WM. H. BURNETT, Newark, N. J.—*Apparatus for Distilling and Refining Petroleum*.—April 4, 1865.—This invention consists of a still connected with a receiver. The crude petroleum is forced into the receiver, and the lighter oils are driven over, in the form of vapor, into the condenser; the receiver being heated by a steam jacket. The petroleum is then allowed to pass into the still, which is provided with agitators, and a receiver to carry off the residuum. The heat of the fire causes the petroleum to pass over, in the form of vapor, into the condenser; the pump being used to exhaust the air and facilitate the evaporation.

Claim.—First, the combination of the receivers C and K with the agitator N and sediment receiver M, substantially in the manner and for the purposes described.

Second, the combination of the parts C E K N and O, substantially in the manner and for the purpose described.

Third, the use of the exhaust pump H and R, in combination with the distilling and condensing apparatus described, substantially in the manner and for the purposes set forth.

No. 47,126.—O. C. PHELPS, New York, N. Y.—*Feed Wheel as a Substitute for Ratchets or Parts*.—April 4, 1865.—This invention consists in a movement in machines in which a feed wheel is used, by which the feed may be readily reversed or stopped.

Claim.—The combination of the shifting apparatus, above described, with said wheel and clutch, as and for the purpose herein set forth.

No. 47,127.—RUFUS S. PICKET, New Haven, Conn.—*Percussion Cap-holder for Firearms*.—April 4, 1865.—The caps are arranged in a row around the interior of an oblong box upon an endless belt extended between a small pulley and a ratchet wheel, which ratchet wheel is revolved by means of a thumb dog passing through the back of the box, so as to drive forward one cap at every movement of the dog.

Claim.—First, the combination of the ratchet wheel with the endless belt and its forked stud *p*, when the whole is constructed and fitted for use, substantially as herein described.

Second, the combination of the endless belt with the guide *m* and cup *l*, when the whole is constructed and fitted for use, substantially as herein described.

No. 47,128.—AMOS RANK, Salem, Ohio.—*Harvesters.*—April 4, 1865.—This invention relates to the manner of applying a "cut-off," in combination with a slatted, dropping platform, from which the grain is discharged, when the platform is dropped by means of the stubble passing between the slats and holding the grain, while the platform is withdrawn by the forward motion of the machine. The cut-off is for the purpose of preventing the grain from falling upon the platform during the operation of discharging the gavel therefrom, and is connected at each end with a rod or lever, which is pivoted, at a fixed point, to the side board of the platform, and extending beyond and back of the pivots; these rods pass through loops or eyes attached to the rear end of the dropping platform, in such manner that, when the platform is dropped, the guard or cut-off is thrown up to intercept the falling grain, and that said cut-off, when the gavel is discharged from the platform, will act as a counterpoise to assist in again elevating the platform to receive the falling grain.

Claim.—First, the combination of a hinged platform with a guard *g* and guard levers *h h*, when the rear ends of said levers are attached by a sliding connection to the platform, substantially as described.

Second, the connecting of the bail or guard *g* at a fixed point to the divider boards of a platform in such a manner that while the bail is always connected to the platform the bearing point *i* of the bail always remains the same, substantially as herein described.

Third, the arms *b b*, applied at the ends of the guard *g*, substantially as described.

No. 47,129.—JOHN RANKIN, New York, N. Y.—*Churn.*—April 4, 1865.—In this invention two screw dashers are arranged, the one over the other; the one feeding from the centre to each arm, and the other from each arm to the centre. These dashers are in combination with a blast of air thrown in by a fan.

Claim.—First, the use or employment of a blower for forcing a blast of air into the churn box, substantially as described, in combination with two screw dashers, arranged one above the other, and so as to create a circulation of the cream, all as and for the purposes herein before set forth.

Second, the employment, in combination, of two screw dashers, one above the other, when one feeds from the middle toward each end, and the other feeds from each end toward the middle.

Third, the employment of the internal and external gears *j i* and pinions *f g*, in combination with the friction rim disk *k* and friction pulley *m* of the blower shaft, the whole arranged and operating as specified.

No. 47,130.—EDWIN REYNOLDS, Mansfield, Conn.—*Steam Boiler.*—April 4, 1865.—This invention consists in the division of the water-space of a boiler by a partition, when the subdivision most remote from the heating influence is connected by a passage or passages with the water-containing projection extending into the furnace chamber; the object being to create a circulation of the water in the boiler, which is produced by the greater amount of heat absorbed by the water in the outer compartment, which causes it to rise in the space above, and this action causes a downward flow through the internal water-space and to the pipe which leads to the water-containing projections. The outer surface of these projections being exposed to the heat of the furnace, and communicating with the water-space of the boiler, allows a free circulation through them also.

Claim.—The arrangement and construction of a boiler, substantially as described.

No. 47,131.—F. W. RITTERHOFF, C. A. COLQUITT, and WILLIAM MULCHAHEY, New York, N. Y.—*Machine for Cutting Tobacco.*—April 4, 1865.—This invention consists in operating the feed roller by means of a slotted, adjustable disk; this disk is adjusted so as to be more or less eccentric, and thus operates the feed roller more or less rapidly.

Claim.—The slotted, adjustable disk *L*, in combination with the lever *K*, ratchet wheel *J*, screw rod *I*, and follower *H*, constructed and operating substantially as and for the purpose described.

No. 47,132.—LOUIS S. ROBBINS, New York, N. Y.—*Process for Preserving Wood.*—April 4, 1865.—This invention consists in first removing the surface moisture of the wood, and then saturating it with oleaginous vapors. The wood is placed in the chambers, which are connected with a retort by means of a pipe; the retort is filled with coal tar, &c., and upon applying heat to the retort the oleaginous vapors generated pass into the chambers and expel the surface moisture from the wood and saturate the pores.

Claim.—The process herein described for preserving wood from mould and decay, the same consisting in first removing the surface moisture from the wood and then charging and saturating the same with hot oleaginous vapors and compounds, substantially as herein described.

Also, removing the surface moisture from wood by means of hot oleaginous vapors, substantially as herein described.

No. 47,133.—JOHN B. ROOT, New York, N. Y.—*Oil Well Pump*.—April 4, 1865.—The object of this invention is to exhaust the gases in petroleum wells, which interfere with the successful operation of pump valves, when the well is tubed in the usual manner, and in applying an additional tube and seed bag, in combination with each other, whereby the oil tube and oil pump may be removed from the well without disturbing the seed bag. Its novelty consists in an additional tube, arranged and applied in combination with the oil pump tube and the exhausting pump with the seed bag, so as to provide for the exhaustion of the gases and the exclusion of water from the lower part of the well. A tube, surrounding and connected with the upper part of the oil tube, is applied within the well, so that the oil tube and oil pump may be removed without removing or interfering with the seed bag.

Claim.—First, the employment in an oil well of an additional tube, so arranged and applied, in combination with the oil tube and an exhausting pump, that, while it permits the exclusion of water from the lower part of the well by means of the seed bag, it provides for the escape of the gases from the well, substantially as herein described.

Second, the arrangement of the tube C, surrounding and connected with the upper part of the well, substantially as herein described, whereby the oil tube and oil pump may be removed without disturbing the seed bag.

No. 47,134.—SARAH E. SAUL, New York, N. Y.—*Churn*.—April 4, 1865.—This invention consists in providing a churn with a cover sliding in grooves, said cover being in two parts and fitting close around the dasher shaft, in connexion with a hand-rest attached to the crank of the dasher shaft.

Claim.—The laterally-sliding covers C C in combination with the dasher shaft, as and for the purpose herein shown and described.

Also, the hand rest F, in combination with the crank E, substantially as and for the purpose herein shown and described.

No. 47,135.—CHANDLER SEVER, Boston, Mass.—*Clasps for Clothing*.—April 4, 1865.—In this invention two disks are connected by a hinge. The inner disk, being perforated, is sewed to the garment. Upon its upper face a stud stands opposite the hinge to enter an eyelet in the part of the garment to be held. The outer disk being now closed upon this, keeps the stud and eyelet in union.

Claim.—Improved clothes fastener attachment, the same consisting of the plates *a* and *d* and the stud *f*, they being constructed and to operate in connection with an eyelet or hole in the outer lap of the garment, substantially in the manner as herein before explained.

No. 47,136.—S. B. SEXTON, Baltimore, Md.—*Base-burning Stove*.—April 4, 1865.—In this invention the supply cylinder is a chamber surrounding the feed opening, in the bottom of which are apertures controlled by a damper. The products of combustion can thus flow into this chamber and directly to the exit pipe, or be directed from the top of the chamber, about the fuel cylinder, by pipes at the side of the stove, down to the chamber about the ashpit, and thence to the exit pipe. There are sliding mica doors in front of the stove. By putting a grate in the bottom of the supply cylinder a fire may be made there when desired instead of in the usual fire chamber.

Claim.—First, a base-burning stove, which is so constructed that the gas which is generated in the coal supply cylinder C can be conducted off through the top plate of said cylinder and around the feed opening at pleasure, substantially as herein described.

Second, a chamber D, with a valvular bottom and escape pipe *d* arranged over the coal supply cylinder or magazine of a base-burning stove, substantially as described.

Third, the draft flues *c c*, when carried out of the top of the chamber B and conducted into a chamber *a* having an ascending flue leading out of it, substantially as described.

Fourth, the combination in a base-burning stove of the projecting ledge *h* formed on the lower edge of the opening through case F and a flanch *i* projecting from the base rim of the cylinder surrounding the chamber B, substantially as described.

Fifth, the application of a supplemental grate S to the magazine of a base-burning stove, substantially as described.

No. 47,137.—JAMES SUTHERLAND, New York, N. Y.—*Manufacture of Propellers*.—April 4, 1865.—This invention consists in forging the wheel of wrought-iron in two parts, each of which forms two opposite blades on one-half the hub connecting them. These two halves of the hub are then interlocked with the arms of one at right angles with those of the other, and secured together by stout rings or bands shrunk upon and around each end of the hub.

Claim.—Constructing a propeller out of two parts by forming the hub of each part substantially as herein shown and described and fitting the two parts together, as and for the purposes set forth.

No. 47,138.—J. H. THOMAS and P. P. MAST, Springfield, Ohio.—*Machine for Distributing Fertilizers*.—April 4, 1865.—In this invention the stirrers are pivoted to a bar running lengthwise over the top of the hopper, and, after passing through a slot in its bottom, are united upon a horizontal swinging bar underneath. The width of the slot is varied by adjustable metal plates. The stirrers are provided with short arms extending horizontally.

Claim.—First, the slats or strips C suspended from the bar B and projecting through the opening in the bottom of the hopper A, when connected at the bottom by bar d, substantially as and for the purposes set forth.

Second, the shafts C provided with the projections a and e, as and for the purposes described.

Third, the slats C, as arranged in combination with the bar D and bottom pieces F and F', as and for the purpose set forth.

No. 47,139.—WILLIAM THOMAS, Ottawa, Ill.—*Device for Raising and Lowering Lock Gates.*—April 4, 1865.—This invention consists in an arrangement of devices designated in the claim for hoisting the lock gates of canals, whereby heavy gates can be easily raised by the application of much less power than is usually required.

Claim.—The combination of the block and tackle, the roller levers, ratchet wheels, the pawls, the springs, and frame of the machine, being operated and used as herein before set forth for the uses and purposes set forth.

No. 47,140.—JOHN THURMON, Pike county, Mo.—*Medical Compound.*—April 4, 1865.—This invention consists of a compound made by distilling, in pure water, sarsaparilla, one part; running brier root, one part; poke root, one part; cherry tree bark, one-half part; blood root, one-half part; and mullein root, one-half part.

Claim.—The medical compound prepared as described.

No. 47,141.—S. F. VAN CHOATE, New York, N. Y.—*Insulator for Telegraph.*—April 4, 1865.—A hook, intended for the support of a telegraph wire, is insulated in a wooden pin which is fastened to a telegraph post. A deep and narrow cavity, opening on the under side of the pin, runs up into it at various angles, being also provided with sundry grooves. In the top of this cavity the hook is secured. The effect of the smallness and crookedness of the cavity with its grooves is to render difficult, or nearly impossible, the deposition of moisture from the atmosphere around the base of the hook, and the consequent diversion of electric current which is very likely to take place when moisture is so deposited.

Claim.—First, the combination of the cavity A, face plate D, and pin hook C, for the purposes set forth.

Second, the wooden bracket B, plate D, and hook C, as above combined, when coated with the composition as above and for the purposes set forth.

No. 47,142.—N. E. WARREN, Cleveland, Ohio, and G. W. WARREN, Hillsdale, Mich.—*Addressing Machine.*—April 4, 1865.—This invention is intended principally for addressing newspapers. It consists of an adjustable head applied to a curved arm operating as a platform worked by a treadle, &c.

Claim.—First, the curved lever C C', operated by the bent spring G, in combination with the adjustable head D, when arranged and operating as herein set forth.

Second, the pall F', rock-shaft L', slotted arm L'', and adjustable rod J, in combination with the quod ratchet I, operating as specified.

Third, the adjustable head D with the faces d d', arranged and operated as and for the purposes specified.

No. 47,143.—TRUE WEST, Roxbury, Mass.—*Railway Carriage.*—April 4, 1865.—This invention consists in the arrangement of four struts, four pendulous rods, and two semi-elliptical springs, disposed on each side of the truck frame, with such frame and the axle boxes thereof, and the platform of the carriage body, the purpose of said arrangement being not only to support the platform at points between as well as outside the axle boxes, but to accomplish the same so as not only to allow a lateral sway of the platform, irrespective of the springs, but so to distribute the pressure of the springs on the axle boxes as to prevent any tendency of such pressure to curve the truck frame.

Claim.—The combination and arrangement of the four struts E E E E, the four pendulous rods or hangers F F F F, and the two semi-elliptical springs G G, disposed on each side of the truck frame B, with the said frame, the axle boxes C C thereof, and the platform or carriage body A, the whole being substantially as represented in figure 1 of the drawings, as hereinbefore explained.

No. 47,144.—LORENZO WESSON, Chillicothe, Ohio.—*Electro-magnetic Musical Instruments.*—April 4, 1865.—This invention consists in the employment of a series of block types arranged upon a slide, so that in pressing under springs the types establish galvanic circuits with electro-magnets, which, by means of lever armatures, operate upon the keys of musical instruments. The extent of the type surface passing under the spring determines the duration of the note. For increasing the sound a second battery is brought into play.

Claim.—First, an electro-magnetic apparatus for playing music with variable power or expression, by automatically varying the battery power exerted on the magnets to accord with the number of magnets in use or with the strength of sound required, in any manner, substantially as set forth.

Second, a music board B, provided with independent movable type, acting upon or constituting circuit breakers or circuit closers, to regulate or govern the tone, power, or length of sounds produced by means of electro-magnetism.

Third, the key board C, connected with a series of magnets, and constructed substantially as set forth, with two or more circuits, by which any of the said magnets may be put in action at will.

Fourth, in combination with the key board C and series of magnets, the levers G, plates I, and wires J, all arranged as described and adapted to operate substantially as and for the purpose set forth.

Fifth, in combination with the electro-magnets E E' E2, music board B, and additional battery F', the lever G', operating substantially as described, to open communication between the additional battery and magnets when required.

No. 47,145.—HENRY P. WESTCOTT, Seneca Falls, N. Y.—*Churn*.—April 4, 1865.—This invention consists in the arrangement of bellows or blowers arranged on top of the cream chamber, and operated by the dasher shaft in such a manner as to cause a blast of air to penetrate numerous holes in the top of the cream chamber, and enter into the mass of cream while being agitated by the dashers; and also in an arrangement for assisting the operation of the dashers, consisting of a spiral spring arranged on an arc in such a manner as to exert a constant tendency to vibrate the hand lever upward when the latter is depressed; and, further, in the adjustability of the dasher and the form of the same, so as to adapt it to either a greater or less quantity of cream in the chamber.

Claim.—First, the employment, in combination with the arm E, lever D, and arc *g* of a spring *f*, substantially as and for the purpose set forth.

Second, the use of a bellows B, or its equivalent, in combination with the receiver and dasher shaft, in the manner and for the purpose substantially as set forth.

Third, making the dasher adjustable, substantially as and for the purpose set forth.

Fourth, the peculiar form of upper dash shown and described, for the specific purposes set forth.

No. 47,146.—JOSEPH F. WHITE, Keene, N. H.—*Pump*.—April 4, 1865.—In this invention a vertical cylinder is submerged, and a hollow rod is pivoted centrally at the bottom and ascends to the desired place of delivery. Fitting snugly within the cylinder are hollow wings with side openings and interior valves. Abutments of like construction are attached to the interior of the cylinder. A reciprocal horizontal motion being imparted to the hollow rod, the water enters its submerged wings and ascends through the tubular rod.

Claim.—The combination, in a double-acting pump, of a valve chest W, provided with triangular valve chambers A, with a rotating pump tube, carrying hollow radial arms E which have partial rotary motion in horizontal directions, and are provided with double-acting valves, substantially as above described.

No. 47,147.—WILLIAM H. WHITMORE, Boston, Mass.—*Apparatus for Dividing Sugar in Blocks*.—April 4, 1865.—In this invention are used circular saws. The improvement consists in combining with the saws certain wheels as rotary separators.

Claim.—The combination of the conduit, one or more saws, and the separators, arranged substantially in manner and so as to operate as specified.

No. 47,148.—GEORGE L. WITSEL and EDWARD BURKE, Philadelphia, Penn.—*Oil Ejector*.—April 4, 1865.—This invention consists in the combination of a compressing and lifting pump with the pipe of an oil well in such a manner that the air from a compressing pump is carried down to the lower end of the eduction pipe in a passage separated from it, and is caused to ascend through that pipe under great pressure, carrying with it a column of oil. This column will be raised as high as the pressure of the air is capable of carrying it. The ordinary pump is attached to the same eduction pipe, and is operated by the same machinery, and in the event of a want of sufficient force in the ascending column of air to force the oil to the surface, this pump aids in the operation by forming a partial vacuum, and thus enables the oil to reach the required height.

Claim.—First, the combination of condensing and exhausting pumps in conjunction with induction and eduction pipes, arranged within an oil well, substantially as and for the purposes described.

Second, connecting both the exhausting engines to a lever which receives a rapid vibrating motion, substantially as and for the purposes described.

No. 47,149.—ORVILLE O. WOODRUFF, Killingworth, Conn.—*Bow Pin for Ox Yoke*.—April 4, 1865.—This invention consists in constructing two latches, placed upon the upper side of the yoke, so that when the bow is passed through the yoke the latches will spring into the pin-holes of the bow and securely hold the same in place until the latches are withdrawn.

Claim.—The combination of the two levers A A, constructed with pins D D, substantially as and so as to operate in the manner and for the purpose specified.

No. 47,150.—WILLIAM C. AMES, Hartford, Conn., assignor to LANDERS & SMITH MANUFACTURING COMPANY, New Britain, Conn.—*Window Cord Pulley*.—April 4, 1865.—This invention relates to that portion of a window sheave which is called the case. The object of the invention is to reduce the cost of the article itself in its manufacture, and to lessen the amount of labor required in fitting it into the jamb of a window for use.

Claim.—As a new and improved article of manufacture, viz: a window or sash-cord pulley case, having the face plate *a* midway, or nearly so, of the case *a*, to be attached to the back side of the jamb casing of the window frame, substantially as described.

No. 47,151.—JOHN CONNER, assignor to himself and HENRY A. AYLING, Boston, Mass.—*Mode of Weaving Fabrics with Button-holes therein*.—April 4, 1865.—A portion of the dents of the reed have inclined projections thereon, the said projections extending forward the length of the button-holes. The reed is given a positive upward motion while weaving the other side, to allow this incline to adapt itself to the gradually increasing web as woven; during which downward motion the take-up is stopped until the last side of the button-hole is finished, when the weaving across the whole warp is resumed and the take-up again applied. The reed may have a double incline.

Claim.—The improvement in weaving suspender webbing, &c., to form button or other similar holes therein, by the employment of a reed having a construction, and operating in the manner substantially as set forth.

No. 47,152.—JOSEF JOHNSON, New York, N. Y., assignor to JOHN WARD, jr., Brooklyn, N. Y.—*Mangle*.—April 4, 1865; antedated March 30, 1865.—This invention consists in a certain combination and arrangement of longitudinal springs and connections with the rollers, which are adjusted by a screw.

Claim.—The combination and arrangement of the screw Q, the spring O, and the links N, with the rollers B' and B, and the frame A, substantially as and for the purpose set forth.

No. 47,153.—GRIFFITH M. MURPHY, assignor to LYMAN S. PAINE, Lewisburg, Penn.—*Seed Drill*.—April 4, 1865.—In this invention an adjustable spring is placed between the drag bar and the lever which holds the tooth in position. This spring, being adjusted nearer to or further from the fulcrum, governs or controls the amount of pressure that is required to draw back the tooth.

Claim.—First, a sliding or transferable spring *g*, whereby the power required to throw the drill tube out of working position may, at the will of the operator, be increased or diminished, substantially as described.

Second, the arrangement of the lever C, entirely above the drag bar A, substantially as described.

Third, the combination of the drill tooth B, drag bar A, lever C, and spring C, substantially as described.

No. 47,154.—FRANCIS B. MORSE, New Haven, Conn., assignor to FREDERIC C. DAYTON, jr.—*Shaft Coupling for Carriage*.—April 4, 1865.—This invention consists in making the stationary part of the coupling or joint with two eyes and a cavity opening forward or towards the heads or movable part of the coupling; the said cavity is filled with India-rubber, or any other elastic substance, to press against the movable part of the joint so as to obviate all rattling.

Claim.—As a new article of manufacture, a shaft coupling, composed of a jack or stationary part, forged with two eyes and a cavity for retaining an elastic presser, an elastic presser, and a plain head with one eye, when constructed, combined, and fitted for use, substantially as herein described.

No. 47,155.—DATUS E. RUGG, New York, N. Y., assignor to himself, F. S. OTIS, JOSEPH I. and J. O. WEST, JEDEDIAH WILCO & Co., and HENRY RICHARDSON.—*Forming Skeleton Skirt*.—April 4, 1865.—This invention consists of a frame of wood of such shape that when the steel hoops destined to form a skeleton skirt are placed upon it, the proper shape will be given them, and they will also be in a convenient position for the attachment of the gallons or ribbons which connect them. This frame is also provided with a block upon which to place the waistband of the skirt.

Claim.—The method herein specified of shaping or forming ladies' skeleton skirts by sustaining the hoops in the proper position, relatively, while being connected together by tapes, gallons, or their equivalents, for the purposes specified.

No. 47,156.—SIGNOR VALLO, assignor to himself and JOSEPH CHAPMAN, Philadelphia, Penn.—*Railway Car*.—April 4, 1865.—This invention consists in the combination and arrangement with a car or truck, of foot pieces for removing persons off the track of a passenger railway without permanent injury, such as would be sustained by the wheels running over them, in such manner as to preserve a uniform proximity of the said foot pieces to the rails at all times. It also consists in a peculiar construction and arrangement of the said foot pieces, by which they are kept free from the guard rails while turning curves.

Claim.—First, connecting the foot pieces E E E E with the springs J by means of the

legs F F F F, bars G G, and spring seats H H H H, substantially in the manner and for the purpose above described.

Second, combining the spring seats H H H H with the bars G G by means of the pins *eeee* on the inner edges of the said seats, and corresponding holes in the bars G G.

Third, the combination and arrangement of the foot pieces E E E E with the legs F F F F by means of the hinges *a* and springs *a'*, substantially in the manner and for the purpose above described.

Fourth, combining the rods M M with the foot pieces E E E E and guards L L to prevent the said foot pieces swinging forward by the motion of the cars, and also to allow them to be borne against the wheels at the proper time, substantially in the manner described and for the purpose set forth.

No. 47,157.—ALBERT M. WHITE, assignor to himself and BARNARD LARVEY, Port Chester, N. Y.—*Brush*.—April 4, 1865.—This invention consists in fastening in the brush each tuft or bunch of bristles independently by a staple-like wire.

Claim.—The mode of securing the several bunches of bristles in the solid back of a brush by means of separate staple-like wires C, applied substantially as herein described.

No. 47,158.—CHARLES A. WOOD, Dorchester, Mass., assignor to DANIEL C. HOOD, of the same place, and W. H. S. JORDAN, West Roxbury, Mass.—*Apparatus for Concentrating Liquids*.—April 4, 1865.—This invention consists of a vacuum pan made of iron and lined with enamel. It is surrounded with a steam jacket, made of wood or other non-conducting material. The said pan is provided with a dome, also lined with enamel, the joint between the dome and the pan being rendered air-tight by means of the elastic packing. A pipe leads from the dome to the cylinder, the said pipe being lined with enamel to the point. From the cylinder H a pipe descends to the cylinder K, said pipe being provided with a stop-cock. The dome is provided with peep-holes and a thermometer.

Claim.—As an improvement in vacuum pans, the pan A, in combination with a steam jacket D, of wood or other non-conducting material, operating substantially as set forth for the purpose specified.

Also, an elastic packing for the joints of vacuum pans, operating substantially as described.

Also, the within-described apparatus for conducting liquids, consisting essentially of the pan A with its jacket D, packing *i*, and dome C, and the condenser H I, the whole combined and operating substantially as set forth.

No. 47,159.—CHARLES E. WOODMAN and CHARLES B. HATFIELD, assignor to CHARLES E. WOODMAN, Boston, Mass.—*Buckle*.—April 4, 1865.—This invention consists in the combination of a holding bar and a straight-edged tongue with the bar, the overlapping tongue, and a buckle frame. A compound and double tongue and bar is combined with the overlapping bar and the buckle frame.

Claim.—The combination and arrangement of the holding bar *b* and the straight-edged tongue C with the bar *a*, the overlapping tongue B, and the buckle frame A.

Also, the combination and arrangement of the compound or double tongue C and the bar *b* with the overlapping tongue B and the buckle frame.

Also, the combination and arrangement of the compound or double tongue C, the bar *b*, or its equivalent, the bar *d*, and the frame A.

Also, the combination and arrangement of the cross bar *d* with a single tongue and an overlapping tongue and the buckle frame.

Also, the construction of the overlapping tongue with a slot, or its equivalent, arranged within it, substantially in manner and for the purpose set forth.

Also, the combination of the connections *ee* with the two cross bars *a b* and the tongue B applied to them, the said bars and the buckle frame, as specified.

No. 47,160.—ALEXANDER A. CROLL, London, England.—*Preparation of Materials to be used in the Purification of Gas*.—April 4, 1865.—This invention consists in combining neutral salts, or salts as nearly neutral as convenient, with wood, sawdust, or other cellular matter, such salts being in a concentrated form obtained by evaporation at a high temperature, the combination with other matters being effected while the salt is at such high temperature. The salts generally employed are the sulphate of alumina, the chloride or sulphate of zinc, the chloride or sulphate of manganese, or the chloride or sulphate of iron. The preparation above described may be used for purifying gas or as a disinfectant.

Claim.—First, the combining the neutral salts referred to, or as nearly neutral as convenient, with wood, sawdust, or other slightly absorbent or cellular matter, in the manner stated, and in employing such mixture in the purifying apparatus for the purification of gas, substantially as described.

Second, the use or application of the chloride or sulphate of manganese referred to with charcoal or wood sawdust, as a disinfectant.

No. 47,161.—FRANS GUSTAVUS BIELEFIELD, Berlin, Prussia, and CHARLES C. E. SCHWARTZ, Hamburg.—*Cork Pull*.—April 4, 1865.—This invention consists of a flat spring formed in a loop, the ends being secured to a rod and handle; at the centre or bottom of the loop is attached a button with a flat face, on which the cork rests when it is being drawn. The loop or spring is compressed as it enters or returns from the neck of the bottle.

Claim.—The combination of the rod B, the metallic spring C, and the button D, substantially as and for the purpose specified.

No. 47,162.—FREDERICK LUDEWIG HAHN DANCHELL, London, Eng.—*Drying and Charring Peat*.—April 4, 1865.—This invention consists in drying the peat by carrying it through a chamber on endless bands, the barrels being so arranged that the peat turns over as it falls from one band to another. A current of air is kept constantly flowing through the chamber, entering by the flues and afterwards escaping. The peat is charred in a retort which is provided with a pipe through which heated gases are admitted to the bottom of the retort. A pipe communicates with a refrigerator, the latter also communicating with a chimney by means of a pipe. A partial vacuum is created by means of a jet of steam from the pipe.

Claim.—First, the improved arrangement of the apparatus for drying blocks of peat, as shown and described in reference to sheet 1, and particularly the arrangement of the endless bands and rollers, by which the blocks are turned over in passing from one set to another.

Second, the arrangement and distribution of the air passages of the apparatus for drying peat.

Lastly, the application of a steam blast for producing the requisite currents of air for drying and charring peat or other carbonaceous substances.

No. 47,163.—CYPRIEN CHABOT, Philadelphia, Pa.—*Breech-loading Fire Arms*.—April 4, 1865.—This invention belongs to that class of breech-loaders in which a hinged breech-block is raised and fold forward upon the barrel; and the improvement consists in a particular form of thumb lever and latch attached to the hinged breech-block, and operating a spring bolt in the stock, and also in a toothed segment and rack-cartridge retractor moved by the swinging breech-block. The devices are mainly designed to facilitate the conversion of the ordinary muzzle loading arms to breech-loaders.

Claim.—In combination with the hinged breech-block swinging upward and forward the lever H and its latch hung thereto, but so as to have a degree of motion independent thereof, and the spring bolt E for the purpose of locking the breech block when down, and for unlocking it by the same motion that raises up again, as herein described and represented.

No. 47,164.—JASPER G. CODMUS, Port Richmond, N. Y.—*Windlass for Tightening Ships' Standing Rigging*.—April 4, 1865.—A frame is suspended by means of an eye from the rope or shroud to be tightened. To this frame is fitted a winch barrel provided with a handspike socket and pawl; the frame has also a pawl of its own, the whole operating in such manner that the rope from which the frame is suspended by a rotation of the pawls may be drawn from opposite ends together and thus tightened.

Claim.—The frame *d*, suspended by the eye *e*, from the rope or shroud to be tightened, in combination with the winch barrel *f*, and a handspike or lever to turn said winch barrel, as and for the purposes specified.

No. 47,165.—JAMES H. CONCKLIN, Yorktown, N. Y.—*Platform Scales*.—April 4, 1865.—The object of this invention is to enable the outer end of the beam to be raised at the same time that the inner end is elevated, thus preserving the beam in a horizontal position.

Claim.—The combination of the lever A, with the other parts C and F of a scale, in the manner and for the purpose substantially as set forth.

No. 47,166.—W. M. DAVIE and CHARLES T. WEBBER, Janesville, Wis.—*Steam-pressure Indicator*.—April 4, 1865.—This invention consists of a scroll spring, cylindrical box, a shaft, chain, and pulley, with a rod for connecting them with a safety-valve lever in such a way that the pressure exerted upon the safety-valve is communicated through the pulley and shaft to the scroll spring, which resists it, and which gives motion to the index-hand.

Claim.—The arrangement of the scroll spring *e*, the cylindrical box or chest *a*, shaft *c*, pulley I, chain K, connecting rod *d*, cross-bar *f*, and hand wheel *g*, substantially as and for the purposes set forth.

No. 47,167.—JOHN H. DUCK and ERWIN S. GOULD, Elgin, Ill.—*Washing Machine*.—April 4, 1865.—The machine is operated by means of a lever projecting from a perpendicular wheel. This wheel gears with a horizontal pinion on a perpendicular shaft which runs down into the churn through the cover, and is furnished at its lower end with four rubbers. The cogs on the aforesaid pinion are in shape longitudinal sections of cylinders, radially arranged. The rubbers stand out at an acute angle to the shaft and at right angles with each other.

Claim.—The pinion N, and wheel T, in combination with the shaft C, and rubbers O' O' O'' O'', constructed and operated substantially in the manner and for the purpose described.

No. 47,168.—HERMAN HAUPT, Cambridge, Mass., and J. Y. SMITH, Alexandria, Va.—*Mining and Tunnelling Machine*.—April 4, 1865.—The object of this invention is to reduce by the employment of machinery the time, labor, and expense attending certain mining operations, and consists in the combination and arrangement of mechanism designated in the claim.

Claim.—First, the pick or series of picks, in combination with a mechanism for imparting rotary motion thereto, to operate in the manner and for the purpose substantially as herein set forth.

Second, the method herein described of mounting the pick or picks upon bevel gear disks, bevel gear and driving pinion being at or near the circumference of said disks, as set forth.

Third, the bevel pointed picks, and the arrangement of the same upon the revolving disk, with the bevel faces alternately reversed, substantially as set forth.

Fourth, the method of hanging the rotary pick disks in a swinging frame so arranged in relation to the gear mechanism as that a translatory movement may be imparted to picks without interfering with their rotation.

Fifth, in combination with the swinging frame and rotary picks, the method herein described of adjusting or feeding the picks up to the work as the operation progresses, independently of the main frame of the apparatus, substantially as set forth.

Sixth, the combination with the rotary picks, held as described in a swinging frame, of a mechanism for laterally reciprocating the swinging frame, substantially as and for the purpose set forth.

Seventh, the stationary cutter in front of the swinging frame, under or between the rotary picks, for the purpose of removing the core of the ore or coal, substantially as set forth.

Eighth, locating within the swinging frame a shaft provided with pinions at either end thereof, and arranged in relation to the gear mechanism so as to receive from the prime mover and impart to the picks rotary movement, substantially as herein set forth.

No. 47,169.—WILLIAM HENSCHEN, Hennepin county, Minn.—*Beehives*.—April 4, 1865.—This hive is constructed of straw in continuous rolls, bound together by splints, of a quadrangular form, with frames at its top and bottom for the reception of boxes, &c.

Claim.—The arrangement in the construction of a straw beehive of a straw rope, or layers of rope, with the splints I, top frame C, and bottom frame D, substantially as and for the purposes herein described.

No. 47,170.—IVON BRUCE MILLER and WM. HARTLEY MILLER, Philadelphia, Penn.—*Lubricating the Packing of Stuffing Boxes, &c.*—April 4, 1865.—This invention consists in using paraffine, either alone, or mixed with cotton, hemp, soapstone, and like substances, for lubricating packing boxes of steam-engines and other parts of machinery.

Claim.—First, the application of the substance, mode, and material, above described, to the stuffing boxes or other joints of engines, or other machinery, or any other substantially the same mode and material.

Second, the application of the above material to other materials used for the manufacture of packing, as cotton and hemp, saturated with it.

Third, the application of above material, or any other substantially the same, to the rod or stuffing box, or to the packing thereof, by using it through the cylinder of the engine, or any other application thereof, whereby the rod will carry the said material to the packing.

Fourth, the substance above described, as an adjunct to the various patent packings.

Fifth, the mode and material above described, or any other substantially the same, and that will produce the intended effect, as a cover or coating in place of mush or other material for rope packing, as applicable in the packing made of powdered and fibrous substance, for instance.

Sixth, the above described material, as applied to the packing of pistons of engines and pumps.

No. 47,171.—LOUIS PLANER, New York, N. Y.—*Brading Guides for Sewing Machines*.—April 4, 1865.—In this invention the guide is attachable to the presser-foot of a sewing machine; the object is the increased facility of guiding the braid, especially in laying it in curved directions on the cloth; also the concave form of the groove, in connection with the pressure of the spring on the braid, tending to keep the braid within the groove, and preventing its passing to one side thereof.

Claim.—First, providing the groove J with a concave bottom, and a spring L, to operate in the manner and for the purpose herein specified.

Second, the arrangement of the set screw M, with spring L, for regulating the pressure of the spring upon the braid in passing under the bottom of the groove J, substantially as herein set forth.

No. 47,172.—DAVID RING, Damariscotta, Me.—*Ground Auger*.—April 4, 1865; antedated March 26, 1865.—In this invention two semicircular disks of steel are each furnished at the ends of their straight edges with cutters, one pointing upwards, the other downwards. The cutter is rendered expansible by means of slots in the disks, through which the confining screws are passed into the cutter-heads, at the bottom of the shaft. The bottom of the shaft is furnished with a gimlet-point to facilitate its entrance into the earth.

Claim.—First, the disks D and E, provided with the top and bottom cutters *h* and *j*, substantially as set forth and for the purpose described.

Second, rendering the borer expansible by means of the oblong slots *f*, substantially as described.

No. 47,173.—THOMAS S. SPEAKMAN, Camden, N. J.—*Lamp for Burning Oil.*—April 4, 1865.—This invention consists of two reservoirs, one for holding oil and one for water. From the bottom of the reservoir a tube extends to a short distance above the top. The wick-tube of the lower reservoir extends up through the tube. The water is carried up to the burner by means of the wick.

Claim.—First, the use, in combination with lamps for burning animal, vegetable, or mineral oils of fatty matters, of a wick, or its equivalent, for conveying to the flame a supply of water, substantially as and for the purpose herein set forth.

Second, the use of the heat of the flame for producing the aqueous vapor which is conveyed to the flame.

No. 47,174.—L. W. TURRELL, SAM'L. STANTON, and L. C. WARD, New York city.—*Oil Ejector.*—April 4, 1865.—This invention consists in inserting into the lower end of the air induction tube, a conical pipe, which forms the lower part of the air-tube through which the oil is raised. Into the lower end of this conical pipe a conical tube is placed and held in position by being secured to the outer pipe; through the centre of this tube a passage for the oil is made, and its external diameter is so much less than the internal diameter of the pipes in which it is placed as to leave an annular space around it for the air to enter. This annular space communicates with the outer pipes through which the air is forced down into the instrument. The annular current of air surrounding the mouth of the oil tube, and passing it with great velocity, causes a column of oil to ascend within the annular column of air, and eject it from the well.

Claim.—First, contrivance for raising oil, like that hereinbefore described, that is to say, one wherein the oil is drawn up through a central passage or tube, around which is an annular passage or tube, through which the compressed air is made to act upon the oil, substantially in the manner and for the purpose described.

Second, the manner of securing the internal tube F within the internal tube A, by means of the perforated disk E, and the coupling clamp C, substantially as described.

Third, the manner of securing the tube J in its position, by means of the disk K, and coupling clamp H, constructed and arranged substantially as described.

Fourth, the stuffing box L, in combination with an internal and external tube, arranged in the manner and for the purpose above described.

No. 47,175.—THOMAS WEAVER, Harrisburg, Penn.—*Writing Tablet.*—April 4, 1865.—A box, containing a roll of paper and an ink bottle, has a lid of sufficient width to receive a few lines of writing at a time. A hinged bar is fastened by elastic bands to the wrist of the person writing.

Claim.—First, the construction of a tablet attachment for the hand, that moves with it and under it, and presents a continuous writing surface under the pen or pencil, whose parts are so proportioned and arranged as to form, when folded, a pocket *vade mecum*.

Second, the combination and arrangement of the paper case M X' N X, with the reels M N, their driver Q, the tablet leaf L A, its bearing O, its spring A; also with the digital leaf B K, its hinges K K', its key-hole B, its stopper R' for the ink bottom B', situated in the hand side of paper case, substantially as and operating in the manner as herein described and set forth.

Third, the combination and joint operation of the metacarpal plates shown in figure 3, with each other, and with the digital leaf B K, and with the carpal plates shown in figures 2 and 6, by means of the slot F, the key-hole E, the concave-convex slots D D', their sliding clamps 4 4, and the button H, substantially as and operating in the manner as herein set forth and described.

Fourth, the combination and arrangement of the carpal plate, shown in figure 2, with the metacarpal plate shown in figure 3, by the buttons T T'; also with the wrist, by the hinged locking bracelet shown in figure 9 and the wristband shown in figure 10, or with the plate shown in figure 6, which has the groove J, the pad P, the bands *a b*, eyelets 1 2 and 3, and buttons U U', operating in the manner as and for the purposes herein set forth.

No. 47,176.—S. W. WETMORE, Erie, Penn.—*Movable Fire-place with Gridiron Attachment.*—April 4, 1865.—This invention consists in a movable upright fireplace, constructed with a closed back of sheet metal, the front being composed of vertical bars set in a movable frame, and the back plate being bent on top so as to form a device for conducting the draught up the chimney, operating somewhat as the throat of a chimney, the space between the back plate and the bars being closed on top by a hinged cover. This fire-place is intended to be placed in front of the door of a cooking stove or in front of an ordinary fire-place, and is provided with handles by which it can be moved. It is intended to use in conjunction with this fire-place, a vertical, revolving, folding gridiron, of ordinary construction, provided with

a dripping pan, and a device for retaining the gridiron in a vertical position; this gridiron is also provided with handles.

Claim.—The movable fire-place, constructed with narrow sides, to be placed in the nature of a false door, in the doorway of the cooking stove, and to be used in connection with the adjustable folding gridiron suspended before it.

No. 47,177.—HORATIO AMES, Falls Village, Conn.—*Manufacture of Ordnance.*—April 11, 1865.—This invention relates to several improvements in the method of constructing ordnance of separate sections, each section being made up of several concentric rings, for which a patent was granted to the said Ames on the 16th day of August, 1865, namely: Firstly, in forming the inner ring of the section by cutting it out of solid iron. Secondly, in constructing each section of rings of gradually diminished length from the bore outwards. Thirdly, in welding the section to the breech, or to the preceding section—the cannon meantime lying in a horizontal position—by means of two hammers working during the same heat, the one vertically and the other horizontally. Fourthly, in attaching the centring pin to a long bar having a handle at each end, for the greater convenience in handling the same and guiding and controlling the section.

Claim.—First, making the interior ring *a*, of a combined series, out of solid metal and without a weld, substantially as and for the purpose described.

Second, making the section of a series of concentric rings, of which the inner one is longer than the one outside of it, substantially as and for the purpose described.

Third, welding the sections to the mass during one and the same heat, by means of two hammers or rams, one working horizontally and the other vertically, substantially as described.

Fourth, combining with the centralizing or matching pin *G* the arms and handles *g h*, by which it is more readily operated, held, and withdrawn, substantially as described.

No. 47,178.—DANIEL R. ARNOLD, Haddam, Conn.—*Lazy Jack for Vessel's Sails.*—April 11, 1865.—In this invention the distinguishing feature of the lazy jack and what constitutes the improvement, is that the instrument in operating revolves and surrounds the boom, sail, and the gaff.

Claim.—A revolving lazy jack surrounding the boom, sail, and gaff, substantially as set forth and described.

No. 47,179.—WM. ARRONQUIER, Worcester, Mass.—*Staging for Buildings.*—April 11, 1865.—This invention consists in securing a portable apparatus to the rounds of a common ladder, capable of being easily raised, and upon which planking can be laid.

Claim.—The construction of the supporting bars and platform, and their combination with the ladder, forming a staging, as described.

No. 47,180.—J. W. BISHOP, New Haven, Conn.—*Boiler Feeder.*—April 11, 1865.—This invention consists in attaching a pipe to a boiler at about the proper waterline, which is made to extend up some distance above the top of the boiler, and to the top of which two vessels are attached, one within the other—the outer one communicating with the boiler, the inner one being filled with water or some other fluid. Above these two vessels, and connected with them, is a plate extending across the mouth of the vessels and to which a pipe is attached which extends down to the bottom of the inner vessel. Above this plate is a diaphragm to which a pipe is attached and through which the fluid is passed to the inner vessel. The upper end of this tube is attached to a lever which acts upon a belt shifter in such a manner that upon the water in the boiler falling below the mouth of the pipe which connects the vessels with the boiler, the steam enters the pipe and converts a portion of the water contained in the inner vessel into steam, which presses up the diaphragm, thus carrying up the tube and with it the lever which is attached to the belt shifter, and carries the belt from the loose to the tight pulley by which means the pump is put in operation through the shaft and crank, to which the pulleys are affixed. The pump continues to work until the water in the boiler rises above the mouth of the pipe above mentioned, when from the condensation of the steam in the vessel the pressure is relieved and the diaphragm falls to its original position, carrying with it the tube and lever and returning the belt to the loose pulley, when its motion ceases until it is necessary that the operation should be repeated.

Claim.—The combination of the vessels *B* and *D*, diaphragm *c* or its equivalent, with a steam boiler supplying pumps, when constructed and arranged to connect or disconnect the power operating said pump, as and for the purpose substantially as herein set forth.

No. 47,181.—J. W. BISHOP, New Haven, Conn.—*Automatic Boiler Feeder.*—April 11, 1865.—A tank to contain feed water is connected by two pipes, one at its top and the other at the bottom, with the boiler. A vessel containing water is situated between the boiler and the tank. Steam admitted to this vessel from the boiler generating steam therein which, pressing upon the water, causes it to rise, and, by means of a float and other mechanism, close the valves by which the steam was admitted to the vessel. At the same time the valve of the pipe which lets water into the tank is opened; water flowing through it is led into

the beforementioned intermediate vessel and condenses the steam therein, so that the water falls and reopens, by means of the before mentioned float and other mechanism, the valves which admit steam from the boiler into the tank. Steam thereupon enters the tank by the pipe at its top and also fills the pipe at the bottom, but the pressure both above and below being equal, the water in the tank flows by its own gravity into the boiler. As soon as the pipes are clear of water, steam, of course, fills them, and operates as above described.

Claim.—The combination of the vessels B and D, diaphragm *c* or its equivalent, with inlet and exit pipe C and M, constructed and arranged to operate a valve A, substantially as and for the purpose specified.

No. 47,182.—J. W. BISHOP, New Haven, Conn.—*Steam Trap*.—April 11, 1865.—This invention consists in providing two vessels, one placed within the other, and of dimensions sufficiently less than the outer one, to leave considerable space between them for the admission of steam. Over the top of the inner vessel is placed a cap which has a pipe inserted in it, extending down nearly to the bottom of the vessel. Above this cap is a diaphragm to which a tube is attached, through which the fluid passes to the inner vessel, and over which a cover is placed. The tube above referred to extends up to, and bears against, the under side of a lever, to the outer end of which a rod is attached to operate the valve in the outlet pipe. Upon the admission of steam to the outer vessel through the induction pipe, and after the water of condensation has passed out through the outlet valve, the water in the inner vessel will be converted into steam, and the diaphragm pressed up, and with it the tube and lever which will close the valve, and prevent the escape of steam.

Claim.—The combination of the vessels B and D, diaphragm *c*, with a water tank or reservoir and steam boiler, constructed and arranged to operate the valves connected therewith, substantially as and for the purpose herein set forth.

No. 47,183.—J. W. BISHOP, New Haven, Conn.—*Low-water Indicator*.—April 11, 1865.—This invention consists in attaching to a boiler a hollow metal vessel, by means of a pipe which communicates with both. Within the vessel above named, another one is placed in such a way as to leave a space around the inner one, which space is filled with steam from the boiler. The inner vessel is filled with water, and a cap placed over it, to which a pipe is secured, which extends down nearly to the bottom of the vessel. Above this cap is a diaphragm, and over this another cap is placed, having a tube which supports the frame of the diaphragm, whenever the water in the boiler falls below the mouth of the pipe which carries the steam to the interior of the outer vessel, the steam rushes in, and by its heat converts the water in the inner vessel into steam, which passes up through the pipe, and presses up the diaphragm, the stem of which raises a lever, which is attached to the valve of the whistle, opening said valve, and thus sounding the alarm.

Claim.—First, the combination of the two vessels B and D, arranged as described, with a diaphragm *c*, or its equivalent, in the manner and for the purpose substantially as herein set forth.

Second, the combination of the vessels B and D, diaphragm *c*, or its equivalent, with a steam boiler, when arranged to operate substantially as and for the purposes specified.

No. 47,184.—J. W. BISHOP, New Haven, Conn.—*Water Regulator*.—April 11, 1865.—In this invention the flow upward through a vertical pipe is regulated by an auxiliary current passing around a seated valve, and pressing upward against a diaphragm, attached to the periphery of the hollow valve stem; by which means the area of pressure to uphold the valve is increased to any desired extent to overcome the pressure of the superincumbent water in the eduction pipe.

Claim.—First, the valve C, when constructed with a hollow stem, and combined with chambers F and G, substantially as and for the purpose herein set forth.

Second, adjusting the pressure of water in pipes by means of the chamber G, and cocks L and O, substantially as herein specified.

No. 47,185.—DANIEL S. BRIGHAM, Worcester, Mass.—*Skate*.—April 11, 1865.—This skate is fastened to the boot of the skater without any straps, by means of buttons as it were on the skate, which enter slots in plates affixed to the sole and heel of the boot. Above these slotted plates are cavities in the leather, large enough to permit the oblong buttons, after having entered the slots, to be turned at right angles thereto, so that they cannot slip out. This turning is effected by a lever on the skate, which, having gotten the buttons in the proper position, is clamped by a set screw so as to keep them so. The skate is simply a steel runner turned over at the ends, and by means of an adjusting screw the central part of the runner may be forced outward so as to produce a pivot on which short curves may be executed.

Claim.—First, in combination with the supporting plates A B, the clamp bolts E G, clamp lever H, and lock plates *h*, of the heel and sole substantially as and for the purpose described.

Second, providing one or both of the catch bolts E G with a pin which enters the leather of the sole or heel, to prevent any longitudinal motion of the skate, substantially as herein described.

Third, the application to a yielding or elastic runner of the adjusting screw L, for the purpose of making the bottom part of the runner flat or crowning, substantially in the manner described.

Fourth, the combination with the supporting plates A B, of the clamp bolts E G, clamp lever H, elastic runner D, and adjusting screw L, when constructed and operated substantially as and for the purposes described.

No. 47,186.—J. K. BUCK, Winona, Minn.—*Fanning Mill*.—April 11, 1865.—This invention consists in the construction of an elevator, so arranged that the belt of endless buckets is moved by the main driving wheel.

Claim.—The combination of the elevator B, shaft *e*, provided with the pulley *d* and wheel *b*, with the driving wheel *a*, when all the parts are arranged to operate as and for the purpose herein set forth.

No. 47,187.—JOHN BUSER, Philadelphia, Penn.—*Saw-set*.—April 11, 1865.—This invention consists in so shaping the jaws of a pair of nippers, in combination with a device hinged upon the joint of the nippers, as to give the proper inclination to the teeth in alternate directions.

Claim.—First, the pinchers A, with their jaws *bb'*, and cheeks *e e*, combined with the within-described devices, or their equivalent, substantially as and for the purpose specified. Second, the plate C, its projection *d*, and arm *f*, in combination with the pinchers A, and springs *g g*, or their equivalents, the whole being constructed for joint operation, substantially as described.

Third, the adjustable plate *i*, combined with the plate C, substantially as and for the purposes set forth.

No. 47,188.—JACOB BUZBY, Philadelphia, Penn.—*Composition for Removing Scales from Boilers*.—April 11, 1865.—This invention consists of a decoction of the bark of the sweet gum tree, to which a proper quantity of gambier is added, the whole being heated until the gambier is dissolved.

Claim.—The use for removing scales from steam boilers of a decoction of the bark of the sweet gum tree, in combination with a solution of gambier or catechu.

No. 47,189.—CHARLES M. CRESSON, Philadelphia, Pa.—*Gas Regulator*.—April 11, 1865.—This invention consists of a cylindrical casing, within which is another cylindrical casing, leaving an annular space between the two, which space contains water or other liquid. The inner cylinder is closed at the top with the exception of an opening for the reception of the valve, and another opening which communicates with the outlet pipe. The valve is suspended by a pin attached to the top of the holder which is made in the form of a hollow frustum of a cone, and has float attached to its lower end. From the top of the holder projects a pin for receiving a weight, and the holder is kept in a vertical position by means of guide rollers; the gas is admitted into the inner cylinder by means of a pipe.

Claim.—The use in a gas regulator of a holder of the tapering form herein described, for the purpose specified.

No. 47,190.—CALEB S. DAVIS, Lancaster, Pa.—*Machine for Spinning Flax*.—April 11, 1865.—The object of this invention is to prevent the slopping of water caused by the use of open troughs, so that the operator is enabled to piece broken rovings without inconvenience from the hot steam or water, however highly heated.

Claim.—First, the direct application of steam to the rovings in their passage through a chamber I.

Also, a chamber I, having a series of slots Y and caps U, with a steam pipe M, having perforations *z* opposite the slots Y within said chamber, together with valve L in combination with the connecting pipe *m'*, arranged and operating in the manner specified.

Also, a modified chamber I' with its slots Y enlarged, in combination with the disk or pulley X, lever W, and steam pipe M without perforations, constructed and operating in the manner and for the purpose specified.

No. 47,191.—E. M. DICKINSON, Fitchburg, Mass.—*Machine for Holding the Uppers of Boots and Shoes*.—April 11, 1865.—This invention consists of a forked clamp, one end being hinged, the other clasping about the rest, with two sets of springs underneath; and also in the same clamp, the springs and rest, in combination with a rod and spiral spring to raise or draw down said clamps.

Claim.—First, the forked clamp B, the springs *i i*, the yoke *j*, and the springs K K, or their equivalents, in combination with the rest A, as substantially described.

Second, the forked clamp B, the springs *i i*, the yoke *j*, and the springs K K, or their equivalents, the rest A, in combination with the rod *d* and the spiral *g*, or their equivalent, for the purpose herein set forth, reference being had to the accompanying specifications and drawings.

No. 47,192.—HEZEKIAH DODGE, Albany, N. Y.—*Press*.—April 11, 1865.—To the follower is attached a solid screw shaft which enters into a cylindrical nut with right and left threads. This cylindrical nut receives a reciprocating motion; its upper end receives a solid screw shaft secured rigidly to the uppermost beam of the frame. This shaft has its threads cut in a direction the reverse of that in which the threads on the follower screw are cut. When the cylindrical nut is rotated in one direction the follower screw with the follower is elevated, and when the cylindrical nut is rotated in the opposite direction the follower screw with the follower is depressed.

Claim.—First, the combination of the right and left hollow screw E, fixed screw G, and movable screw F, with the follower D, substantially as and for the purpose set forth.

Second, the stationary and movable right and left screw shafts F and G, hollow screw E, and spur wheel, C, with the driving spur wheel and shaft B B', substantially as described.

No. 47,193.—WM. FOSTER DODGE, New York, N. Y.—*Pump*.—April 11, 1865.—The cylinder cover, air chamber, and covers for the side pipes are cast all in one piece for the purpose of simplifying the construction. The piston rod and its stuffing box are situated in a tube which connects the air chamber with the cylinder cover. The follower or gland of the stuffing box is made so as to be withdrawn by the act of unscrewing the cap which confines it within the stuffing box, for the purpose of facilitating the removal of the follower when desired.

Claim.—First, the cylinder cover C, the air chamber D, and the covers for the two side pipes, when such parts are united with the cylinder A and side pipes by a single plane joint, substantially as described.

Second, in combination with the air chamber, arranged directly over the cylinder, and with the stuffing box on the top of the so arranged air chamber, the tube E surrounding the piston rod, connecting the top of the air chamber with the cylinder cover, and isolating the piston rod and stuffing box from the air chamber, substantially as and for the purpose herein specified.

No. 47,194.—WM. H. DOWNING, Philadelphia, Pa.—*Apparatus for Withdrawing Tubes from Wells*.—April 11, 1865.—This invention consists of a pair of pivoted jaws having sharp edged projections, in combination with a pair of toggles for opening and closing said jaws, for the purpose of engaging with and bringing to the surface broken tools or tubing in oil-wells.

Claim.—First, the laws or arms A A having projections *a' a'* and adapted to be opened or spread by the spring F and lever G, when lowered into the tubing of a well, for the purpose of taking hold of and raising the same, substantially as herein set forth.

Second, the combination of the toggles C C, yoke C', and cord D, for contracting the jaws A A, when the apparatus is to be withdrawn from the tubing, as explained.

Third, the detachable cap E employed to retain the jaws A A in their closed position while the apparatus is being lowered into the tubing, substantially as described.

No. 47,195.—MEXWORTH D. DRAKE, Providence, R. I.—*Upper Bearings or Bolsters for Spindles of Spinning Frames*.—April 11, 1865.—This invention is designed as a self-lubricator; the upper annular chamber first receiving the oil whence it descends to and through the spiral groove into the lower annular chamber; when the spindle is set in motion the oil is caused to pass up the spiral groove towards the upper chamber, and thus diffuse itself generally throughout the whole length of the bore of the bolster.

Claim.—First, the use and employment of an upper and lower groove or oil chamber in the bore of the bolster, in combination with the use and employment of a spiral or helical groove, substantially as described.

Second, the use and employment of a spiral groove in the bore of the bolster, in combination with a groove *a* at the bottom, whether the top groove is used or not.

No. 47,196.—SPENCER B. DRIGGS, New York, N. Y.—*Piano Fortes*.—April 11, 1865.—This invention consists in making a sounding chamber beneath an ordinary bottomless case, and in connecting the strings to the sound board by means of metal bearings on the bridge.

Claim.—First, the sounding chamber B provided under the case proper of the piano forte, substantially as and for the purpose herein specified.

Second, connecting each or any one of the strings with the sound-board bridge independently of the other strings by means of two metal bearings *t m* constructed or provided on or in one side of a stud *n* or *p* secured in the bridge, and having between them a lateral opening through which the string can be inserted in a lateral direction, substantially as herein described.

No. 47,197.—JOHN EBY, Muncie, Ind.—*Wardrobe Bedstead*.—April 11, 1865.—This invention consists in the combination of a wardrobe with a bedstead, so arranged that it can be readily folded and unfolded and used for both purposes.

Claim.—The combination and arrangement of the posts A A C C and F F, bars B B and G, rails D and E E, doors H and K K, with the elevating board P and table T, the whole being constructed as described, for the purpose specified.

No. 47,198.—ALEXANDER H. EVERETT, New York, N. Y.—*Composition and Manufacture of Iron*.—April 11, 1865.—This invention consists in producing cast-iron possessing toughness and capable of taking a deep "chill," by using anthracite pig-iron, 80 parts; wrought-iron, 20 parts; oxide of manganese, 3 parts; oxide of iron, 3 to 5 parts; with a flux of fluor-spar or other fluoride, 2 or 3 parts. This combination of materials may be effected in either pot furnaces or in a reverberatory furnace when large masses are to be treated. The cast-iron is first melted and the refining materials then added, and the whole raised to a high temperature; the wrought-iron previously heated is then added.

Claim.—First, the combination of the cast-iron, wrought-iron, oxide of manganese, oxide of iron, and fluor-spar, or other fluoride, as and for the purposes set forth.

Second, the combination of cast-iron, magnetic iron ore, oxide of manganese, and fluor-spar or other fluoride, substantially as set forth and described.

Third, the process herein described for improving the qualities of cast-iron.

No. 47,199.—GEORGE W. FRANCIS and WILLIAM L. WOODS, Washington, D. C.—*Tobacco Pipe*.—April 11, 1865.—This invention consists of an ordinary pipe bowl which fits loosely in an outer casing made completely air tight except as to its upper end, where there are apertures to admit air; the bowl has a small nipple on its upper end which projects through the casing, and to which the stem is affixed; the lower part of the casing is closed by a cap of metal. In this pipe the fire is applied at the bottom of the bowl, and the tobacco is burnt upwards. If necessary, the casing may be made to enclose the bowl tightly, and no air space is left between them, in which case a series of grooves must be made on the surface of the bowl to admit of a circulation of air.

Claim.—First, the combination of case A, with its air holes F F, with the bowl B and its nipple D, the cap C, the grooves G, and air chamber x, substantially as described.

Second, the combination of the bowl B and cap C, with its air holes F, substantially as described.

The bowl B with its nipple D and cap C, when arranged and operating, substantially as described.

No. 47,200.—KINGSTON GODDARD, Philadelphia, Penn.—*Pumps*.—April 11, 1865.—In this invention the piston is lifted by a large cylinder within the main cylinder, which is so cut away along its course as to permit the flow of water around it; the alleged advantage consisting in the firmness of a cylindrical rod and the lightness obtained by the openings therein.

Claim.—The construction and arrangement of the tubular and perforated piston rod, substantially as described.

No. 47,201.—KINGSTON GODDARD, Philadelphia, Penn.—*Machine for Rolling Tea Leaves*.—April 11, 1865.—This invention consists in subjecting the tea leaves to the action of two rolling disks radially ribbed.

Claim.—The machine substantially as described, which submits the leaves to the rolling action of the two described rollers.

No. 47,202.—WILLIAM HANSFORD, San Francisco, Cal.—*Method of Preserving Eggs*.—April 11, 1865.—This invention consists in coating the eggs with glue by dipping them in liquid glue at a temperature that will not affect the egg. The eggs may be repeatedly dipped in order to increase the thickness of the coating; the eggs are then placed upon pins arranged in a board, and the glue allowed to dry.

Claim.—The coating of eggs with glue, substantially as and for the purposes herein recited.

No. 47,203.—DAVIS HARVEY, Jackson township, Iowa.—*Fence*.—April 11, 1865.—This invention consists in placing upon the top of a fence an inclined board of sufficient width to prevent dogs or wolves from gaining a foothold below. The body of the fence may be vertical or inclined.

Claim.—Placing upon any common fence a panel or board projecting outward and upward for the purpose of preventing dogs and wolves from getting to sheep.

No. 47,204.—ISAAC HELLMAN, St. Louis, Mo.—*Tonic Bitters*.—April 11, 1865.—This invention consists of tonic bitters made from cologne spirits, sugar sirup, water, orange peel, mace, cinnamon, calamus root, cloves, galanza root, and anise.

Claim.—The combination of the several ingredients mentioned in the foregoing specification, in the proportions and for the purpose set forth.

No. 47,205.—PETER and FREDERICK HINKEL, New York, N. Y.—*Apparatus for Generating Carbonic Acid Gas*.—April 11, 1865.—This invention consists of a generator and washing vessel connected by means of a pipe. The generator is lined with lead, and both vessels are provided with apertures for filling. The jar which contains the marble is made of lead, and is perforated and provided with a long neck extending through an aperture in the top of the generator. A piece of rubber hose is attached to the top of the neck and also to the top of the generator to prevent the escape of gas. The neck is supported by a cross-

bar which slides freely up and down on wires. From the top of the washing vessel extends a pipe, one end of which terminates in a chamber which communicates with said washing vessel; by this means all water which may be driven through said pipe is returned to the washing vessel.

Claim.—First, the long-necked jar *l*, hose *r*, or their equivalents, and the air-tight connection between them and the cover of a gas generator *A*, as described, or its equivalent.

Second, the sliding bar *m*, the wires *w w*, or their equivalents, and the connection of them with jar *l*, hose *r*, and cover *k*, in the manner fully described, or its equivalent, and for the purpose set forth.

No. 47,206.—NELSON HOMES, Laona, N. Y.—*Wash Board.*—April 11, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—The wash board composed of the plane-edged slats or bars *B B* fitting closely together so as to prevent the leakage of water through, and having a necessary degree of elasticity; said slats being provided with corrugations *a a b b*, so arranged that the corrugations of any one slat alternate with the next, substantially as and for the purpose described.

No. 47,207.—THOMAS W. HOUCHIN, Morrisaina, N. Y.—*Instrument for Lighting Gas.*—April 11, 1865.—This invention consists in a curved tube enclosing a taper to light gas, so arranged as to protrude or retract the taper within the tube at the will of the operator.

Claim.—In combination with the tube *A* the use or employment of the wick or taper *B*, cord or string *C* and attachment *D*, when the frame shall be constructed and combined substantially as shown, for the purpose specified.

No. 47,208.—JOHN JOHNSTON, Alexandria, Va.—*Straightening Rails of Railroads.*—April 11, 1865.—This invention consists in the arrangement of a suite of three or more pairs of rolls, each pair being grooved to correspond in size and shape with the rail to be straightened. The rolls are so arranged that the grooves of the several pairs are perfectly in line, by means of which the rail, after having entered the groove of one pair, will be drawn through and made to enter successively the grooves of the second and third pairs.

Claim.—The use, for straightening rails, of three or more pairs of rollers having depressions and projections conforming to the shape of the rails, the rollers themselves as well as the said depressions and projections of the several pairs being arranged in respect to each other, as set forth.

No. 47,209.—JOHN K. LEMON, Allegheny City, Penn.—*Machine for Pressing Brick.*—April 11, 1865.—This invention consists in the use of a reciprocating follower in conjunction with a movable bed, the latter being actuated by means of a follower and a spring, so that the pressed bricks are forced out of the press box simultaneously with the retrocession of the follower, and brought into a position for being moved out of the way by a reciprocating follower, so arranged as to work in a plane at right angles to the plane of the pressing follower.

Claim.—First, a brick press which employs a pressing follower *C* and a movable supporting follower *b*, which are so combined and operated that the latter is allowed to descend by its own gravity during the introduction of a brick into the press box, and to rise during the retrocession of the pressing follower *C*, substantially as herein described.

Second, a spring *d* or its equivalent, for elevating the follower *b* in combination with the cross-head *E* and rods *f f* of the frame *C'* for allowing the follower *b* to descend, substantially as described.

Third, providing for adjusting the followers *C* and *b* so as to work nearer to or farther from each other, according to the thicknesses of the bricks required, substantially as described.

Fourth, sustaining the follower *b*, when in an elevated position, upon a spring *d* or its equivalent, and when it is in a depressed position upon the bottom *i i* of the press box *a*, substantially as described.

Fifth, the combination of a reciprocating follower *G* and guides *H H'* with the movable followers *C* and *b*, substantially as described.

Sixth, a movable separating board *K*, in combination with a brick press, in which the three followers *C b* and *G* are employed, substantially as described.

Seventh, the separator *K*, when used in conjunction with a follower *G* or its equivalent, and a removable shelf *M*, substantially as described.

Eighth, the parallel guides *H H'*, in combination with the movable followers *C b* and *G*, arranged and operating substantially as described.

No. 47,210.—JOSHUA O. LEWIS, Worcester, Mass.—*Clamps for Stretching Card Clothing upon Carding Cylinders.*—April 11, 1865.—This invention will be understood by reference to the claim and drawings.

Claim.—As a new article of manufacture a card clothing clamp constructed with forked braces to sustain and strengthen the ends of the clamp so that they cannot spring or yield, and with looped ends for the operating strap, all substantially as and for the purposes described.

No. 47,211.—LEWIS W. MASON, Shelburne Falls, Mass.—*Carriages*.—April 11, 1865.—This invention consists in a peculiar arrangement of two sets of shafts and a cross bar with respect to two whiffletrees, whereby the cross bar is brought in rear of the draught animals when they are applied to the shafts, and such shafts become a substitute for a pole as ordinarily employed.

Claim.—A peculiar arrangement of two sets of shafts A B C D and a crossbar E with the whiffletrees F G, whereby the crossbar carrying the whiffletrees is brought in rear of the draught animals when they are between the shafts.

Also, the combination and arrangement of the connector K and the two sets of shafts A D C D and the crossbar E.

Also, the combination and arrangement of the two mud guards L L with the two sets of shafts and their crossbar E.

No. 47,212.—JOHN G. LEFFINGWELL, Newark, N. J.—*Lantern*.—April 11, 1865.—The parts of this lantern are put together by means of rivets or eyelets instead of solder, as the latter is liable to melt. The lamp and the lantern are united by means of two hooks, one on the former and the other on the latter, and a spring so that they may be easily connected or disconnected. The burner is set in a cup instead of a collar. This cup is provided with two legs, one on each side, which have a slight spring, so that when the burner is set into the cup and turned slightly, the spindle of the ratchet wheel is forced under the lugs and holds them firmly.

Claim.—First, the lugs C when used in the manner and for the purposes specified, substantially as described.

Second, attaching the lamp to the lantern part by means of hooks or flanges represented working in combination with a spring, substantially as set forth.

Third, the lantern as it stands with its several devices, to wit, lugs, hooks or flanges, and spring fastening with rivets, reflectors, and posts, combined and arranged substantially as described.

No. 47,213.—ALBERT J. S. MOLINARD, Baltimore, Md.—*Packing Projectiles for Rifled Ordnance*.—April 11, 1865.—In the base of the projectile is a conical cavity whose axis coincides with that of the projectile. The base of the projectile is of the form of the frustum of a cone. In the base are openings leading to the interior conical cavity. In these openings and on and around the base of the projectile lead packing is cast in quantity such that its perimeter is equal to that of the head of the shot. The inclination of the aforesaid openings to the axis of the said conical cavity is about 60° , so that before the packing which fills these openings can be separated from the shot by the centrifugal force imparted to it by the spiral grooves into which it is forced, it must move faster than the shot, a thing which, of course, it cannot do.

Claim.—The inclination of the mortises or openings E connecting the conical hole in the base with the outer belt of metal or packing, in combination with the soft metal packing united to the shot as therein described, and the tapering of said packing to a thin feathered edge at or near the base of the shot that is raised by the gases acting simultaneously against the solid lead at the base and feather edge at the time of the discharge, for the purpose set forth.

No. 47,214.—WILLIAM MOREHOUSE, Buffalo, N. Y.—*Helve*.—April 11, 1865.—This invention consists in making upon each side of that part of the handle which fits into the eye of the axe longitudinal cavities, and in these concavities transverse sockets, so that the wedges after being exposed to the weather may swell into the said sockets, the wedges being made of soft wood and perfectly dry when driven.

Claim.—First, a helve or handle A constructed with sockets e, therein substantially as and for the purposes described.

Second, a helve or handle A constructed with a concavity b, therein substantially as and for the purpose described.

Third, so forming axe helves and other handles that when fastened in the eyes of implements by wedges of wood, the wedges will be allowed to expand and swell into recesses or sockets formed in the handles, substantially as and for the purpose described.

No. 47,215.—C. P. MORTON, Chester, Pa.—*Alarm for Railroads*.—April 11, 1865.—This invention consists of an adjustable arm having elastic fingers, and so connected with a distant bridge that in opening the draw the said arms will be turned into such a position across the track that a passing train will necessarily impinge, rub, or rattle against said fingers so as to produce an alarm.

Claim.—The combination of the arm F, spring H, projections f' f'' , with the rod M and bell-crank L, so constructed and arranged as to operate in connection with the drawbridge C D in the manner and for the purpose herein described.

No. 47,216.—JOSEPH NEWBERGER and PETER J. ILLIG, Buffalo, N. Y.—*Fruit Can*.—April 11, 1865.—This invention consists of a jar, the neck of which is formed tapering towards the top, the said neck being made with a recess to hold the packing. A cover provided with a rim is made to fit over the neck, and is held in position by the buttons.

Claim.—First, as a distinct article of manufacture a rim A, made of tin or other similar material, having a slightly tapering neck with a groove *a'* formed therein for receiving and holding a packing strip C, substantially as and for the purpose set forth.

Second, in making a cap or cover B to fit on to the taper neck of the rim, and having a flange *b* formed thereon in combination with a button D, for the purposes and substantially as described.

No. 47,217.—THEODORE A. NIXON, Philadelphia, Penn.—*Treating Straw to Obtain Paper Pulp.*—April 11, 1865.—In this invention the straw to be treated is first placed in a tank and covered with the waste liquor from the second treatment of the straw, next to be described. This tank is then heated by means of steam pipes, and is kept at the boiling point for about six hours. This liquor is then washed out. The second treatment is to place the warm straw from the first treatment in a boiler, with caustic soda of the strength of about $3\frac{1}{2}$ alkolimeter heated to about 250° Fahrenheit. Steam is then introduced till the straw is pulped. The liquor is then drawn off and used for treating fresh straw, as first described.

Claim.—First, manufacturing paper pulp from straw by a process substantially as described.

Second, subjecting the prepared straw to the action of a hot solution of alkali prior to boiling the same, substantially as set forth for the purposes specified.

No. 47,218.—EDWIN A. PARKER, Horseheads, N. Y.—*Stove.*—April 11, 1865.—In this invention external air is led into a passage and thence into a heating chamber around the base of a stove, whence it can flow upwards, coming in contact with the fire pot, and through apertures in the outer casing about the fire pot into the room, or by flues and dampers the air can be introduced under the grate to aid combustion.

Claim.—The special arrangement for supplying the air drawn from the outside of the room, partly to supply the combustion, and partly to supply the room, the same consisting of the passage E, central heating chamber G, the induction pipe H, and the draught pipe I, operating substantially in the manner and for the purpose herein set forth.

47,219.—EDWARD J. PHILLIPS, Prescott, Wis.—*Churn.*—April 11, 1865.—This invention consists of a churn in which a vertical dasher is moved by a pitman connected to a disk rotating above it; the pitman is made to adjust nearer or more remote from the centre, thus varying the length of stroke.

Claim.—The crank wheel A, pitman B, and adjustable wrist I, in combination with the dasher C and guide pin D, the several parts being constructed, arranged, and operating as and for the purpose herein set forth.

No. 47,220.—WILLIAM QUINN, Philadelphia, Penn.—*Velocipede.*—April 11, 1865.—One of the forward wheels rotates with their axle and the other rotates independently of it to facilitate turning. Between the hind and forward axles are suspended two stirrups for the feet, the pendulous motion of which serves to impart a rotary motion to the hind wheels by means of rods connecting said stirrups and cranks on the rear axle. Between the two axles are also hand levers connected also with cranks on the rear axle for the propulsion of the machine.

Claim.—First, the combination of the two cranked axles G and G' with the connecting link z, with the bearing c, substantially for the purpose as described and shown.

Second, the construction of the fulcrum bearing N, the treadle levers when used in combination with the brace D, substantially as described and shown.

Third, the construction and arrangement of the frame as herein before set forth and described.

No. 47,221.—JOSIAH T. REED, Charlestown, Mass.—*Dyeing Kid Gloves.*—April 11, 1865.—This invention consists in stretching the glove, after it is cut out and sewed, upon a form and applying the dye to the outside with a suitable pencil or brush.

Claim.—As a new article of manufacture, a kid glove having the inside of the same color as the skin from which it was made, and the outside being colored of any desired shade after the glove is cut out and sewed, substantially as described.

Also, the art, method, or process of coloring kid gloves by applying with a brush or sponge the required dye or color to the exterior of the glove while it is stretched upon a suitable form or mould.

No. 47,222.—CHARLES ROBINSON, Springfield, Mass.—*Apparatus to Preserve and Exhibit Photographs.*—April 11, 1865.—This invention consists of a box containing two rollers to receive and discharge a band of pictures; a glass between the two admits of their being seen when turned by a knob reaching to the outside of the box.

Claim.—The combination of a continuous band G provided with means for mounting the photographs thereon, two cylinders B C, of sufficient diameter not to injuriously affect the appearance of the photographs by being bent around them, and an enclosing box or case A

provided with an aperture or apertures H H, through which the photographs are exhibited, substantially as and for the purposes herein specified.

Claim.—Also, the brake clamp shown in Fig. 4 for keeping the tangent portion of the connecting band or strip straight, as herein set forth.

No. 47,223.—HENRY W. SERGEANT, jr., Boston, Mass.—*Clothes Pin.*—April 11, 1865.—This invention consists of a clothes pin with three flexible prongs.

Claim.—Constructing a clothes pin with three flexible prongs, substantially as and for the purpose described.

No. 47,224.—JOHN B. ROOT, New York, N. Y.—*Pump for Oil Well.*—April 11, 1865.—This invention consists in the employment in an oil well of tubing composed of wooden staves surrounded by bands of metal; also in the arrangement of the pump cylinder in combination with the tubing of wood, whereby the said cylinder can be drawn up through the tubing without disturbing it by means of the piston rod.

Claim.—First, the employment in an oil well of tubing composed of wooden staves and surrounding bands of metal, substantially as herein specified.

Second, the arrangement of the pump cylinder in combination with the tubing of wood, substantially as herein specified, whereby the said cylinder can be drawn up through the tubing without disturbing it.

Third, the arrangement of the pump cylinder in the interior of the tubing of wood in an oil well, whereby the said cylinder and its piston may be withdrawn together from the said tubing by means of the piston rod, substantially as herein described.

No. 47,225.—CHARLES A. SAXE, Philadelphia, Penn.—*Machine for Boring Wells.*—April 11, 1865.—This invention consists in an arrangement of machinery by which the power that drives the machine may be continuous and in one direction, while the drill in connection with its rising and falling motion may have a downward feeding motion, and a rotary motion, or a rising, falling, and rotary, without the feed motion; and, in addition thereto, the facility of being raised up out of the hole to add a new section to the drill stock, or for repairs, while the power that operates the machine, as above stated, may run at a uniform speed always in the same direction.

Claim.—First, the combination of the drill frame and the frame that carries the double cam planes, both suspended to the screw nut and arranged to operate substantially as herein described and represented.

Also, in combination with a drill or boring tool that is raised and dropped, rotated, and fed up to the work, as herein described, the gear U and its stem or shaft, by which said feed motion may be increased, diminished, or suspended, as and for the purpose set forth.

Also, in combination with the raising and dropping, rotating and feeding mechanism, the gear V and its appliances for raising the drilling tool and its frame, and automatically stopping its action when the drill is up, and without stopping the first moving power, substantially as described.

No. 47,226.—S. FRANKLIN SHOONMAKER, New York, N. Y.—*Oil Ejectors.*—April 11, 1865.—This invention consists in providing a nozzle for the delivery of the air to the instrument in such a manner that the air will act upon the external and internal surface of the column of oil at one and the same time. The device for producing this result is composed of an annular vessel having an annular passage for the escape of the air from the induction pipe, and a central passage for the oil to pass up through, so as the air escapes from this passage the oil passes up on both sides.

Claim.—First, the use, in apparatus employed for the raising of liquids from great depths or to great heights, of an annular-shaped orifice or opening for producing an air blast in the same, said orifice being so arranged as to allow the liquid to be raised to come in contact with both the exterior and interior surfaces of the air blast, substantially as described and for the purpose specified.

Second, in combination with the nozzle *c c*, having an interior oil passage, the conical plug *n*, or its equivalent, arranged and operating substantially as and for the purpose specified.

Third, adjusting the height of the nozzle of the air pipe in the oil or liquid pipe, the same consisting in the use of the movable plate or ring *e e*, arranged and operating substantially as described.

No. 47,227.—S. FRANKLIN SHOONMAKER, New York, N. Y.—*Oil Ejectors.*—April 11, 1865.—This invention consists in the arrangement of a device for delivering the air from the end of the pipe, which conveys the same down to the ejector, and is composed of a series of small pipes attached to the end of the air pipe, and so placed as to form an annular passage for the oil which flows up in two columns, one outside of the column of air, and the other within the same. Directly above the outlet of the air pipe an inverted cone is placed for the purpose of deflecting the column of oil outward from the centre of the delivery pipe. From the interior of the oil pipe and projecting therefrom is an inverted cone, with a trun-

cated conical flange covering the mouth of the delivery of the air pipe, for the purpose of giving the proper direction to the air current.

Claim.—First, forming the delivery nozzle of an air-blast pipe in elevators for petroleum or other liquids, of a series of pipes of any desired number and size, with their delivery ends in the same horizontal plane, and having the form of a circle or any other suitable form, and so arranged as to give the oil in the oil tube and surrounding the air pipe a passage through which to communicate with and to approach the interior surface or surfaces of the air blast, substantially in the manner and for the purpose specified.

Second, the combination with the double truncated conical diaphragm *o p* of the adjustable cone *l*, arranged together substantially in the manner and for the purposes specified.

No. 47,228.—ABEL SHARLOW, Fort Lee, N. Y.—*Egg Boiler*.—April 11, 1865.—This invention consists of a cylindrical vessel of tin or sheet metal, having a concave bottom, over which is fitted a flat perforated disc, enclosing a small space between it and the concave bottom; the apparatus has a handle by which it can be lifted, said handle extending down the side of the vessel, and serving to steady it. There is a small measure attached to the handle, which contains just enough water to generate steam sufficient to cook the eggs, which are placed on the perforated disc or bottom; and the water is then poured into the space beneath said bottom, is evolved in the shape of steam, and rises up among the eggs, and cooks them. When the steam ceases to escape from a hole in the top, the eggs are known to be done.

Claim.—As a new article of manufacture the culinary vessel A, when constructed and operated substantially as described for the purpose set forth.

No. 47,229.—J. H. SNYDER, Killbuck, Ill.—*Ditching Machine*.—April 11, 1865.—This invention consists of a ditching machine, made to move upon a railroad upon wheels which impart motion to the excavating device.

Claim.—First, the guides *m' n'*, spring catches *r*, and levers *m n*, in combination with the adjustable standards *p* and slides *L*, as and for the purpose set forth.

Second, the curved levers *G'*, arms *j*, in combination with the scrapers *G* and links *H*, as and for the purpose set forth.

Third, the standards *E*, cross trees *k'*, in combination with the shoots *D* and scraper *G*, as and for the purpose set forth.

Fourth, the carriers *f*, guides *f'* and spring *g'*, in combination with the shoots and scrapers, as and for the purpose set forth.

No. 47,230.—WM. A. SPRAGUE, Boston, Mass.—*Signal Frames*.—April 11, 1865.—These frames are either angular or square. The former are provided with three different kinds of joints, viz: hinge at the apex, and on the side opposite the apex to allow the frames to be opened, slide in the side frames to allow them to be lengthened or shortened, and swivel at the points of junction of the side frames with the end frames. The square frames are provided with a hinge joint in the centre of each side piece, to enable it to be folded together or opened; and also with hinge joints at the points of junction of the side pieces.

Claim.—Two kinds of frames to extend signals when there is no wind, as herein described and set forth in this specification.

No. 47,231.—THOMAS TAYLOR, Washington, D. C.—*Fuse Hood for Explosive Shells*.—April 11, 1865.—In this invention a hood or shield is secured around the neck of a projecting fuse stock, conforming generally to the front portion of the shell, and in close proximity thereto, for the purpose of directing the windage flame more certainly upon the time fuse.

Claim.—The use of the flame hood *E*, located between the front end of the shell and the front of the fuse, held secure in its place by the flange of the plug *c*, the same constructed and operated substantially as described.

No. 47,232.—ELI THAYER, Worcester, Mass.—*Sediment Extractor for Steam Boiler*.—April 11, 1865.—This invention consists in placing a vessel upon the outside of the boiler for the reception of the sediment, and connecting it with the generator by pipes, in such a manner that a brisk circulation is kept up, and the earthy matter is deposited in the outside vessel.

Claim.—The vessel *O*, when arranged in the manner and for the purposes substantially as set forth.

No. 47,233.—FRANCIS S. THAYER, Troy, N. Y.—*Flour Bolt*.—April 11, 1865.—In this invention a tube passes through the shaft, and the weight is placed in the tube, which falls as the bolt rotates from side to side.

Claim.—The use of one or more falling weights, in combination with an inclosed tube, when the said tube passes entirely through the shaft, thus allowing the weights to fall from side to side of the bolt, substantially as and for the purpose set forth.

No. 47,234.—TIMOTHY F. WARDWELL, Penn Yan, N. Y.—*Box for Transporting Plants*.—April 11, 1865.—This invention consists in forming a box of flat pieces, grooved in such a manner that the parts will set correctly together, and form a strong and light box; and it also consists in the employment of a mould in which to put the box together, introduce the plant, and envelop and tie the box.

Claim.—A box for plants, &c., formed by the flat pieces of wood grooved and set together in the manner specified, and provided with an opening for the purposes and as set forth.

No. 47,235.—CYRUS M. WARREN, Boston, Mass.—*Apparatus for Distilling Petroleum, &c.*—April 11, 1865.—This invention consists of a still connected with the lower end of a worm, the said worm being contained in a vessel placed over a furnace, and situated above the level of the still; the upper end of the worm is connected to the upper end of an ordinary condensing worm. The vessel is filled with oil, having a higher boiling point than the liquid to be distilled, and is provided with a thermometer. The object of the invention is to separate the different products contained in the petroleum, &c., so as to have them of a uniform consistency, as shown by their boiling point.

Claim.—The special application of heat by means of a separate fire, or its equivalent, to a condenser attached to a still, for the purpose of controlling and regulating the temperature of vapors given off in distillation, in order to produce a more complete separation of the constituents of complex mixtures of liquids.

No. 47,236.—THOMAS WELLHAM, Washington, D. C.—*Machine for Pressing and Shaping Screws*.—April 11, 1865.—This invention consists in inserting in the periphery of a pair of rolls three or more adjustable dies at regular intervals; each die in one roll constituting, with the corresponding die in the other roll, a matrix in and by which, as the rolls revolve, and bring the corresponding dies together, the screw is formed by pressure.

Claim.—The combination and arrangement of the movable and adjustable dies H, and revolving stop J, as herein described, for the purpose of pressing and shaping screws by pressure, instead of cutting and swaging the threads of screws as heretofore.

No. 47,237.—WM. WHARTON, jr., Philadelphia, Penn.—*Machine for Levelling and Smoothing Ice*.—April 11, 1865.—This invention consists of an oblong frame, upon the front side of which is affixed a cutting edge of steel. From the forward end a tongue projects, and from the rear a guiding pole, with a bent knee, composed of a metallic rod that runs upon the ice. A wide board adjusts to the front side of the frame for removing snow.

Claim.—First, a machine for levelling and smoothing ice, consisting of a frame to which one or more blades or plates are secured, so that they may be carried across the ice perpendicular, or nearly perpendicular, to the surface of the latter, substantially as described.

Second, the inclined draught pole C, combined with the frame A and its blade *a*, substantially as and for the purpose described.

Third, the frame A, its blade *a*, draught pole C, and guide rod B, with its support D, the whole being constructed and arranged substantially as and for the purpose specified.

Fourth, the detachable plank H, in combination with the frame A and draught pole C, arranged substantially as and for the purpose specified.

No. 47,238.—JOHN M. WHITTALL, Philadelphia, Penn.—*Stopper for Fruit Jars*.—April 11, 1865.—This invention consists of a hollow stopper, with an opening in the top to admit cold water. The part which fits the neck of the jar is made tapering; when the jar is filled with hot fruit, and the stopper is inserted in the mouth, the water in the stopper causes the steam to condense, forming a vacuum in the jar, and the pressure of the atmosphere on the stopper will cause it to remain securely in its place.

Claim.—A hollow stopper, with an opening at the top, and a cavity in it to hold ice or cold water, substantially as described, for the purpose specified.

No. 47,239.—JOSEPH WHITTLE, Philadelphia, Penn.—*Knitting Machine*.—April 11, 1865.—The object of this invention is to make what is technically called a "tuck." The longer-latchet needle in its descent does not allow the loop thereon to pass over it, and hence, in again ascending this loop, and the new one both remain on the needle shank, the next formed loop is carried over them both. The result is, that at desired intervals, which may be varied at will, a loop of one row or series may be interlaced with those of two or more, instead of only the adjacent series; these points of interlacing or tucking may alternate with similar series next formed.

Claim.—First, the self-acting needles *a'*, with their long latches operating in combination with the self-acting needles *a* and their short latches, substantially as and for the purpose specified.

Second, the cam cylinder, forming a zig-zag groove, one or more of the projections in which are cut away, in the manner and for the purpose described.

No. 47,240.—JAMES P. WOOD, Philadelphia, Penn.—*Automatic Valve for Steam Radiator*.—April 11, 1865.—This invention consists of a metallic cup placed inside of another, filled with any expansive substance, properly fastened in. Steam circulates between the two

cups, from any convenient connection with the radiator, and thence into a passage in the arch over the top of the apparatus and into a tubular projection, reaching nearly down to the thin metal-depressed cover of the smaller cup. A valve or plug resting on this cover fits into the end of this projection. When the heat expands the substance in the inner cup the cover is raised and the plug driven into this projection air-tight.

Claim.—The cup B, diaphragm C, and valve D, in combination with the vessel A and its tubes E and F, or their equivalents; the whole being arranged and operating substantially as and for the purpose herein set forth.

No. 47,241.—MICHAEL COLGAN, assignor to himself, CHARLES D. COOPER, and L. H. BECKWITH, Port Jervis, N. Y.—*Chain Hook*.—April 11, 1865.—This invention consists in constructing the hook and links of such size and shape that the strain is divided between three links.

Claim.—The hook A, in combination with corresponding suitable sized chain links B and D, so constructed that the hook will grasp the chain in the manner herein described, for the purposes set forth.

No. 47,242.—OLIVER P. MACGILL, Brooklandville, Md., assignor to himself and T. POULTNEY, Baltimore, Md.—*Horseshoe*.—April 11, 1865.—This invention consists of a false shoe, to be readily attached or taken off from the shoe that is fastened to the foot, which is constructed of two parts and hinged at the toe. The outer edges are flanged at the top and bottom, making a groove to embrace the insides of the fast shoes. Near the heel is an expanding screw, which, when the false shoe is placed within the shoe that is fast to the foot, screws outwardly, causing the flanges of the false shoe to embrace the other tightly, so as to hold it on while being worn. The upper face of the fast shoe is depressed sufficiently to receive the upper flange of the false shoe. In the lower flange of the false shoe are holes for the reception of calks or sharp points, with their heads resting against the lower face of the fast shoe, which may be readily removed to sharpen as required.

Claim.—First, the expanding frame, to be attached to the horseshoe, and provided with calk points or edges, substantially as described.

Second, the removable roughing points or calks passing through the frame and resting at their upper ends (in situ) upon the under side of the horse's shoe.

Third, the method of securing the false shoes to the ordinary shoe by means of the flanges on the expanding bars of the false shoe.

Fourth, the expanding false shoe, consisting of two parts hinged together, and provided with the expanding screw, substantially as described.

No. 47,243.—JAMES MOLYNEUX, assignor to the BORDENTOWN MACHINE COMPANY, Bordentown, N. J.—*Air Pump*.—April 11, 1865.—This invention consists in the combination of two pumps, having barrels of different diameters, with a reservoir situated between, and communicating with, both pumps, the air being partially compressed by the larger pump, and the air vessel serving to insure uniformity of action.

Claim.—The combination of two air pumps, having barrels of different diameters, with an air vessel or reservoir G situated between, and communicating with, both pumps, all substantially as set forth.

No. 47,244.—OLIVER B. NORTH, assignor to O. B. NORTH & Co.—New Haven, Conn.—*Harness Saddle*.—April 11, 1865.—This invention consists, first, in casting on or in the frame of the saddle-tree a series of studs or pins, which, entering into holes made to match them in the skirts, jockeys, or back bands, securely hold them together. By this mode of uniting these parts the jockeys and skirts can be sewed or stitched before they are attached to the frame, while the common mode is to do this afterward, and with great inconvenience, as the frame is an unwieldy thing to hold in the sewing clamps. And it further consists in a projection, cast on the under side of the seat, for fastening said seat, frame, and rein hook together.

Claim.—The use of studs or pins upon the frame, for the purpose of holding or of aiding to hold the skirts, jockeys, back or tug straps of the harness thereto, substantially as described.

Also, casting the bolt or projection *e* on the under side of the seat, as and for the purpose herein described.

No. 47,245.—ALVIN POND, Hamden, Conn.—*Carriage Bolt*.—April 11, 1865.—This invention consists in so swaging a square necked bolt from round iron that the line of junction of the square with the cylindrical portion shall be distinctly defined; the corners of said square portion terminating squarely and sharply, and not, as heretofore, merging gradually into the round or cylindrical portion.

Claim.—Manufacturing bolts from round iron by means of dies, formed so as to produce sharp corners at the ends of the squared portion, as set forth.

No. 47,246.—TIMOTHY J. POWERS, assignor to J. P. FITCH and J. R. VAN VECHTON, New York, N. Y.—*Machine for Cupping Metallic Cartridges*.—April 11, 1865.—This invention consists mainly in the arrangement and operation of an annular punch, the cutting edge of

which fits the upper part of a hollow or female die, and between which and the punch the blanks are cut. This annular punch, after cutting the blank, further descends and clamps the blank by its edge upon an inwardly projecting ledge, a short distance below the surface in said female die. While held in this position a mandrel, passing through the annular punch, forces the centre of the blank downward through the smaller portion of the female die, which, compressing the blank around and causing it to assume the shape of the mandrel, is carried by it through the said female die, and discharged on the withdrawal of the mandrel, and falls into any convenient receptacle.

Claim.—First, the combination, as described, in a machine for cutting out and cupping cartridge shells of the punch *d*, dies *i c e*, and adjustable table *B*; the whole operating as and for the purpose herein set forth.

Second, the rising and falling gauge *p*, applied in combination with the punch and dies, operated by means of a rod *q'*, tappet arm *q*, and tappet collars or pieces *p' p''*, and controlled by a rest *r*, substantially as and for the purpose herein specified.

No. 47,247.—**MARTIN ROBBINS**, assignor to himself and **MAHLON M. WORNBAUGH**, Cincinnati, Ohio.—*Automatic Grain Weigher*.—April 11, 1865.—This invention consists of a cylindrical barrel, rotating upon an inclined axis and divided into partitions. The support for the barrel is so balanced that when one of the partitions is filled with a certain amount of grain it is freed from a detaining catch, and allowed to come over the delivery spout, the fastening lever of the discharge gate passing in the mean time an upright by which it is opened. The opening and closing of the gate of the grain hopper is caused by a series of cam projections on the upper surface of the barrel acting upon a roller and lever attached to the hopper. The amount of grain discharged by the weigher can be regulated by the self-acting governor, which consists of a dial, having upon it a series of holes, into one of which a pin can be inserted. This dial plate is made to revolve simultaneously with the barrel until the pin strikes the lever, by which the roller is thrown off the cam and the hopper closed.

Claim.—First, the revolving and gravitating drum *E E'*, supported and balanced in the represented inclined position, and containing two or more chambers or compartments *F F' F'' F'''*, for the automatic weighing of grain, substantially as set forth.

Second, the provision, on an inclined gravitating grain drum, of the cams *J J' J'' J'''*, when combined with the devices *b b' C c*, or their equivalents, for the automatic opening and closing of the hopper bottom, as set forth.

Third, in the described combination, with an inclined gravitating grain drum, armed with studs *K K' K'' K'''*, or other suitable projections, the adjustable gauge *D d*, substantially as represented, or any mechanical equivalent thereof.

Fourth, the devices *L l' I* and *M*, or their mechanical equivalents, for the automatic opening and closing of each successive grain chamber, as set forth.

Fifth, the self-acting governor, consisting of the parts *P Q R S T U V W w*, in the described combination, with the parts *b b' C c*, or devices substantially equivalent, for the automatic arrest of the weighing action, as set forth.

No. 47,248.—**LUKE WHEELOCK**, assignor to himself and **O. B. LEAVENWORTH**, New Haven, Conn.—*Syringe*.—April 11, 1865.—In this invention the discharge orifices are so made that the liquid is thrown backward instead of forward.

Claim.—A syringe, when the discharged apertures are formed substantially as and for the purposes specified.

No. 47,249.—**ALBERT A. WILSON**, Green Point, N. Y., assignor to himself and **HOFFMAN ATKINSON**, Rouseville, Penn.—*Wet-boring Device*.—April 11, 1865.—This invention relates to that portion of a boring tool called the "jar," and consists in constructing the jar so that the surfaces thereof which come in violent contact are so strengthened, without increasing the diameter of the jar, as to lessen the liability of the links of the jar being broken when the second blow is struck by the upper link.

Claim.—The method, substantially as herein described, of increasing the sectional area and strength of the concussion surface of jars used in connection with tools for artesian well boring, for the purpose set forth.

No. 47,250.—**GEORGE CARTER**, Nottingham, England.—*Shears*.—April 11, 1865.—This invention consists in making a thin cutting blade, which is fastened to one of the jaws of the shears by screws. The other jaw is composed of two parts, with the edges bevelled on the outside, between which the cutting blade is made to shut in operating.

Claim.—Constructing shears, scissors, and other cutting instruments of a similar character thereto, with three edges, viz: one cutting edge and two edges for keeping the cutting edge in proper position, and for preventing the same moving sideways, substantially as set forth and described.

No. 47,251.—**M. ANTOINE ESPIRAT** and **ETIENNE SAUSÉ**, Marseilles, France.—*Filter*.—April 11, 1865; patented in France January 30, 1864; patented in England July 19, 1864.—

In this invention one or more filters are so arranged that when a certain quantity of water has passed through them a lever and valve are automatically operated to reverse the current, and thus remove the accumulated impurities.

Claim.—The combination of the filters G H and R S, with their reservoirs B and L, when constructed and operated substantially as and for the purposes described.

Also, in combination with the filters and their reservoirs above described, the self-cleansing apparatus, consisting of pipe *p*, reservoirs *c c' O'*, wheel *a*, and syphons *d u*, when constructed and operated as herein described.

Also, in combination with the filters and the reservoirs *c c' O'* and their operating devices, the recipient *x* and pipes V Z, as substitutes for the pipe *p*, as and for the purposes set forth.

No. 47,252.—ALEXANDER GUERRIERO, Genoa, Italy.—*Revolving Fire-arms.*—April 11, 1865.—In this invention the cylinder is provided with a removable breech cap attached to it by a bayonet-joint fastening and spring catch so as to revolve therewith, and this again is cased in a stationary breech cap attached to the stock or frame. On the turning of a locking cam pin, which secures the barrel to the centre pin, the barrel, cylinder, and its breech cap are separately removable from the centre pin and stock.

Claim.—First, the combination in a revolver of the following parts: the barrel, the cylinder, the breech plate, and the stock, when the said parts are constructed as described, each being capable of being detached in the manner and for the purpose set forth.

Second, in combination with the many-chambered cylinder and rotating breech plate, the means herein described of locking and unlocking the same.

Third, the combination of the rotating cylinder and breech plate with a fixed breech casing and its spring packing device, to hold the breech plate in place without interfering with its rotary movement.

No. 47,253.—THOMAS BURNS, Williamsburg, N. Y.—*Barrel Packer.*—April 11, 1865.—This invention consists in giving to the barrel a rocking motion while being packed, such motion being produced without striking the edges of the barrel with much force, the head of the barrel being kept constantly upon the platform.

Claim.—First, giving to the barrel the rocking motion, substantially as shown, for the purpose specified.

Second, in combination with the flanged platform A, levers C C2, provided with the elongated slots G G2, the adjustable clamp J, when the same shall be combined and operated substantially as and for the purpose specified.

No. 47,254.—CHARLES W. CAHOON, Portland, Maine.—*Wick Scraper.*—April 11, 1865.—This invention consists of a flat piece of metal, having a part of it made in the form of a ring for a handle by which to hang it up, and another with a rectangular inlet to scrape the top of a lamp wick.

Claim.—A wick scraper substantially as described.

No. 47,255.—EDWIN S. DRAKE, Portland, Maine.—*Saw.*—April 11, 1865.—This invention consists in affixing to or forming the teeth of a straight or circular saw of diamonds or other precious stones of great hardness for the purpose of cutting stone.

Claim.—As a new article of manufacture, a saw constructed with cutting points or edges, substantially as described.

No. 47,256.—JOHN H. IRWIN, Chicago, Ill.—*Apparatus for Carburetting Air.*—April 11, 1865.—This invention consists in placing the carburetter above the burners, in order that the carburetted air may fall by its own weight to the burners, and its place in the carburetter be supplied by fresh air through the inlet.

Claim.—Arranging a carburetting apparatus, provided with an inlet for air and an outlet for gas above the point of combustion, substantially as and for the purposes herein set forth and shown.

No. 47,257.—JOHN H. IRWIN, Chicago, Ill.—*Process for Carburetting Air.*—April 11, 1865.—This invention consists of a furnace connected with a flue, the said flue communicating with the carburetter. The air in the furnace on being heated rises into the tube, and from thence passes into the carburetter, where it is discharged with hydro-carbon vapor. It is then allowed to pass to the different burners.

Claim.—Producing a current of air through a carburetting apparatus and a pressure at the burners by the action of heated air, substantially as and for the purposes herein specified and shown.

No. 47,258.—JOHN H. IRWIN and ISAAC SIMMONS, Chicago, Ill.—*Apparatus for Carburetting Air.*—April 11, 1865.—This invention consists of a series of carburetting chambers, connected together by means of pipes. The air is admitted through a vertical flue, which is connected to the carburetting chambers by means of pipes, and the carburetted air passes through similar pipes into a chamber to be drawn off for use. The chambers are so arranged that any one of them can be removed for repairs without stopping the operation of the others.

Claim.—First, so arranging a series of carburetting pans, A, with the chambers C D and connecting pipes, provided with stop-cocks or other equivalents, that the apparatus may be regulated, controlled, and operated substantially as and for the purposes set forth and shown.

Second, the combination of a series of carburetting pans with the chambers C and D and the two series of connecting pipes G and L, provided with the stop-cocks or their equivalent, operating substantially as and for the purposes specified and shown.

Third, the combination of a series of carburetting pans with the chambers C and D, and the three series of connecting pipes G, L, and Q, substantially as and for the purposes specified.

Fourth, in combination with the series of pans A and the chambers C D, the employment of a condensing chamber, E, as and for the purposes set forth.

Fifth, connecting the said pans and chambers A C D by removable or detachable pipes, substantially as and for the purposes specified.

No. 47,259.—DANFORTH JOHNSON, Chicago, Ill.—*Churn Dasher*.—April 11, 1865.—This invention consists of a churn dasher having grooves around the bottom in the form of a wedge, thereby giving a greater pressure to the cream than one ordinarily made with holes, and at the same time causing the cream to expand in its upward motion and breaking the globules more effectually.

Claim.—A wooden churn dasher, conical or oval on the top, with wedging apertures around the bottom edge of the dasher for compressing the cream, in the manner and for the purpose set forth.

No. 47,260.—E. L. PRATT, Boston, Mass.—*Scraper for Cleaning Gun Barrels*.—April 11, 1865.—This cleaner is constructed of a series of thin plates cut separately out of steel or rolled metal, and set in a grooved or morticed shaft or foundation piece at one end to secure them in position. This foundation piece is affixed to the end of the rammer. A ring confines the blades, so that as they descend into the gun barrel they do not touch its inner surface. On striking the bottom the ring is forced upward and the blades allowed to expand so as to press against the inner surface of the barrel and cleanse it as they are drawn out. A swab is arranged between the blades so as to cleanse the breech.

Claim.—The spring blades, when cut from sheet metal, and swayed or stamped into form, substantially as set forth.

Also, the attachment of the blades to a shank or foundation piece, in the manner substantially as described.

Also, the construction of the gun cleaner, by which the ring is prevented from slipping therefrom, substantially as set forth.

Also, the employment of the swab in combination with the spring blades, substantially as set forth.

Also, the construction of the spring blades, by which they form a trumpet mouth, substantially as described.

No. 47,261.—THOMAS SIMMONS, Chicago, Ill.—*Filters*.—April 11, 1865.—This invention consists of a tube, within which are two coils of wire in line, each confined between two disks. Each coil is enveloped with cloth drawn tight above, below, and between the two coils. The water is admitted within the upper distended sack, and percolates laterally and downward into the lower sack, whence it flows out of the narrowing cylinder and into another cylinder, the top tapering end and the bottom tapering end of which contain gravel, confined by a perforated cone pointing to the cylinder, the body of said lower cylinder being filled with carbon, separated from the gravel at each end by a perforated disk.

Claim.—First, the combination and arrangement of the spiral wire C, the horizontal plates H, and the fibrous covering F, when inclosed inside of a case, A, substantially as and for the purpose set forth.

Second, the combination and arrangement of the above with the carbon cups, substantially as and for the purposes described.

No. 47,262.—HENRY TUBESING, Pittsburg, Penn.—*Flexible Types and Apparatus for Printing*.—April 11, 1865.—This invention is intended for marking boxes and packages having uneven surfaces, and it consists of a roller over which elastic types, cast in a peculiar form, are bent and fastened.

Claim.—Making the separate pieces of elastic type, with a projection at top and bottom having a gutter for the purpose of holding them in place by means of a cord or similar device for that purpose.

Also, the use of a flexible bed plate for holding the movable elastic type, so that the bed plate and type may be attached to the curved surface of a frame, substantially as described.

Also, the use of strips of leather or other flexible material, placed above and below the upper and the lower line of type, for the purpose of keeping the movable type straight and yet allowing the form to be readily curved when set on the machine for the purpose of printing.

Also, the mode of securing the movable elastic type to the bed plate, by means of elastic cords resting upon the projecting base of the type, substantially as described.

Also, the combination of the flexible bed plate A, flexible strips b and d, and slide c, with a curved or cylindrical frame for printing with movable elastic type, substantially as described.

No. 47,263.—ERASTUS S. WOODFORD, Winchester, Conn.—*Ox Yoke*.—April 11, 1865.—This invention consists in arranging the blocks in the slot of the yoke, so as to give any desired leverage to the same.

Claim.—The manner of arranging the staples and cords, in combination with the bow blocks 5 and 6, the centre blocks 1 and 2, and the caps 3 and 4, as and for the purposes herein set forth.

No. 47,264.—WM. ADAMSON, Philadelphia, Penn.—*Apparatus for Agitating and Kneading Substances*.—April 18, 1865.—This invention consists of a circular vat provided with openings, the top and bottom being furnished with covers. In the centre of the vat is a vertical shaft passing through a stuffing box in the cover. To the spindle is secured a horizontal arm, one end of which is connected to the link, the other end being connected to the ring by means of a rod. The shaft of the conical roller has its bearing at one end in the link and at the other end in the ring, which turns freely on the shield.

Claim.—First, the cone-shaped roller caused to traverse in a circular path and to revolve on its own axis in a closed vessel within which pressure is maintained by the introduction of steam or otherwise, all substantially as and for the purpose herein set forth.

Second, the combination of the vat, having either an open or closed top, with the central shield H and the traversing and revolving roller.

No. 47,265.—G. T. ALLAMBY and JOHN G. BUGBEE, Bangor, Me.—*Crutch*.—April 18, 1865.—This invention consists in inserting in the foot of the crutch a movable spike, which can be pushed out when desired and held firmly in position by means of the catch moving in the curved slot.

Claim.—A spike, C, inserted in a metal socket, B, placed on the lower end of a crutch or cane, and provided with a spring, D, and an arm, E, the latter extending through a slot, F, in the socket, all arranged to operate substantially as and for the purpose set forth.

X No. 47,266.—THEODORE ASCHERFELD, Elkton, Md.—*Time Reporter*.—Antedated April 18, 1865.—A dial marked with figures to indicate hours and fractions of hours is placed in a box with a lid slotted to such an extent as to enable the hand of a man to be introduced far enough to admit of writing a name on the dial. As the dial revolves once in twelve hours, the place thereon where the name is written indicates the exact time when it was written, and thus enables the employers to detect any lack of promptness on the part of employes. The dial is securely fastened by means of pins to metallic plates to prevent its being changed. Another metallic plate is so placed beneath the dial and the slot through which it is written upon as to prevent the introduction of a pointed instrument to stop the turning. Upon this plate is placed a cloth saturated with printers' ink or other transferring material, which being in contact with the under surface of the dial, receives impressions when the latter is written upon, and thus indicates that the writing was done through the slot.

Claim.—First, the plates C D, having pointed projections *c d* and apertures *c' d'*, for securing the dial E and preventing the position of the same being changed without detection, substantially as and for the purposes specified.

Second, the metallic plate G, applied beneath the dial E and aperture A2, to prevent the entrance of a pointed instrument, as described.

Third, the cloth G' placed between the aperture A2, and saturated with printers' ink or other suitable material, or covered with transferring paper for preventing fraudulent inscriptions, as explained.

No. 47,267.—J. S. & T. B. ATTERBURY, Pittsburg, Penn.—*Lantern*.—April 18, 1865.—This invention consists in a lantern frame made without fastenings, and attached to the glass case by screwing over its points in the manner described, and other combinations therewith.

Claim.—First, securing in place the guard frame of a lantern in the act of securing the metallic mountings or collars to the globe of the lantern, substantially as described.

Second, the combination of screw collars, rings, or mountings B B' with a wire guard frame and a globe adapted to receive the same, substantially as described.

Third, a lantern globe constructed substantially as described.

No. 47,268.—JAMES S. & THOS. B. ATTERBURY, Pittsburg, Penn.—*Globe Lantern*.—April 18, 1865.—This invention consists in a combination of a reflection and one or more signal plates with a lantern globe, substantially as described.

Claim.—First, a signal globe lantern, having one or more signal plates, *b*, applied to it, substantially as described.

Second, the combination of a reflector *a*, signal plate or plates *b*, and lantern globe A, substantially as described.

No. 47,269.—ALFRED BAILEY, Amesbury, Mass.—*Making Printed Felt Hats*.—April 18, 1865.—In this invention, after the hat has been reduced to its ultimate shape on the block, the crown is cut off an inch or more above the brim. Each of the sections are then reduced to a plane by the usual means. The two parts are then printed or embossed; when they are restored to their shape on the block and served together.

Claim.—As an invention the improved mode, as above described, of making a printed or embossed felt hat.

No. 47,270.—A. T. BALLENTINE, New York, N. Y.—*Feed Bags for Horses*.—April 18, 1865.—This invention consists in attaching to the head strap of a feed bag another strap across the forehead, for the purpose of keeping the bag from slipping back over the neck of the animal; and also in the arrangement of loops at the opposite end, so as to admit of the horse moving sidewise in either direction.

Claim.—The combination of the flexible bag A, head-stall a b, rope B, sheave C, and adjusting loops c, all as herein described and for the purposes specified.

No. 47,271.—STEPHEN S. BARTLETT, Providence, R. I.—*Self-lubricating Spindle Bolsters of Spinning Frames*.—April 18, 1865.—In the rail of a spinning frame is set a bolster for the support of the spindle. Within this bolster is accurately fitted a metallic casing, which immediately surrounds the spindle. In the outer surface of this casing, and between it and the bolster, is a vertical groove running from the top into a transverse circular groove near the bottom of the casing. At the junction of these two grooves is a hole through the casing, with which communicates a spiral groove on the inside of the casing, traversing it from top to bottom. The lubricant is poured into the vertical groove first mentioned, passes through it into the horizontal circular groove and thence through the aforesaid hole into the spiral groove on the inside of the casing, in which it comes in contact with the surface of the spindle and passes up.

Claim.—First, the combination with the bolster and casing of a spinning frame spindle of a vertical groove d and oil hole g, substantially as and for the purposes described.

Second, the combination of the groove m in the upper part of the bolster C with the vertical groove d and oil hole in the casing, substantially as and for the purpose described.

Third, the combination of the circular grooves in the bolster and casing with the vertical groove d and oil hole g, substantially as and for the purposes specified.

Fourth, the combination with the bolster C of a casing a, having a vertical groove d, oil hole g, and inner spiral groove n, substantially as and for the purposes specified.

No. 47,272.—JOHN A. BASSETT, Salem, Mass.—*Apparatus for Carburetting Air*.—April 18, 1865.—This invention consists of a case, provided with a holder, working in a seal. In the lower part of the vessel, a few inches from the bottom, are placed a series of half-cylinders with serrated edges, the open part of said cylinders being below the level of the benzine. These half-cylinders are connected with a hood, through which air is forced, the air entering at the edges into the benzine. The air is forced into the hood by means of the metre, which consists of a case containing a flexible diaphragm, connected to the shaft by means of a cross-piece. On the top of the case are valve-seat openings which communicate with the space on each side of the diaphragm; these openings being covered by the valve. At one side of the case is placed a reservoir containing benzine. This reservoir communicates with the case by means of an aperture provided with a valve. A tube, connected with the interior of the case, terminates in the upper part of the reservoir.

Claim.—First, the general arrangement and construction of the apparatus, as shown and described.

Second, the carburation of air or gases by the submerged serrated tubes, in combination with the reservoir, substantially in the manner described.

Third, the combination of a power metre, constructed substantially as described, with an apparatus used to aerate and vaporize liquid hydro carbons, the whole operating together in the manner and for the purpose substantially as set forth.

No. 47,273.—JOHN A. BASSETT, Salem, Mass.—*Barrel for Holding Oil*.—April 18, 1865.—This invention consists in lining barrels for holding petroleum, &c., with a composition of sulphur, white clay, and plumbago.

Claim.—The herein described compound, consisting of the materials specified, or their equivalents, when used for lining or coating barrels or other vessels, substantially as set forth.

No. 47,274.—ANTHONY A. BENNETT, Norwalk, Conn.—*Waste Saving Attachment to Cording Engine*.—April 18, 1865.—The object of this invention is to retain the short waste fibre escaping from the main cylinder. The roller, by reason of the direction of its revolution, prevents the currents of air, caused by the quick motion of the main cylinder, from drawing this fibre away from the doffer, inasmuch as it breaks the current. The heavy dirt will fall between the blades of the roller and be brushed off by the leather.

Claim.—First, the combination of the curved shell waste saver A, having a plain face, and the receptacle guard roller c, or their equivalents, in the manner and for the purpose substantially as herein described.

Second, the clearing brush G, or its equivalent, operating in combination with the waste saver A and the guard roller c, for the purpose described.

No. 47,275.—N. E. BLAKE, Almond, N. Y.—*Fire-proof Roof Composition*.—April 18, 1865.—This invention consists of earth containing oxide of iron, coal tar, and linseed.

Claim.—The within described composition, made substantially in the manner and proportions as set forth.

No. 47,276.—**POLITORUS BOTTIER**, Newark, N. J.—*Harness Saddle*.—April 18, 1865.—This invention consists in a recess or groove to receive the shank of the hook, two holes through the saddletree and the shank, corresponding to two projections on the under side of the cantle. A piece of leather is placed between the cantle and the tree. The parts of the saddle are held together by means of screws, the heads whereof are countersunk into the under side of the saddletree.

Claim.—Inserting the rein hook in, and securing it to, the saddletree, as herein above specified.

Also, holding the parts of the saddle together, in the manner described, when so held in combination with the improved manner of holding the hook.

No. 47,277.—**JAMES F. BREWER** and **ENOS E. STOW**, Plantsville, Conn.—*Whip Socket*.—April 18, 1865.—This invention relates to the mode of attaching whip sockets to the dash-boards of vehicles by means of straps. The socket is provided, at its upper and lower ends, with slots or openings through which the straps are passed and made to encompass the socket in such a manner as to form cushions or guards within the socket to hold the whip-stock firmly, the straps also serving as a means of securing the socket to the dash-board.

Claim.—The securing of whip sockets to the dash-boards of vehicles by means of straps passing alternately in and out through slots or openings in the socket, substantially as herein shown and described.

No. 47,278.—**GEORGE W. BRIGGS**, Fiskeville, R. I.—*Self-lubricating Spindle Bearing for Spinning*.—April 18, 1865.—In this invention the revolving cup receives and retains the oil which escapes from the bolster, and the annular chamber at its top prevents its being thrown out by centrifugal force and wasted.

Claim.—In upright and inclined bearings the cup or socket D attached to and revolving with the spindle, in the described combination with the spiral groove G in the bearing C, for the purposes set forth.

No. 47,279.—**VICTOR H. BUSCHMAN**, Baltimore, Md.—*Sawing Machine*.—April 18, 1865; antedated April 17, 1865.—This invention consists in having a series of sets of feed rollers so arranged and controlled by a central weight (to each set) that the frames in which the rollers are hung will preserve their parallelism and accommodate themselves to boards of different thicknesses; they also being capable of deviating from parallel planes to accommodate themselves to boards of unequal thickness. It consists also in the employment of pressure rollers, applied so as to guide and hold the end of the boards up to the saw after leaving the main feed rollers. These pressure rollers only take hold of the upper end or edge of the boards.

Claim.—First, so arranging and supporting feed and pressure roller frames B B', which are controlled by a central force, that while they will preserve their parallelism and accommodate themselves to boards of different thicknesses passed between them, they are also allowed to deviate from parallel planes and accommodate themselves to boards of uneven or unequal thickness, substantially as described.

Second, the employment of pressure rollers *f f*, or their equivalents, applied so as to guide and hold the ends of the boards up to the saw after leaving the main pressure rollers, substantially as described.

No. 47,280.—**GEORGE B. CLARKE**, Leonardsville, N. Y.—*Combined Spittoon and Foot Warmer*.—April 18, 1865.—In this invention, inside a foot warmer, and surrounded by the heating agent, such as coals or lamps, or any convenient device, is placed a detachable spittoon, the flaring mouth of which opens on top of the foot warmer.

Claim.—A combined spittoon and foot warmer, or furnace, constructed substantially as described.

No. 47,281.—**RICHARD CLEMENT**, Philadelphia, Penn.—*Artificial Leg*.—April 18, 1865.—Within the leg, and immediately below the calf thereof, is placed a pin, to which is fastened one end of the principal cord that supports the knee. As considerable wear and strain come upon this cord, it is often necessary to remove a worn and apply a fresh one. The aforesaid pin is made removable in order to facilitate this operation. A firm gut cord is fastened at one end in the lower part of the heel, passes thence round a pulley just forward of the hollow of the foot and runs thence directly upward to its connection with an elastic spring, which is joined by means of another gut cord to a holder just above the front part of the knee joint.

Claim.—First, the removable pin I, when used in the manner and for the purposes specified, substantially as described.

Second, the cord I, in combination with the pulley M and spring N, when constructed in the manner and for the purpose specified, substantially as described.

No. 47,282.—**ALBERT L. DEWEY**, Westfield, Mass.—*Treadle Motion*.—April 18, 1865.—This invention consists of a spiral spring placed upon a shaft and confined at one end to a hub, the other end being free. The hub is fitted loosely on bosses, and is provided with two

flanges extending around it, and between these flanges is a belt, which is secured to the hub; the lower end of the belt being secured to the hub.

Claim.—The spring E and hub D applied to shaft A, substantially as shown, and used in connection with a foot treadle, all arranged to operate in the manner substantially as and for the purpose set forth.

No. 47,283.—EDWARD DUNSCOMB, Boston, Mass.—*Guide for Piston Rods.*—April 18, 1865.—This invention consists in placing two friction rollers, which are grooved to fit the rod, one upon each side thereof, in such a way as to receive the steam upon the end curved by the angles at which the crank presses upon said rod. The object of this arrangement is to dispense with the necessity of providing a cross-bend, and at the same time lessen the friction upon the parts.

Claim.—As my invention in a crank, eccentric or any equivalent motion or movement, the employment and application of anti-friction rollers, substantially as herein before described.

No. 47,284.—CHARLES E. EMERY, Brooklyn, N. Y.—*Balanced Slide Valves.*—April 18, 1865.—This invention consists in the combination and arrangement of a valve having two parallel faces, and bearing upon two seats, one directly above the other, with the steam chest so arranged that the parts which support the valve seats and regulate the distance between the same shall be in actual or metallic contact with the surface upon which they rest, and thence prevent any change in that respect. Provision is made in the construction of the valve and its seats by which it can be withdrawn from its position without disturbing the joints of the steam chest.

Claim.—First, the combination of a valve, of the kind or style above specified, with its seats in such a manner that when the parts *a* and *b* of the valve are secured together, or cast or formed in a single piece, the whole valve may be inserted in and removed from its place by putting one part *b* through an opening *c* in one of its seats *a'*, substantially as described and as shown in the figure numbered 3.

Second, the use of the supports *a'' a''*, Fig. 4, or their equivalents, between the valve seats *a* and *b* and of the standards or supports *s* between the parts *a* and *b* of the valve, with actual or metallic contact at such of their joints as can vary the distance between the valve seats or faces, combined in manner described, to secure the purposes herein specified, with a common joint, of any reliable kind, to prevent leakage, substantially as shown and applied in Fig. 4, between the steam chest, seat *a'*, and cover D.

Third, the combination, to accomplish the purposes intended and specified, of a double-faced slide valve, of the kind or style to which these improvements are applied, as above expressed, with a steam chest, or its equivalent, supporting one or both the parallel valve seats, and so constructed that all joints between the parts of such steam chest or equivalent or between such steam chest and either or both of said valve seats *a'* and *b'*, which can vary the distance between said seats, are made in sufficient actual or metallic contact, by scraping, grinding, or other means, to be tight without other appliances, and sustain said seats at a proper and certain distance from each other, substantially as described.

No. 47,285.—TURNER EVANS, Paris, Iowa.—*Hand Spinning Machine.*—April 18, 1865.—This invention relates to a combination of devices designated in the claim and not admitting of a brief description.

Claim.—The combination of the roll receiver H, the crank shaft R, the spindle frame *o*, the thread guide *m*, the shaft T with pulleys attached, the bar G, the pivoted bar F, spring W, and the hook *u*, the whole constructed and operating substantially as and for the purpose herein set forth.

No. 47,286.—WILLIAM L. FABER, New York, N. Y.—*Process of Working Silver Ores.*—April 18, 1865.—The object of this invention is to work silver ores more economically than can be done by the present process, and it is intended to be applied to real ores of silver, such as occur in Arizona, Nevada, &c., but not to argentiferous lead ores. Where gold occurs with the silver ores, it is all obtained by this process alloyed with the silver.

Claim.—First, the within described process for treating silver ores, consisting of eight different manipulations, as enumerated under the proper heads.

Second, the process as modified by omitting the first and sixth manipulations, and treating the ore as described under the second, third, fourth, fifth, seventh, and eighth heads.

Third, the process as modified by omitting the fourth, seventh, and eighth manipulations, and treating the ore as described under the first, second, third, fifth, and sixth heads.

No. 47,287.—JOHN P. FARMER, Cambridge, Mass.—*Skate.*—April 18, 1865.—This invention relates to a skate by which it can be fastened to the foot of a person with ease and security. A broad strap goes across the entire foot part and comes down in front of the toe of the skater's boot. At the toe a screw projects backward and into a long slider on which a nut is screwed. On the heel is a catch on hooks. The toe of the boot is to be inserted, the skate then pulled backward to cause the catch to extend in rear of the heel of the boot. The nut is then rotated on the screw until it abuts against the toe rest on the front end of the slider.

Claim.—The combination and arrangement of the encompassing toe strap D with the slider E, its retracting mechanism, the heel catch C, and the foot rest A applied to the runner B.

Also, the arrangement and combination of the screw F and the nut G with the toe part of the skate runner and the slider E and strap D, the whole being substantially as described.

Also, the combination and arrangement of the passage *a* with the slider E and the screw F, and the nut G, arranged at the toe part of the skate runner as described.

No. 47,288.—E. VICTOR FASSMANN, New Orleans, La.—*Hoop Lock for Cotton Bales.*—April 18, 1865.—The object of this invention is to obtain a cotton bale tie which may be cheaply manufactured, admit of having the ends of the hoops readily applied or attached to it to secure the hoops on the bales, and which will admit of the hoops being applied to bales varying in size.

Claim.—The plate A provided with the slots B B, and ridges or projections *b b* at one or both sides of the plate, and with the slits *a'*, to form a new and improved cotton bale, tie or hoop lock, as set forth.

No. 47,289.—THOMAS M. FELL, New York, N. Y.—*Mine Pump.*—April 18, 1865; ante dated, April 7, 1865.—The object of this invention is to produce a direct acting mine pump to be actuated by the combined force of steam and air, made more available by the production of a vacuum, whereby to considerably reduce the expenditure of fuel and the cost of engineering for such purpose. Its novelty consists in the combination and arrangement of the cylinder connected to the main pump by the rods, chain, weight, exit pipe valves and condensing apparatus.

Claim.—The combination of the several devices, viz: the cylinder *a* connected with the mine pump by the rods T, exit pipe S, weight V, chain *w*, condensing apparatus K Q and L, and the valves B C R L and O, substantially and for the purpose as herein set forth.

No. 47,290.—WILLIAM S. FICKETT, Rochester, N. Y.—*Rock Drill Apparatus.*—April 18, 1865.—This invention consists in providing the driving shaft of a rock drill with a compound, or a fixed and a loose crank, which permits the drill to fall suddenly and rapidly from its raised position, instead of gradually as when it is operated by a fixed crank. A self-acting locking bar is employed to catch and hold the loose crank on the upper centre, and thus prevent its vibrations, which would otherwise occur when it is relieved from the weight of the drill at this point.

Claim.—First, working the drill by means of a crank composed of a fixed arm C, and a loose one C', constructed and operating conjointly, substantially in the manner shown and for the purposes described.

Second, the employment of the locking bar or latch G for the loose arm of the crank, said bar having an automatic action, substantially as and for the purpose set forth.

No. 47,291.—CHARLES FOWNES, Pittsburg, Penn.—*Stove.*—April 18, 1865.—In this invention, into and through a central tube, air from below the stove flows by convenient passages. In the chamber formed by this tube and outer cylinder flanges are placed alternately on the tube and cylinder, so that products of combustion from the fire-pot will roll from side to side and against both walls.

Claim.—The annular deflectors F G attached alternately to the external case A and internal tube D, in the described combination, with a fire chamber from which heated products of combustion are passed through the annular flue so as to heat air in its passage through the air tube D.

No. 47,292.—A. O. GALLOP, Salem, Conn., and E. A. HEWETT, New London, Conn.—*Churn.*—April 18, 1865.—This invention consists in a peculiar formation of the sides or bottom, or both, of the churn, with a series of sharp pyramidal polygonal or any other suitable shaped projecting points or spurs of any desired number and size, and at any suitable distance apart, against which the cream, as it is agitated in the churn by any suitable dasher, is thrown and thereby its globules of butter broken. It also consists in the use of a peculiarly shaped dasher, composed of a series of beaters arranged on a shaft, either spirally or otherwise, and having their outer ends formed with one or more sharp points or spurs for cutting and breaking the butter globules, said dasher shaft being placed in a proper position to act in connection with the said pointed bottom or sides of the churn.

Claim.—First, forming the sides or bottom of the churn, or both, with a series of sharp pointed spurs or projections, arranged substantially as and for the purpose specified.

Second, the use of the pointed dashers or beaters arranged as described and for the purpose specified.

Third, the combination of the dashers *h h* with projections *f f*, arranged and operating substantially as described.

No. 47,293.—EDWARD M. GARDNER, Nantucket, Mass.—*Smoke Pipe Damper.*—April 18, 1865.—In this invention a smoke pipe which has narrow openings cut horizontally, a narrow curved damper is arranged, so that it can be drawn up by a nut to cover said opening, and give free passage for the products of combustion, or let down so as to close said pipe entirely.

Claim.—The combination of the curved damper with the round pipe, and the air inlet C, such damper being hinged to the pipe, and arranged with respect to the said air inlet, in manner and so as to operate with the same and the pipe substantially as specified.

No. 47,294.—JOSEPH GEORGE, Green county, Mo.—*Plough*.—April 18, 1865.—In this invention, a curved coulter bar has its heel secured to the back brace and beam of the plough and the working parts, composed of the land side and mould board, so that one piece of various sizes can be secured upon the stock.

Claim.—The curved coulter bar B, it having a heel *e*, secured to the back brace *b*, and beam A, as described, in combination with the land side D, and mould board C, they forming plough shares of various sizes to be fitted on one stock, the same being secured and operated substantially in the manner herein set forth.

No. 47,295.—WILLIAM GINNAUGH, Niles, Mich.—*Composition for Cleaning Marble, &c.*—April 18, 1865.—This invention consists of a composition of ground marble, oxalic acid, pumice stone, muriatic acid, alcohol, saltpetre, borax, and sal soda.

Claim.—The within described marble restorative, made of the ingredients specified, and mixed together in about the proportions and substantially in the manner set forth.

No. 47,296.—GILBERT R. GLADDING, Providence, R. I.—*Artificial Fuel*.—April 18, 1865.—This invention consists of seventy-five pounds of anthracite coal dust, twenty-five pounds of coke dust, sixteen pounds of fresh slaked lime, and four pounds of adhesive clay. The mass is well mixed and moulded into cakes of proper size and form.

Claim.—A composition fuel composed of the combustible materials above mentioned, in combination substantially as described, and held in mass by fine and adhesive clay, or similar substances, as described.

No. 47,297.—ALEXANDER W. HALL, New York, N. Y.—*Machine for Crushing Ore, &c.*—April 18, 1865.—A horizontally-moving, direct-acting stamp is employed in connection with a stationary abutment. The upper faces of the stamp and abutment are inclined from each other, so as to form an opening for the reception of the ore, while their lower faces are parallel, or nearly so, that the ore may be crushed between them. The stamp is operated by means of an eccentric and sliding journal-box at its rear end, whereby the inventor claims he obtains a more effective crushing force than is obtained by placing the eccentric near the head of the stamp.

Claim.—The combination of a horizontally-moving, direct-action stamp and a stationary abutment, having the upper parts of their working faces convergent, and the lower parts thereof parallel, when the movement of such stamp is produced by an eccentric at the rear end of the stamp, acting in concert with a sliding journal-box near the head of the stamp, substantially as and for the purpose herein specified.

No. 47,298.—ADOLPH HAMMER, New York, N. Y.—*Cooler for Breweries*.—April 18, 1865.—This invention consists of a shallow pan, divided into two chambers by a horizontal partition. This partition is provided with zig-zag flanges on the top and bottom, and the work flows through the channels formed by the upper flanges, the cooling liquid flowing in the opposite direction through the channels on the under side of the partition.

Claim.—The horizontal partition *a*, with a double set of zig-zag flanges *b b*, one above and the other below, in combination with the pan A, constructed and operating substantially as and for the purpose set forth.

No. 47,299.—JOSEPH HAMPSON and GEORGE LADUE, Newburgh, N. Y.—*Pump*.—April 18, 1865.—In this invention a horizontal cylinder receives water near both ends below and discharges it into an air chamber above. The several valves, being set to operate alternately in pairs, are connected to a single lever by means of which they may be controlled. A spiral spring determines the position of this lever and of the valves when the same is at rest. The piston has a brass exterior attached by depressing a narrow circle of it into an annular groove in the cylinder. Thick elastic disks, clamped to the inside of the cylinder heads, form at once packings and cushions to sustain the shock of the piston stroke.

Claim.—First, the arrangement to lift both suction valves and one discharge valve by means of small cogs below the valves connected by the rods *r1 r3 r4* to the one main rod P P', and by a spiral spring applied to the rod P P' as specified.

Second, in combination therewith a solid piston, having an exterior of brass attached, as herein specified.

Third, the application of India-rubber plates on the inside of the cylinder heads, so as to form a packing and a cushion for the piston, all substantially as shown and described.

No. 47,300.—JOHN HARVEY and FREDERICK HERKSTRODER, St. Louis, Mo.—*Lap Shaver and Leather Splitter*.—April 18, 1865.—This invention consists in an adjustable pillar block, a pressure roller, a gauge fastened to the machine, and a lock pin to be inserted into holes bored in one of the ends of the excentric roller to stop the motion of the latter when it strikes against the plate of the gauge.

Claim.—The adjustable pillar block *a*, the pressing roller *d*, the gauge *e*, and the adjustable block pin *i*, arranged and operating in the manner and for the purpose set forth.

No. 47,301.—CHAS. HEATON, New York, N. Y.—*Separating Gummy and Silicious Matters from Vegetable Fibres*.—April 18, 1865.—In this invention the gummy matters are first softened by means of steam and then dissolved by means of an alkaline liquor. The fibrous material is then passed between rollers, or crushed in a press, afterwards dried, and beaten in a *willon* or other machine, so as to separate all in vegetable matters.

Claim.—The application of mechanical pressure substantially as described for the purpose of separating gummy or silicious matters from vegetable fibrous materials.

No. 47,302.—H. A. HILDRETH, Lowell, Mass., and W. J. JOHNSON, Newton, Mass.—*Wire Broilers or Toasters*.—April 18, 1865.—This invention consists of an ordinary square, folding wire gridiron, made with a frame of stout wire on which the cross wires are fixed: the ends of the frame at which the cross wires are fixed are crimped to keep said cross wires firmly in position.

Claim.—An improvement in the construction of wire broilers and toasters, the crimping of the frames for the reception of the bars or slats, substantially as and for the purpose described.

No. 47,303.—WILLIAM HOFFMAN, Washington, D. C.—*Bayonet Attachment*.—April 18, 1865.—This invention consists in the way of making the bolt which secures the ear of the frog to the loop and inserting the pin in the plate, which pin coming in contact with the projections in the bolt head will prevent the scabbard from revolving above the horizontal line on either side.

Claim.—The form above described of the bolt and plate making part of the frog or attachment, which prevents the scabbard from revolving above the horizontal line on either side.

No. 47,304.—PETER HOGG, New York, N. Y.—*Steam Trap*.—April 18, 1865.—The object of this invention is to discharge, automatically, water of condensation from steam pipes and other vessels. Its novelty consists in an open-mouthed float with its valve collar in combination with the perforated pipes, the casing, and the connecting pipe.

Claim.—First, the open-mouthed float with its valve collar, or their equivalents, in combination with the perforated pipe D, substantially as described.

Second, the use in steam traps of an open-mouthed float which opens and closes the orifices for the discharge of water from the trap, substantially as described.

Third, the combination of the float, constructed substantially as described, with the discharge pipe D, the casing A, and the connecting pipe G, substantially as shown.

No. 47,305.—SAMUEL M. HOOVER, Carlisle, Penn.—*Gum Elastic Coupling Spring*.—April 18, 1865.—This invention consists in making a spring by enclosing disks of vulcanized rubber in a metal tube with a rod running through the disks to a nut and washer.

Claim.—The use of elastic rubber enclosed in a metallic case, constructed and connected substantially as and for the purposes specified.

No. 47,306.—HENRY B. HORTON, Ithaca, N. Y.—*Calendar Clock*.—April 18, 1865.—This clock indicates the time of day, the day of the week, the day of the month, and the month. The changes are made instantaneously at midnight. The several wheels are held at all times by means of stops or pawls, so that no accidental turning can occur or displacement be effected by motion of vessels at sea, or from other causes. The pawl, which acts against each of the thirty-one teeth of the month wheel in succession, is made to pass over the 29th, 30th, and 31st teeth, or over the two latter, or over the last as occasion may require, by means of a lever cam on the month wheel.

Claim.—First, the use of the stops or pawls S and S X, or other equivalent device, for the purpose of fixing with precision the movements of the month, the day of the week, and the year wheels, as described.

Second, the lever cam *f* on the month wheel J for the purpose of passing the stop or pawl R over the 31st tooth of the month wheel for months of 30 days, and over the 30th and 31st teeth for February, leap-year; and over the 29th, 30th, and 31st teeth of said wheel when February has 28 days, or otherwise using the said lever cam *f* for the same purpose.

Third, the detached lever *a* for the purpose of changing the length of the months, and of February in leap-year, in a 31 toothed month wheel; and also the detached lever when acting in combination with the lever cam *f* of the month wheel, the cams on the year disk, and the projections on the four-year wheel.

Fourth, putting on, but not fixing fast, the four-year wheel to the shaft of the month wheel as described.

Fifth, the wide cam *e* on the corrugated disk Z of the year wheel, or its equivalent, for the purpose of carrying the bent rod lever *a* on the projections of the four-year wheel.

Sixth, operating the calendar by the slotting of the rod R about the shafts of the cam A for retaining the rod in its place; and also by the combination of the cam A and rod B, producing the changes of the calendar instantaneously at midnight.

Seventh, securing by the pin W the double flexion of the rod B at C, and thus the pawls T and U; and also holding the lever H by the other pin *w* and the pawls under it; and also by the said pins, the pawls *m* and *k*, thereby preventing any displacement of the calendar during transportation.

Eighth, the click *r* for reducing the labor of bringing up the weight lever *n*, drawing a period of 72 hours or less, according to the distance the lever falls, by the lengths of the different months.

No. 47,307.—JAMES G. HUNT, Cincinnati, Ohio.—*Farm Gate*.—April 18, 1865.—In this invention the gate is operated by pulling a pendent cord on approaching the gate, which is thereby opened by the action of a system of wheels and levers. The wheels are enclosed between two plates, which form bearings for the same, the lower one of which covers and protects the top of the post from exposure to the weather.

Claim.—First, the hollow cap composed of plate *C'*, constructed and applied together, and to the gate post *A*, substantially as and for the purpose described.

Second, the arrangement of pulleys *g g'*, on the arm *e*, of the segment, in combination with the pull-cords *i i'*, arranged and operating upon the gate and bolt *m*, substantially as described.

Third, the levers *D G*, rod *u*, and spring-bolt *m*, applied to a swinging gate, which is opened and closed by means of two cords *i i'* acting upon a system of levers, substantially as described.

No. 47,308.—GUSTAVUS A. JASPER, Charlestown, Mass.—*Cleansing and Revivifying Charcoal*.—April 18, 1865.—This invention consists of a filter for containing boneblack for purifying sirup, with a close-fitting dome, and two cisterns for sirup and water. A chambered pan is fastened to the bottom of the filter, and above it are perforated plates with a space between them for the entrance of steam. The arrangement of the pipes and stop-cocks is such that either steam or water may be passed through the charcoal in the filter either upward or downward, at pleasure, so as to remove all impurities from the charcoal without taking it from the filter.

Claim.—The washing or cleansing of the charcoal within the filter by reversed currents of water, and by steam applied to it, substantially as hereinbefore described.

Also in combination therewith, the application of an acid solution, substantially in the manner and for the purpose described.

Also, the combination and arrangement of the separate blanket chamber with the filter, so applied to the filter as to enable the blanket or blankets to be removed from it without disturbance of the charcoal charge of the filter.

Also, the application of the exhaust-cock *h*, and the pipe *t*, or either, to the side of the filter and to its blanket chamber, substantially in manner as described.

Also, the combination and arrangement of the cistern *F*, its pipes *p' t*, and the discharge cock *c*, with the filter *A'*, the pipes *p' and t*, having stop-cocks *b and d*, and the whole being to operate substantially as described.

Also, the combination of the filter, an apparatus or means of causing water to flow through it in reversed directions, and a means of applying steam to the filter or contents thereof, in manner, and the whole being for the purpose or objects as specified.

No. 47,309.—NATHIEL JENKINS, Boston, Mass.—*Cock*.—April 18, 1865.—In this invention a flexible globular valve is embraced by a thimble, which screws upon a swivel revolving within the follower, so that when the valve is seated it is further pressed to its place by the revolution of the follower, the valve and swivel remaining stationary.

Claim.—First, the swivel *H*, in combination with the follower *E*, and seat *L*, substantially as and for the purpose described.

Second, the combination and arrangement of the thimble *I*, swivel *H*, and packing *K*, substantially as and for the purpose described.

No. 47,310.—ISAAC JOHNSON, Lodi Station, Ill.—*Lightning Conductor*.—April 18, 1865.—The nature of this invention is explained by the claim and engraving.

Claim.—A lightning conductor composed of a triangular tube *A* with inwardly arched sides, in combination with a continuous central iron wire *C'*, extending partly or wholly through the length of the tube, substantially as and for the purpose herein set forth.

No. 47,311.—STEFAN KACKOWIZER, New York, N. Y.—*Manufacture of Friction Matches*.—April 18, 1865.—This invention consists in giving the friction mass of matches a metallic-like coating by mixing with the mass, salt of lead, and then exposing the match to sulphurated hydrogen until a coating of sulphate of lead is formed.

Claim.—The formation of a metallic skin around the friction or phosphoric mass of matches, consisting of sulphide of lead, substantially in the manner above described.

No. 47,312.—PETER LOTH, New York, N. Y.—*Chandelier*.—April 18, 1865.—This invention consists in the combination of a sliding-joint with the central tube of a chandelier in such a manner that it can be used in the ordinary manner, and at the same time a drop-light is obtained which can be used alone or in combination with the chandelier.

Claim.—First, a chandelier and central adjustable drop-light combined, as a new article of manufacture.

Second, the chamber *b c g*, in combination with tubes and pipes *d' e j*, arms *f* and *h*, and balance weight *k*, or their equivalents, all constructed and operating substantially as and for the purpose set forth.

No. 47,313.—ALFRED E. LYMAN, New York, N. Y.—*Deodorizing Coffin*.—April 18, 1865.—In this invention the gases which are evolved from decomposition are conducted from the coffin through a tube and chamber filled with a deodorizing composition. By making the tube in sinuous form, a greater length is obtained.

Claim.—The deodorizing machine of the crooked or angular form, for the purposes herein described and substantially set forth.

No. 47,314.—DANIEL LYNAN and HARRY H. KOCK, Buffalo, N. Y.—*Fastening for Blocks of Shoe Last*.—April 18, 1865.—This invention consists in a revolving spring-bolt set vertically in the last, with its lower extremity enclosed in a spiral spring intervening between the head and the wooden plug, the upper end of the bolt being bent to form a hook, to bear upon the block by the force of the spring.

Claim.—The improved device for fastening the blocks to shoe lasts consisting of the revolving hooked bolt *b* and spring *e*, or its equivalent, arranged and operating substantially as described.

No. 47,315.—WM. C. MCGILL, Cincinnati, Ohio.—*Mechanical Movement*.—April 18, 1865.—This invention consists in the peculiar combination and arrangement of the parts, and is well understood by the claim.

Claim.—First, the arrangement of shaft A, ratchet wheel C, geared levers D D', and pawls E E', combined and operated in the manner set forth.

Second, the arrangement of shaft A, duplex reversed ratchet wheel C, general levers D *d* and D *d'*, and reversible duplex pawls E¹ and E², combined and operating as represented.

No. 47,316.—JAMES P. MCLEAN, Brooklyn, N. Y.—*Manufacture of Gun-cotton and Lint*.—April 18, 1865.—This invention consists in the use of the "asclepias syriaca," commonly called milk-weed, in the manufacture of gun-cotton and lint. In preparing the fibre for lint it is taken from the pods and the seeds separated by hand. The fibre is then oiled with vegetable oil and spun into yarn, the oil afterwards being removed in any well-known manner.

Claim.—The introduction and use of the asclepias, or milk-weed fibres N N, figures 1 and 2, for the manufacture of a new article of gun-cotton, also for lint, either from the fibre itself or from the fabric or yarn made of the fibre, as above set forth.

No. 47,317.—DAVID M. MEFFORD, Cincinnati, Ohio.—*Cartridge for Small Arms*.—April 18, 1865.—This cartridge for sporting purposes consists of a light wooden can to contain a charge of shot and a small quantity of powder, in combination with a fuse tube deeply imbedded in the charge, intended to be ignited at the discharge of the piece, so that it may explode the powder and scatter the shot in the cartridge, at a distance from the gun, greater or less, according to the length of the fuse.

Claim.—The combination of the wood case A, the binding cord *f*, the metal cap *e*, and the fuse tube D, for explosive cartridges as herein described, for the purposes set forth.

No. 47,318.—C. MASON MOODY, Greenfield, Mass.—*Dusting Brush*.—April 18, 1865.—This invention consists in a dusting brush composed of a series or bundle of flexible or elastic quills, or supports, to which any suitable soft, flossy, or fibrous material is attached.

Claim.—A dusting brush composed of a series or bundle of flexible or elastic quills or supports A, to which any suitable soft, flossy, or fibrous material is attached, substantially as herein shown and described.

No. 47,319.—RICHARD W. MORAN, St. Louis, Mo.—*Printing Press*.—April 18, 1865.—This invention consists of a combination of impression cylinders and conducting tape rollers, by means of which both sides of continuous sheets of paper can be printed by once passing through the press, and by a peculiar construction of the "turtles" and "galleys."

Claim.—First, the combination in a single printing press of two independent type cylinders B B', and corresponding impression cylinders H H' and J J' with each other, and with independent systems of tape rollers and endless tapes, substantially as herein set forth, whereby two separate rolls or sheets of paper may, in passing simultaneously through the press, both receive on each side opposite impressions from each type cylinder.

Second, also the within-described combination of distinct galleys *g g* with the turtles E E of a printing press, when the same are constructed and arranged substantially in the manner and for the purpose herein set forth.

No. 47,320.—D. B. MUNGER, Mumfordsburg, N. Y.—*Bean Harvester*.—April 18, 1865.—In this invention pullers are guided on and out of a hollow cylinder, by a cam upon one end. The pullers rest upon springs inside the cylinder.

Claim.—First, the cam guides *g*, in combination with the puller heads H, substantially as and for the purposes set forth.

Second, in combination with the cam guides *g* and puller heads, the springs S, or their equivalents, for the purposes specified.

No. 47,321.—ISAAC MYERS, Pisgah, Ohio.—*Apparatus for Manufacturing Sugar, Wine, and Oil from Sorghum*.—April 18, 1865.—This invention consists of an evaporating pan, supported over the furnace by means of the ropes attached to windlasses. The pan has an inclined bottom, and is provided with a partition extending from the top to near the bottom. At one side of the furnace is placed a finishing pan resting in a square boiler containing water, which is heated by a pipe connected with the chimney of the furnace. The boiler is connected to a cylinder by means of a pipe, which is also connected to a water chamber kept filled with cold water by means of the gate.

Claim.—The arrangement, construction, and combination of the oblong furnace A, adjustable molasses pan J, finishing pan N, boiling-water pan P, with its steam-condenser R, all as herein described, and for the purposes herein set forth.

No. 47,322.—JOSEPH W. NORCROSS, Middleton, Conn.—*Tackle Hook*.—April 18, 1865.—The object of this invention is to overcome two of the principal difficulties experienced in the use of the common hooks, &c., the straightening of the hook and the spontaneous unhooking of the same.

Claim.—The band B, passing around the neck and point of the hook, and secured to the latter, in the manner herein set forth.

No. 47,323.—A. B. NIMBS, Buffalo, N. Y.—*Tension Pulley*.—April 18, 1865.—In this invention the frame is constructed of such weight that it will produce the required tension upon the belt, and the journal boxes will admit of easy adjustment.

Claim.—First, supporting the tension pulleys B in a frame A of cast iron, having in itself sufficient weight to give the required tension to the belt, substantially as described.

Second, combination of the spherical sleeve C', within which the straight journal of the shaft runs, with the spherical socket C, for the purposes and substantially as set forth.

Third, supporting the tension pulleys B in the frame A, by means of journal boxes C O', made capable of adjustment to bring the tension pulley shafts in line with that of the driver, without such adjustment causing them to bind the journals running therein.

No. 47,324.—JOHN H. NOYES, Oneida, N. Y.—*Travelling Lunch Bag*.—April 18, 1865.—This invention consists in combining with a travelling bag a lunch bag, or receptacle, and also a pocket, if desired; all being constructed and arranged in such a manner that the necessary clothing of a traveller, letters and papers, and also provisions or lunches may be carried in one device, with equally as great facility as clothing alone can be carried in ordinary bags.

Claim.—A combined travelling bag and lunch box, or receptacle, with or without the pocket, constructed and arranged as herein set forth.

No. 47,325.—HENRY OAKS, Waynesboro', Pa.—*Lock*.—April 18, 1865.—In this invention this lock is applied to the jamb or post of the door instead of the door itself, and consists of a case in which is arranged two arms, which, diverging from a pivot which passes through one end of each, embraces between them an India-rubber spring. In the outer end of each arm is a notch to receive corresponding hooks formed on the inner edge of each of the two limbs of a staple. A bar of iron secured to the face of the door projects beyond the edge of the door, and has a groove formed on three sides of the said projecting portion for the reception of the staple. To lock the door the staple is passed into the lock, and as it is pressed inwards the two arms are forced towards each other until the hooks enter the notches and the staple lying in the groove embraces the projecting bar. For unlocking, a key is used which, acting upon certain devices, press the arms toward each other and then release the staple.

Claim.—First, the hooked detachable hasp I, in combination with the bar D, the expanding jaws J T', and spring K, substantially as and for the purpose described.

Second, the combination of the expanding jaws J J and spring K, with the drawing and thrusting bars L M, operated respectively by the bits R S on the key, as described.

Third, the key Q with the operating bits R S, as described, and the supplementary safety bits T, located on the shank relatively to a notch in the side of the passage way occupied by the shank in unlocking and affording a means of adapting each key to a specific lock, as described.

No. 47,326.—S. E. OVIATT, Richfield, Ohio.—*Threshing Machine*.—April 18, 1865.—The blast is discharged directly upon the carrier that conveys the straw from the threshing cylinder to the endless apron in the rear that stacks it. The blast is discharged in this manner for the purpose of flattening the straw down upon the carriers and preventing its clogging the machine; also for the purpose of clearing the front of the machine from dust. The stacker is connected to the rear part of the frame by means of an articulating attachment, so that it may be elevated or depressed without changing the relative positions of the pulleys which operate its elevator belt. Diagonal cross-braces connect the carrier straps of the elevator belt to prevent their running off their pulleys. In the grain receptacle are placed about at the centre two inclined planes meeting at their upper sides which shed the grain to each side of the box and enable it to be drawn off by gates provided for the purpose.

Claim.—First, the discharging the blast from the case K, above the threshing cylinder through a pipe or flue upon the separating carrier between the threshing cylinder and the tail board for the purpose of bearing down the straw upon the separating carrier and of forcing the same along without clogging, as well as for clearing the front of the machine from dust, substantially as and for the purpose described.

Second, hinging the stacker to the rear end of the threshing machine in such a manner that it is perfectly free to be elevated or depressed on said hinge without changing the relative positions of the pulleys D and D', which operate the elevator belts of the stacker, substantially as and for the purposes described.

Third, the braces I I in combination with the carrier C C and S, as described.

Fourth, the grain box F with the inclined planes G G and gates F, so arranged as to draw the grain from either side of the machine, as herein specified.

No. 47,327.—CHARLES PALMER, Brookline, Mass.—*Foot Warmer*.—April 18, 1865.—This invention consists of a sheet metal box, in the bottom of which is placed a close receptacle filled with sand, through which the gas passes, and at the top of which it is burned; a plate of soapstone is placed over the flame to rest the feet on, and to keep this plate from burning a piece of wire gauze is interposed between it and the flame.

Claim.—A foot warmer, consisting of a receptacle B for holding sand, upon the surface of which the gas is burned, and a box or casing A, provided with a perforated foot rest, substantially as described.

No. 47,328.—JOHN S. PATRIE, Victor, N. Y.—*Air-compressing Apparatus*.—April 18, 1865.—This invention consists in the employment of a reservoir or chamber composed of two compartments, which are separated by a flexible diaphragm connected to an adjusting bar that operates the inlet and outlet water valves of each chamber. The apparatus is placed at the foot of a water fall and water is supplied to the compartments, which are filled alternately and emptied by means of the floats and valves. When either compartment is emptied of the water contained therein, an air valve is opened and the air rushes in and fills the space vacated by the water, when, at the proper time, by the action of the floats and levers acting upon the diaphragm, the inlet valve is opened and the water enters by virtue of its gravity, and the air is compressed and forced out of that compartment to a suitable reservoir, where it is reserved for use in any suitable engine.

Claim.—First, the combination of the floats F and F', and the diaphragm d with the inlet and outlet water valves a and E and E', all the parts being arranged and operating within the air and water chamber.

Second, operating the water valves a and E by the bar s, which is connected to the flexible diaphragm d, substantially as set forth.

Third, the combination of the floats F and F', with the jointed levers f and f', arranged and operating substantially in the manner and for the purpose shown and described.

No. 47,329.—THEODORE G. PELTON, Lyons, Iowa.—*Hog Tamer*.—April 18, 1865.—This invention consists of a pair of slotted jaws in shear blades that have an iron or steel barbed staple which is forced through the snout of the hog.

Claim.—The slotted spring e, the slotted jaw a2, the grooved jaw a, with its gage B, the barbed wire m of steel or iron, all for the purpose as above set forth.

No. 47,330.—ROBERT PERRINE and SAMUEL M. STEWART, Rochester, N. Y.—*Hose Carriage*.—April 18, 1865.—This invention consists in the employment of a peculiarly formed crane or frame on each side of the carriage for supporting the hose-reel, so arranged as to furnish the greatest amount of strength and to allow the front wheels to run under the same. The box that contains the same and the fuel box have a single spring on each side, so as to give the desired elasticity to both cranes and fuel box.

Claim.—The construction and arrangement of the cranes B, and the box C, and their connection with the same springs h by means of the joints G, or their equivalent, substantially as and for the purposes herein set forth.

No. 47,331.—NATHANIEL F. POTTER, Providence, R. I.—*Machine for Tempering and Preparing Peat*.—April 18, 1865.—A mas of raw peat is placed in a circular bed provided with a rim. At the centre of this bed is an upright rotating shaft which carries a radial arm, upon the end of which is a wheel arranged to approach and recede from the aforesaid upright shaft along the radial arm, as the latter sweeps over the circular bed. The wheel thus describes a spiral track through the mass of peat. Upon the hub of the wheel, enlarged so as to form a drum, is arranged a series of fingers, long enough to penetrate nearly to the bottom of the mass of peat as the wheel cuts through it, and take up such undecomposed vegetable fibres as may lie in their way. This fibre is removed from the fingers by a revolving brush, and deposited in a trough in which is an Archimedean screw longitudinally arranged, which carries off the fibre to the waste box.

Claim.—First, the use of a series of combing teeth a a a, or their equivalents, operating upon the mass of peat to remove the undecomposed vegetable fibre, in the manner and on the principle substantially as described.

Second, the combination of a brush, or a series of brushes O or clearers, with the combing teeth *a a a*, substantially as described for the purposes specified.

Third, the employment of a series of comb teeth N, arranged substantially as shown, in combination with the brush or series of brushes O, for the purposes described.

Fourth, the method, substantially as described, of separating the vegetable fibre from a mass of crude peat and transferring the same to a place where it can be removed by the combination of the movable set of comb teeth *a o a*, the stationary set of comb teeth N, and the clearing and delivering brushes O, as herein set forth.

Fifth, the use of a receiving trough G, or its equivalent, provided with the Archimedean screw K, arranged and operating to receive the refuse vegetable material extracted from the peat and to deliver the same to suitable receptacles, as described.

Sixth, the combination of such receiving and delivering apparatus with the apparatus for extracting and transferring the refuse vegetable material to the same, as herein described.

No. 48,332.—T. J. POTTS and P. C. YOST, Hamilton, Ill.—*Cultivator*.—April 18, 1865.—In this invention the ploughs are moved laterally by a lever arranged on a slotted perpendicular bar, and working at its front end between the prongs of a foot lever.

Claim.—The lever L, fitted in the slotted bar M, and connected at its rear to a cross bar J attached to the standards *e* at the rear of each beam, the front end of said lever being fitted between the prongs *h h* of a foot lever N, and all arranged to operate in the manner substantially as and for the purpose set forth.

No. 47,333.—THOMAS L. ROBINSON, Boston, Mass.—*Apparatus for Separating Fish Oil from Water and other Impurities*.—April 18, 1865.—This invention consists of a cylinder-shaped vessel placed in a vertical position within the frame-work, and having its ends closed and of a conical shape. A water tank communicates with the cylinder by means of a pipe, through which the water and other impurities are withdrawn. Water is then let through the pipe, by means of which the oil is washed and caused to flow through the pipe into a proper receptacle.

Claim.—First, automatically separating and purifying oils from all extraneous matter and liquids contained therein, by means of an apparatus arranged and operating substantially as herein described.

Second, forming the oil vessel *b b* with heads or ends of a conical shape, substantially as described and for the purpose specified.

Third, the use of the peculiar-shaped nozzle or sprinkler *z* for the delivery of water to the oil vessel *b*, arranged and operating substantially as described and for the purposes specified.

Fourth, dividing the oil vessel *b b* into two or more chambers having communication with each other, for the purpose of preventing the violent upward agitation of the oil, substantially as described.

Fifth, the apparatus herein described for separating and purifying oils from extraneous and refuse matters and liquids, the same consisting of the double-headed conical-shaped vessel *b b*, oil pipes *o o* and *r r*, water pipes *h* and *p*, and sprinkler *z*, or their equivalents, the whole being arranged together and operating substantially as described.

No. 47,334.—ELISHA ROBBINS, Worcester, Mass.—*Carriage*.—April 18, 1865.—In this invention the body of the cart is allowed to move so that the load will be kept in advance of the axis of the axle, and the cart is prevented from tipping.

Claim.—The application of the axle to the cart body so as to be capable of moving underneath and with reference to such body, in manner as described, and connecting the axle with the thills, and the latter with the body by mechanism, substantially as specified.

Also, in combination with the axle, so applied to the body and thills, the rack and pendulous double catch, or the equivalents thereof, such being applied to the body and axle, substantially as and to operate as described.

Also, the combination of the tongue *e* and the eye or clasp *f*, or their mechanical equivalents, with the axle applied to the cart body and the thills, in manner and to operate substantially as explained.

No. 47,335.—CHARLES WILLIAM ROESLING, Cleveland, Ohio.—*Powder for Lighting Cigars, &c.*—April 18, 1865.—This invention consists of a mixture of potash, burnt alum, powdered charcoal, and rye flour. These ingredients being well mixed, are heated to redness in a close vessel.

Claim.—The composition, prepared substantially as set forth for the purpose specified.

No. 47,336.—HERMANN ROETTGER, Philadelphia, Penn.—*Acromatic Object Glass for Photographic Cameras*.—April 18, 1865.—The object of this invention is to obtain a large amount of equally illuminated surface, and avoid spherical and chromatic aberration. It is attained by the use of four glasses—two flint and two of crown glass—of different curves, cemented together.

Claim.—The construction of an achromatic object glass, composed of four lenses—two of crown glass and two of flint glass—cemented, to compose one object glass for telescopes, as well as for other purposes, in the manner shown and described.

No. 47,337.—**JULIUS AUGUSTUS ROTH**, Philadelphia, Penn.—*Artificial Fuel*.—April 18, 1865.—This invention consists of coal dust, seven parts, with lime, one part, mixed into milk of lime, and formed into blocks. The blocks are placed in a hoop or kiln, and the fumes from sulphurous coal passed through them to dry and change the lime into sulphate or carbonate and solidify the blocks.

Claim.—The impregnation of the solution of lime with sulphurous acid, obtained from coal or other sulphate, for the purpose of conglomerating the waste coal dust, and thereby producing a solid fuel, substantially set forth in specification.

No. 47,338.—**E. P. RUSSELL**, Manlius, N. Y.—*Reel for Harvester*.—April 18, 1865.—This invention consists in making the reel shaft in two pieces, which overlap and slide past each other through clamps which retain them in proper relation to each other: the object being to adapt the reel, in a machine having a hinged cutting apparatus, to the varying relations of the reel supports while passing over uneven ground. It further consists in a peculiar construction of the double clamps which unite the reel ribs with the arms.

Claim.—First, constructing the shafts of harvester reels in two pieces S^1 S^2 , or their equivalents, operating substantially in the manner and for the purpose specified.

Second, the clamps L , constructed, applied, and operating substantially as and for the purposes herein specified.

No. 47,339.—**WILLIAM RUSSELL**, Beloit, Wis.—*Graining Instrument*.—April 18, 1865; antedated December 14, 1864.—In this invention the improvement consists in placing curved strips of wood in sections over the painting surface, and making them elastic or adjustable by means of spiral springs, &c., so as to print on unequal surfaces.

Claim.—As an improvement in a graining machine or tool, the curved-shaped pieces of wood B B , or any other available material, divided in sections and attached to the solid piece A , and made with screws and springs adjustable, and made of brass, iron, rubber, or any other proper material, the whole in combination and for the purpose set forth.

No. 47,340.—**J. A. SAFFORD**, Boston, Mass.—*Leather Shoe-string Cutter*.—April 18, 1865.—This invention consists in a circular cutter with a tangential opening and a cutting end: in the employment of a cutter spring within the cutter, whereby the leather is kept in a proper position while being drawn out into strings: in rendering the opening adjustable, and in continuing the circular cutter outward of the throat so as to form a wing.

Claim.—First, the circular cutter C with a tangential opening and a cutting end h , substantially as set forth and for the purpose described.

Second, the employment of the spring J , or its equivalent, within the circular cutter C , substantially as and for the purpose described.

Third, rendering the tangential opening or throat adjustable, substantially as and for the purpose described.

Fourth, the tangential wing or cutter i , substantially as set forth and for the purpose specified.

No. 47,341.—**JOSEPH F. SARGENT**, Boston, Mass.—*Heel-trimming Machine*.—April 18, 1865.—This invention consists in an irregular-shaped pattern block, the outline of which, in different horizontal planes, corresponds to the outlines of the various sizes and form of heels to be cut: in the combination with said block of jaws claspings the shoe, and by their contact therewith determine the size and form of heel to be cut: and in the provision for vertical movement of the shoe or the cutter for trimming such heels as are united to vamps, upon a curved or irregular joint.

Claim.—The combination of a pattern block with a heel-cutting or trimming mechanism, when the block is so arranged and is of such form as to serve as a pattern for trimming heels of different sizes and contours, substantially as set forth.

Also, a mechanism so organized that the size and form of the heel are determined by the size of the shoe and patterns or pattern block, substantially as set forth.

Also, the combination of the jaws l , arm i , inclines h , and pattern block, arranged to operate together, substantially as specified.

Also, the employment of an adjustable or spring last pin in connection with a clamping mechanism, substantially as described.

Also, the auxiliary roll r in combination with the pattern roll, for giving the proper angle of presentation to the stationary knife g .

Also, the arrangement of a shoe in a yoke with the heel, centered with respect to the post which carries the pattern, and so as to be held toward and rotated with respect to the cutting mechanism, substantially as set forth.

Also, the arrangement of the mechanism by which, when the joint between the heel and vamp is irregular, the shoe shall have a corresponding vertical movement given to it, as set forth.

No. 43,342.—**GEORGE W. SAYRE**, Piquah, Ohio.—*Railway Car Seat*.—April 18, 1865.—This invention consists in an adjustable swinging and revolving chair operated by an

arrangement of upright parts, and a notched lever at the side, and an adjustable flat spring underneath.

Claim.—The arrangement, construction, and combination of the upright ends G of the bar E, notched lever M, and adjustable flat spring J, as herein described and for the purposes set forth.

No. 47,343.—T. S. SPERRY, New York, N. Y.—*Machine for Covering Wire.*—April 18, 1865.—In this device the wire to be covered passes through a vertical hollow shaft or standard, supported by a suitable frame, and forming a spindle, the top of which is surrounded by a sleeve bearing on its upper end a disk or circular platform, upon which is mounted, on upright pins or standards, two or more spools containing the covering wire, by fastening the end of which to the top of the wire to be covered, and revolving the disk or platform, the wrapping wire surrounds the other, which is prevented from turning by the standard or spindle that supports it, and which remains stationary, while each successive coil of the wrapping wire, crowding between the preceding one and the conical top of the spindle, gives an automatic feed to the central wire.

Claim.—First, in a machine for covering wire with wire, making the main wire self-feeding, by means substantially as herein described.

Second, the smooth projection *d* on the end of the hollow spindle C, in combination with one or more guides *c*, or equivalent therefor, or the disk F, which carries the spools containing the covering wire, substantially as and for the purpose shown and described.

No. 47,344.—N. SUTTON, Detroit, Mich.—*Pump.*—April 18, 1865; antedated April 3, 1865.—The object of this invention is to cause a continuous flow of water or other fluid from the pump by a constant movement upward of the pump pistons alternately. The novelty consists in the combination of the eccentric gearing with the piston rods. The stuffing box applied to the upper piston is used in combination with the solid and tubular piston rods.

Claim.—The combination and arrangement of the eccentric gearing with the piston rods C D, substantially as and for the purpose specified.

Also, the stuffing box E, when applied to the upper bucket or piston B, and used in combination with the solid and tubular piston rods C D, substantially as and for the purpose set forth.

No. 47,345.—DANIEL TAINTER, Worcester, Mass.—*Carding Machine.*—April 18, 1865.—In this invention the claim and drawing define the object and nature of the improvement.

Claim.—First, the combination with the main frame of a machine for carding wool or cotton of a supplemental hinged or swinging frame for supporting the feed rolls, burr, and leading in cylinders, substantially as and for the purposes described.

Second, the combination with the hinged frame H of the pivoted hook *b*, or its equivalent, with the pin *c* on the main frame, substantially as and for the purposes specified.

Third, mounting the burr cylinder and feed rolls on a hinged frame, whereby said cylinders and frame can be lowered or removed from the main cylinder, substantially as and for the purposes described.

Fourth, mounting one or more of the small cylinders which assist in conveying the fibrous material to the main carding cylinder of a wool or cotton carding machine, upon a hinged swinging frame, whereby the latter can be expeditiously lowered or removed from the main cylinder, for the purpose of clearing, grinding, or repairing said cylinders, or to make room for the easy removal of other cylinders, substantially as herein described.

No. 47,346.—B. F. TRIMMER, Rochester, N. Y.—*Grain Separator.*—April 18, 1865.—The nature of this invention is fully set forth in the claim.

Claim.—First, a draught passage D, of sufficient transverse dimensions to enable a draught proportioned in amount to the quantity of grain passing through it, to be employed and arranged so as to diffuse or concentrate the draught uniformly upon the falling grain, according to the kind, quality, or condition thereof, and at right angles, or nearly so, thereto. And in combination therewith a valve L and board K, or its equivalent, arranged so as to properly separate the sound grain from the refuse, as the intensity of the draught or the kind or condition of the grain varies, substantially as herein specified.

Second, in combination with the board K, having a passage for the draught both above and below, and with the pocket I, the valve N, so arranged as to cut the passage off entirely at the top and force it to pass downward through the pocket, or to allow the passage at the top, substantially as described.

Third, the adjustable board H, arranged in combination with the mouth *a* of the space D, in such a manner as to contract or concentrate the draught upon a particular portion of the falling stream of grain, or to diffuse it through said space, substantially as described.

Fourth, a series of two or more pockets I I', in combination with the screws S S S beneath, in such a manner the contents of said pockets will fall on said screens and mix with the main portion of grain through spout F, and so that the pockets I', that contain the greatest amount of refuse with the smallest amount of sound grain, shall pass over a shorter space of the screens, substantially as described.

Fifth, the combination and arrangement of the tilting board *W* with the pocket *I'*, screens *S S*, tube *T*, and discharge pipe *p*, in such a manner as either to discharge the contents on said screen, or into said spout, substantially as herein set forth.

Sixth, the combined construction and arrangement of the tubes *T U*, provided with the valves *v v'* at their upper ends, and having the grain crossing the lower ends from the screens, by means of the chutes *q s*, as and for the purposes herein described.

Seventh, in combination with the shoe *P*, the spring standards *Q Q'*, those in the rear being raised or lowered by means of the rock-bar *k* and pinion *l*, in such a manner as to adjust the angle of the shoe, said shoe being operated by the spring pitmen *R R*, the whole arranged and operating substantially as and for the purpose herein set forth.

Eighth, the removable section *S'* and the slide *S''* of the screens *S S*, arranged in relation to said screens, and the shoe *P*, in such a manner that the end of the shoe may be opened to allow the cleaned grain to fall directly through, substantially as described.

Ninth, in combination with the section *S* of the screen, provided with enlarged perforations, the slide *u*, substantially as and for the purpose herein set forth.

No. 47,347.—MATHEW TSCHIRGL, Dubuque, Iowa.—*Reservoir for Beer, Wine, &c.*—April 18, 1865.—This invention consists of a reservoir made of brick and provided with a pipe near the top, and an air discharge pipe. The reservoir is also provided with a gauge and gate near the bottom. The inside of the reservoir is lined with cement, and coated with a varnish made of alcohol, shellac, and beeswax.

Claim.—First, the employment of subterranean structures for the purpose of storing beer and other fermentable liquids, which are constructed of masonry, and rendered impervious to air, substantially as described.

Second, providing reservoirs of masonry, which are adapted for storing beer and other liquids, with feed pipes, gauges, and man-holes, substantially as described.

No. 47,348.—ALBERT W. UPTON, Lowell, Mass.—*Suspenders.*—April 18, 1865.—In this invention an elastic strap ascends the back of the wearer between the converging ring, or eye of the back straps, and the converging ends of the shoulder straps.

Claim.—The improved suspenders as made with the single elastic dorsal strap *b*, arranged and combined with the shoulder and back buttoning straps, substantially in manner and by means as specified and as represented.

No. 47,349.—SYLVENUS WALKER, New York, N. Y.—*Lock for Piano Forte.*—April 18, 1865.—This invention consists in substituting for bolts with a hooked end, and which move out vertically and horizontally, a bolt with straight and parallel edges, which moves out diagonally, and which, when projected through the mortise of the catch plate, prevents said plate from being raised up, except it follows the overhanging inclined edge of the bolt, which it cannot do when attached to the lid of a piano.

Claim.—A lock constructed with the diagonal movement of the bolt *B*, substantially in the manner and for the purposes set forth.

No. 47,350.—ALBERT M. WHITE, Port Chester, N. Y.—*Breech-loading Fire-arm.*—April 18, 1865.—In this invention a pivoted rolling breech block swings through a mortise in the stock and contains the lock. The sliding bolt, by which the breech block is secured in position, is operated by a forward movement of the trigger, which, with the thumb-piece of the hammer, serve as levers for rotating and opening the breech. A folded spring, one end of which is pivoted to the swinging breech block, while the other or free end rests under the flange of the cartridge, serves as the cartridge retractor.

Claim.—First, operating the latch which holds the lock frame in position in the receiver by means of the trigger, substantially as above described.

Second, elongating the slot in the trigger which receives the joint pin *r* of the latch in a vertical or nearly vertical direction, so as to permit the trigger to have a vertical downward movement when it is pushed forward to draw the latch, substantially as above described.

Third, elongating the slot *c* of the fulcrum *J* horizontally to permit the trigger to move horizontally forward when unlatching the lock frame, substantially as described.

Fourth, the combination of the vertically-elongated slot *q* and the horizontally-elongated slot *c*, as arranged to permit the sear and the trigger to have a vertical, horizontal, and rotary motion when the latch *G* is thrown forward to release the lock frame, substantially as described.

Fifth, the spring cartridge shell drawer, connected with the swinging breech piece or lock frame by means of a pin *h* and slot or lock *f* in such manner as to preserve the connection while the pin *h* moves in a circle concentric with the pin *J* on which the breech swings, and the said drawer moves parallel, or nearly so, with the bore of the barrel, substantially as herein described.

Sixth, so combining and arranging the hammer and the trigger in a swinging breech piece or lock frame that the two may form arms of a three-armed lever, of which the attachment of the cartridge shell drawer forms the third arm, and of which the pin on which the trigger works is the fulcrum, whereby, with the thumb in front of the comb of the hammer, and the

fingers behind the trigger, the whole power of the hand may be applied to withdraw the cartridge shells from the barrel, substantially as herein specified.

Seventh, the sliding latch *G* and the stop *a* in combination with each other as described, as a means of forming a rigid connection between the hammer and trigger, whereby they are made to serve as two arms of a lever for the purpose of withdrawing the cartridge shell.

No. 47,351.—BENJAMIN WIELAND, Orangeville, Ill.—*Harvester*.—April 18, 1865.—This invention relates to the manner of combining in a hand machine an adjustable platform with the main or handle frame and the cutting apparatus and its driving mechanism, as identified by the claim.

Claim.—The combination of the adjustable platform *D*, uprights *B*, and the endless sickle, constructed as described, and operated through the medium of the spur wheel *q*, pinion *p*, bevel gearing *o m*, shaft *F*, and polygonal pulley, as described and represented.

No. 47,352.—DANIEL T. BROWN, Newton, N. Y., assignor to JAMES H. McWILLIAMS, New York, N. Y.—*Padlock*.—April 18, 1865.—In this padlock there is a series of swinging tumblers, each of which being notched in the usual manner, and another tumbler having a stud upon it, which is pivoted to the swinging catch lever, and which, crossing the notched ends of the other tumblers, passes under and receives the nose of the hasp in a sort of notch in its upper edge. The catch lever and series of tumblers are cut out so as to permit the passage through them of a double-bitted key, which latter, on being turned, sets the tumblers, draws upon the catch lever and, consequently, upon the stub tumbler; the latter, owing to the outer inclined wall of its notch drawing against the inclined nose of the hasp, being gradually forced downwards until its stub enters the notches in the other tumblers, which permits the catch to disengage itself entirely from the nose of the hasp.

Claim.—First, a compound tumbler *f* swinging upon the bolt *d*, and acting in the manner specified, to retain the tumblers when unlocked, substantially as specified.

Second, projecting the bolts by the action of the spring, compound tumbler, and incline *4'* substantially as specified.

No. 47,353.—THEODORE BURR, Battle Creek, Michigan., assignor to himself and SMITH M. KELLOGG.—*Artificial Leg*.—April 18, 1865.—The nature of this invention consists in the use of a knife-edged joint for connecting the foot with the leg, thereby obtaining freedom of motion and obviating friction.

Claim.—First, the segment *C* constructed with the plates *c c*, and otherwise, substantially as described, for the purpose set forth.

Second, the combination of the parts *F G r*, constructed and applied so as to form a knife-edged joint, substantially as described.

No. 47,354.—A. C. CAREY, Malden, Mass., assignor to SAMUEL A. BRADBURY, Dorchester, Mass.—*Knitting Machine*.—April 18, 1865.—This machine knits a whole stocking—heel, toe, and all—and all of a mitten but the thumb. A thumbless mitten may be knit by itself, or a string of such mittens may be knit and afterward separated. There are two rows of needles, in each of which every needle acts independently of the other. The needles of one row are pushed forward successively far enough for the yarn from the thread guide to catch on their hooks, while the needles of the other row are forming loops preparatory to knitting. There is a self-adjusting compound weight which keeps the needles out of action until they are wanted, and which, as it falls in pieces, gradually lets on the needles, so to speak.

Claim.—First, a knitting machine so constructed as to be capable of knitting the closed end or tip of a stocking or other tubular article, in the manner and by the means substantially as described.

Second, the combination of the two rows of needles, in each of which every needle acts independently of the others, with the inclines *A* and *A'* and the jack *E*, as and for the purpose substantially as herein described.

Third, the ring gear *R*, in combination with the moving arms *p* and *p'*, the cross-head *a*, the slide *s*, thread guide *g*, and the inclines *A A'*, substantially as and for the purpose described.

Fourth, the jack *E* for the purpose of pushing forward successively the needles of the right or left hand row, while those of the other row are forming the loops preparatory to knitting, substantially as described.

Fifth, the snail wheel *N*, in combination with the arms *L L* and the levers and connections by which it operates said arms. Also, the self-adjusting compound weight, as and for the purpose herein described and represented.

Sixth, in combination with a jacquard chain or pattern that has at times a revolving or forward motion independent of its frame, and at times an uniform backward and forward motion with its frame, a series of adjustable weights that are in active operation when the chain has its forward or rotary in connection with its backward and forward motion for the purpose of widening the work as it is being knitted, and that are in passive operation only when the chain has only an uniform backward and forward motion for continuing the work of uniform size or width, substantially as described.

No. 47,355.—WILLIAM HAMILTON, assignor to DAVID CARLISLE, St. Louis, Mo.—*Smoke Houses*.—April 15, 1865.—In this invention the products of combustion flow from fire-boxes through a perforated partition into chambers, one on each side of the smoke-house, which is arched over and extending the whole length, and each being about one-third the width of the house; thence they pass through the perforated sides of these chambers and up among the meats, &c. A ledge extends along the top edge of the smoke-chamber to catch the drippings from the meats, &c.

Claim.—Constructing the fire-box A outside of the smoke-house, in connection with the smoke-chamber B inside of the house, and the openings *t* and the plate *z*, substantially as described.

No. 47,356.—CHARLES B. HATFIELD, assignor to CHARLES EUGENE WOODMAN, Boston, Mass.—*Shoe Fastening*.—April 15, 1865.—This invention consists in the combination of a buckle with a catch or catch socket with a plate having a recess, and attached to the upper. The buckle is provided with a large or plated tongue, on the rear of which there is a pointed one. With this invention the buckle can be fastened while being fixed on the confining strap.

Claim.—The combination of the catch *f* and its socketed plate C, or their equivalents, with a buckle or strap holder.

Also, the arrangement of the pointed tongue *h* and the larger or plate tongue *g*, and the buckle frame *a*.

Also, the combination and arrangement of the pointed tongue *g* with the buckle frame *a*, the catch *f*, and its socketed plate C, or their equivalents.

Also, the catch socket recess *k* and its mouth *l*, as made with reference to the shank of the catch, and arranged substantially as described.

No. 47,357.—JOHN JACKMAN, JR., assignor to the AMERICAN AUTOMATIC STOP MOTION COMPANY, Newburyport, Mass.—*Automatic Stop Motion for Steam Engines*.—April 15, 1865.—This invention consists of a trip lever, a governor, a button, and a spring, arranged in such a manner that when the engine is running at its regular speed, and the governor balls assume their normal condition, the trip lever acts on the shoe or catches, and the position and throw of the cut-off valve is regulated by the governor; but if the balls drop down from any cause while the engine is in motion, the combined action of the button and spring on the trip lever trips off the shoe or catches of the cut-off or valve, and the supply of steam is entirely shut off from the engine and its motion ceases.

Claim.—The combination of a spring *d* or *d'* and button *e* or *e'*, with the rod *a* or its equivalent, and with the trip lever B or inclined planes B' or their equivalents, and with the governor A, substantially as and for the purposes herein shown and described.

No. 47,358.—JOHN JACKMAN, JR., assignor to the AMERICAN AUTOMATIC STOP MOTION COMPANY, Newburyport, Mass.—*Automatic Stop Motion for Steam Engines*.—April 15, 1865.—This invention consists in combining with a governor, a coupling sleeve with a dog let in crosswise of the same, and a supporting spring and button in such a manner that when the engine runs at its regular speed and the balls occupy their normal position, the connection between the valve and governor rod is not disturbed, and the valve remains open; but if from any cause the balls drop down, the dog will strike the button so that it is thrown back, and the sleeve is liberated from the rod of the governor, allowing the same to follow the action of the spring and close the valve and thus stop the motion of the engine.

Claim.—The sleeve D connected to the rod C of a governor, and locked to the same by a dog *a* in combination with a spring *d* and button *e*, constructed and operating substantially as and for the purpose set forth.

No. 47,359.—JOHN JACKMAN, JR., assignor to the AMERICAN AUTOMATIC STOP MOTION COMPANY, Newburyport, Mass.—*Automatic Stop Motion for Steam Engines*.—April 15, 1865.—This invention consists in a spring and a suitable stop applied in combination with the governor shaft, and with arms mounted on a bar which turns in its bearings, and which, when it turns, causes said arms to come in contact with the catch bars and to liberate the same from the pins of the levers, shoes, or other parts of the engine, acting on the valve in such a manner that when the arms are turned to such a position that they do not interfere with the action of the catch bars, the spring is moved up on the rod and returned in this position by the stop, and the engine is allowed to run in its regular manner; but if from any cause the governor balls drop while the engine is running, the shaft of the governor liberates the spring, and the arms are turned, causing them to liberate the catch bars automatically and to stop the engine.

Claim.—First, the spring H applied in combination with the rod I, arms J, catch bars D or their equivalents, governor A, and with a suitable stop, substantially as and for the purpose set forth.

Second, the adjustable cam *c* with an inclined plane, in combination with the lever K, notched disk *b*, spring H, rod I, with arms J, and with the governor and catch bars or their equivalents, constructed and operating substantially as and for the purpose described.

No. 47,360.—CHAS. H. JOHNSON, assignor to himself and CHAS. EUGENE WOODMAN, Boston, Mass.—*Detachable Horseshoe Calks*.—April 18, 1865.—This invention consists in, constructing the calks with mortises to receive tenons projecting from the shoe, and mortises in the shoe to receive tenons on the calks at each side of the tenons on the shoe. The same are secured together by bolts running through the tenons into the shoe. The end of the projections from the shoe are cross grooved and the bottom of the mortises of the calks which receive the said projections have corresponding cross projections which fit each other so as to resist any lateral strain upon the calks.

Claim.—The arrangement and combination of the two tenons *c c*, and their mortises *b b*, or *b' b'*, on opposite parts of the calk and flange, with the shoe, the calk, and the flange. Also, the combination of the relievo and incavo crosses *f g*, or their equivalents, with the calk, the flange, and the tenons and mortises of the calk and shoe.

Also, the combination of the lateral recess *d*, on the flange, and the corresponding projection *e* on the tenon, with the calk tenon, and flange applied to the shoe, substantially as specified.

Also, the arrangement of the fastening screw *h*, viz: so as to pass through the shoe and through the tenons, as set forth.

No. 47,361.—ALONZO R. JUDSON, assignor to himself, E. H. CLARK, New York, N. Y., and JAMES D. GRAY, Brooklyn, N. Y.—*Apparatus for Cooling and Stirring Lard*.—April 18, 1865.—This invention consists of a tank within which are two vertical shafts, the said shafts being provided with radial arms or bars which are attached to the shafts near their upper ends. These bars are provided with arms which project downward. To the top of each shaft is attached a crank connected with the rods by means of which a reciprocating motion is given to the stirrers.

Claim.—The combination of the cranks *H H*, vertical shafts *C C*, radial arms *D D*, and stirrers *F G*, all constructed and arranged as herein described, so as to oscillate the said stirrers simultaneously in horizontal planes and in opposite directions as explained.

No. 47,362.—WM. MALLERD, assignor to J. D. ALVORD, Bridgeport, Conn.—*Regulator for Gas Burners*.—April 18, 1865.—This invention consists of a gas burner containing a regulator in the enlarged part. The regulator is made in two pieces. A diaphragm of flexible material is fastened to a ring which is held between the two sections of the regulator. To the underside of the diaphragm is attached a rod upon the lower end of which is secured an adjustable valve, and in the upper part of the regulator is a hollow screw. By means of these devices the position of the flexible diaphragm is adjusted.

Claim.—The employment of the independent ring in combination with the inner case and the diaphragm, substantially as herein shown and described.

Also, the combination of the diaphragm regulator with the diaphragm, substantially as herein shown and described.

Also, the combination of the said diaphragm regulator with the adjustable valve, substantially as herein shown and described.

No. 47,363.—THOMAS OLIVER, New York, N. Y., assignor to himself and WILLIAM H. FARRAR, Oregon.—*Lining Petroleum Barrels, &c.*—April 18, 1865.—In this invention the gelatinous extract of prickly pear (*Opuntia Vulgaris*) is mixed with whiting, lime, flour, bran, or other material, to the consistency of paint, and then applied to the inside of barrels. Over this, before it is dry, is spread a composition of glue, molasses, isinglass, and shellac; other vegetable extracts may be used instead of that of the cactus.

Claim.—First, a preparation composed of the juice of the prickly pear, or other gelatinous plants, mixed with lime, plaster of Paris, flour, bran, or other similar substances, as a priming or preliminary application to the inside of barrels or other vessels, as and for the purposes set forth.

Second, the combination of a first and second application to the inner surfaces of barrels or other vessels, as described.

Third, the application of the ingredients herein described, when incorporated in one composition, and applied substantially as and for the purposes herein set forth.

No. 47,364.—BENJAMIN C. PHELPS, Wethersfield, Conn., assignor to himself and FREDERICK H. WILLIAMS, Hartford, Conn.—*Fruit Picker*.—April 18, 1865.—In this invention a vertical blade is fixed to the end of the handle and against this blade another is caused to work like a pair of shears, the movable blade being operated by a cord and spring. The stem of the fruit is cut, the fruit falling into a pocket attached to the top of the pole.

Claim.—A vertical blade *C'*, upon the shank *D*, in combination with the vibrating spring lever blade *F H C*, basket *B E*, handle *A*, and cord *G*, when constructed and arranged substantially as described.

No. 47,365.—G. ADOLPH REIDEL, Philadelphia, Penn.—*Low-water Indicator for Steam Boilers*.—April 18, 1865.—This invention consists in the arrangement of a receiver for the feed water, in such a manner that when the water in the boiler gets below a given point the

communication therewith is cut off from the receiver above it, where it had been forced by the steam in the boiler, and the water passes down a connecting pipe and the receiver is emptied. The position of the receiver is changed by the weighted lever, which change of position sets a pump in motion, and a new supply is forced into the boiler. An alarm whistle is attached to the receiver in such a way that, as its position is changed, the valve of the whistle is opened and an alarm sounded.

Claim.—First, the oscillating receiver C, combined and arranged with the boiler A, substantially as described and for the purposes specified.

Second, the jointed pipes D and E, arranged and operated substantially as described.

Third, the combination of the weighted lever H, with the receiver C, substantially in the manner described and for the purpose set forth.

Fourth, the combination and arrangement of the conical valve N, and whistle O, or other alarm, substantially as described.

No. 47,366.—JOHN A. SEAVEY, assignor to himself and EDWARD S. HUTCHINGS, Kennebunkport, Maine.—*Trace Connection.*—April 18, 1865.—This invention consists of two pieces, one to be attached to the trace, the other to the whiffletree: the latter is formed with a vertical eye opening into a locking notch made transversely across the head. A screw projects down from the head to enter the thill or shaft. By pressing the head of the shank through the eye, and turning the head, the spring draws it into the notch and thus holds the two parts.

Claim.—As my invention the breeching or trace connection as composed of the eye *a*, the shank *b*, the head *c*, the spring C, the head *g*, the passage *d*, the notch *e*, and the screw *f*, or the equivalent of the latter, the whole being arranged substantially as and so as to operate as specified.

No. 47,367.—FRANCIS BRESSON, Paris, France.—*Lubricator.*—April 18, 1865.—In this invention the end of the nozzle has a disk within it slightly concave on the under side and punctured at the end of the centre, the overflowing of which emits the drops through the puncture. The end of the tube fitting the periphery to be lubricated so closely as to permit no flow, except while the cylinder is in motion. Within the tube described there is another tube which ascends through the reservoir and through a packing at its top. The elevation and depression of this latter tube regulates the pressure of the atmosphere within the reservoir, and consequently the emission of the oil.

Claim.—The combination of the air-tight vessel A, with the pipes *b c* and I, substantially as and for the purpose specified.

Also, the combination of the air-tight vessel A, and stopper B, and pipes *b c* and I, substantially as and for the purpose described.

Also, in combination with the pipes *b c* and I, when applied to the vessel A, the vessel A, the concave cap *e*, substantially as and for the purpose described.

No. 47,368.—WILLIAM C. FULLER, London, Great Britain.—*Method of rendering Doors and Windows Water Tight.*—April 18, 1865; patented in England February 16, 1864.—The object of this invention is to furnish packing for making a close joint in closing doors, hatchways, portholes, deadlights in ships, &c., and the invention consists in making a solid bar of hard rubber, or other substance, and uniting it with a bead or strip of soft rubber.

Claim.—The employment of a rib, strip or bead of elastic India-rubber, chemically united to a harder surface, whether of vulcanite or brass, as herein set forth and described.

No. 47,369.—GEORGE GOLDENFINGER, Seloncourt, France, and J. LOUIS RICHET, Besançon, France.—*Winding and Setting Watches.*—April 18, 1865.—This invention consists in eliminating from the winding-up apparatus of a watch the fourth wheel, or, in other words, in doing away with cogged wheels in two directions—the vertical and the horizontal. The watch is wound up by means of a small shaft passing through its side and gearing with a wheel on the shaft which winds the motor spring. After being wound up the motor spring is disengaged from the winding apparatus by a recoil spring on the latter.

Claim.—First, combining with the wheels H and H', which respectively control the movements of the watch hands and of the winding devices, a movable double pinion F upon a stationary shaft, which pinion can be set in and out of gear with either of said wheels, substantially as and for the purposes described.

Second, the combination with the wheels H and A', of the movable pinion F, stationary shaft A, and spring clutch lever G, substantially as and for the purposes specified.

No. 47,370.—CHARLES EUGENE LAEDERICH, St. Imier, Switzerland.—*Winding and Setting Watches.*—April 18, 1865.—This is one of the "remontoir" or keyless watches, wound up by a shaft entering through the side. The device for winding up and those for setting the hands are located on the same side of the pillar plate, underneath the dial, and are arranged so as to admit of passing from one operation directly to the other by means of an adjustable pinion on the winding-up shaft.

Claim.—The above described arrangement and operation of the stem and its pinion with the train and other wheels, for the purpose and in the manner substantially as described and illustrated in the drawings.

No. 47,371.—JAMES M. JAY, assignor to W. H. ALEXANDER & Co., Canton, Ohio.—*Horse Rake*.—April 18, 1865.—This invention relates to the construction of the hangers, by which the rake is attached to the axle, being so arranged that the bars will swing into one of the curves of the hanger and the rake head into the collar.

Claim.—In combination with the bar *D'* and rake head *d*, the S-shaped hangers *a*, so arranged that the bars will swing into one of the curves of the hanger, and the rake head into the other, substantially as and for the purpose described.

No. 47,372.—WILLIAM H. ELLIOT, Plattsburg, N. Y.—*Breech-loading Fire-arm*.—April 18, 1865.—This invention consists in operating the brace of the swinging breech plate of a breech-loading fire-arm, when said brace receives the recoil of the charge from the breech plate and communicates it to the frame of the arm, independently of the pivot of the hammer. The brace between the hammer and the main spring is arranged so that in firing the spring first communicates its power to the brace and then through the stirrup to the hammer. The hammer thus operated upon is pivoted to the breech plate. The hammer and brace are locked by means of a notch in such position that the breech plate may be turned away from the chamber for the purpose of loading, and turned back again without danger of an accidental discharge of the piece.

Claim.—First, a brace, which receives the recoil of the breech plate and communicates it to the frame or other portions of the arm, independently of the pivot or bearing of the hammer, when said brace is operated by the hammer, substantially as herein specified.

Second, the arrangement of the brace *e* between a hammer and main spring, when said hammer and brace swing upon separate pivots, substantially as herein described.

Third, operating the brace *e*, by means of a hammer which is pivoted to a breech plate, substantially as herein specified.

Fourth, the employment of lock notch *w* for locking the brace out of the way of the breech plate, substantially as set forth.

Fifth, so arranging the full-cock notch *v* upon the hammer that the brace *e* will still support the breech plate when the hammer is cocked for firing, substantially as herein shown and described.

Sixth, passing the pivot of the hammer through the hubs of the breech plate, substantially as and for the purpose described.

Seventh, the combination and arrangement of the auxiliary spring *i*, the half-cock notch *u*, and trigger *h*, substantially as and for the purpose set forth.

No. 47,373.—G. ADOLPH RIEDEL, assignor to A. MERRITT ASAY, Philadelphia, Penn.—*Car Springs*.—April 18, 1865.—This invention consists of a nest of springs confined between plates, and held in position by means of clamp bolts projecting from each of the said plates, and of such length as not to meet until after considerable compression of the said springs. The central spring of the nest is made stiffer than the rest for the purpose of supporting them under extraordinary pressure, and is surrounded by a metal tube of such length so as not to interfere with a due, and at the same time to prevent an undue, compression of the said central spring.

Claim.—First, the tubes *J*, combined with the head plates *A B* and arranged and operating in relation to the springs *C F* substantially as herein before described and for the purpose set forth.

Second, combining and arranging the spring *C'* with the tube *J*, substantially in the manner and for the purpose above set forth.

Third, constructing the combining spring *G* of a twin shape bar or plate, substantially in the form represented in Fig. 4, when operated as described for the purpose set forth.

No. 47,374.—E. P. ALLYN, North Canaan, Conn.—*Slide for Extension Table*.—April 25, 1865.—This invention consists in having a series of slides, of malleable cast-iron or other metal, and fitted together by means of dovetail projections, grooves, and stops, whereby a durable slide is obtained and the annoyance occasioned by the shrinking and warping of wooden slides avoided.

Claim.—A slide for extension tables, manufactured of malleable cast-iron or other metal, with its parts fitted together by the dovetail projections and recesses, and provided with stops, substantially as herein described.

No. 47,375.—IRA ALMY, Farmer, N. Y.—*Coffin Handle*.—April 25, 1865.—The plate is provided with a flange which bears against the bottom of the coffin and is provided with pins which penetrate the wood. On the upper part of the plate is a thumb-screw, by which it is retained against the side of the coffin, and by this means the plate can be readily attached or detached from a coffin when desired.

Claim.—A detachable coffin handle, secured to a coffin through the medium of a plate applied in the manner substantially as shown and described.

No. 47,376.—JAMES ARKELL, BENJAMIN SMITH, and ADAM SMITH, Canajoharie, N. Y.—*Paper Bag*.—April 25, 1865.—This invention consists in making or preparing paper bags in

such a way as to give to them, at their proper ends, a flexible character, so that, when properly filled with flour or other substance, the sides of the bags, at the proper ends, will come together after the manner of the sides of a cloth bag.

Claim.—As a new article of manufacture a quadrangular paper bag, with a double bottom produced by folding and pasting in the particular manner herein described.

No. 47,377.—JOHN BAIRD, New York, N. Y.—*Steam Engine.*—April 25, 1865.—This invention consists in the arrangement of condensing horizontal engines for driving propellers in such a manner that the condenser is attached directly to the cylinder head and at the same time acts as a guide for the cross head. An aperture is formed through the condenser at right angles to the axis of the cylinder, through which the shaft passes, and the piston is furnished with two piston rods, between which the shaft also passes. There are two or more pairs of these engines which are placed athwart ship, with their connecting rods working toward the centre, and a propeller is placed upon each side of the stern port, so that the engines upon one side of the ship work the propeller on the opposite side. Pillow blocks are arranged at the side of the condenser and fastened thereto by wrought iron rods designed to allow for any spring that there may be in the timbers to which the engines are attached.

Claim.—First, a horizontal engine, provided with a box framing near and attached to the cylinder, and containing vertical pumps, substantially as described, said framing also constituting the condenser, or the channel ways thereof.

Second, a horizontal engine, having a box framing, containing pumps and an independent pillow block framing, when the latter is combined with the former by wrought-iron rods, substantially as described and for the purpose specified.

Third, arranging engines, having the characteristics set forth in the second claim, on opposite sides of a vessel, when such engines have openings through the framing for the passage of a propeller shaft or shafts, substantially as hereinbefore described.

No. 47,378.—CYRUS BALDWIN, Manchester, N. H.—*Table Writing Desk.*—April 25, 1865.—This invention consists in combining with a table a writing desk. The desk is pivoted beneath the top of the table, and swings out for use when desired.

Claim.—The combination of the table and writing desk, when arranged to operate substantially as set forth.

No. 47,379.—G. BALDWIN, Bluffton, Ind.—*Hay Rack.*—April 25, 1865.—This invention consists in the application to a hay rack of two parallel bars, having rods passed through the same, and attached to the sills at the bottom. The said rods have at their upper ends threaded screws, to admit of nuts being put on after the bars are secured in their place. By screwing said nuts down firmly on the top of the load, an uniform pressure is exerted from top to bottom in all parts of the load, thereby preventing the strain on the rack and avoiding the inconvenience to the driver of having a binder pole in the centre of the load.

Claim.—The binder B and C, or their equivalent, for the purposes set forth.

No. 47,380.—L. B. BARTON, Metamora, Ill.—*Cultivator.*—April 25, 1865.—This invention relates to cultivators of that class in which the ploughs or shovels have a lateral adjustable movement, in order that they may be made to conform to the sinuosities of the rows of plants, and cast up the earth to the same or cast it therefrom without the liability of ploughing out the plants or injuring the roots thereof.

Claim.—The hinged or jointed frame E placed within the main frame A, as shown, in combination with the laterally swinging shovel or plough standards *g g*, levers *J J*, with stirrups *K K* attached, and the curved or bow-shaped bar *M*, all arranged to operate substantially as and for the purpose herein set forth.

No. 47,381.—W. W. BATCHELDER, New York, N. Y.—*Coal Oil Burner.*—April 25, 1865.—This invention consists mainly in the employment in a gas burner of a combination of a tubular wick-holder, a gas chamber, a perforated plate, and a heat conductor projecting downwards into the wick.

Claim.—The employment, in combination with a tubular wick-holder and vapor or gas-generating and air-mixing chamber, of a perforated plate, or the equivalent thereof, together with a metallic or other heat conductor or conductors projecting downwards and dripping into the wick, substantially in the manner herein described, for operation as herein set forth.

No. 47,382.—J. J. BAUSCH, of Rochester, N. Y., assignor to BAUSCH & LOMB, of Rochester, N. Y.—*Microscopes.*—April 25, 1865.—This microscope is capable of being closed in compact form, so as to be carried in the pocket; and to this end the object piece is connected with the eye piece by a spring in such a manner that the latter may be shut within the former by the compression of the spring, and separated from the former by the extension of the spring at a distance just equal to the focus of the lens.

Claim.—The combination of the object piece A, eye piece B, and spring C, substantially as and for the purpose herein set forth.

No. 47,383.—CHARLES F. BAYLOR, Clinton, N. J.—*Churn*.—April 25, 1865.—This invention consists in the application to a churn of pulleys placed within the framing of the same, having a belt passing around them and connected to a block placed at one end of the pitman sliding within a groove in one side of the framing, the other end of the pitman being attached to the crank. The crank being turned, operates by means of the belt, the vertical dashers sliding in grooves made in the framing.

Claim.—The combination of the belt and rollers, substantially as described, with the slides S and T attached to the dasher shafts, and the block or attachment J deriving its motions from the hand crank and its connections, as described and represented.

No. 47,384.—ADOLPH BEHR and W. J. WARD, Black Hawk, Colorado.—*Shaking and Rocking Table for Amalgamating Gold, &c.*—April 25, 1865.—This invention consists of a sheet of amalgamated copper or brass, bent in such a manner as to form a furrow with projecting ribs. This sheet is secured to wooden sides, and the whole is suspended by rods and operated by an eccentric or cam.

Claim.—A shaking or rocking table, with amalgamated copper or brass riffles or grooves, which may be charged with more or less additional quicksilver, alone or in connection with one or more wooden riffles or grooves, in the shape and manner above described, or constructed in any manner, substantially the same, which will impart to substances suspended in water both the sifting and splashing motion which throws and forces the particles in contact with the amalgamated surface of the copper or brass riffles or grooves.

No. 47,385.—J. B. BENNETT and JAMES S. GIBBS, Buffalo, N. Y.—*Manufacture of Soap*.—April 25, 1865.—This invention consists in agitating and commingling, by any suitable machinery, the ingredients used for making soap in a closed vessel while under heat and pressure sufficient to insure the desired new combinations, and produce cheaply and quickly a uniform good quality of soap.

Claim.—The agitation and commingling, by any suitable machinery, of the ingredients used for making soap in a closed vessel while under heat and pressure sufficient to insure the desired new combinations, and produce cheaply and quickly a uniform good quality of soap.

No. 47,386.—E. F. BISHOP, Burton, Ohio.—*Straw Cutter and Feed Mixer Combined*.—April 25, 1865.—This invention consists in the arrangement and combination with a straw cutter of a feed-mixing apparatus, composed of a vertical shaft extending down within a receptacle attached to one of the front legs of the machine and a little below the level of the same, the said shaft having arms placed thereon for mixing the food. Extending down to this receptacle are a couple of spouts attached to the machine, one from the mouth and the other from the side from under a hopper, whereby the food is conveyed into the said receptacle and mixed.

Claim.—The special arrangement of the hopper H, mixer F, shaft *d*, within its arms *f*, and spout *g*, in combination with the straw cutter when operating conjointly, substantially as and for the purpose set forth.

No. 47,387.—LOUIS BOUDREAU, Thibodaux, La.—*Press*.—April 25, 1865.—This invention consists in the employment of toggle levers and a windlass so arranged that the press may be used in either a vertical or a horizontal position, and by any convenient power.

Claim.—In combination with the toggles I I and beater H, the shaft C and jacket F, so constructed as to be coupled and uncoupled by the lever G, and adapted to permit the rope K to be unwound and the beater to be raised without reversing the motion of the wheel L.

No. 47,388.—ROBERT BRIGGS, Philadelphia, Penn.—*Coupling for Shafting*.—April 25, 1865.—This invention needs no further description than is made in the claim. The coupling is divided, and has slots and bolts as there mentioned.

Claim.—The construction of couplings for shafts of a cylindrical casting or forging C, with a slot or opening *n* along one side, and clamped together by bolts *b*, as described.

No. 47,389.—DANIEL J. BROWNE and CYRUS W. BALDWIN, of Boston, Mass.—*Galvanic Battery*.—April 25, 1865.—This battery consists of an electro-negative plate, consisting of a square rod or prism formed of hard gas coke placed within a cell of unglazed pottery. This cell is placed within another cell, and within the outer cell and around the inner are radially arranged the electro-positive plates, consisting of bars of wrought or malleable iron. This arrangement renders possible the employment of a large amount of surface in the positive cell, and in consequence effects the diminution of the number of cells required in a battery of given power, whereby expense of construction is lessened, and the increased positive surface is enabled to be brought near the negative surface.

Claim.—The arrangement of the separate iron positive bars or rods C C radially around and in combination with the carbonaceous negative plate D, substantially as and for the purposes herein specified.

No. 47,390.—J. D. BUTLER, North Adams, Mass.—*Engine for Operating Rock Drills.*—April 25, 1865.—This invention consists of three cylinders, with their pistons and tubular piston rods so arranged as to operate the clamps which hold the drill, and at the same time to operate the drill. Provision is made for partially releasing the hold of the clamp upon the drill when it strikes the rock, and at the same time prevent the too violent recoil thereof. Provision is also made for cushioning the piston of the main cylinder so as to regulate the force of the blow. The engine is automatic in its action, and is provided with supports extending from the lower part of the cylinder, upon which a crosshead, which guides the lower end of the drill, and to which the cam rod for moving the valve is attached. The drill passes through the centre of the tubular piston rod.

Claim.—The combination and arrangement of the piston E, the openings $c\ c'$, the piston rod F, its packing b^* , the piston G, and the openings d , with the cylinders K A, the tubular piston rods C D, and the hollow cones I and L, and the gibs J J, the whole being constructed in manner and so as to operate substantially as described.

Also, the combination of the crosshead Q and the slides Q'', constructed and operating substantially as described, with the drill N and the tubular piston C; and also the combination of the collar Q' therewith, the same being for the purpose specified.

Also, the connection of the crosshead Q with the piston rod C, in such manner that there may be a freedom of transverse and rotary motion with reference to one another, as and for the purpose herein before described.

Also, the combination of the cushioning space x and the piston extension $b''\ b'''$, or their equivalents, with the port r' , arranged in the cylinder and with reference to such space, substantially in manner as specified.

Also, the construction of the cylinder A with the reduction of bore, as shown at $a\ a'$, and with the piston B, with the part $b\ b$, to operate in such reduction, the part r being disposed with reference thereto as specified.

Also, the combination of the spring M, the nut H, and the series of notches $h\ h$, or their equivalents, with the hollow cone I, the same being substantially as and for the purpose described.

Also, the combination of the segments P P' of a conical ring, the cylinders $p\ p'$ and $p''\ p''$, the ring p'' , and the hollow cones in the head A'' and the follower A''', the whole being substantially as and for the purposes set forth.

Also, the combination of the spring W, the pin w , and the yoke V'', with the valve stem U and the slide bar V, constructed, arranged, and operating substantially as described.

Also, the combination as well as the arrangement of the piston E, the piston rod F, its packing b^* , and the piston G.

Also, the combination of the openings $c\ c$ and d , the piston rods D F, arranged with a tubular space between them, the pistons E and G, and the packing b^* , the whole being arranged substantially as described.

No. 47,391.—M. C. CAMPBELL, Philadelphia, Penn.—*Artificial Skating Pond.*—April 25, 1865.—This invention consists in covering an ordinary floor with a composition of carbonate of soda and sulphate of soda. The two salts are mixed in equal proportions and melted. The composition is then poured upon the floor, which is divided by strips of wood into sections proportioned to the quantity of material prepared, the strips being removed after each section has become solid.

Claim.—The preparation of a surface with a congealed material or composition, substantially as described and for the purpose specified.

No. 47,392.—JAMES CHASE and WILLIAM S. LOUGHBOROUGH, Rochester, N. Y.—*Curtain Fixture.*—April 25, 1865; antedated April 15, 1865.—This invention consists in a bracket, with a guide loop for the cord, an oblong journal box or socket, with suitable stops, and in that class of curtain fixtures in which the gravity of the curtain causes it to lower, and the adjustability is regulated by a single cord.

Claim.—The combination and relative arrangement of the guide loop i on the bracket b with the spool and oblong journal socket c and stop e , the parts being constructed and operating in the manner and for the purposes shown and described.

No. 47,393.—JOHN CHILLCOTT, Brooklyn, N. Y.—*Apparatus for obtaining Extracts from Vegetables, &c.*—April 25, 1865; antedated April 20, 1865.—This invention consists of a vessel A within another vessel B, leaving a steam chamber between the two. The vessel A is provided with a man-hole and cover, and also with perforated shelves, on which the vegetables are placed. Steam is admitted into the steam chamber by means of a pipe, and from the steam chamber into the vessel A by means of a pipe. The extracts obtained are drawn off through a pipe E.

Claim.—First, subjecting the substances to the action of heat in a steam-tight chamber or box, in which they are separated by perforated shelves, and in which they are surrounded by an atmosphere of steam, but protected from direct contact with the steam during the whole or any portion of the extracting process, substantially as herein described.

Second, providing between such chambers a connecting steam pipe F, by which steam can be admitted among the substances under treatment during any stage of the process, substantially as herein specified.

No. 47,394.—JOHN CHILLCOTT, Brooklyn, N. Y.—*Process for preparing Grain for Distillation*.—April 25, 1865; antedated April 15, 1865.—This invention consists of a steaming vessel, with a perforated partition, upon which the grain is placed and subjected to the action of steam until it begins to soften and swell; it is then allowed to fall out through a door into the hopper and between rollers.

Claim.—First, the process of preparing grain for distillation by steaming and crushing it between rollers, substantially as herein described.

Second, the combination of the steaming vessel A, perforated pipe d, hopper B, and rollers C C', substantially as and for the purpose set forth.

No. 47,395.—H. M. CLAFLEN, Cleveland, Ohio.—*Mode of Splicing Timbers*.—April 25, 1865.—This invention consists in a mode of joining or splicing timbers together, whereby the fibre of the wood is not injured or its strength impaired, so as to make a safe splice for any wooden structure.

Claim.—First, the knobbed plates C', as and for the purpose set forth.

Second, the knobbed plates C', in combination with the link C, or its equivalent, substantially as and applied to the purpose specified.

No. 47,396.—JOHN W. COCHRAN, New York, N. Y.—*Breech-loading Fire-arm*.—April 25, 1865.—The barrel of the arm swings horizontally on a vertical pivot, and is held in its closed position by a transverse spring catch at the breech. The improvement consists in placing a sliding pin behind the spring catch in such a manner as to come in contact with the hammer, and thus prevent it from striking the cartridge until the said catch is sprung into its place on the accurately closed breech of the barrel.

Claim.—The safety pin h, applied and operating substantially as herein described, in combination with the hammer and with a spring catch applied to lock the barrel opposite the breech, as herein set forth.

No. 47,397.—WILLIAM COES, Worcester, Mass.—*Horse Shoe*.—April 25, 1865.—This invention consists in providing the shoe with a toe-piece or cap to fit over the toe of the hoof, and having the shoe pointed at its sides, and the rear part of the latter provided with lips and a catch or fastening, all arranged so as to admit of applying or removing the shoe without the use of nails.

Claim.—The bars A C C, connected by joints and provided respectively with a toe piece or cap B and lips D D, and the bars C C, constructed or secured by a suitable catch or fastening, substantially as and for the purpose herein set forth.

No. 47,398.—STILLMAN COOPER, Antwerp, N. Y.—*Mop Head*.—April 25, 1865.—This invention consists of a fixed portion composed of a rod bent so as to form three sides of a quadrangle, and curved in order to attach it to a handle. A jaw is pivoted to the fixed portion, between which the mopping cloth is placed, and can be adjusted by means of a slot and notches to different thicknesses of cloth, and held in position by rings.

Claim.—The fixed or permanent jaw A, provided with oblong slots h h and notches d d, in combination with the movable or adjustable jaw B, provided with pins g g and teeth e, and the sliding collars C C, fitted or placed on the sides c c f f of the jaws, substantially as and for the purpose set forth.

No. 47,399.—ERASTUS CROOKER, Buffalo, N. Y.—*Oil Ejector*.—April 25, 1865.—This invention consists in covering the steam pipe with gutta-percha or other equivalent material fitting closely to the pipe in combination with an ejector and discharge pipe.

Claim.—A steam pipe covered with gutta-percha or other equivalent material fitting closely thereto, in combination with an ejector or discharge pipe, substantially as and for the purpose set forth.

No. 47,400.—JAMES DONNELL, Allegheny City, Pa.—*Device for Well Boring*.—April 25, 1865.—The object of this invention is to cause a drill in the operation of boring artesian wells to turn through a given arc of a circle at each stroke, by a mechanical contrivance connected therewith, which operates to turn the tool first as it is completing its downward stroke and prevents its turning back or dropping into the hole or indentation made by the preceding stroke.

Claim.—The combination of the two toothed rings, the teeth of which have one side parallel and the other side at an angle to the axis of the rings, with the bevelled arms o o' of a shaft which has a reciprocating motion between the rings, for the purpose of producing an intermittent rotary motion of the shaft or rings, according as one of them is fixed and the other capable of rotation at each stroke of the shaft; the length of the arc of motion at each half stroke being regulated by the number of teeth in each of the rings, substantially as herein before described.

No. 47,401.—HENRY EARL, Edwards, N. Y.—*Sap Pans*.—April 25, 1865.—This invention consists of a pan provided with partitions forming a continuous winding passage for the sap. The sap is received in one pan at the centre of another pan through a supply pipe

which is surrounded by a steam pipe. The said steam pipe is connected with a cover of the steam box, which is directly under the main pan. This pan is provided with partitions similar to those in the first named pan, and the sap flows from said pan into another pan. A gate is placed in the latter pan to prevent the unfinished sap from being drawn off with the sirup. The steam pipe inclines from the centre to the side of the pan in order that the condensed steam may not flow back into the steam box.

Claim.—First, the combination of the receiving pipe A with the steam pipe D, substantially as and for the purpose set forth.

Second, the combination of the movable pan H with the pipes A and D, substantially as and for the purpose set forth.

Third, the combination of the steam box K with the movable pan H, substantially as and for the purpose set forth.

Fourth, the combination of the main pan M with the steam box K, substantially as and for the purpose set forth.

Fifth, the combination of the slide or gate *o* with the main pan M, substantially as and for the purpose set forth.

Sixth, the winding arrangement or channelling the pan, by means of which the sap, being admitted at the central or hottest part of the pan, is conducted to the outer or cooler parts of said pan substantially as described and for the purposes set forth.

No. 47,402.—E. D. EASTWICK, Baltimore, Md.—*Process for Treating Sirup and Saccharine Solutions.*—April 25, 1865.—This invention consists in the use of an acid, an acid salt, or neutral salt, that will decompose the coloring matter in sirup, &c. The acid or salt is added in such quantities as may be required or until no further change is produced. The sirup thus treated may be either stirred until the change is produced, heated, or boiled, until the decomposition is effected.

Claim.—The use of acids, acid salts, or neutral salts, for the purpose of decomposing and altering the coloring compounds in molasses and analogous sirups, the products of mother liquor remaining after crystallization of the sugar manufacture or refining.

No. 47,403.—R. EGAN, Brooklyn, N. Y.—*Awl.*—April 25, 1865.—This invention consists in the manner of fastening an awl into the haft. A metal socket piece forms the ends of the haft, which is attached by a stout tongue screwed into the wooden haft, the socket having an internal screw thread formed therein which receives the threaded shank of an awl.

Claim.—First, constructing awl hafts in the manner substantially as above described.

Second, in combination with the screw threaded socket piece B, constructed as specified.

Third, forming a screw thread upon the shank of the awl as and for the purpose set forth.

No. 47,404.—WM. EMRIS and H. J. BOSWORTH, Hudson, Mich.—*Sawing Machine.*—April 25, 1865.—This invention consists in attaching a bent lever to the side of the sawing machine, with the lower end bent so as to project under the arm that works the saw, so that by throwing the lever one way it raises the saw, and by releasing the lever the saw will be free to fall. This lever is held in place by contact with a spring having notches in it, so that it holds the lever when the lever is operated to slide in the spring into the notches.

Claim.—The lever S in combination with the spring V, when constructed and operated substantially as and for the purpose herein set forth.

No. 47,405.—JOHN EVANS, New Haven, Conn.—*Drop Hammer.*—April 25, 1865.—This invention consists in the method of attaching the connecting rod of the hammer to the crank of the driving wheel, by which a variation in the length of stroke of the hammer is permitted to allow for the varying thickness of the work it is intended to operate upon.

Claim.—The combination of the connecting rod with the hammer when they are constructed and attached, substantially as herein described.

Second, the combination of the connecting rod with the crank pin, when they are constructed, arranged, and fitted for adjustment substantially as herein described and set forth.

No. 47,406.—W. R. EVANS and L. D. BENNER, Thomaston, Maine.—*Pencil and Eraser.*—April 25, 1865.—This invention consists of a holder having an eraser in one end and a pencil in the other, arranged with bayonet joint catches.

Claim.—The combined pencil and eraser above described, constructed substantially in the manner above set forth.

No. 47,407.—WM. L. FABER, New York, N. Y.—*Smelting Copper Ores.*—April 25, 1865.—This invention consists in roasting and pulverizing the ores several times, and then roasting it at a low heat until nearly all the sulphur contained is converted into sulphuric acid, which combines with the oxides of the metals, and until nearly all the acid has been driven off by the heat of the roasting. Common salt is then added, the quantity being four times as great as the weight of the arsenic and antimony combined contained in the ore. The whole is roasted again at a low red heat, gradually increasing the temperature to a higher range and maintaining it at this until the operation is finished.

Claim.—The within described process for expelling antimony and arsenic from copper and copper ores by roasting with some substance developing chlorine during the process of roasting, substantially as herein set forth.

No. 47,408.—AUSTIN W. FIELD, Vergennes, Vt.—*Carriage Jack.*—April 25, 1865.—This invention consists in the employment of two parallel slides fitted in a suitable stock or standard, and having a lever placed between their upper ends, all being arranged in such manner that the device may be readily applied to axles of any height, and the latter elevated and secured in such a position with facility to enable the wheels to clear the ground or floor, so that they may be removed from the place on the axle for lubricating purposes.

Claim.—The stock or standard A, perforated sliding bars B B, and lever D, in connection with the pin E, all arranged substantially as shown and described, to form a new and improved carriage jack.

No. 47,409.—JACOB FOX, Philadelphia, Penn.—*Coal Breaker.*—April 25, 1865.—This invention consists of a stationary hopper in which the coal to be broken is placed, vibrating plates, to which picks are attached, the said picks being made of hard wood or metal, and being moved in a reciprocating horizontal direction by the vibration of the plates, caused by the action of a system of eccentrics and shafts moved by a pulley or crank.

Claim.—First, a stationary hopper B B, adjustable at the bottom to regulate the size of coal, substantially as described and for the purpose specified.

Second, the vibrating plates *c c* in combination with picks D D, substantially as described and for the purpose specified.

Third, a stationary hopper B B, with picks D D, in combination with vibrating plates *c c*, or their equivalents, as and for the purpose specified.

No. 47,410.—J. FRASER, Buffalo, N. Y.—*Mode of Treating Oil Wells to Remove Paraffine, Tar, &c.*—April 25, 1865.—This invention consists in forcing hot water, petroleum, naphtha, &c., down into the well to render the paraffine fluid and dissolve it.

Claim.—The method of treating petroleum wells with hot liquids for the removal of obstructions composed essentially of paraffine, substantially as set forth.

No. 47,411.—C. O. FURBUSH, Machias, Me.—*Apparatus for Delivering Paper from Printing Presses.*—April 25, 1865.—This invention consists in the attachment of nippers to bars moving on endless bands, so that cam wedges can open or shut the nippers at proper intervals.

Claim.—The bars D E, provided respectively with jaws *c d*, the projection *f*, and pin *e*, in combination with inclined planes *g g*, the spring F, and bolt C, by which the jaws are opened and closed at the appropriate times to receive, clasp, convey, deliver, and return, substantially as above described and represented.

No. 47,412.—FREDERICK A. GILES, New York, N. Y.—*Winding and Setting Watches.*—April 25, 1865.—Watches constructed on this system are wound by means of an arbor passing through the stem or pendant of the watch and permanently attached thereto. But one wheel and two pinions are employed in addition to the ordinary gear of the watch, and the ratchet clutch commonly employed in watches of this construction is dispensed with, as is also the minute wheel.

Claim.—The combination of the wheel C, having two series of teeth *a* and C, turning on a fixed pivot *n*, the two pinions *b d* movable lengthwise upon the arbor, the spring *f*, and the sliding pin *h*, the whole arranged and applied in relation to the wheel A and the cannon pinion, substantially as herein set forth.

No. 47,413.—H. A. GOUGE, Brooklyn, N. Y.—*Ventilator.*—April 25, 1865.—At a convenient point in the wall and near the floor of an apartment is an aperture, opening into a small chamber outside the room in which a gas jet or lamp is burned. The products of combustion, rising into a small conical shield, circulate around it and up into a pipe inside another and larger pipe. By the heat a circulation is caused to flow through the aperture and along with the products of combustion. Near the ceiling is another opening in the wall, likewise connected with the inner pipe. By means of doors in both apertures the circulation can be controlled at will.

Claim.—First, the ventilating apparatus described, with the several parts arranged and acting together substantially as set forth.

Second, the combination of light F, flues B and C, and ventilator E, constructed and arranged substantially as and for the purposes described.

No. 47,414.—THOMAS GRAHAM, Philadelphia, Penn.—*Coffin.*—April 25, 1865.—This invention consists in attaching two vessels to the opposite interior sides of a coffin in such a manner that they may be readily detachable therefrom. These vessels are open at the top, and are filled with alcohol previous to the deposition of the corpse in the coffin. After such deposition and the closing of the coffin the alcohol evaporates, and the vessels may be removed.

Claim.—The vessel G, containing alcohol or other equivalent fluid, and arranged in a coffin so as to be detachable therefrom, as set forth, for the purpose specified.

No. 47,415.—F. B. GREEN, Seneca Falls, N. Y.—*Grape Wire Support.*—April 25, 1865; antedated April 17, 1865.—This invention consists of an axis adjustable upon a frame which turns down and rests on the ground during winter. By this device all strain is taken off the vine and its root.

Claim.—Making the frame or support B adjustable vertically between the posts A A by means of the adjusting holes and pins *d f*, or equivalent, the whole arranged, combined, and operating substantially in the manner and for the purpose herein set forth.

No. 47,416.—N. GROH, Helenville, Wis.—*Roofing Composition.*—April 25, 1865.—This invention consists of a composition of asphalt, iron filings, wood ashes, and hydraulic cement.

Claim.—A roofing compound, made of the ingredients herein described, and mixed together about in the proportion and substantially in the manner herein set forth.

No. 47,417.—JOHN H. HAMAKER, Frease's Store, Ohio.—*Grain Separator.*—April 25, 1865.—This invention consists in connecting the carrier with the close and open portions together, and with transverse grooves and projections. The straw and grain are carried forward and upward on a single carrier by imparting to the carrier a rapid vibratory motion by means of double sets of cranks and an auxiliary connecting rod.

Claim.—The construction of the carrier, with the close and open portions together, with transverse grooves *a a* and projections *d d*, substantially as and for the purpose herein specified.

Also, conveying the straw and grain forward and upward on a single carrier, by giving the said carrier a rapid vibratory motion through the means of double sets of cranks and auxiliary connecting rod, substantially as and for the purpose set forth.

Also, communicating the vibratory motion to the shoe directly from the vibrating carrier by means of the connecting rod G, or its equivalent, as herein described.

No. 47,418.—JAMES HANLEY, New York, N. Y.—*Lamp-shade Holder.*—April 25, 1865.—This invention consists in bending a wire so as to form a loop to hang loosely around the chimney, and then bending the two ends into chips for holding the shade.

Claim.—The making a ring attachment with clips for the purpose of holding the shade and connecting with the lamp.

No. 47,419.—AUSTIN S. HATCH, Addison, N. Y.—*Marine Propeller.*—April 25, 1865.—This propeller consists of two screws of ordinary form in conjunction with each other, but in reverse positions. The effect of this arrangement is stated by the inventor to be this: the water is laterally displaced by the forward screw, which is twisted in a direction to propel the ship backward; and this side motion is immediately checked by the rear screw, so that, in point of fact, no motion is imparted to the water, except a motion to the rear. The drums of the screws are tapered uniformly as one drum, and the hull of the ship is tapered to correspond both fore and aft.

Claim.—The combination and arrangement of the double screws or wheels C D, revolving in opposite directions, and the taper form of the hull or bottom of the vessel before and behind the said screws or wheels, and in combination of the form of their blades, substantially as and for the purposes herein specified.

No. 47,420.—JONAS HOOVER, Oskaloosa, Iowa.—*Removing Foreign Substances from Sugar.*—April 25, 1865.—This invention consists in moistening the sugar with a mixture of sweet milk and alcohol, and subjecting it to pressure. The sugar is then spread upon cloth, and the cloth piled one above the other, and the whole is again subjected to pressure.

Claim.—First, treating crude sugar to alcohol and sweet milk, substantially as and for the purpose specified.

Second, subjecting sugar to a second pressure between cloths, after the same has been moistened with alcohol and milk, and pressed once, substantially as described.

No. 47,421.—EMIL HUBNER, New York, N. Y.—*Implement for Cutting Rubber, &c.*—April 25, 1865.—This invention consists of an adjustable knife, which is secured to a head that slides upon a rule. The handle is fastened by means of a screw, which presses upon a friction plate, and secures the head at the desired joint. The said rule is attached to a stationary head, which is provided with a movable arm rest and a centre pin.

Claim.—First, an adjustable circular packing cutter, constructed as herein described, as a new article of manufacture.

Second, the movable head C, holding the knife *d*, in combination with the rule A, screw handle D and stationary centre *a*, constructed and operating substantially as and for the purpose set forth.

Third, the swivelling or stationary arm rest *b*, in the stationary head B, in combination with the centre *a* and adjustable knife *d*, constructed and operating substantially as and for the purpose described.

No. 47,422.—HENRY JACKSON, Brooklyn, N. Y.—*Stair Rod Fastening*.—April 25, 1865.—This invention relates to an improvement in the ordinary fastening hitherto employed for securing flat stair rods to the risers of the stairs, and it consists in the application of a spring to one of the buttons composing the fastening, whereby the rods are securely fastened, being prevented from casually slipping off from the buttons by a longitudinal movement.

Claim.—The spring D, dish E', and the supplemental shoulder C, applied to one or both buttons, in connection with the flat stair rods, having its flanges *a* provided with curved notches *e e*, all arranged substantially as and for the purpose herein set forth.

No. 47,423.—WM. H. JAMES, Cincinnati, Ohio.—*Fire-Place*.—April 25, 1865.—This invention consists in the attachment of a cast-iron back to a cast-iron mantel, the lower part being elliptical in form, and the upper part being arched forward to meet the mantel. The gate is of a basket-shape, and made low in front; in the plate at the back holding the ends of the base are notches for air to pass up from the ash-pit, and throw jets upon the surface of the fire.

Claim.—As a new article of manufacture the fire-place composed of the elements A B C D E F and G, the same being formed, combined, and adapted to operate in the manner set forth.

No. 47,424.—HENRY JOHNSON, Pittsburg, Penn.—*Steam Engine*.—April 25, 1865.—This invention consists in placing in the cylinder of the engine a short distance below its head a movable disc or piston, the cylinder being lengthened sufficiently to give room for the stroke of the piston below the disc, and causing the steam from the boiler to pass into and through the space between the cylinder head and the disc. The disc is placed in this position to prevent injury to the engine, in the event of the piston rising too high in the cylinder. In the event of such an occurrence, the piston strikes the disc, and forces it up in the cylinder in which it fits steam tight, and as the steam is in contact with the opposite side of it, it acts as a cushion for the piston, and prevents injury to the engine.

Claim.—The use of a movable disc or independent piston seated in the steam cylinder above the working piston, with a steam space between it and the cylinder head, through and into which the live steam from the boiler is caused to pass on its way to the steam chest of the engine, for the purpose of a steam cushion, and to increase the efficiency of the steam engine, substantially as hereinbefore described.

No. 47,425.—JOHN F. JONES, Rochester, N. Y.—*Machine for Grinding Paper Pulp*.—April 25, 1865.—The object of this invention is to retain the water between the grinding surface, and thus keep the pulp from clogging. The bottom of the case is lightly inclined towards its outlet, the better to allow of the discharge of the pulp.

Claim.—The machine for grinding paper pulp having the grinding surfaces *d d* made dish-shaped or inclined upward from the centre to the periphery, and used in connection with the case H, the whole arranged and operating substantially as and for the purpose herein set forth.

No. 47,426.—J. H. JONES, New York, N. Y.—*Gas Heater*.—April 25, 1865.—This invention consists in an inverted conical-shaped screw in the top of a tube, near the other end of which gas is admitted, and mingles with the air as it rises through the tube.

Claim.—The combination and arrangement of the concave or inverted conical-shaped screen C, and tube A, in connection with a gas jet or opening G, for the purpose herein set forth.

No. 47,427.—J. KELLEY, Troy N. Y.—*Machine for Oiling Wool*.—April 25, 1865.—This invention consists in so constructing the can as to allow it to be closed air-tight at the top; a discharge pipe at its bottom supplies the cistern or tank, whilst another pipe extending from the top of the cistern above the oil line down into the cistern forms an air pipe. This pipe extends down as far as it is desired the oil shall rise in the cistern. When the oil rises to this level it closes the mouth of the air pipe, and the discharge of oil stops; thus a uniform level is kept up.

Claim.—The two rollers A A', one of which dips in a cistern containing oil, while the other serves to spread the wool, when used in combination with a can C, and pipes *b c*, arranged substantially as herein set forth, for the purpose of keeping up a uniform supply of oil to the lower roller.

No. 47,428.—W. H. KING, Troy, N. Y.—*Universal Chuck*.—April 25, 1865.—This invention consists in forming the chuck of two or more transverse sections connected by dovetailed grooves and slides, operated by screws, by which the centre of the face of the chuck when on the mandrel may be thrown out of line in the said mandrel, and be eccentric thereto.

Claim.—A concentric or other chuck, provided with one or more laterally adjustable plates, substantially as herein shown and described, for the purpose of converting a concentric chuck into an eccentric chuck, as set forth.

No. 47,429.—IRA KINMAN, Freeport, Ill.—*Hanging Latching Farm Gates*.—April 25 1865.—This invention consists in adjustable hinges, operating on rings on the back post, and the combination of an upright bolt, with a movable latch, movable prop, and its staple.

Claim.—First, the arrangement and combination of the adjustable hinges P and K, operating on the rings H and I on the back post, as herein described and for the purposes set forth.

Second, the construction and combination of the upright bolt A, with the movable latch B, as operating on the staple E and movable prop G, as herein described and for the purpose set forth.

Third, the construction and combination of the self-acting prop G, and staple E, as herein described and for the purpose set forth.

No. 47,430.—G. F. KOLB, Philadelphia, Penn.—*Jewel Case*.—April 25, 1865.—This invention consists in a jewel case, which is made with a movable bottom, raised on opening the lid by a bent lever fastened to the lid. When the box is opened the bottom rises at an angle inclining forward.

Claim.—The within-described jewelry case, composed of the lower portion A, the upper portion or lid A', the leaf B and spring D, the whole being constructed and operating substantially as and for the purpose herein set forth.

No. 47,431.—ALBERT KOMP, New York, N. Y.—*Metallic Skeleton Hat Frames*.—April 25 1865.—This hat frame is constructed of two iron hoops of skirt-spring wire; said hoops being connected by means of three or more vertical stays, the connection between the hoops and stays being effected by means of clasps, each clasp consisting of a horizontal part having flanges to enable it to clasp the hoop, and a vertical part having flanges also to enable it to clasp the vertical stay.

Claim.—Forming the frame for a hat body of hoop-skirt spring wire, by forming two hoops and by connecting the same with three or more vertical stays, by means of clasps formed of thin metallic strips, each of said clasps being shaped into a horizontal part O P, and a vertical part R, cut to the required shape and bent over and pressed to the joint, substantially in the manner and for the purpose substantially as described.

No. 47,432.—R. J. LA MOTHE, New York, N. Y.—*Fountain Pen*.—April 25, 1865.—The object of this invention is to carry a spring trough, which is for the purpose of carrying ink from the reservoir and handle, and the piston used to fill the reservoir is made a pencil holder.

Claim.—First, the spring ink-conveyor, formed as a trough, passing through an opening near the pen, in the manner and for the purposes specified.

Second, the pencil x, formed in the manner set forth, and combined with the plunger of the fountain pen as specified.

No. 47,433.—ANDREW F. LAPHAM, New York, N. Y.—*Washing Machine*.—April 25, 1865.—This invention consists of a box placed on pivots so that it can vibrate with a rocking motion, in connection with a coiled spring, and with winged boards, to which are attached springs.

Claim.—First, the spring M, combined and arranged relatively to the rocking box D, and bed A, or its equivalent, substantially in the manner and for the purposes herein set forth.

Second, the hinged boards H H, and springs I I, in combination with a rocking box D, adapted for washing or churning, substantially as and for the purpose herein set forth.

No. 47,434.—A. P. LIGHTHILL, Boston, Mass.—*Apparatus for Inhaling Vapors*.—April 25, 1865.—This apparatus is designed to be employed in the application of vapor to the nasal or aural passages for the cure of diseases of such passages, and it consists of a glass bottle through the stopple of which pass three tubes, one of which is designed to be taken into the mouth and the other two to pass into the nostrils. The bottle being filled with a suitable medicament to a height above the bottom of the mouth tube, (which passes into the bottle to any convenient distance,) when breath from the lungs is expelled into the bottle, passing up through the medicament it vaporizes some portion of it, and the vapor is conveyed to the nostrils.

Claim.—The inhalation apparatus, substantially as and for use in manner as described.

No. 47,435.—JOHN B. LINDSAY, Davenport, Iowa.—*Churn*.—April 25, 1865.—This invention consists in arming the blades of the dasher with leaves of metal, or other suitable material, set at right angles to them, and also in combining therewith the screw shank of the dasher.

Claim.—First, arming the blades of the dasher of the ordinary churn with leaves set vertically upon their upper faces, substantially as described.

Second, the combination of the twisted shank of the dasher with a dasher constructed of vertical and horizontal leaves and blades, substantially as described.

No. 47, 436.—C. B. LONG, Worcester, Mass.—*Gear Cutting*.—April 25, 1865.—The nature of this invention is explained by the claim.

Claim.—A gear-cutting rule upon which is marked in figures the number of cogs of a given pitch which can be cut upon a given diameter of a wheel, substantially as and for the purposes described.

Also, making the first inch of the rule with a figure or figures to indicate the number of cogs of a given pitch which can be cut upon a wheel of one inch diameter, with allowances for pitch line, substantially as set forth.

No. 47,437.—DAVID LYMAN, Middlefield, Conn.—*Hay Spreader*.—April 25, 1865.—This invention consists in constructing the teeth so as to allow them to yield in an upward direction, by attaching them to a block which moves up and down in a slot in the teeth levers, and has a coiled spring inserted above it.

Claim.—First, in combination with the teeth for scattering the hay of a spring attachment, so arranged as to allow the teeth to yield upward in accordance with the irregularities of the ground, substantially in the manner herein set forth.

Second, the method herein described of attaching the teeth of hay-making or spreading machines to blocks, or the equivalents thereof, capable of sliding up and down, substantially as set forth.

Third, in hay-making or spreading machines in which levers are used having an up-and-down and back-and-forth motion, the teeth when constructed and combined with springs giving them elasticity both backward and upward, as described.

No. 47,438.—JAMES E. MACKERLEY, Paint, Ohio.—*Photographic Name Plate*.—April 25, 1865.—This invention relates to a device to be used by photographers, the object of which is to secure, in addition to the photographing of the sitting person or of a picture or view, and upon one and the same negative plates, the full or any desired portion of the person's name, or the title of the picture view.

Claim.—As an improved article of manufacture, an adjustable photographic name plate, made substantially as herein shown and described.

Also, the employment, in combination with the said name plate, of the movable letters or cards, substantially as and for the purpose set forth.

No. 47,439.—ROSWELL MARSH, Steubenville, Ohio.—*Cultivator*.—April 25, 1865.—This invention consists in a cylindrical roller with wooden teeth, which is used in combination with clearing fingers arranged upon a bar over the roller.

Claim.—The combination of the rotating cylinder with the digging forks and the clearer, substantially as described and for the purpose set forth.

No. 47,440.—A. F. McCRONE, Ellicott's Mills, Md.—*Railroad Car Brake*.—April 25, 1865.—The object of this invention is to provide a brake mechanism which shall be operated by steam from an apparatus in the locomotive, and under the control of the engineer, by which a series of bars, united by connecting links between the cars, and running the whole length of the train, shall be made to operate a series of brakes through the whole length of the train.

Claim.—The coupling and brake-operating bars, extending through the length of the train and operated by the steam from the engine, to rotate the pinions, to whose shafts are attached the crossheads, which connect by suitable rods and levers with the rubber bars, the whole described arrangement being constructed and operated substantially as described.

No. 47,441.—WM. V. MCKENZIE, Jersey City, N. J.—*Oil Press*.—April 25, 1865.—Several separate press boxes are combined in one press, the sides of the boxes being arranged to slide apart and together as desired. The top and bottom of each box is formed of a slide working in a longitudinal groove in its side. Each side is provided with mortises for the reception of the sliding top and bottom of its neighboring side when the sides are slid together. Each sliding top and bottom is provided with a longitudinal lip at one edge, which is received within a groove in the side. The press boxes are supplied with steam from a pipe running along the sides of the boxes, and communicating with each box by a branch pipe, which is made of such thin and elastic material that it may be moved to and fro with the side of its box, and thus complicated joints may be avoided.

Claim.—First, the combination of the separate slides D D and mortises *g g* with the sides B of the press boxes, when constructed and arranged to operate as herein specified.

Second, the lips *c*, in combination with the slides D, grooves *d*, and sides B of the press boxes, constructed and operating substantially as and for the purpose described.

Third, the pipes E F, with branch pipes *e f*, arranged in combination with the movable sides of a press, substantially as specified, so that said branch pipes retain sufficient spring to allow of the motion of the sides of the press boxes.

No. 47,442.—JOHN MILLER, Buffalo, N. Y.—*Beer Faucet*.—April 25, 1865.—The plug being of unequal diameter, permits the flow of beer around it and downward, and being pressed down, cuts off the flow and drives out with force through minute converging channels in the conical lower end of said plug a small quantity of liquid in the lower part of the barrel; the object being to excite the liquid already drawn.

Claim.—The combination with the plunger C of the valve nozzle F, discharge nozzle D, operating for the purposes and in the manner described.

No. 47,443.—JOSEPH A. MILLER, New York, N. Y.—*Hot-air Furnace*.—April 25, 1865.—Passing through the top and bottom plates of the chamber, which receives the products of combustion from the fire chamber on the same plane, is a series of upright flues, through which air flows from a chamber below, up into the reservoir of hot air. Among these tubes are placed bricks or any incombustible substance, through which the products of combustion circulate, and passing into a space at the rear of the furnace, flow down into a bent pipe passing through the chamber below that containing the open mouth tubes, nearly to the front, and thence, by a bend downwards, back and out of the rear wall of the furnace.

Claim.—First, forming a heat reservoir between or within the tubes of a hot-air furnace by means of lumps or pieces L L of brick or other material which is a poor conductor of heat, so applied that the flame and heated gaseous products of combustion may circulate through interstices between the said lumps or pieces, substantially as herein specified.

Second, the arrangement of the horizontal flue C, drop flue I, forward and backward circulation pipe flue J, in combination with each other and with the cold-air chamber H, tube sheets D D', air tubes G G, and air-distributing chamber E, substantially as herein specified.

No. 47,444.—GEO. E. MILLS, New York, N. Y.—*Oil Ejector*.—April 25, 1865.—This invention consists in attaching to a cone-pointed perforated base a light corrugated pipe of metal for discharging the oil, and a pipe for carrying the air to the ejector, which consists of short pieces in very thin plain or corrugated tubes, the bottom piece being closed up at its lower extremity, and made conical to fit into the interior of the cone upon the outside. The ejector is formed in sections, so that the point of exit may be varied at any time by removing or adding these sections.

Claim.—First, the use of corrugated metal for tubing oil wells, the same being supported on a perforated bulb, and cone-pointed base, substantially as herein described.

Second, the tube C C', put together in sections and secured by screws in sockets on the air-pipe E, so that the point where the air comes in contact with the fluid may be adjusted in height, as and for the purposes set forth.

No. 47,445.—JARVIS T. MUDGE, Cleveland, Ohio.—*Washing Machine*.—April 25, 1865.—This invention consists in hinging a weighted lever to the side of the water receptacle, and providing the lever with tubes, through which the water passes upward.

Claim.—First, the plunger C, moving in a vertical plane upon the pivot or hinges c', and operated by a system of levers, substantially as herein described.

Second, the use of the tubes C', in connection with the plunger C, to prevent the water from overflowing and adding weight to the latter, as explained.

No. 47,446.—L. H. OLMSTEAD, Newark, N. J.—*Ratchet Brace*.—April 25, 1865.—In this device the ratchet and stock are surrounded by a wide ring or cylinder, from each end of which project two wide arms, parallel to each other, and between which the handle is pivoted by a pin passing through the outer ends of said arms, the inner end of the handle being formed into a pawl, which passes through a slot in the ring for that purpose. The feed nut upon the top of the shank is a hollow cylinder, threaded in its entire interior to admit the male screw forward on the top of the shank, the balance of which, down to the handle, is reduced in size the thickness of the thread on top, allowing it to fit it snugly.

Claim.—First, the combination of the frame B and handle S of the ratchet brace, constructed and arranged substantially as set forth.

Also, making the main spindle of a ratchet brace with a part of the thread cut away between the socket for the drill and the upper end of the spindle, as shown and described and for the purpose set forth.

No. 47,447.—I. E. OVERPECK, Overpeck's Station, Ohio.—*Manual Power*.—April 25, 1865.—This invention consists in the combination of two levers, one of the first and one of the second kind, both connected to the same crank by rods, which are jointed to their respective levers at a point lateral to, and at some distance from, a vertical line drawn through the centre of the crank shaft, to which they are attached. The said levers are so arranged above and below the said crank shaft as to be easily operated by both the hands and feet of one or two attendants.

Claim.—The arrangement of the connecting rods c c, at an angle to a vertical line drawn through the centre of the crank shaft of wheel b, to operate in combination with levers d and e of my manual power sawing machine, substantially as described, for the purposes specified.

No. 47,448.—C. C. PHELPS, Janesville, Wis.—*Chimney*.—April 25, 1865.—This invention consists in constructing chimneys (of cast iron or its equivalent) in sections, the interior of the chimney being divided into four flues by means of cross-diaphragms. In the lower section of chimney is an ash-drawer.

Claim.—The construction of chimneys (of cast iron or its equivalent) in sections, substantially as described and for the purpose specified.

No. 47,449.—C. L. PIERCE, Buffalo, N. Y.—*Shingle Sawing Machine*.—April 25, 1865.—This invention is designed as an improvement in dogs for holding shingles while they are

being cut into bolts, and it consists of a table upon which the block to be sawed is placed, a longitudinal slot being cut in the same for the saw to project through. Bolted to the top of the table is a hollow arched standard; near the top of which and across the same is a partition. On each side of the standard is a screw that carries two pairs of dogs; the said dogs are formed with right angled shanks, one pair of dogs at the bottom and one pair near the top of the same, the dogs projecting through slots that are cut in the standard. On top of these screws are keyed two gear wheels, one on each screw, and between these two wheels is another wheel that gears in the two latter wheels, the wheel being keyed fast to a shaft that projects through the top of the standard. On the other end of the shaft is secured a hand-wheel, by turning which to the right the upper dogs lower and the lower dogs rise, and thus engage the block in the top and bottom of the same.

Claim.—The combination of two pair of dogs, C C', with the reciprocating table A, said dogs being so arranged as to clamp the block above and below upon each side of the saw kerf, in a manner to prevent the block from pinching or binding the saw, when constructed and operating substantially as set forth.

No. 47,450.—JOHN T. PLASS, New York, N. Y.—*Bread Cutter*.—April 25, 1865.—This invention consists of a knife and gauge, so arranged that when the slice is cut the action of the knife and lever operates upon the gauge so as to force it out of the way and to let the bread fall.

Claim.—The knife D and bar E, in combination with the automatically moving gauge J, all arranged to operate in the manner substantially as and for the purpose specified.

No. 47,451.—A. H. PLATT, Yellow Springs, Ohio.—*Coal Oil Lamp*.—April 25, 1865.—This invention consists of two perforated partitions, both convex downwards, the upper less convex than the lower; also in the combination of a flaring base, perforated partition, and deep flame opening operating together.

Claim.—The combination of the downwardly convex perforated basilar partition B and the perforated cap C, having a degree of convexity downward less than the former, substantially as and for the purpose herein specified.

Also, the combination of the flaring open base A, perforated partition B, perforated cap C, and deep flame opening d, arranged and operating together, substantially as and for the purpose herein set forth.

No. 47,452.—ALEXANDER F. PORTER, Philadelphia, Penn.—*Pump*.—April 25, 1865.—A large hollow piston is attached to a hollow piston rod. This piston has a concentric cylinder within it a little larger in diameter than the interior of the rod. Within this smaller cylinder a ball valve rests upon its seat at the bottom of the cylinder. Above the ball, when seated, are perforations in the small cylinder, through which water enters during the ascent of the cylinder, and during the descent thereof the water enters under and around the ball. The water enters the bottom of the main pump cylinder through a supporting leg lifting a puppet valve at the top of such leg, and enters near the top of the main cylinder through a cylinder supplied through a leg at the bottom thereof, an aperture near the periphery of the top disk of the piston admitting the current in the ascent of the piston.

Claim.—First, constructing and arranging a cylindrical double-acting pump, having inlet, through, and exit passages, substantially as herein described, and adapting the same to the raising of oil or other liquids from deep wells, as set forth and explained.

Second, fastening and supporting or securing a pump in a deep well, by accurately fitting it to the bore of said well and resting it upon legs or other supports at the bottom of the well, through which legs or support the liquid is drawn into the pump, thus rendering the pump firm and steady, preventing vibration, the opening of the joints, and other injurious consequences arising from instability, substantially as herein described and represented.

No. 47,453.—J. RANKIN, Detroit, Mich.—*Balanced Slide Valve*.—April 25, 1865.—This invention consists of a lever which is pivoted to lugs raised on the back of the valve. One end of this lever rests upon the knife edge of a standard which is stepped in the valve seat. To the opposite end of the lever a link is pivoted, whose opposite end is pivoted to another lever having its outer end resting upon another knife edge fastened to the steam chest at the end opposite to the one in which the standard is placed. The opposite end of the last named lever rests in a slot in the piston rod, the cylinder of which is centrally located on the steam chest cover, with its lower end opening into the steam chest. As steam is admitted into the chest it presses down upon the valve and up upon the piston, which last named force is transmitted through levers and links to the valve and counteract the downward pressure upon it, thus rendering it a balanced valve.

Claim.—The lever D, rocker E, link F, and lever G, in combination with the piston H and slide valve B, constructed and operating substantially as and for the purpose set forth.

No. 47,454.—HENRY REDLICH, Chicago, Ill.—*Printing Press*.—April 25, 1865.—The object of this invention is to print, in a small way, labels, tickets, circulars, &c. It is accomplished by a system of cylinders for type, inking, and pressure.

Claim.—The peculiar manner of constructing the type cylinder O, to wit, by means of the metal heads F F', wooden heads e e', nuts G G, wooden segments f, and removable types h, substantially as herein described.

No. 47,455.—JOHN H. REED, New Haven, Conn.—*Car Coupling.*—April 25, 1865.—This invention consists in a combination of devices designated in the claim, and will be understood by reference to the engraving.

Claim.—The combination of the bar B B with lever E E' and catch b, when constructed, arranged, and fitted to produce the required results, substantially as herein set forth and described.

Second, the combination of the bar B B with the levers l and k and the springs a a, when constructed, arranged, and fitted for uncoupling, substantially as herein described.

Third, the combination of the lever E E' with the coupling pin c and link F, when constructed and fitted for use, substantially as herein described.

Fourth, the combination of the lock lever G with the bar B B, when combined, and made to operate substantially as herein described.

Fifth, the combination of the draw head with the link F, when constructed and fitted for use, substantially as herein described.

Sixth, the combination of the link t with the pedal g, when fitted to prevent coupling, substantially as herein described.

No. 47,456.—J. WYATT REID, New York, N. Y.—*Horse Power.*—April 25, 1865.—This invention consists in constructing and arranging the several parts of the device in such a manner that power may be taken from different shafts having different degrees of speed, and machinery driven with a greater or less application of power, as circumstances may require.

Claim.—The combination of the master wheel F, arms a a', stationary tubular spindle A, platform G, shaft C, and one or more horizontal shafts, H, when constructed and arranged to operate as herein specified.

No. 47,457.—GEO. S. RICE, New York, N. Y.—*Manufacture of Hard Rubber Articles.*—April 25, 1865.—This invention consists of a mode of making watch cases, &c., of hard rubber. The case is made of five parts, namely, the covers, the basil, the shank, and ring. The inner side of each cover is provided with an annular groove containing a metallic ring, to which is attached a portion of the hinge, the other part of said hinge being secured to the besel. The said besel has a thin overhanging rim, sufficiently elastic to allow of the glass being inserted in the same manner as in the ordinary gold cases. The shank is riveted or screwed into the besel, and the interior of the case is coated with lacker or varnish, to prevent the sulphur from injuring the metallic watch movements.

Claim.—As a new article of manufacture, first, watch cases or lockets made of hard rubber or vulcanite, in the manner herein before set forth.

Second, in vulcanite watch cases or lockets, the method of securing the hinge, substantially as described.

Third, in vulcanite watch cases or lockets, forming an annular groove, with a thin overhanging rim for the inserting and holding the glass, substantially as set forth.

Fourth, the method of securing the hard rubber shank to the hard rubber basil, substantially as described.

Fifth, in combination with vulcanite watch cases or lockets, the use of varnishes, in the manner and for the purpose set forth.

No. 47,458.—E. A. L. ROBERTS, New York, N. Y.—*Exploding Torpedoes in Artesian Wells.*—April 25, 1865.—This torpedo is intended to be used for blasting and similar purposes within artesian wells, and consists of an elongated or tubular magazine of powder, provided at its upper end with a tubular neck containing a nipple for carrying an ordinary percussion cap and a plunger held slightly above the cap by an India-rubber sleeve, securely attached to the tubular neck and the plunger. A perforated weight allowed to slide down the wire by which the torpedo is suspended, causes the explosion at any desired position of the torpedo by falling on the plunger.

Claim.—First, the priming chamber b, in combination with the flask plug and nipple, substantially as described.

Second, the arrangement of the tube f or its equivalent, composed of India-rubber or other similar material, with the guard d and bolt e, substantially as described, in combination with the flask.

No. 47,459.—JOHN B. ROOT, New York, N. Y.—*Vibrating Piston Engine.*—April 25, 1865.—This invention is designed as an improvement in that class of steam engines in which the power is communicated to the crank through pistons which are vibrating in their motion, and which move through an a c of a circle. Its novelty consists in arranging the crank directly between the vibrating piston and within the cylinder, and in so arranging the connections between the said pistons and the cranks that each piston, though being only single-acting, may act upon the crank during more than half of each revolution of the latter, thereby

avoiding the occurrence of any dead point in the revolution of the engine. It further consists in the connection of the side-packing strips of the piston with the end strips by means of pins and slots, in combination with the mortise and tenon joints in the same.

Claim.—First, the combination of a cylinder, A, of a form substantially as herein specified, and two vibrating pistons, D D*, occupying reversed positions within the said cylinder, and both connected with the same crank shaft, to operate substantially as herein set forth.

Second, so arranging the connections between the said vibrating pistons and the crank, that each piston, though being only single-acting, may act upon the crank during more than half of each revolution of the latter, substantially as herein described.

Third, the crank E', arranged directly between the vibrating pistons and within the cylinder of an engine, substantially as herein described, with a separate and independent connection with each piston, substantially as herein set forth.

Fourth, the connection of the side-packing strips *c'* and end-packing strips *c2* of the piston, by means of pins *f* and slots *e*, in combination with mortise and tenon joints, substantially as and for the purpose herein specified.

No. 47,460.—WM. F. ROSSMAN, Hudson, N. Y.—*Coffee Settler*.—April 25, 1865.—This invention consists of a tin cylinder, the lower half of which is perforated and the bottom convex, to be placed in the coffee-pot. It has on its top a hollow cone, the apex terminating in a handle, beneath which is suspended a funnel reaching down about half way into the cylinder. The cone and funnel are connected, and may be detached from the cylinder at pleasure. The apparatus has feet on which to rest in the coffee-pot, and by the current produced by boiling, it is alleged that all the grounds, &c., will collect in the cylinder and the cone and funnel will prevent their escaping again.

Claim.—First, the hollow cone A, with open base, having funnel B attached, in combination with the perforated cup C, all constructed substantially in the manner and for the purpose set forth.

Second, the open space between the base of the cone A and top or upper margin of funnel B, and for the purpose described.

No. 47,461.—D. SARGENT, New York, N. Y.—*Street Sweeping Machine*.—April 25, 1865.—This invention relates to certain improvements in that class of sweeping machines in which a rapidly revolving brush is used for the purpose of throwing dirt on an inclined scoop.

Claim.—The adjustable scoop E and box I, in combination with the three-armed hangers F, adjustable brush H, rock shafts *t t*, hand-levers *t' t'*, movable pinion *c*, and wheel B, constructed and operating substantially in the manner and for the purpose herein set forth.

No. 47,462.—FREDERIKA SCHENKL, Boston, Mass., administratrix of the estate of JOHN P. SCHENKL, deceased.—*Adjustable Tension Device for Sewing Machine Shuttle*.—April 25, 1865.—The shuttle driver carries a spring lever, one end of which, during its traverse, is acted on by an adjustable incline, which causes the other end of the lever to enter a hole in the shuttle and press upon a spring shell in such a manner and at such time that the required degree of tension of the thread is effected when the needle-thread is drawing into the work.

Claim.—The arrangement and combination of mechanism herein described, when made to operate substantially in the manner and for the purpose specified.

No. 47,463.—CHAS. SLATER, Brooklyn, N. Y.—*Ships-of-War*.—April 25, 1865.—This invention consists in the application of certain punches, augers, and a hinged keel turning up upon the fixed keel. The scuttling augers are transverse. This, or athwart ship, actuated by steam.

Claim.—First, the hinged adjustable keel C, applied in combination with the main keel B, of a vessel, and with the vertically-adjustable rods *f*, and ropes *c*, all constructed, arranged, and operating substantially as and for the purposes specified.

Second, the combination of the punches H, piston H', and steam cylinders H2, constructed, arranged, and operating as and for the purposes specified.

Third, the scuttling augers I, applied in combination with the horizontal shaft *i*, and adjustable gear *p2*, substantially as and for the purpose herein shown and described.

No. 47,464.—R. L. SMITH, Stockport, N. Y.—*Machine for Attaching Revenue Stamps*.—April 25, 1865.—The gummed stamps are passed between rollers, moistened, attached by a plunger, and torn from the sheet at one operation.

Claim.—First, the rack bar F, and gate D, with feed rollers G G, and subjected to the action of a weight or spring, in combination with an automatic stop *c*, and plunger H, all constructed and operated substantially as and for the purpose set forth.

Second, making the rack bar F removable, substantially as described, so that the machine can be readily adjusted for stamps of different width.

Third, the oscillating arm *i*, and tappet *m*, in combination with the stop *c*, rack bar F, handle *l*, and plunger H, constructed and operating substantially as and for the purpose specified.

Fourth, the rollers G G, arranged in the longitudinal sliding gate D, and operating in

combination with the absorbent roller *q* and plunger H, substantially as and for the purpose set forth.

Fifth, the employment of the elastic spring block *p*, or its equivalent, in combination with the plunger H, and metal edges *o*, substantially as and for the purpose described.

No. 47,465.—HENRY W. STEPHENSON, Cincinnati, Ohio.—*Barrel-rolling Device*.—April 25, 1865.—This invention consists of a pair of handles, of a convenient size, crossed and pivoted at the point of crossing like a pair of scissors. The opposite ends of the handles are each provided with a disk of a diameter somewhat less than that of the common barrel-head. And each disk is pivoted at its centre to its supporting arm, and so as to revolve freely. The handles are of such form that the disks may be applied one at each end of a barrel, and pressed closely against it, whereupon the barrel may be easily rolled away.

Claim.—The frames A A, crossed and pivoted at *c*, in combination with the disks B B, the whole constructed and arranged so as to be capable of being applied to a barrel, substantially as and for the purpose described.

No. 47,466.—JAMES H. SWING, Cleveland, Ohio.—*Coffee Pot*.—April 25, 1865.—Around the top of a filter is a band embracing the cover and forming an open receptacle; in the centre of the cover of the filter is a hole with a flange, extending down into a cap secured to the under side of the cover, so as to leave a space all round and under the lower edge of the flange, thereby making a water joint. The bottom is perforated and sets in a vessel with perforated sides, which fits into the top of the coffee pot. There is a detachable perforated plate, to be placed inside the filter on the grounds. The flow of the coffee from the filter into the pot is regulated by raising or lowering the filter in the vessel in which it sets.

Claim.—First, the cup *d*, and flange *b*, in combination with the rim *l*, annular chamber and section A, as and for the purpose set forth.

Second, the disk *h*, strainer *f*, and filter B, in combination with the section A and cover D, as and for the purpose herein described.

No. 47,467.—CHARLES N. TAYLOR, Upton, and ELIJAH J. H. HOLMES, Dedham, Mass.—*Forge*.—April 25, 1865.—In this device the whole bottom of the forge is formed of a grate extending from side to side, the whole surface of which where needed can be used at once. For work requiring a fire of a particular shape, as for heating tin, a plate having an annular opening through it of the proper size is laid over the grate, which excludes the passage of the air, except at such parts as are needed. When a fire of round or square form is needed a plate with a corresponding opening is used.

Claim.—The improved forge herein described with its removable plates, for the purpose of adapting it to the size and shape of the article to be heated.

No. 47,468.—J. C. THOMAS, Redpoint, Md.—*Corn Planter*.—April 25, 1865.—This invention consists in a hollow draught wheel with triangular seed chambers that deposit the seed in the hollow cultivator teeth as each fork of the chamber passes the same; also in a circular rack, sector, lever, and arm for adjusting the machine.

Claim.—First, the forked seed-box B, in combination with the wheel A, and the hollow tooth C, when constructed substantially as and for the purpose specified.

Second, the circular rack A, sector B, lever C, and arm D, when the several parts are constructed and arranged substantially as and for the purpose herein set forth.

No. 47,469.—HOPKINS THOMPSON, New York, N. Y.—*Reclining Chair*.—April 25, 1865.—This invention consists in the arrangement and combination of a hinged brace bar and clamp fastening or holder, with a hinged reclining chair. The hinged brace bar is jointed to the foot support, and the whole operated by the screw on the outside of the chair.

Claim.—In combination with a clamp fastening on the stationary part of a reclining chair, a hinged brace bar jointed to one of the movable parts of a jointed reclining chair, substantially as described, whereby the movable parts may be clamped and braced rigidly to the stationary parts, substantially as set forth.

No. 47,470.—B. M. VANDERKEER, Clyde, N. Y.—*Lock*.—April 25, 1865.—The important feature of this lock is a rectangular block lying in the central part of the case and pivoted to one of the outer plates, which, when turned in the manner of a turn button, to a certain position will be in line with the latch bolt, the latter entering but a short distance within the case and against the inner end of which the end of the turning block abuts. Within the turning block there is arranged a small sliding bolt which may be thrust forward into the end of the latch-bolt, and thus prevent the button from being turned, while the latter prevents the latch from being forced inwards. The lock has but one keyhole, although two keys are used, one, namely, for turning the pivot and thus withdrawing the small bolt, and the other for turning the block crosswise of the case so as to permit the drawing back the latch-bolt.

Claim.—The traverse or key dog, with its bolt, operated by its keys in locking and unlocking the latch, together with the spring catch in the head of the latch, which holds the dog in its linear or central position after having accomplished its mission.

No. 47,471.—S. VAN HENNICK and T. ALLEN, New York, N. Y.—*Pulley Block*.—April 25, 1865.—This invention consists in providing a pulley block with an extra or supplemental sheave of larger diameter than the others, and provided with an independent chain or rope for the purpose of gaining power in operating the blocks or in raising weights.

Claim.—The combination in a single pulley block of the small sheave *a'* for carrying the rope or chain B to which the weight is attached, and the larger sheave *a''* attached rigidly to the first two, and carrying the rope or chain D to which the power is applied, all the parts being constructed and arranged to operate as herein specified.

No. 47,472.—JOHN M. VAN NEST, Clayton, Iowa.—*Sheep Tender*.—April 25, 1865.—This invention consists in providing a sheep rack at one end with two feed boxes, each having a sliding door in connection with troughs running longitudinally with the frame of the rack, the object of the doors being to graduate the feed to the troughs as they are drawn out from the frame for the purpose of feeding the sheep.

Claim.—The combination of the sliding trough with the granary, the latter being provided with a spout or opening to discharge the feed into the trough, which moves beneath it, substantially as described.

No. 47,473.—ZALMON B. WAKEMAN, Rockford, Ill.—*Vehicle*.—April 25, 1865.—This invention consists in a rod attached at one end near the end of a tongue, and at the other end to a spiral spring, situated under the forward axle. This spring admits of sufficient vertical movement of the tongue, and at the same time relieves the draught animals of its weight. To prevent the sudden lateral jerking of the tongue, and the consequent liability of injury to the draught animals, two helical springs are attached to the rear side of the forward axle, one on each side of the bar connecting the two axles, and they bear against angular pieces of metal projecting from each side of said connecting bar.

Claim.—First, in combination with the tongue C the swivelled box or bearing F, having an eye or aperture increasing in size from front to back, and employed to receive and support the end of the brace rod E, substantially in the manner and for the purpose explained.

Second, the combination of the coiled spring E' and nut I with the supporting rod E, the nut permitting the spring to be contracted and expended at will for the purpose of varying the position of the tongue.

Third, the tube I' employed in combination with the spring E', rod E, tongue C, and nut I, substantially as herein set forth.

Fourth, the adjustable springs K K, adopted to operate in connection with the knuckles L L, in the manner and for the purposes set forth.

Fifth, the spring or springs J wrapped around the tongue rod, and with their ends secured under the tongue hounds, and the forward axle or sand board adapted for adjustment in any manner, and employed for sustaining the tongue C, as set forth.

No. 47,474.—G. W. WALKER, Boston, Mass.—*Stove*.—April 25, 1865.—This invention consists in the construction of a stove of sheet metal in a square or oblong form, with a sub-base separated from the main base by an air chamber or passage, which sub-base is connected with the interior of the stove by means of flues at the corners of the stove, said flues being made of the material of the outside of the stove body and of the sheets within the stove.

Claim.—A stove constructed with a sub-base separated from the main base by an air chamber or passage, and operating in the manner and for the purpose substantially as described.

Also, the construction of a stove with flues formed of the material of the outside of the stove body, and of the sheets within the body, when such flues are arranged to convey the products of combustion to heat a hollow extension of the base in front of the stove.

No. 47,475.—EDWIN WASSELL, Pittsburg, Penn.—*Rolling Mill*.—April 25, 1865.—This invention relates to the mode of attaching or supporting the guide or cleaver, which is effected by hanging it to the lower end of a rod having a piston at its upper end, and which works in a cylinder hinged to a beam in front of the rolls. Beneath the piston-head is a spiral spring, and above it a screw, by which means the piston rod and the guide attached thereto is regulated in regard to the rolls. A flanged guide-roller, having the part between the flanges tapered, is employed to give the bar when resting thereon a lateral or sideways motion.

Claim.—The use of a flanged guide-roller placed in front of a pair of rolls, when such roller is tapered between the flanges, for the purpose of causing the iron bar to slide sideways when it drops out from one pass between the rolls to the proper position in front of the next adjoining pass, substantially as described.

Also, the use of a guide holder, consisting of the combination of a cylinder or box *d*, rod *e*, spring *i*, and pressure screw *f*, constructed substantially as and for the purpose hereinbefore set forth.

No. 47,476.—JAMES WATSON, Cliff Mine, Mich.—*Apparatus for Separating Ores*.—April 25, 1865.—This apparatus consists of a hopper which is provided with a trough at one side, and a chute which communicates with said hopper by means of an aperture, at the opposite side. A deflecting board is placed in the hopper directly opposite the trough, and at a short

distance from it, the said deflecting board extending to one side of the hopper. Below the hopper and communicating with it is a chamber with an opening closed by a gate; directly opposite this opening is a passage leading to a tube, which is provided with faucets and a water pipe entering below said faucets.

Claim.—First, the hopper A, provided with the deflecting board C, chute or trough D, and the opening *a* at the bottom, substantially as and for the purpose set forth.

Second, the chamber B below the hopper, communicating with the pipe or tube E, provided with one or more plugs or faucets, and having water admitted into it under pressure, substantially as and for the purpose specified.

Third, the combination of the hopper A, chamber B, pipe or tube E, provided with faucets or plugs, the deflecting band C, and chute or trough D, all arranged to operate substantially as and for the purpose set forth.

No. 47,477.—WILLIAM WEBSTER, Middletown, Ohio.—*India-rubber Packing Former*.—April 25, 1865.—This invention consists of a cylinder standing upon a projecting base, top edge of said cylinder being chambered. The packing rings are placed upon the cylinder, the metal ring being placed above them.

Claim.—The cylindrical packing former A for preparing India-rubber annular packings for sealing fruit cans, in the manner described and represented in the accompanying drawings.

Also, the pressure ring *x*, or its equivalent, in combination with the flange or base *a*, applied and used in the manner and for the purpose specified.

No. 47,478.—WILLIAM WESTLAKE, Chicago, Ill.—*Machine for Making Lanterns*.—April 25, 1865.—This device consists of a pair of disks placed upon an upright mandrel, adjusted at a suitable distance apart, and of the proper diameter, the bottom one being rebated on the periphery, so as to receive and hold, by means of clamps, the wire ring which constitutes the bottom of the frame or guards, and both disks being notched to receive at the proper place the longitudinal ribs connecting the bottom, middle, and top rings, and hold them securely while being soldered together.

Claim.—The former or device constructed substantially as described upon which to make lantern guards.

No. 47,479.—N. W. WHEELER, Brooklyn, N. Y.—*Tramway for Ferry Boats*.—April 25, 1865.—This invention consists in the use of a tramway of crescent form, so that wagons and other vehicles can enter the boat upon one of the horns of the crescent and leave the boat at the other without being turned round for disembarkation.

Claim.—First, in combination with the deck A and coaming D, the deflector or switch bar G, so arranged and operated as to slide the rear wheels outward and cause them to describe the larger curve, substantially in the manner and for the purpose herein set forth.

Second, in connection with the above, the employment of the perforated or roughened plates F F of hard material, combined and arranged to operate in connection with the deflector G, so as to afford a hold for the animals and provide for the lateral movement or sliding of the wheels, substantially as and for the purposes herein described.

No. 47,480.—N. W. WHEELER, Brooklyn, N. Y.—*Tubular Condenser*.—April 25, 1865.—This invention consists in forming the joints between the tubes and their sheets. The sheets are provided with holes of various diameters, the smaller portion lying on the inner side of the sheet, the larger in the centre, and the medium sized on the outer side. The largest or central portion receives a ring of some soft packing, through which and the inner portion of the hole the flue is passed, leaving the outer space in the head to be closed by an annulus of well-seasoned wood, which encircles the tube, and is of sufficient diameter to fit snugly in the aperture in the flue sheet. By driving the annulus through its portion of the sheet and against the packing, a tight joint is formed; and the wood from which the annulus is made being previously thoroughly dried, it is alleged that it will swell in consequence of its contact with the steam and water, contract and expand them sufficiently to hold the packing in its position, and prevent any leaking.

Claim.—The improvement in condensers and analogous tubular constructions herein described, to wit, the employment of the soft packing G and driven annulus E, the latter holding itself in place and supporting and guiding the tube D and compressing the packing G, substantially in the manner and with the effect herein set forth.

No. 47,481.—N. W. WHEELER, Brooklyn, N. Y.—*Movable Berth*.—April 25, 1865.—This invention consists in a combination of devices by which sleeping berths can be temporarily set up and supported by the sides of the deck house, or other like deck structures.

Claim.—First, in the described combination with a vessel, the employment of the sockets D D and E E, stanchions F and H, the two or more berths C' C2, and the free supporting stanchions I and K, arranged substantially as and for the purposes described.

Second, in connection with the above, combination of hooks, links, and stanchions, constructed and arranged to operate together substantially in the manner and for the purposes described.

No. 47,482.—N. W. WHEELER, Brooklyn, N. Y.—*Landing Platform for Steamboats and other Vessels*.—April 25, 1865.—This invention consists in a combination of devices by which a landing platform, one end of which being hinged to the vessel, is turned over and back, thus bridging over the space between the vessel and her landing pier or land.

Claim.—First, the construction and use of an adjustable bridge B permanently attached to a vessel A, and arranged to allow of its being turned in-board, and operated by the hoisting means in both positions, substantially in the manner as herein set forth.

Second, in combination with an adjustable bridge, the yielding and rolling hinges G A' B', arranged to operate in the manner and for the purposes substantially as herein set forth.

Third, the within-described arrangement of the jib stay H, continuations h h, and rigid post I, for the purpose herein set forth.

No. 47,483.—E. R. WILBUR, New York, N. Y.—*Bottle Stopper*.—April 25, 1865.—This invention consists of a tube and cork attached together by means of flanges. A longitudinal diaphragm divides the tube into two parts; part of the tube on one side of the diaphragm below the cork is cut away, and a part above the cork on the opposite side of the diaphragm is also cut away from just above the cork. The lower part of the tube is provided with an aperture in the side and a small aperture at the end. A cap is made to fit securely over the top of the tube.

Claim.—The bottle stopper above shown, constructed and applied substantially as described.

No. 47,484.—J. E. WILLIAMS, Xenia, Ohio.—*Railway Chairs*.—April 25, 1865.—This invention consists in supporting the points of rails by means of a two-part chair resting upon and bridging the space between two separate ties, with lips extending the entire length, and flanges extending below and falling between the ties, the parts being clamped and held by bolts or their equivalents. In combination with the foregoing is used a block of wood.

Claim.—First, supporting the joints of rails by means of a two-part chair resting upon and bridging the space between two separate ties, with lips b b extending the entire length, and flanges c c extending below and falling between the ties, the parts being clamped and held by the bolts e e, or their equivalents, substantially in the manner herein described.

Second, in combination with the foregoing, the block of wood f, for the purpose specified.

No. 47,485.—HENRY F. WILSON, Elyria, Ohio.—*Shield for Breaststraps*.—April 25, 1865.—This invention consists of reversed hooks, having their upper ends covered so as to correspond to the inner circle of the ring, for the purpose of giving the greatest possible length to the hooks, and at the same time admit the ring freely.

Claim.—The reversed hooks, having their upper ends covered so as to correspond to the inner circle of the ring, for the purpose of giving the greatest possible length to the hooks, and at the same time admit the ring freely, the whole being constructed and operating in the manner and for the purpose described.

No. 47,486.—T. WINSLOW, Cleveland, Ohio.—*Plough*.—April 25, 1865.—This invention relates to such a construction of a plough that, without changing the relative position of any of its parts, a deep or shallow furrow may be ploughed at pleasure.

Claim.—The herein-described construction of ploughs, the distinguishing feature being the relative position of the lower edge of the mould board to the land side, substantially as herein set forth, thus forming in one implement a common and subsoil plough.

No. 47,487.—O. R. BURNHAM, assignor to J. I. and J. O. WEST, New York, N. Y.—*Braiding Machine for Covering Skirt or other Wires*.—April 25, 1865.—By means of this improvement upon an ordinary braiding machine for covering flat wires, two wires lying face to face are simultaneously covered, the interlacings of the threads lying between the flat surfaces of the wires, the devices being such as to keep the wires separate or divergent from each other at the point where the braiding takes place, immediately above which they pass, united by such braided covering through a guide which yields to inequalities or to the overlapping ends of wires, and then between compressing guide rollers, which act against the edges of the covered wires in such a manner as to force the wires to wedge, thus tightening the braid.

Claim.—First, the uniting, by a braided covering, of the wires, held separately and apart until the point of braiding, and the bringing them together at the point so as to braid them just before or as they are brought together side by side or parallel, and then the twining them edge to edge during the continuous movement of the wires, so as to strain and tighten the braid upon the wires, as described.

Second, the construction and use of the guide and supporting pieces b b, with the apertures in the same for the passage of the wires, by which the wires are supported and directed to the point of braiding without interfering with the motion of the bobbins or threads, in the manner and for the purposes described.

Third, the guide piece c, constructed and operating in the manner and for the purposes described, by which the wires are brought and kept together, as they ascend, at the required

point for braiding, and at the same time the continuous and unobstructed passage of the wires and their joints is provided for as the braiding proceeds and is completed.

Fourth, the application and use of the pressure and delivery rollers, whether with or without the guide piece *f'*, combined with the apparatus above described, underneath, by the combined operation of which the wires are twined edge to edge by a gradual progress from their position of side by side, at the same time that they are conducted away as completed.

No. 47,488.—A. C. CAREY, Lynn, Mass., assignor to himself and GEORGE S. SULLIVAN, Boston, Mass.—*Knitting Machine Needle*.—April 25, 1865.—The object of this combination of the long flexible hook (instead of the usual short rigid hook) with the latch needle, is to enable it to make a finer or more even fabric, the angle made by the latch with the shank being reduced. The thread is also retained in the needle as long as may be necessary.

Claim.—The combination in a machine knitting needle of a latch with an elongated flexible hook that extends upwards nearly parallel with the shank of the needle, and to such a distance or length as to reduce the angle that the latch makes with the shank, thus forming a narrow or slim needle that can be used for fine work, substantially as herein described.

No. 47,489.—D. C. COLBY, assignor to himself, D. W. RAWSON, J. H. REDDINGTON, and THOMAS I. HARRIS, Claremont, N. H.—*Heating and Fuel Device*.—April 25, 1865.—This invention consists in placing a pipe concentrically within a stove-pipe so as to leave a space all around between them for the products of combustion to circulate. This inner pipe is intended to connect at both its ends with an apartment adjoining the one in which the stove is placed, and the air from the room enters the bottom of the inner pipe cold, and is delivered from the upper end hot; by means of an arrangement of dampers at both top and bottom of this pipe the circulation may be controlled. If desired, the inner pipe may be made directly up through the fire chamber of the stove before entering the stove-pipe; in that case the pipe must be made of cast instead of sheet-iron.

Claim.—The arrangement of the damper H, the pipe G, and the orifice *j*, on the upper end of the funnel B, the damper I, the pipe F, and the orifice *k*, on the other end, substantially as described, and the combination of the funnel B, thus provided, with the outer funnel A and the stove C, one or both, as and for the purposes set forth.

No. 47,490.—GEORGE C. DAVIES, assignor to OHIO EROLIN COMPANY, Dayton, Ohio.—*Cotton Press*.—April 25, 1865.—This press is constructed so that the platen can swing to either side and be out of the way while the press box is filled. It is a limited claim, confined to specific parts.

Claim.—First, the provision in a baling press of the screw B, winged nut C *c*, vertical guides D and *a*, toggles G G', rods F, platform E, and baling trunk H, in the described combination with the swinging platen I, the whole being arranged and operating substantially as set forth.

Second, the suspended platen or abutment I articulated to the frame by means of the links K K' and pintles L L', so as to be capable of being swung to one side for filling or charging the baling trunk, in the manner described.

No. 47,491.—J. T. EDSON, Stowe, Mass., assignor to himself and GEORGE L. CROSBY, Berlin, Mass.—*Game Boards*.—April 25, 1865.—This invention consists in having a groove surrounding an ordinary game board to receive the marbles used and convey them to a box beneath the board.

Claim.—The combination of the groove B and passage *b* leading therefrom with the game board A and the receiver *c*.

No. 47,492.—C. E. GAGE, assignor to C. DREW, Winona, Minnesota.—*Valve Gear for Steam Engines*.—April 25, 1865.—This invention consists in adapting the valve rods to constitute supports and guides for the cross-head which is attached to the end of the reciprocating bar, which receives its motion from the piston rod of the engine, and acts to open and close the valves at the proper intervals of time.

Claim.—The sliding valve rods 14 14, constituting supports and guides for the bar 7, which imparts movement to the valve rods by coming in contact with the shoulders 5 13, and thus effect the alternate opening and closing of the proper induction and exhaust parts.

No. 47,493.—ALONZO HICKS, Factoryville, N. Y., assignor to himself and L. JONES, New York, N. Y.—*Lamp*.—April 25, 1865.—This invention consists in the combination of a diaphragm, deflectors, guards, and wick tube.

Claim.—The combination of the diaphragm *d*, deflectors *i i'*, guards *f f*, and wick tube *c*, in the manner and for the purposes specified.

No. 47,494.—H. HOLT, assignor to W. W. LECOMBE, New York, N. Y.—*Composition for Preparing Ribbons for Hand Stamps*.—April 25, 1865.—This invention consists in applying an ink composed of aniline red or other aniline color, dissolved in glycerine, to the ribbon.

Claim.—The within described composition applied to a ribbon, substantially as and for the purpose set forth.

No. 47,495.—CHARLES H. JOHNSON, assignor to himself and C. E. WOODMAN, Boston, Mass.—*Horseshoes and Calks*.—April 25, 1865.—This invention consists in constructing the shoes with sockets, mortises, tenons, and shoulders of the calks, and bolting the flanges of the shoe and calks together, so that the calks are readily attached or removed.

Claim.—The invention of the fastening flange *a* and the mortise *b* with the corresponding socket *c* and tenon *d* of the calk, and with one or more bolts *a'* or equivalents, extending through the flange and the calk, substantially as specified.

No. 46,496.—H. LOEWENBERG, New York, N. Y., assignor to himself and EMILE GRANIER, Paris, France.—*Composition for Lining Oil Barrels*.—April 25, 1865.—This invention consists of gelatine, acetic or other acid diluted with water of sufficient quantity to cover the gelatine and sirup. Coloring matters may be combined with the composition if desired.

Claim.—The use of a compound of the ingredients herein described, viz: of glue, acid, and sirup, and mixed together substantially in the manner and about in the proportion set forth.

No. 47,497.—W. ADOLF OTT, assignor to himself and HENRY JACKSON, Brooklyn, N. Y.—*Process for Treating Auriferous Ores*.—April 25, 1865.—This invention consists in the employment of a mixture of hypochlorous acid in extracting gold from auriferous ores, and particularly from pyrites containing gold.

Claim.—The use, in treating auriferous ores, and particularly pyrites containing gold, of hypochlorous acid, substantially in the manner herein set forth.

No. 47,498.—HENRY PENNIE and CHARLES CHINNOCK, assignors to themselves and LEVI BISSELL, New York, N. Y., and reassigned by L. BISSELL to said PENNIE and CHINNOCK.—*Feed Bag*.—April 25, 1865.—This invention is set forth in the claim.

Claim.—A feed bag or portable crib for a horse or other animal, so constructed that it may be at the same time suspended from the head and attached to or near the breast of the animal, and when so suspended and attached may have its bottom inclined downward toward or from the animal's mouth, by the downward and upward movements of his head, substantially as and for the purpose herein described.

No. 47,499.—ROBERT POOLE, assignor to himself and G. H. HUNT, Baltimore, Md.—*Food Water Heater*.—April 25, 1865.—This invention relates to the combination and arrangement of the parts, which consist of a vessel for the reception of a portion of the exhaust steam from the engine. Within this vessel is arranged a series of deflectors for the purpose of communicating the water as it passes from the induction pipe at the top of the vessel to the eduction pipe at the bottom thereof, the object being to present the greatest possible amount of water to the action of the steam for the two-fold purpose of condensing the steam and heating the water. The induction passage for the steam to the vessel is connected directly with the exhaust pipe of the engine, but is not so arranged as that all the steam therefrom is forced into it, but only so much enters as induced by the partial vacuum which may be produced therein. The water is taken from the instrument by a pump and forced into the boiler.

Claim.—The manner in which I have arranged and combined the tank A with regard to the inlet and outlet water pipes connected with it, the scatterer, and the branch pipe leading from the ordinary exhaust or waste pipe to its interior for the purpose of heating the water passing through said tank without interfering with the free escape of the steam through said exhaust or waste pipe, substantially as herein described.

No. 47,500.—J. SHEPARD, New Britain, Conn., assignor to himself and R. BUTLER, New York, N. Y.—*Fastening for Harness*.—April 25, 1865.—This invention consists of two curved side pieces connected at their ends by three cross-bars, the middle cross-bar being provided with a pin to receive and hold the ends of the straps.

Claim.—A strap fastening for harnesses and for similar purposes, composed of two curved side pieces *a a*, connected at their ends by cross pieces *b b' b''*, placed relatively with each other as shown, and the centre cross piece *b'* provided with central piece *c*, substantially as described.

No. 47,501.—E. TURNER, assignor to SIMON R. GOLIBART, Baltimore, Md.—*Floating Dock*.—April 25, 1865.—The object of this invention is to avoid the liability of straining the hull of a vessel during the operation of elevating it from the water for repairs or overland transportation, and also to avoid the necessity of sinking the docks or pontoons, and then pumping out the water from them for the purpose of raising a vessel. By this invention, also, the pontoon may be used as workshops for those employed upon the dock, and to elevate a vessel at pleasure to any desired height, so that the workmen can have access to any part of the hull and a steady foundation upon which to stand.

Claim.—First, so constructing a floating dock that a vessel may be raised bodily out of water and suspended between floats or pontoons upon vertically adjustable frames or elevators, substantially as described.

Second, the use of vertically adjustable frames D D, in combination with pontoons A A, and mechanism applied to these latter, which is adapted for adjusting the frames independently of each other or simultaneously, substantially as described.

Third, the employment of guides D' D' in conjunction with the elevating frames D D and A A, substantially as described.

No. 47,502.—A. TYRRELL, assignor to himself and K. FERRIN, Batavia, N. Y.—*Horseshoe*.—April 25, 1865.—This invention consists in forming a shoe with a semicircular recess or narrowing between the toe and heel on each side of the shoe on the inside, and an upward projecting flange on the upper inside of the heel, to press against and spread out the heel of the hoof when the shoe is spread for the purpose of curing contracted hoofs.

Claim.—A horseshoe constructed as described, with the recesses *a a* made at any point between the heel and toe, for the purposes specified.

No. 47,503.—F. L. M. DORVAULT, Paris, France.—*Capsules for Preventing the Soiling of Fire-arms*.—April 25, 1865.—This invention consists of a capsule made of gelatine, gum, and sugar, and containing grease or oil.

Claim.—The employment or use of self-discharging capsules, substantially as herein described, in combination with fire-arms to prevent them from soiling, as set forth.

No. 47,504.—L. MORGENTHAU, Mannheim, Baden.—*Medicated Candy*.—April 25, 1865.—This invention consists in heating the sugar until it melts, and while in this condition adding a small quantity of tartaric acid. The heat is continued until all the water is expelled from the sugar, and a mixture of Fichtennadel extract, Fichtennadel essence, and Fichtennadel oil is added and the whole poured upon a marble slab to cool.

Claim.—First, in combination of sugar with an extract from the young shoots of the pine tree, substantially in the manner and for the purpose herein set forth.

Second, the compound formed of the several specific ingredients in the proportions set forth.

No. 47,505.—Z. GASPARD, A. N. PETRONE ORIOLI, AMABLE ALFRED FREDET, and P. A. HENRI MATTESSIEVARE, Paris, France.—*Mode of Disintegrating Vegetable Substances for Paper Pulp*.—April 25, 1865.—This invention consists in subjecting wood, straw, &c., in the form of fine fragments, to the action of a bath, composed of nitric and hydrochloric acids. After the fragments have absorbed a quantity of acid equal to their weight, they are washed, reduced to pulp, washed again, and then bleached.

Claim.—The within described process for disintegrating vegetable materials by the application of aqua regia, substantially in the manner herein set forth.

No. 47,506.—GEORGE PARRY, Ebbw Vale Iron Works, England.—*Manufacture of Iron and Steel*.—April 25, 1865; patented in England November 18, 1861.—This invention consists in a process for producing purified wrought iron, and hard or soft cast steel, in large masses, in an economical manner.

Claim.—The process above described, whereby purified wrought iron, and hard or soft cast steel, in large masses, is produced in an economical manner.

No. 47,507.—CHARLES T. ANDERSON, Clarksburg, Md.—*Churn*.—May 2, 1865.—This invention consists in connecting to a pair of bellows a handle and arm, through the medium of a link and cross-piece at one end of the arm, and at the other end is connected a dasher and dasher-rod, whereby a current of air is produced during the operation of churning. The said arm is made adjustable by means of holes and a pin, so as to increase or diminish the extent of vibration of the arm and motion of the dasher.

Claim.—First, the combination of the rod C, arm D, link G, and handle H, the parts being so arranged that the motion of the handle will be transmitted to both the bellows and dasher, substantially as set forth.

Second, in a churn of the description herein given, the pin *g* and perforations *d*, employed as and for the object specified.

No. 47,508.—JAMES G. ARNOLD, Worcester, Mass.—*Letter Envelope*.—May 2, 1865.—This invention consists in cutting the blank with rounded instead of notched corners, to allow of a certain latitude in folding, &c.

Claim.—Cutting envelope blanks in the manner and for the purposes substantially as set forth and described.

No. 47,509.—CHARLES H. BAGLEY, Waltham, Mass.—*Sick Chair*.—May 2, 1865.—This invention relates to a chair designed for bedrooms, and constructed and arranged in such a manner that all unpleasant odor or smell is effectually prevented from escaping therefrom, either while the device is in use or when closed, and the chamber also prevented from emitting any unpleasant odor while being removed from the chair.

Claim.—The sliding box B, provided with the lid H and hole G, in connection with the

vessel K, cover L, slide I', and the bar J, provided with the slotted arm N, all arranged in connection with a case A, to operate in the manner substantially as and for the purpose set forth.

No. 47,510.—JULIUS BAUR, Brooklyn, N. Y.—*Manufacture of Steel*.—May 2, 1865.—This invention consists in the use of the following ingredients in the manufacture of steel, viz: iron, cryolite, oxide of iron, oxide of manganese, phosphate of lime, vegetable charcoal, and animal charcoal.

Claim.—The above described process, consisting of combining aluminum with iron in the manufacture of steel, substantially as set forth.

No. 47,511.—GEORGE BEZ, Mokena, Ill.—*Evaporating Pan*.—May 2, 1865.—This invention consists of a pan, under which is a boiler, which is supplied with water by means of a pipe. The steam from the boiler is carried through pans by means of pipes, and heats the sirup before it is let into the pan.

Claim.—The combination of fire and steam pans and pipes, as herein set forth and shown, for evaporating sirups.

No. 47,512.—ELIJAH BRADY, New York, N. Y.—*Sofa Bedstead*.—May 2, 1865.—This invention consists in so forming the sofa that the back can be let down and the surface of the back cushion brought in a line with the surface of the seat cushion, both forming one plain surface and forming the body of the bed, and by arranging the drawer under the seat of the sofa in such a manner that the front of the drawer, when pushed in, acts as a support to the back, holding it firmly. When the drawer is pulled out it forms a support under that part of the bed formed by the back of the sofa.

Claim.—The combination and arrangement of a sofa with the bed and drawer, substantially as described, for the purposes specified.

No. 47,513.—MELLEN BRAY, Boston, Mass.—*Shoe Lacing*.—May 2, 1865.—This invention consists in the use of staples arranged in opposite pairs, each pair overlapping or interlocking, in combination with a locking device.

Claim.—The employment of staples, arranged in opposite pairs, each pair overlapping or interlocking, in combination with a cord, string, or wire, or other such flexible or non-flexible locking device.

No. 47,514.—JOSEPH T. BRYAN, Lebanon, Ind.—*Corn Planter*.—May 2, 1865.—This invention consists in a combination of seed boxes, slides, cross-pieces, levers, tubes, shovels; also in a rod, connected at one end with the seed slide, and forming with the other end a valve at the bottom of the seed tube.

Claim.—First, the arrangement of the boxes H H with their slides I I and apertures d d, the cross-pieces b b, bar J, lever K, and tubes in front shovel posts P P, in combination with the ploughs Q Q Q Q P P and set piece F, for hilling.

Second, the attachment of the rods R R to the machine, for the purpose of ploughing and planting corn.

No. 47,515.—JAMES BUCKETT, Harlem, N. Y.—*Photographic Picture Holder*.—May 2, 1865.—A cylinder, divided into compartments to hold the picture, turns on a perpendicular shaft within an outer case, having apertures or regular intervals to show the pictures, and is governed by a worm screw and handle at one side, near the bottom.

Claim.—First, the movable cylinder or prism A, or its equivalent, containing a series of panels b, in combination with a movable or stationary case B, constructed and operating substantially as and for the purpose set forth.

Second, the bay windows applied to the case B, in the manner and for the purpose substantially as described.

No. 47,516.—THOMAS BYRNE and THOMAS HENRY, New York, N. Y.—*Machine for Printing Hats*.—May 2, 1865.—This invention consists in the employment of a conical printing roller, in combination with a suitable pattern roller, to which color is supplied by an endless apron, or other mechanism, in such a manner that hats and other articles, secured to the conical printing roller and revolved with it, are brought in contact with the pattern rollers, and continuous stripes, or other designs, can readily be produced on said hats or other material.

Claim.—The employment or use of the conical printing roller F, in combination with a suitable pattern roller B, of any desirable form or shape, and with a mechanism for supplying color, constructed and operating substantially as and for the purpose set forth.

No. 47,517.—JOHN CADY, Staffordville, Conn.—*Picker Motion for Looms*.—May 2, 1865.—The object of this invention is mainly to secure a parallelism and steadiness in the vibrating of the picker staff, that it may deliver its blow squarely to the shuttle. Means for adjustment and compensation are also provided to effect the same end.

Claim.—First, the stop *L*, constructed and fastened to the bed *H* in the manner substantially as above shown.

Second, making the bed *H* of a concave form, by means of adjustable ends or inclined planes, substantially as described.

Third, the mode, substantially as above described, of attaching the picker staff and its strap to each other and to the shoe *C*.

Fourth, forming longitudinal grooves *o* inclining in the direction shown on the periphery of the part *q* of the box *Q*, for the purpose of lubricating its axis, substantially as shown.

Fifth, the notched flanch *M'* of the part *q* of the box, in combination with the key *f*, substantially as above described.

Sixth, arranging the slot *g* in the bed *H* which receives the key *f*, so that the box and its axis can be lubricated from above the said bed, substantially as described.

No. 47,518.—CYRUS C. CARTER, Exeter, Ill.—*Seeding Machine*.—May 2, 1865.—In this invention adjustable tubes are fitted in the turning axle. By means of a jointed lever and rod extending up from the axle, the seed is shut off by the turning of the axle.

Claim.—First, the adjustable tubes *C*, fitted in the turning axle *A*, and provided with the funnel *G*, in combination with the seed-box *E*, provided with the reciprocating slide *H*, having the pendent plates *i* attached, and the perforated plates *g h*, all arranged to operate as set forth.

Second, the combination of the adjustable tubes *C*, turning axle *A*, seed-box *E*, provided with the slides *f g h*, the scattering board *M*, and the spring lever *K*, and notched bar *L*, all arranged substantially as set forth.

No. 47,519.—P. S. CARVER, Honeoye Falls, N. Y.—*Horse Rake*.—May 2, 1865.—This invention relates to devices by means of which the mechanism for locking and releasing the rakehead is enclosed, thereby preventing clogging, which will be readily understood from the claim and engraving.

Claim.—Enclosing the pawls *H I* in the groove *b* of the joint-rim *D*, by means of the strap *G*, in such a manner as to prevent obstruction, said strap also serving to form the joint and retain the parts together, and used in connection with a single handle *E*, the whole arranged, combined, and operating substantially as and for the purpose herein set forth.

No. 46,520.—E. D. CLAPP, Auburn, N. Y.—*Coupling for Thills*.—May 2, 1865.—This invention consists of a thill iron, constructed in two parts, and with conical perforated bearings, the said two parts being pivoted together, and made to overlap one another under the thill, in combination with the clip-iron.

Claim.—The thill iron, constructed in two parts, and with conical perforated bearings, the said two parts being pivoted together, and made to overlap one another under the thill, in combination with the clip-iron, constructed and arranged as described, all operating in the manner and for the purpose set forth.

No. 47,521.—GEORGE P. CLARK, Brooklyn, N. Y.—*Boot and Shoe*.—May 2, 1865.—This invention, relating to soles for boots and shoes, consists in inserting within or attaching to the same, a series of elastic studs, of any flexible and elastic material.

Claim.—Inserting within or attaching to the sole and heel of a boot or shoe, or in and to any desired portion of the same, a series of elastic studs or projections, made of any suitable flexible and elastic material, and of any desired number, size, and shape, substantially as described, and for the purposes specified.

No. 47,522.—JAMES CLAYTON, Brooklyn, N. Y.—*Crank-wrist Connections*.—May 2, 1865.—This invention relates to making the connection of a crank or other wrist with a piston-rod, or other reciprocating piece, from which it receives or to which it transmits rotary motion, by means of a slotted cross-head without a pitman. It consists in a construction of the box which receives the crank-wrist, whereby facility is afforded by tightening it upon the crank-pin, and within the slot of the cross-head, when it has become loose by wear, and in so providing or applying a guide for the cross-head as to dispense with flanges in the aforesaid box.

Claim.—First, the combination of the living pieces *e e*, having their exterior sides of sloping form, the independent wedge-shaped side pieces *b b*, the screws *d d*, and the nuts *e e*, substantially as and for the purpose herein set forth.

Second, in combination with the said lining pieces, side pieces, screws, and nuts, applied within a cross-head, the guides *a a* provided for the cross-head, substantially as and for the purpose herein described.

No. 47,523.—W. R. CLOSE, Bangor, Me.—*Ox Yoke*.—May 2, 1865.—This invention consists in the adjustment of the draught in order to cause the leverage on the carriage pole, when connected with the yoke, to be duly proportioned to the power of the oxen, when the yoke may be in use.

Claim.—Improved yoke-ring adjusting mechanism, as constructed, of the supporting saddle *F*, the vibrating hanger *C*, its catch block *b*, its confining screw and nut or nuts, and the

curved rack D, arranged together and applied to the yoke, in manner and so as to operate therewith substantially as and for the purpose specified.

No. 47,524.—JOSEPH CORDNAN, Brooklyn, N. Y.—*Awning and Reflector*.—May 2, 1865.—This invention consists in a series of slats mounted on axles, and provided with crank arms connected by a bar that is operated by cords or similar device, so that the slats may be turned sufficiently to exclude the direct rays of the sun, and at the same time become reflectors to illuminate the store. This awning is easily managed, and equalizes the light both beneath itself and in the store in front of which it is located.

Claim.—The combined awning and reflector, constructed and applied substantially as specified.

No. 47,525.—G. W. DEMOND, Boston, Mass.—*Chimney Cap*.—May 2, 1865.—A revolving chimney cap with broad blades somewhat spiral in shape, and answering with narrow wind vanes of quite similar shape, to form buckets, one part or edge of each of the blades being inclined down into the cylinder of the device.

Claim.—Combining with the vanes *e* the blades *f*, extending down into the cylinder, and having open spaces between their inner wedges, substantially as herein set forth.

No. 47,526.—Z. W. DENHAM, Washington, D. C.—*Paper Fastener*.—May 2, 1865.—This invention consists of a curved piece of sheet metal, having one or two holes punched through in such position that when the wedge is passed through holes cut in the paper, it may double on itself and be secured by lapping through the holes.

Claim.—The fastener A B C, substantially in the manner and for the purposes described.

No. 47,527.—JAMES DODGE, Waterford, N. Y.—*Grinding and Polishing Metals*.—May 2, 1865.—This invention consists of two grinding cylinders or wheels, mounted on a suitable frame, adjustable to or from each other, and having during their revolution a longitudinal movement. On a vertical plane between them, in suitable guides, is the gate or frame containing a series of sockets for the reception of the articles to be ground, each socket being geared to the other by small pinions, by which they can be rotated together by the operation; the frame or gate is raised or lowered by a screw. Two vertical gauge bars attached to the ends of the upper cross-head of the gate, and moving with it, play between the adjusting slides upon which the wheels are mounted, and cause them to move to or from each other, to suit the shape of the article to be ground.

Claim.—First, the method of and machinery apparatus for grinding and polishing spindles, tools, file blanks, and other regular or irregular-shaped articles, substantially as herein described; that is to say, by the employment of two revolving grindstones or polishing wheels, in combination with a mechanism for moving, in accordance with a pattern, the said stones or wheels, or either of them, while revolving to and from each other, substantially as herein set forth.

Second, for grinding and polishing round articles, in combination with the above, causing the said articles to revolve in contact with the guide stone or polishing wheels, substantially as set forth.

No. 47,528.—AARON DOUGLASS, Paterson, N. J.—*Lock Joint for Railroads*.—May 2, 1865.—The object of this invention is to obtain a lock joint for railroad rails which, presenting little difficulty of construction, will meet all the required conditions in its operation, and the invention consists in a novel formation of the ends of the rails, or bars, whereby the desired result is obtained without cutting away any portion of the necks of the rails.

Claim.—The combination of the three laps A B C, two formed of portions of the base and head of the rail, and one of a portion of the neck thereof, by dividing the rail in vertical and horizontal planes, and offsetting the neck in a lateral direction between the said horizontal planes, substantially in the form and manner herein specified.

No. 47,529.—WM. H. ELLIOT, Plattsburgh, N. Y.—*Kerosene Stove*.—May 2, 1865.—Around the burner is an annular piece of metal, so fitted as to allow the lamp to be readily pushed under the stove and form a good connection with the flue holes in the bottom of the stove and become thus a part of the flue holes. Suitable cleats and stops are under the side of the bottom plate to guide the lamp, when being pushed into its place.

Claim.—First, so constructing a lamp with its connecting piece *g*, and the lower plate of the stove, that the connection between the lamp and stove may be made by sliding the lamp under the stove, substantially as described.

Second, jointing the several rings of said connecting piece together, substantially as represented at *g*, for the purpose set forth.

No. 47,530.—WM. H. ELLIOT, Plattsburgh, N. Y.—*Oil Pump*.—May 2, 1865.—The piston of the pump descends to the receptacle of oil, at the bottom of the well. The auxiliary gas-pump is above ground, and its pipe descends into the well only far enough to receive the gas above the liquids. The auxiliary force-pump for forcing water into the well is in like manner above ground. The auxiliary gas-pump is convertible into a force-pump by the application of a three-way cock.

Claim.—First, the main pump B, applied to the elevation of oil from the well, and the auxiliary pumps *g*, applied to the exhaustion of gas or air from a higher position in said well, co-operating substantially as described.

Second, the auxiliary pumps *p*, arranged in relation to the foregoing, substantially as shown and described.

Third, a suction or gas-pump *g*, and gas-separator *f*, the one arranged above the surface of the earth, and the other below the seed-bag, or packing, substantially as described.

Fourth, a reversible suction and force gas-pump *g*, and lifting pump *b*, so arranged in relation to the seed-bag, or packing, and to the surface of the earth, substantially as set forth.

No. 47,531.—CHARLES EVANS and W. C. BARTLETT, Morton, Ill.—*Grading Scrapers.*—May 2, 1865.—This invention consists in the employment of a revolving scraper in a stationary frame, mounted on wheels and arranged with a lever, so that the said scraper is allowed to rotate without raising the main frame of the machine, and its wheels and the machine rendered capable of being arranged with the greatest facility.

Claim.—The revolving scraper G, in combination with the stationary mounted frame A, and lever E, all arranged substantially as and for the purpose set forth.

Also, the lever J, in connection with the wheel H. or their equivalents, for the purpose specified.

No. 47,532.—H. EVERETT, Philadelphia, Penn.—*Manufacture of Boxes.*—May 2, 1865.—This invention consists in forming a joint by means of a narrow strip, the two edges of which are folded over, so that an end view would somewhat resemble the letter S, into the left bend of which the lower end of the side of the box is inserted vertically, and into the other bend, the edge of the bottom, bent up at a right angle. The whole joint is then clamped and soldered.

Claim.—The bent strip D, applied to the formation of the joints of boxes, packages, or other vessels, in the manner described, for the purpose specified.

No. 47,533.—ABRAM FANCKBONER, Schoolcraft, Mich.—*Fanning Mill.*—May 2, 1865.—In this invention there is a peculiar arrangement of the upper screens and receptacles for the grass-seed, cockle, &c., so that they are separated at first from the heavier and perfect grain, and thus saved from being blown away by the fan-blast.

Claim.—First, the arrangement in relation to each other, above described, of the double screen B, the inclined board P, and the divisions F and G of the receiving box E, when the parts are so constructed as to operate in conjunction with each other, as herein set forth.

Second, the construction and arrangement of the receiving box E, substantially as and for the purpose set forth.

No. 47,534.—JAMES R. FINLEY, Delphi, Ind.—*Cultivator Plough.*—May 2, 1865.—In this invention the ploughs are double, and the shares and mouldboards are made of one piece of steel plate. The mouldboards are symmetrical in form, oblate, and curvilinear.

Claim.—The equal or symmetrical mouldboard when said parts form a continuation of the share, and have the peculiar form and configuration, as set forth and described.

No. 47,535.—DARIUS G. FLETCHER, Racine, Wis.—*Heat Radiator.*—May 2, 1865.—This invention is designed as an improvement on a patent granted to the same inventor April 17, 1860, and consists of a cast-iron ring at the base of the conical part of the inner cylinder, supported by arms resting on the lower part of the outer cylinder. The perforations in the upper part of the inner cylinder are rectangular, the space between the two cylinders being covered by an iron ring.

Claim.—First, the cast-iron ring *c* and arms *d* for supporting the chamber B within the case A, substantially as and for the purpose specified.

Second, the rectangular openings *e f* of the upper register of the chamber B for the purpose of facilitating the construction of the device.

Third, the cast-iron ring or cover E for the space between the chamber B and cylinder, as set forth.

No. 47,536.—C. FORD, Forest City, Ill.—*Shovel Plough.*—May 2, 1865.—This invention consists in connecting to the frame of the ploughs by means of hinges, shafts, to which is connected at one end an adjustable bar provided with holes and made adjustable by bolts fastened rigidly to the handles of the shafts, having on their ends nuts for the purpose of adjustment.

Claim.—First, the mode of making an even-draught two-horse shovel plough as herein described, with the shafts F attached to the frame by the hinges *m* and *n*, and connected by the coupling bar H, which arrangement, while it holds the shovels evenly, enables the operator to change the face of the shovels at will, and thereby guide the plough.

Second, the false cutters K, in connection with the braces I, made to slide in the groove in the head piece D, and secured by the clamps J, as herein set forth, in such manner that the operator, by loosening the clamps J, may change the width between the shovels by sliding the tops of the braces in the groove.

Third, the ring-headed bolt O for holding the double trees on the plough, substantially as herein set forth, in such manner that when the plough is thrown on its slide they will balance, remaining parallel to the neck yoke.

No. 47,537.—F. G. FORD, Washington, D. C.—*Window Lock*.—May 2, 1865.—In this device a round bolt, surrounded by a spiral spring inserted in the top rail of the lower sash, and having on its inner end a bottom formed by a transverse pin passing through it, plays through a face plate having an inner cylindrical flange surrounding a portion of the bolt. In this cylinder a rectangular slot is cut to guide a pin in the bolt, by which the first motion allowed thereto is forward sufficiently far to allow the transverse pin to pass through a slot in the plate on the opposite lower rail of the top sash, when the other portion of the said rectangular slot allows the guide pin to move therein and the bolt to be turned one-fourth of a revolution, which causes the transverse pin to slide upon the inclined jaws of the slot in the catch plate and draws and holds the two sash rails together.

Claim.—The face plate, to which is attached the double right angle slotted tube, the semi-rotating sliding spring bolt, the recessed guiding plate, and the double inclined recessed plate catch, the same being applied and operating in the manner and for the purposes herein specified.

No. 47,538.—JIM B. FULLER and J. P. UPHAM, Claremont, N. H.—*Preparing Hemp, Flax, &c., for Spinning*.—May 2, 1865.—This invention consists in subjecting the fibres, while moist, to the action of drawing rollers previous to carding, so as to separate the masses of fibres into suitable short fibres. The distance between the sets of drawing rollers is regulated to suit the kind of fibres treated. It is best to card the fibres while still moist, but this is not necessary.

Claim.—Drawing or separating the vegetable fibre in the manner specified previous to a carding, picking, or beating operation, for the purposes and as set forth.

Also, carding the fibres of flax, hemp, &c., in a moist condition, for the purposes specified

No. 47,539.—JIM B. FULLER and JAMES P. UPHAM, Claremont, N. H.—*Process for Separating the Fibres of Hemp, Flax, &c.*—May 2, 1865; ante-dated April 18, 1865.—This invention consists in subjecting the fibres to the action of steam in a close vessel and then suddenly withdrawing the steam by opening a valve, the fibres being retained in the vessel. The operation is repeated until the fibres are sufficiently separated.

Claim.—The mode herein specified, of separating vegetable fibres while retained in a suitable vessel, by subjecting such vegetable fibre to the action of steam under pressure, and then to a series of expansions derived from the sudden discharge of steam (but not fibre) from such vessel, as and for the purpose specified.

No. 47,540.—J. P. GILBERT, M. D., Long Island city, N. Y.—*Instrument for Curing Piles*.—May 2, 1865.—This invention consists in the employment of any cold body provided with a nipple to enter the rectum in such a manner that by said cold body the blood in the tumor is deprived of its superfluous heat and returned to its regular channels. The nipple serves to keep the cold body in its place; and, in order to allow the blood to circulate from the tumor, the said nipple is provided with grooves near its base. By applying suitable ointment to the nipple the effect of this instrument can be improved, and the instrument is kept in a box placed in the cold body, which is made hollow for the purpose, and provided with a cover that can be readily removed and replaced.

Claim.—First, the cold body A provided with a nipple B, constructed and operating substantially as and for the purpose specified.

Second, the grooves A in the nipple B, applied and operating substantially as and for the purpose set forth.

No. 47,541.—HERMAN HAUPT, Cambridge, Mass.—*Mode of Mounting Drills*.—May 2, 1865.—In an application for patent of even date herewith, there is described a drill operated by steam or other elastic fluid, consisting of a cylinder, through the hollow piston of which a drill bar is inserted. In lieu of a hollow piston rod a solid one may be used in connection with outside gripper boxes. The object of this invention is to mount such drills so as to economize space and allow of easy and speedy adjustment.

Claim.—First, mounting drilling, boring, or other like machinery, when arranged for operation by steam, compressed air, or other fluid, upon a columnar frame, whether solid or tubular, and whether steam or other fluid is conveyed to said machinery by independent pipes or through the columns, substantially as set forth.

Second, in combination with the columnar frame for the support of machinery for drilling or boring rocks or other subterranean operations, the pointed set screws, or the equivalent thereof, to brace and steady the said frame, in the manner substantially as set forth.

Third, in combination with the columnar frame, which, for the purpose of conveying steam or other fluid, is hollow, the thimbles incasing the set screws to protect the same and prevent leakage, substantially as set forth.

Fourth, the combination of the columnar frame with adjustable supports for the bearings

of the trunnions of drills or other like machinery, so as to admit of adjustment of said drills at any height and at any angle in the plane perpendicular to the axis of the trunnions.

Fifth, making the supports of a segmental form, and forming the bearing therein adjustable, so as to admit of universal motion of the drills, substantially as set forth.

No. 47,542.—GEORGE W. HAWK, Chicago, Ill.—*Chair and Cradle*.—May 2, 1865.—This invention consists in so constructing the parts composing a cradle that, by an easy re-arrangement, the cradle is converted into a chair for a child.

Claim.—First, the combination and arrangement of the two sections A A, the ends C C, and the rockers B B, operating substantially as and for the purposes herein shown and described.

Second, constructing the bottom of the cradle of five parts, D E F G H, when arranged and operating as and for the purposes specified and shown.

No. 47,543.—BENJAMIN S. HILL, New York, N. Y.—*Die for Cutting Screw Threads*.—May 2, 1865.—This invention consists in cutting the clearing openings through the die in a diagonal line so as to have the cutting points of the threads act spirally to the axial line of the bolt.

Claim.—The arrangement of the chasing or cutting points of a die or chaser for cutting male screw threads in a line or lines diagonally across the cutting faces or edges, or spiral to the axis, substantially as and for the purposes herein set forth.

No. 47,544.—B. B. HOTCHKISS, New York, N. Y.—*Explosive Shell*.—May 2, 1865.—This shell has longitudinal ribs or webs extending from its inner surface towards the axis; these ribs are radially arranged. It has also transverse ribs running round the interior of the shell. The object of these ribs is to strengthen the shell, and also to prevent such concussion of the charge of the shell against its inner surface as shall result in premature explosion.

Claim.—The employment of the webs B and C, or either of them, arranged to extend from the inner surface of a shell nearly to the centre or axis, substantially in the manner and so as to serve the double purpose herein set forth.

No. 47,545.—JAMES H. W. HUCKINS, Boston, Mass.—*Tomato Soup*.—May 2, 1865.—This invention consists of a composition made by cooking together one and a half pound of onions, one and a half pound of turnips, one and three-quarter pound of carrots, one pound of beets, three and a half pounds of butter, three and a quarter pounds of flour. The mixture is allowed to cool, and one ounce of black pepper, half pound of salt, and three-quarters of a pound of brown sugar are added. Tomatoes which have been cooked and strained, and a liquor made by boiling beef in water are then added. The liquid is then separated from the solid portion and put up in cans for use.

Claim.—The composition made in manner and of materials substantially as herein before specified.

No. 47,546.—DANIEL HURD, Chicago, Ill.—*Rotating Stop Cock*.—May 2, 1865.—The object of this invention is to draw fluids from several sources by one cock. The cock is formed with several lateral openings, to be brought at will into coincidence with the pipes for which they are severally designed, and a dial upon the end of the plug serves to indicate the relative positions of these parts.

Claim.—First, the combination and arrangement of the jacket E, and the barrel F, provided with the three series of holes *a'* *a''* and *g*, operating as and for the purposes specified and shown.

Second, in combination with the above, the employment of the dial and pointer, arranged as and for the purposes described.

No. 47,547.—JOHN GOULDING, Worcester, Mass.—*Jacks and Mules for Spinning Yarn*.—May 2, 1865.—The object of these improvements is to economize space on the floor of the factory; to avoid the liability of the yarns to break from sagging, as when spun in a horizontal position; to facilitate the attendance upon the machines, and to secure greater evenness and uniformity in the thread produced. The spindles are supported in a prostrate position, in fixed rails near the floor; the carriage supports the roller jaws which deliver and hold the rovings during spinning, and also the spools of rovings. Two sets of prostrate spindles are used and operated from the same drum, the carriages of the first and second set being connected with the same counter-shaft. Two other sets may also be arranged in the other side of the frame of the driving mechanism, and operated by the same mechanism. An upright mule for extending rovings by drawing rollers previous to stretching and twisting, the inventor proposes to construct in accordance with his invention, by mounting the successive pairs of drawing rollers, together with the gearing for imparting to them the required speed, upon the rising and falling carriages, in which case the last pair of drawing rollers may act as the jaws which deliver the roving to the spindles.

Claim.—First, the combination of a series of prostrate spindles, roller jaws, a movable carriage, and upright guides for the carriage, substantially as set forth.

Second, the combination of a series of prostrate spindles, roller jaws, turning spool support, movable carriage, and upright guides for the carriage, substantially as set forth.

Third, the combination of the rising and descending carriage, and roller jaws, with upright guides for the carriage, and a rack, substantially as set forth.

Fourth, the combination of the rising and descending carriage, roller jaws and turning spool support, with upright guides for the carriage, and a rack, substantially as set forth.

Fifth, the combination of the rising and descending carriage, the roller jaws and their gearing, with instrumentalities for stopping the revolution of said jaws, when the length of rovings required for one spinning operation has been delivered, substantially as set forth.

Sixth, the combination of the rising and descending carriage, the roller jaws, turning spool support, and the gearing for transmitting motion to roller jaws and turning spool support, with instrumentalities for stopping the revolution of said jaws and spool support when the length of rovings required for one spinning operation has been unwound and delivered, substantially as set forth.

Seventh, the combination of a series of prostrate spindles, with two trains of driving mechanism, and with shifting mechanism to put the spindles in connection with one or other train of driving mechanism, and disconnect them therefrom, substantially as set forth.

Eighth, the combination of a series of prostrate spindles with a train of mechanism for turning them backwards, and with shifting mechanism to connect and disconnect the spindles therefrom, substantially as set forth.

Ninth, the combination of a series of prostrate spindles, and the train of backing-off mechanism, with mechanism for varying the extent of the backing-off movement, substantially as set forth.

Tenth, the combination in a jack of the backing-off mechanism, the faller mechanism, and the devices for varying the extent of movement of these two mechanisms, substantially as set forth.

Eleventh, the combination of a series of prostrate spindles, and the train of driving mechanism for impelling them with varying speed during winding, with mechanism for changing the varying speed, substantially as set forth.

Twelfth, the combination of two series of prostrate spindles and their appurtenances, arranged back to back with one set of driving mechanism, substantially as set forth.

No. 47,548.—H. A. HARVEY, New York, N. Y.—*Machinery for Making Screws*.—May 2, 1865.—This invention is fully set forth in the claim.

Claim.—First, the combination, substantially as described herein, of hoppers or receptacles, forwarding ways, delivering apparatus, and two sets of conveyers or elevators, with shaving, nicking and threading machines, whereby headed blocks may be thrown into a hopper and converted into screws without manual labor, as described; the blanks being transferred from one machine to the hopper or receptacle of another by elevators or conveyers, operating in the combination substantially as specified.

Second, the combination of a shaving machine and a nicking machine, with an elevator and a hopper and its accessories, substantially as described, whereby headed blanks may be converted into nicked blanks, substantially as specified.

Third, the combination of a nicking machine and a threading machine, with an elevator and a hopper, and its accessories, substantially as described, whereby shaved blanks may be converted into screws, substantially as set forth.

Fourth, a pyramidal hopper or receptacle, provided with an oscillating agitator, constructed and operating substantially as specified.

No. 47,549.—H. A. HARVEY, New York, N. Y.—*Machinery for Making Screws*.—May 2, 1865.—This invention will also be understood by the claim.

Claim.—First, the combination, substantially as described herein, of hoppers or receptacles, forwarding ways, delivering apparatus, and shaving, nicking and threading machines, whereby headed blanks may be thrown into a hopper and converted into screws without manual labor; the machine operating on the blanks being arranged on different levels, as described, and the blanks descending from one machine to another, substantially as set forth.

Second, the combination of a nicking and shaving machine, on different levels, and in working connection with each other by means of apparatus substantially such as described, the whole arranged and operating substantially as set forth.

Third, the combination of a nicking machine with a threading machine, on different levels, and in working connection with each other by means of apparatus substantially such as described, the whole arranged and operating substantially as specified.

Also, arranging shaving and nicking, also nicking and threading, and also shaving, nicking and threading machines, on different levels, in such manner substantially as described, that blanks may be transferred from one machine to another without handling, substantially as set forth.

No. 47,550.—DANIEL HURD, assignor to himself, E. K. HURD and A. E. SWIFT, jr., Chicago, Ill.—*Apparatus for Carburetting Air*.—May 2, 1865.—This invention consists of a vessel divided into several compartments by horizontal partitions. In each compartment

there is a series of vertical partitions. The ends of all the partitions in the lower compartment extend to the sides of the case, and the ends of the partitions in the upper compartment are drawn in toward a pipe. A partition crosses the ends of all the partitions A, at a short distance from the walls of the case, the said partition being about one-third the height of the partitions A, and between the partitions C and the wall are openings communicating with the compartment below A. At the opposite end of this compartment is a partition similarly arranged. The air enters the pipe D, and passes up through the passages out of the pipe C. The naphtha is supplied through the openings B.

Claim.—The peculiar combination and arrangement of the cylindrical vessel A, the floors *g h i*, the peculiar curved vertical partitions *a*, and the barriers *c d e f*, constructed and operating as and for the purposes specified and shown.

No. 47,551.—JOHN H. IRWIN, Chicago, Ill.—*Lantern.*—May 2, 1865.—This improvement consists in dividing the lantern guard horizontally into two or more parts, connected by a hinge and spring.

Claim.—First, dividing the guard of a lantern in two or more parts by a horizontal section, substantially as and for the purposes herein specified and shown.

Second, connecting the parts of the guard by a hinge upon one side, and the catch F, or it equivalent, upon the other, substantially as shown and described.

Third, providing the parts of said guards with the curved projections *a*, substantially as and for the purposes specified and shown.

Fourth, the combination and arrangement of the guards *a* and *b*, &c., the rings *c d*, substantially as shown and set forth.

No. 47,552.—H. C. KETCHUM, Bloomfield, N. J.—*Toy.*—May 2, 1865.—A puzzle is made by boring a circuitous hole in each of two pieces of wood, so that when the two are united and a cord passed through the holes, the cord may apparently be cut by a knife and not be divided.

Claim.—The apparatus called the mystic cord, constructed and operating as above described, as an improved article of manufacture.

No. 47,553.—GEORGE W. KING, Greenville, N. Y.—*Horse Hay Rake.*—May 2, 1865.—This invention relates to certain devices for holding the rake in working position and raising and turning the same. A detailed description is unnecessary, as the invention will be readily understood from the claim in connection with the engraving.

Claim.—First the lever N, in combination with plate *h* and arm Y, provided with wheel C; the whole arranged and operated in the manner substantially as and for the purpose set forth.

Second, the lever D, in combination with lever E, arranged and operating as and for the purpose herein specified.

No. 47,554.—ROBERT H. LECKY, Allegheny City, Penn.—*Coupling Shafts of Boring Tools.*—May 2, 1865.—In this coupling or joint the tenon upon the one rod which screws into the enlarged end of the other is enlarged, and of a cone shape at its base, terminating in an annular groove which receives the edge of the socket on the other rod and prevents the same from spreading outwards.

Claim.—The use of the conformed base E and angular groove R, either separate or combined, when used in connection with the screw A, or male part of the socket joints, for oil, tools, &c., the nut B, or female part of the joint, being fitted and adapted to the male part; the whole being constructed, arranged, and operating substantially in the manner herein described and for the purpose set forth.

No. 47,555.—ROBERT H. LECKY, Allegheny City, Penn.—*Coupling Shafts for Boring Tools.*—May 2, 1865.—This invention relates to the screw threads which unite and hold the two rods together, and consists in cutting that surface or side of the thread upon which the percussive force is suspended, as the drill descends in a plane perpendicularly to the axis of the rod, instead of cutting the thread with both faces inclined, or of V-shape, as commonly practiced.

Claim.—Constructing the screw threads of socket joints for oil, tools, &c., in the manner substantially as herein described and for the purpose set forth.

No. 47,556.—F. and CHARLES LEMME, San Francisco, Cal.—*Belt Buckle.*—May 2, 1865.—This invention consists in hinging the buckle in the middle, so that when flattened out binding processes on each flap will hold the belt firmly in place.

Claim.—The arrangement of the cross-bar and flange D and E, with the tongue F, in combination with the main plate or shield A B C, when the parts are connected and tilted to produce the result substantially as described.

No. 47,557.—WILLIAM H. LONG, Mountain City, Colorado Ter.—*Gold Separator.*—May 2, 1865.—This invention consists of a tube A, in the centre of which is a revolving shaft. Another tube is attached to said shaft, and from the bottom of said tube extend the tubes D

D to the bottom of the tube A, when they are bent at right angles to the shaft and extend to the sides of vessel. The tubes C C extend from a distance above the tube E down through the bottom of said tube into the vessel A, where they are bent in the same manner as the tubes D D. In the side of the vessel A is a slot, through which the dirt escapes and falls into the vessel L, and any amalgam that may escape will be returned to the vessel A. The bent pipes D D and C C are provided with sheaves, which extend from said pipes downwards nearly to the bottom of the vessel A.

Claim.—First, conveying the product of the battery through the mercury and discharging it beneath the same, by creating a vacuum at the end of the conveying tubes D' D', substantially as and for the purposes herein specified and shown.

Second, the employment of one or more tubes D' D', arranged and operating substantially as and for the purposes set forth and described.

Third, the combination of one or more air tubes C C' with the tubes D D', arranged and operating as and for the purposes shown and set forth.

Fourth, the combination and arrangement of the aprons S with the tubes C' D', as and for the purposes described.

Fifth, the combination of the shaft F, the funnel E, tubes C C' D D', and aprons S, arranged and operating as and for the purposes described.

No. 47,558.—PETER LUCK, Williamsburg, N. Y.—*Pulley Block*.—May 2, 1865.—This invention consists in the application to a pulley block of one or more movable side wings, in combination with a locking pin, and hung upon the axle of the sheave or sheaves in the pulley block in such a manner that by withdrawing the locking pin said movable side wing or wings are liberated and free to turn down, and thereby free access is given to the sheave or sheaves in the block. By this arrangement much time is saved in hitching the rope.

Claim.—The movable side wing or wings, applied in combination with the locking pin and with the axle of the sheave or sheaves of a pulley block, substantially as and for the purpose set forth.

No. 47,559.—JOHN F. MORGAN, Boston, Mass.—*Lunch Box*.—May 2, 1865.—This invention consists in so attaching the sides of the box to the cover and bottom portions or plates thereof that when the box is empty the said side plates can be all folded and laid down upon the bottom and held together by closing the cover. There is an additional receptacle at the bottom for holding a flask.

Claim.—A folding box, made substantially as herein shown and described, either with or without a bottom receptacle.

No. 47,560.—N. NIEDERPRUEN, Buffalo, N. Y.—*Adjusting Sewing Machine*.—May 2, 1865.—The wheel has its bearings in a frame, capable of being raised or lowered by a thumb-screw, which is located above the table.

Claim.—The arrangement of the sliding frame F, thumb-screw E, and journal boxes *e e*, in combination with the table top of a sewing machine, substantially as and for the purpose herein set forth.

No. 47,561.—L. H. OLMSTED, Newark, N. J.—*Lubricator*.—May 2, 1865.—This invention consists in using a hollow shaft, with an orifice running from the interior to the exterior, at the place where the pulley revolves on the shaft. This orifice is closed with leather or any other sufficiently porous substance to allow the oil within the hollow shaft to permeate to the rubbing surface.

Claim.—A hollow shaft with an aperture or apertures open from the interior to the exterior, said apertures being closed with leather or any other substance that will produce the intended effect, for the purpose set forth.

No. 47,562.—H. S. OSBORN, Belvidere, N. J.—*Preparation of Nitrate of Potassa*.—May 2, 1865.—This invention consists in lixivating wood ashes with pure water at a temperature below 60° Fahrenheit. The solution thus obtained is evaporated to a density of 24° Baumé, and allowed to flow while hot into vats lined with lead. It is allowed to remain in these vats until cold, when the chloride of sodium will be decomposed and chloride of lead will be precipitated. The liquid is then decanted and treated with a mixture of nitric acid and water of density of 19° Baumé. The solution is then evaporated and crystallized.

Claim.—The manufacture of nitrate of potassa from the lixivum of wood ashes, in the manner substantially as described.

No. 47,563.—GEORGE M. PAGETT, Adams Township, Ind.—*Animal Trap*.—May 2, 1865.—This trap is provided with a poised platform placed in such position in regard to the bait that to reach the latter the animal must step upon the former. Before reaching the bait the animal encounters a treadle, which it is obliged to step upon in order to get at the bait. No sooner, however, has the animal stepped upon the treadle than, by depressing its front end and raising its rear end, a wire hinged to its rear end is made to throw off the catch which retains the poised platform, whereupon the animal is precipitated into a box beneath, and the platform returns to its original position.

Claim.—The combination of the catch and head board, thereby holding a poised platform stationary until the treadle is depressed.

Also, the stationary bait pans, in combination with the self-adjusting lever treadle, so arranged that the rat must come in contact with the treadle before it is in reach of the bait; consequently the platform falls leaving the bait untouched.

No. 47,564.—NATHANIEL F. POTTER, Providence, R. I.—*Apparatus for Preparing Peat for Fuel.*—May 2, 1865.—This invention consists of a tube mounted upon wheels and provided with a central shaft, the said shaft being rotated by means of gear wheels, &c. The shaft is provided with arms and a screw propeller blade near the bottom to force out the peat. The peat after leaving the tube passes to an endless apron, and is cut into cakes of proper size by a cylinder, after which it is dried.

Claim.—First, the combination of a mill for tempering peat, as described, with a movable carriage, for the purposes specified.

Second, the combination of the clutch H with the pinions F F' and the toothed gears G G', for the purpose of imparting motion to the shaft B, in either direction as desirable for the purposes specified.

Third, the combination of the endless apron L with a cylinder where surface is provided with cells, or its equivalents, substantially as described, for the purposes specified.

No. 47,565.—JAMES POWELL, Cincinnati, Ohio.—*Globe Cock.*—May 2, 1865.—In this cock the valve stem screw works on the removable cap, and when the cap is lifted the valve is guided by lateral wings upon the stem within the smooth cylinder, upon which the screw cap fits, and also by isolated projections from the valve which passes down through the valve seats.

Claim.—The combined valve and valve stem, constructed and guided substantially as herein set forth.

No. 47,566.—J. L. QUINBY, Pleasant Grove, Penn.—*Stone Gatherer.*—May 2, 1865: antedated April 26, 1865.—This invention consists in the employment of a revolving toothed cylinder and an endless apron, connected with a stone-receiving box suspended from a mounted frame and provided with a hinged tail-board and hinged bottom, with fastening operated from the driver's seat.

Claim.—First, the endless apron K, in connection with the rotating toothed cylinder N and the scoop L, arranged with the bars I I and arms M M applied to the mounted frame A, substantially as and for the purpose herein set forth.

Second, the shaft H, the bars I I, arms M M, and cords g, in combination with the lever d, bearing a, shaft E, and lever G, all arranged substantially as shown.

No. 47,567.—LEWIS RATHBONE and WILLIAM HAILES, Albany, N. Y.—*Cooking Stove.*—May 2, 1865.—This invention consists in forming the fire-pot of stove in such a manner that air is admitted at the back sides and front by a peculiar arrangement of air chambers, &c., beneath and behind the fire-pot.

Claim.—First, grating the back plate of a stove so that the draught flue will cause air to circulate through the bed of partially ignited coals from a point near the base to the top thereof, from a chamber in rear of said back plate, in such manner that the refractory particles of coal are caused to burn, substantially as described.

Second, the combination of a front passage i, a grated back D, and a cross passage f, substantially as described.

Third, the combination of the front passage i, and passages F F, cross passage f, grated back D, and draught flue b, substantially as described.

No. 47,568.—WILLIAM RHODES and M. PORTER, Lovington, Ill.—*Cultivator.*—May 2, 1865.—This invention consists in an ordinary wheel cultivator, with the front cross-bar forming the arc of a circle. Upon the tongue is a roller, which bears against the cross-bar. The rear end of the tongue is pivoted, thus enabling the driver to change the line of draught of the machine.

Claim.—First, the roller F mounted upon the tongue E and adapted to move simultaneously therewith, so as to change the line of draught, in the manner and for the purpose herein set forth.

Second, the slot e, whereby the draught may be shifted at will from the tongue E to the roller F, in the manner and for the purpose described.

No. 47,569.—HAMILTON RICHARDSON, Janesville, Wis.—*Apparatus for Heating Buildings.*—May 2, 1865.—In a chamber in the chimney above the fire-place are two series of sheet metal pipes connected at the top and bottom by a metallic diaphragm, and open at both ends. These openings are so governed by valves and connecting passages that the products of combustion can be directed through them simultaneously by opening said valves, or by closing them can be sent in a circuitous route, entering the pipes at the sides and passing out of the same in the centre. In this chamber convenient pipes convey heat as

desired. Near the floor are apertures for admission of air to this chamber, and likewise in the back of chimney are apertures to admit external air.

Claim.—First, the series of radiating pipes 1, 2, 3, &c., arranged in a hot air chamber within the chimney, and so provided with cross or connecting pipes and valves that the draught may be varied at pleasure from a direct to an up and down draught, substantially as and for the purposes herein set forth.

Second, in combination with the hot air chamber above described, the flues or passages *d* and *e*, constructed and arranged to operate substantially as and for the purpose set forth.

Third, in combination with the hot air chamber above described, the flues or passages *g* and *h*, for the purpose of admitting cold or fresh air from the room or from outside of the building, as herein set forth.

No. 47,570.—C. D. W. RIES, Edwards, N. Y.—*Tug Buckle.*—May 2, 1865.—This invention consists in the combination of a hinged bar fixed across the box, and held, when shut by a spring, with a tongue projecting from the inner bar of the buckle.

Claim.—The combination of the hinged bar I with the tongue K, projecting from the inner bar of the buckle, substantially as described and for the purpose set forth.

No. 47,571.—CALVIN B. ROGERS, Deep River, Conn.—*Tool for Making Dice, &c.*—May 2, 1865.—A tube having a reservoir at one end and a screw point at the other, for the delivery of the paint, acts like a fountain.

Claim.—The implement A, constructed and operated substantially as above described, for the purpose of blacking dice tablets and other articles.

No. 47,572.—CALVIN B. ROGERS, Deep River, Conn.—*Machine for Cutting Ivory.*—May 2, 1865.—The object of this invention is to cut ivory and similar substances by machinery, and it consists of a circular cutter revolving by means of a hollow shaft around a holding rod, which is forced down upon the block of ivory to be cut, holding it firmly in place while the circular revolving cutter is then brought in contact with the block, cutting it into circular pieces, while a centring or marking cutter comes up through the table from below and centres or makes other marks on the under side of the ivory block.

Claim.—First, the cutter H, operated from below the bed upon the under side of the work while it is held upon the bed, substantially as above described.

Second, the combination in machines for cutting ivory and other substances of a holding rod applied within the kerf of a cutter with a cutter which divides the work from the stuff, and with a drill or centring or marking cutter operated from below the work, substantially as described.

No. 47,573.—LYNFORD ROWLAND, Philadelphia, Penn.—*Bucket Ear.*—May 2, 1865.—This invention consists in swaging the ear outwardly, so as to form a socket from the centre to the top of the same of a proper size to admit of inserting the piece of wire which forms the bail eye vertically between the ear and the side of the pail at the bottom of the socket. A hole is made in the ear, so that the end of the said wire is bent outwardly and clasps the bottom of the socket tightly.

Claim.—As an improved article of manufacture, a bail ear for buckets and other vessels, made substantially as herein shown and described.

No. 47,574.—CYRUS W. SALADEE, Putnam, Ohio.—*Harness Buckle.*—May 2, 1865.—This invention consists in pivoting the buckle in a groove in the tongue, so that a spring shall make the front end of the tongue snap under the front bar of the buckle, which is provided with a shoot passing through the strap to be held, and takes in a corresponding hole in the tongue.

Claim.—First, constructing a buckle so as to be unbuckled without slackening the strap, in the manner described.

Second, the buckle G in continuation with the tongue F.

Third, pivoting the buckle to the tongue in the manner described.

Fourth, forming the tongue F as a combination of plate A, in the manner described.

First, the stud *i*, or its equivalent, operating as described, in combination with the indentation V.

No. 47,575.—JAMES SARGENT and H. W. COVERT, Rochester, N. Y.—*Lock.*—May 2, 1865.—In this lock there is a series of rotating tumblers surrounded by an opening of magnetized iron. A lever hinged to the bolt near its front end carries an armature which connects the poles of the magnet on its lateral surface, while another armature fitted to embrace its perimeter is suspended in front of the magnet. This latter armature carries a spur, which, when the tumblers are properly set, passes through between the two ends of the ring and into their notches. When the bolt is out it is held there by a trigger, which, operating by gravity, sets against a stock upon the bolt. To retract the bolt the key is inserted and the tumblers properly set; a further movement then forces the hinged lever off, so as to break the connection of its armature with the magnet, whereupon the suspended armature is attracted, and in its movement towards the magnet strikes against the trigger

and turns it so as to remove its arm from behind the stock, while at the same time the spur upon the armature passes into the notches of the tumblers.

Claim.—A maguet employed in combination with the mechanism of a lock in such a manner as to disconnect the action of the dog, or equivalent, that releases the bolt from the operating shaft or key, substantially as herein set forth.

Also, in combination with the magnet E, the employment of the armatures G H, the former having the dog *g* attached, and so operating in relation to the permutation wheels that when the connection of H is broken that of G will be formed to allow the dog to enter the notches, substantially as set forth.

Also, in combination with the gate I, the shoulders *m* and the cam pin *o*, arranged and operating substantially as described.

Also, the tumbler K in combination with the armature G, substantially as herein set forth.

Also, retaining the permutation wheels in place on their bearing, and preventing them from coming in contact with each other, by means of the grooves J J and pins Z Z, or equivalent, substantially as herein set forth.

Also, the combination of the spring ring *u* and centre *w*, constituting the permutation wheels, substantially as and for the purpose herein set forth.

No. 47,576.—PETER SCHUTLER, Chicago, Ill.—*Machine for Boring Hubs*.—May 2, 1865.—This machine bores the hub by the rotation of the latter rather than of the former. The boring tool is mounted upon a horizontal bed, which is susceptible of an oscillating motion about a centre for the purpose of allowing the tool to be set at any desired angle. With this bed is combined a laterally adjustable tool holder and a longitudinally adjustable carriage. The carriage is provided with a contrivance for throwing it in and out of gear, with a feeding screw for the purpose of feeding the tool up to its work with a slow motion, and retracting with a quicker motion.

Claim.—First, the employment in combination with a machine designed for boring taper eyes or holes in hubs of a horizontal pivoted bed C, or its equivalent, substantially in the manner and for the purpose described.

Second, the employment, in combination with a machine designed for boring taper holes or eyes in hubs, of a laterally adjustable carriage E, and a longitudinally movable carriage D, and a pivoted bed C, all constructed, applied, and operating substantially as and for the purpose set forth.

Third, the employment of rack and pinion *r p* in combination with a feeding screw B, and contrivances for throwing this screw into and out of gear with the carriage D, substantially as described.

Fourth, the vertically sliding half nut *h*, toe lever *i*, weight *w*, shaft *j*, and feeding screw B, in combination with the tool carriage of a hub-boring machine, substantially as described.

Fifth, in combination with the lever *i* and half nut *h*, the adjustable stop H, substantially as described.

Sixth, the boring tool E constructed with a cutter *f*, spiral flange, and a shoulder cutter *g*, substantially as described.

No. 47,577.—CHARLES A. SEELY, New York, N. Y.—*Mode of Amalgamating Precious Metals*.—May 2, 1865.—This invention consists in injecting steam in the bottom of the amalgamating pan, so as to agitate and heat the quicksilver, thereby increasing the affinity of the same for gold and silver, and also making the scattered globules more easy to collect.

Claim.—The injection of steam or water, or both, at the bottom of the mercury in an amalgamating vessel, substantially as described.

No. 47,578.—THOMAS SHAW, Philadelphia, Penn.—*Steam Gauge*.—March 2, 1865.—The object of this invention is to register the steam pressure in boilers with unerring accuracy. Its novelty consists in the introduction of an India-rubber tube within a spiral spring, so that through the agency of the tube pressure is indicated.

Claim.—The employment of a gum tube in the manner specified for the purpose set forth.

No. 47,579.—CHARLES SHIRTCLIFF, Philadelphia, Penn.—*Circular Knitting Machine*.—May 2, 1865.—The object of the depression in the lower plate is to permit any one of the needle levers to be raised at its forward end, in order that a defective needle may be readily removed from the machine without disturbing any other needle or its lever.

Claim.—The plate G and plate G', with its depressions *d*, arranged and operating in respect to the levers H of a circular knitting machine, substantially as and for the purpose described.

No. 47,580.—HENRY SMITH, Naubuc, Conn.—*Slides for Carriages*.—May 2, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—The combination of the lever, segment, gears *h* and *g*, pawl and ratchet wheel *k* and *i*, and creeper wheel *m*, with the carriage, substantially as described.

Also, the combination of the guide *n*, plate *o*, and foot lever *q*, with the carriage, substantially as described.

No. 47,581.—WM. H. STONE, Brooklyn, N. Y.—*Lining for Petroleum Barrels*.—May 2, 1865.—This invention consists in heating the barrels to 180 or 200 degrees, and, while hot, introducing wax, which may be previously melted if desired, and then giving the barrel a rolling and oscillating motion to distribute the wax.

Claim.—The described process of rendering barrels or other packages impervious to petroleum or other similar liquids, by treating them in the manner substantially as herein set forth.

No. 47,582.—A. H. STRATTON, New York, N. Y.—*Fifes and Flutes*.—May 2, 1865.—This invention consists in making the instrument with a double tube and two sets of key-holes, so that, by turning the tubes, the key may be changed; and the mouth-piece is also adjusted in the same manner, and lengthened or shortened as required.

Claim.—First, the revolving finger-piece B, with two or more sets of finger holes, in combination with the main barrel A of a flute or fife, constructed and operating substantially as and for the purpose set forth.

Second, the longitudinally adjustable mouth-piece C in combination with the main barrel A of a flute or fife, constructed and operating substantially as and for the purpose described.

Third, the self-adjusting plug *e* applied to the sliding mouth-piece C, in the manner and for the purpose substantially as set forth.

No. 47,583.—MILBERN TIBBETTS, Lancaster, Ind.—*Apparatus for Shifting Sugar Pans*.—May 2, 1865.—This invention consists of a furnace provided with a pan. The furnace has two railways attached to it, one on each side, and the pan has arms hinged to it, the said arms being grooved wheels, which rest upon the rails. When the lever is depressed the pan is raised above the furnace, and can be moved freely from one end of the railway to the other, and when the lever is raised the pan is lowered upon the top of the furnace.

Claim.—First, in the described combination with a furnace and railway, the mode of elevating the evaporating pan on to the ways by means of the arms D *d* D' *d'*, wheels E *e* E' *e'*, levers F G F' G, and catches H H', or devices substantially equivalent.

Second, the removable sections *c* and *c'*, arranged and adapted as set forth.

No. 47,584.—T. R. TIMBY, Saratoga Springs, N. Y.—*Globe Time-piece*.—May 2, 1865.—This invention consists in combining with a globe, revolving once in twenty-four hours under a stationary index, one or more hands, revolving upon a clock-dial, in such a manner that by said clock-dial and revolving hands the local time is indicated in the usual manner, and at the same time the globe and the stationary index afford the means to read off the difference of time in places of different longitude, or the difference of time between any place on the globe and place where the clock is used.

Claim.—Attaching the axis of a terrestrial globe to a dial, and revolving both once in twenty-four hours, substantially for the purposes herein specified, with or without an ordinary clock-dial.

No. 47,585.—THEO. R. TIMBY, Saratoga Springs, N. Y.—*Globe Clock*.—May 2, 1865.—This invention consists in combining with a globe, revolving once in twenty-four hours under a stationary index, one or more hands, revolving upon a clock-dial, in such manner that by said clock-dial and revolving hands the local time is indicated in the usual manner, and at the same time the globe and the stationary index affords the means to read off the difference of time in places of different longitude, or the difference of time between any place on the globe and the place where the clock is used.

Claim.—A globe, revolving once in twenty-four hours, in combination with a fixed dial and moving hands, substantially in the manner and for the purpose herein shown and described.

No. 47,586.—FREDERIC TOGGENBURGER, Chicago, Ill.—*Firing Explosive Shells by Clock-work*.—May 2, 1865.—When the gun is fired the pressure of the expanding gases within the gun acts upon a yielding plug in the rear end of the shell, and causes, by means of an intervening mechanism, to set free the action of a spring barrel within the shell, and thus set in motion the clock-work. This motion continues until it sets free the action of a spring which pulls a rod out of a capsule containing fulminating powder, which is exploded by the act and explodes the charge. To determine the time within which the shell is to explode a dial is countersunk into the side of the shell, and provided with a hand indicating seconds. This hand is connected with the exploding machinery, and is set before the shell is charged.

Claim.—First, exploding a bombshell by means of a clock-work applied within said shell, substantially in the manner described.

Second, providing the clock-work used within a bombshell for exploding the same with a regulating apparatus, by means of which said clock-work can be set to explode the shell at a given time.

Third, starting the clock-work within a shell, by which it is to be exploded by the action of the powder-charge which is used in firing the shell from the gun.

Fourth, the combination of the clock-work movement with the rod M and the fulminating capsule for exploding the shell, substantially in the manner described.

Fifth, the combination with the clock-work and the exploding device within the shell of the yielding plug H, by means of which the clock-work is set in motion by the firing of the shell, substantially as herein described.

No. 47,857.—H. TUNISON, Whitehall Grove, Ill.—*Horse-rake*.—May 2, 1865.—This invention relates to a machine for gathering hay in large quantities, and transporting it to the stack or barn.

Claim.—A horse hay-rake, consisting of the body A, provided with the series of teeth *a a*, and provided with the reversible rods *d*, or their equivalents, attached separately, as shown, for the purpose of enabling it to be drawn and operated by animals acting independently at each end, substantially as herein shown and described.

No. 47,588.—CONRAD P. WAGNER, New York, N. Y.—*Lock*.—May 2, 1865.—The principal features of this lock are, first, a series of rotating tumblers, connected by means of concentric tubes with a series of permutation plates lying upon the outer surface of the lock-case; second, enclosing the tumblers in a case separate from the other parts of the lock, the bolt, flattened for that purpose, passing through the case between the bottom thereof and the lowermost one of the series of tumblers; third, a device for preventing the retraction of the bolt, even after the tumblers shall have been properly set, until said device shall also have been properly adjusted; and, fourth, a hollow hinged cover which encloses the permutation plates, and which, when closed, is locked in a peculiar manner.

Claim.—First, the movable stop H H in combination with the longitudinally movable central spindle F, rotating tumblers B B' B2 B3 B4, permutation plates G' G2 G3 G4, and tumbler box C C*, substantially as and for the purpose herein specified.

Second, the tumbler box C C*, enclosing the tumblers separately from the other parts of the lock, forming a guide for the bolt D and a bearing for the tumblers and their central spindle, substantially as herein specified.

Third, the sleeve M, with one or more slotted flanges or tumblers M*, and the pin *r* in the yoke L, or its equivalent, applied in combination with the bolt of the lock and with the spindle K, substantially as and for the purpose herein specified.

Fourth, the cover P, for enclosing the permutation plates, secured by means of two or more revolving buttons Q, and catches *u*, substantially as and for the purpose herein specified.

No. 47,589.—HARVEY WATERS, Northbridge, Mass.—*Blank for Scythes*.—May 2, 1865.—This rod or blank, for four or more scythes, is made by rolling out a bar of a width sufficient for two and of a length equal to two or more scythes, one surface being plain or flat, the other somewhat arched at the middle, that is thicker in its middle than at the two edges. Thus rolled, the bar is bent at the middle of its length around so that the plain or flat side of one limb will be close upon the flat surface of the other, but not welded to it. The bent end of this double bar is then swaged so as to make its extremity thinner and broader, giving to it thus a shape not greatly unlike the bit of a rock-drill or a cold chisel.

Claim.—The double rod or blank for two, four, or more plates, when shaped and arranged substantially as and for the purposes specified.

No. 47,590.—HARVEY WATERS, Northbridge, Mass.—*Machine for Rolling Metal*.—May 2, 1865.—The rollers employed have each a series of grooves, which operate in unison with each other in the usual manner, but of which the last pair of the series only give the perfected form to the article, the grooves through which it had previously passed having served successively only to bring the article up by gradual approaches to the finished form. The grooves are so shaped that while that portion of a pair which first nips the metal is formed, so as to impart to the bar at the nipped end a shape approximating more or less toward the true one, that form gradually emerges into that of a plain cylindrical groove, which, while drawing out the bar, simply rounds it. In the first pair of grooves, the emergence into the cylindrical form is found quite near the first or nipping portion, but in each succeeding pair this point of emergence is removed more and more remotely from the biting point, until that pair which immediately precedes the last is arrived at, which latter gives the proper shape to the bar throughout its entire length, the last pair of all serving only to finish it more completely.

Claim.—A system of grooves for drawing and shaping, substantially as and for the purposes specified.

No. 47,591.—J. D. WILBER, Pleasant Plains, N. Y.—*Horizontal Baling Press*.—May 2, 1865.—In this invention a single follower is used for two press boxes. The other portions of the invention relate to arrangement of the parts, as mentioned in the claim.

Claim.—First, the employment or use of two press boxes, placed or arranged in line with each other, in connection with a single follower, operated by four screws, all arranged as herein set forth.

Second, the opening *e*, employed in the described combination, with and relation to the follower D and slots *c* and *d*, to admit of the introduction of the material into the press boxes, without the use of doors, as explained.

No. 47,592.—ERASTUS S. WOODFORD, Winsted, Conn.—*Ox Yoke*.—May 2, 1865.—This invention consists in arranging a double spirally-grooved rod longitudinally with the frame of the yoke, connecting the bow blocks, so that either ox, in crowding or hauling, will instantly bring the other ox to the same relative position, whether close together or separated the length of the yoke, thus preventing further efforts to crowd or haul.

Claim.—The spirally-grooved rod *D*, by which their simultaneous movement is directed, thus adjusting the length of bow by which each ox works.

No. 47,593.—LINN WOODRUFF, Ann Arbor, Mich.—*Seed Planter*.—May 2, 1865.—For the purpose of scattering the seed evenly, centrally beneath the dropping aperture is placed the point of a cone, the base of which extends to within a few inches of the surface of the soil. This cone is suspended from a point as near as possible to its apex, and is allowed some freedom of motion, so as always to be in the main perpendicular, whatever be the position of the carriage. To thoroughly prepare the ground for the action of the seed drill, the tooth making the furrow is placed within and behind a triangular toothed drag. Behind this tooth and within the drag is placed the aforesaid conical dropper, and behind that the teeth for covering the furrow. Lastly comes an adjustable gauge, the effect of which is to leave the ridge smooth, compact, and even, as well as to gauge the depth of the covering.

Claim.—First, the conical dropping tube *A*, consisting of the cone *a a*, with the partitions *b b* separating the space between the cone *a a* and its concentric outer covering *A* into several grooves or channels, for the more effectual scattering of the seed, the whole being constructed and arranged substantially in the manner and for the purpose above specified.

Second, the arrangement of the small triangular drag *B B* with the teeth *t t*, when placed on each side and in front of the furrow tooth *d* and the covering teeth *e e*, substantially in the manner and for the purposes set forth in the above specification.

Third, the adjustable cross-bar or gauge *c*, when movably attached behind the teeth *e e*, so that it may be raised or lowered to control the depth of working of the teeth *e e*, as described in the specification.

No. 47,594.—WM. WOODS and E. SMITH, Worcester, Mass.—*Spring Bedstead*.—May 2, 1865.—In this bedstead two sets of springs, with intervening cross-bars and sockets, are used. This arrangement constitutes the improvement.

Claim.—The combination of the two sets of springs, intervening cross-bars, and sockets, when constructed and operating in the manner and for the purpose of giving ease and buoyancy to the slats, substantially as described.

No. 47,595.—PHILANDER ANDERSON, assignor to himself and P. K. BRONSON, East Avon, N. Y.—*Water Elevators*.—May 2, 1865.—This invention relates to that class of chains used in water elevators, and consists in casting each alternate link with curved lips or clasps, sufficiently open to receive the ends of the other links. When the curved lip, after having been malleablized, is closed up with a hammer, thereby forming a joint similar to a strap hinge.

Claim.—As an improved article of manufacture, the malleable iron square or flat link chain, the links and swivels being constructed and connected in the manner shown and for the purposes specified.

No. 47,596.—LEWIS D. CHICHESTER, assignor to himself and C. W. MILLS, Brooklyn, N. Y.—*Grain Dryer*.—May 2, 1865: antedated April 15, 1865.—This invention consists of two or more elevators combined with a grain dryer, having hollow walls and a delivery elevator. The elevators and grain receptacle are separated by partitions extending from the bottom nearly to the top; the grain flows into these from the general bin at the bottom, is elevated and cast upon a series of flat inclined shelves, so arranged that it flows from the base of one series upon the apex of the next, and so on, and at the bottom is discharged into its delivery elevator receptacle, and then elevated and delivered; the whole operation going on at the same time. If necessary, the delivery elevator can act independently from the dryer.

Claim.—First, the combination, with a drying or cooling apparatus for grain, of two or more elevators, substantially as described, so that the grain can be passed through the drying apparatus, and again elevated and delivered, or elevated and delivered at once, substantially as specified.

Second, a series of flat drying tables for grain, inclined in alternate opposite directions, and receiving the grain from the bottom of one set of tables upon the apex of the tables below, substantially as specified.

Third, the combination of the series of tables *o p*, inclined in alternate opposite directions with the hollow walls *q t*, forming the inlets and outlets of the air, as set forth.

No. 47,597.—W. R. CLOSE, assignor to himself and G. W. MERRELL, Bangor, Maine.—*Hanging Circular Saws*.—May 2, 1865.—This invention consists in having a fast collar upon the arbor, on the outer end of which is cut a screw thread, a nut of equal diameter of the fast collar being screwed upon the arbor. This nut has a flange or shoulder cut down and turned off of the size of the centre hole in the saw, and upon this rests the saw, and by

which it is centred. Outside of the saw and upon this centring nut or collar is also a cut screw thread, upon which is screwed a nut, which holds the saw fast to the centring nut, which can, with the saw, be attached to or taken from the arbor.

Claim.—As my improvement or invention for centring a circular saw, or applying it to its arbor, the combination described, the same consisting of the head *A*, screw *s*, the nut *C*, and hub *B*, with its screw *f* and shoulder *h*, such nut *C* and hub *B* being provided with the recess *i* and the polygonal head *k*, or their equivalents, and the whole being arranged substantially as specified.

No. 47,598.—ROBERT P FULLER, Machias, Maine, assignor to HENRY RICHMOND, San Francisco, Cal.—*Pulley Block*.—May 2, 1865.—The object of this invention is to construct ship blocks in such a manner that the cheeks of the same will be prevented from splitting, and to this end the cheeks are arranged with the grain of the wood at right angles with the metallic strap which encompasses the block, the strap being fitted in grooves in the cheeks, so that the outer surfaces of the former will be flush with the surfaces of the latter.

Claim.—The combination of the grooved cheeks *A A*, straps *C C*, metallic strap *a a b b* and hook *D*, all constructed and arranged as and for the purpose herein specified.

No. 47,599.—THOMAS J. LOVEGROVE, assignor to himself and HENRY BALDWIN, jr., Philadelphia, Penn.—*Borer for Wells*.—May 2, 1865.—The object of this invention is to prevent the jamming of the drill in the well to ensure the turning of the drill between the strokes, and to facilitate the removal of the detritus.

Claim.—First, a drill with two or more cutting edges, sloped from toe to heel, at an angle to its line of vibration, substantially in the manner described, for the purpose of boring a hole of larger diameter than the drill, as set forth.

Second, the combination with the drill of the inclined wings or flanges *E E*, substantially as described, for the purpose of turning the drill automatically, and of smoothing and rounding the hole, as set forth.

Third, a tubular jar, so constructed as to serve as a pump for removing detritus from the well.

Fourth, a cylinder containing a chamber which serves the double purpose of an air cylinder and a detritus chamber.

Fifth, the combination of a tubular jar and a sand pump, in such a manner that one of the tubes of the jar shall form the induction pipe of the sand chamber.

Sixth, the combination in an instrument for boring wells of a hollow drill and a tubular jar.

Seventh, the combination of a hollow drill, a tubular jar, a sand pump, and a flexible hose or discharge pipe.

Eighth, the combination with a drill of flanges *E E'* to turn it, and ratchets *d d'* to prevent its backward movement, substantially as described.

No. 47,600.—T. J. LOVEGROVE, assignor to himself and HENRY BALDWIN, jr., Philadelphia, Penn.—*Borer for Wells*.—May 2, 1865.—The object of this invention is to prevent the jamming or sticking of the drill to rotate it automatically, and to remove detritus from the bottom as fast as formed.

Claim.—First, rotating a boring tool by hydraulic pressure, substantially in the manner described.

Second, the combination with a drill of a tubular jar, rotated by the fluid passing through it, substantially as described.

Third, the combination with a tubular jar, rotated in one direction by hydraulic pressure of a ratchet or other device to prevent its rotation in the opposite direction, substantially as described.

Fourth, the combination of a rotating drill with a discharge pipe with a swivelling joint, substantially in the manner described, for the purpose of rotating the drill without twisting the pipe, as set forth.

Fifth, suspending and vibrating a rock drill by two ropes, substantially in the manner described, for the purpose of rotating the drill by the reaching twist of the ropes, as set forth.

Sixth, the combination of an automatically revolving drill, with an automatically rotating jar, substantially as and for the purpose set forth.

No. 47,601.—T. J. LOVEGROVE, assignor to himself and HENRY BALDWIN, jr.—Philadelphia, Penn.—*Rock Drill*.—May 2, 1865.—The objects of the invention are to prevent jamming or sticking of a boring tool, to rotate it automatically, and to remove detritus as fast as formed.

Claim.—First, a rock drill, perforated from its face to its head, and having cutting edges around the perforation, in combination with a valve, substantially as described, for the purpose of removing the detritus through the drill.

Second, a drill having part of its cutting surface radial to its centre, and at a right angle to its line of vibration, and the other part sloped downward from heel to toe, at an oblique angle to its line of vibration, substantially in the manner described, for the purpose of cutting a hole of a diameter greater than that of the drill, as set forth.

Third, a drill having two or more cutting surfaces on one side, and a single cutting surface in a higher plane on the other, substantially as described, for the purpose of cutting a core with the polygonal surfaces to be removed by the single cutter.

Fourth, a drill having cutting edges on different planes, the one horizontal, and the other at an obtuse angle thereto, substantially as described.

Fifth, the combination with a drill, having its cutting edges in different horizontal planes of the wings or flanges for rotating the drill, substantially as described.

No. 47,602.—JOHN W. MILLET, Bachelorsville, N. Y., assignor to BENJAMIN R. JENKINS and CYRUS SUMNER, Edinburg, N. Y.—*Machinery for Forming Baskets*.—May 2, 1865.—This invention consists in having in a suitable framing a conical revolving drum, in the heads of which are channels to receive the ribs or upright supports of the basket, and a rest from which the bands which go around the basket are fed and guided to their proper places by means of a spring and lever over the conical drum, where they are nailed fast to the ribs or uprights of the basket.

Claim.—First, the conical drum F, provided with the channels or grooves *f f f f*, and alternate projections *g g g g*, in combination with the chuck G, and flange-plate L, substantially as shown.

Second, the follower M in the movable rest pressed against the movable drum by means of weights in the manner described.

Third, the vibrating lever R, and the guide spring T, substantially and for the purpose specified.

No. 47,603.—JOHN NELSON, assignor to himself and WALES NEEHAM, Rockford, Ill.—*Device for Securing Grain Bands*.—May 2, 1865.—This invention consists in securing the bands by means of metal strips of suitable length, bent into the form of the letter V, which are made to embrace and clamp the lapped ends of the cord bands with sufficient force to prevent their slipping. They may be compressed upon the band by a pair of pincers.

Claim.—Securing the ends of the twine or cord bands used for binding sheaves of grain by means of metallic clamps, applied in the manner, without any knotting of the band in fastening, as herein set forth.

No. 47,604.—EZEKIEL PHILLIPS, Blackstone, Mass., assignor to himself and D. B. POND, Woonsocket, R. I.—*Machine for Cleansing, Dressing, and Cutting Flax, &c.*—May 2, 1865.—The object of this machine is to reduce long fibres into lengths, as well as to cleanse and beat them preparatory to spinning, &c. The longer spring tooth in the sectional gear through which the knife is periodically actuated is designed not only for the purpose of ensuring the engagement of the toothed arc with the teeth of a gear, but of preventing a tooth of the arc from so riding on or impinging against a tooth of said gear as to break a tooth or damage the machine.

Claim.—The combination or machine as consisting not only of the intermittent feeding mechanism, and the movable knife or mechanism for cutting off the fibres in the manner as described, but a stationary grid or grating (arranged in the case as set forth) and a rotary beater, so arranged as not only to operate with the knife, and cause it to cut off the flax or fibrous material, as explained, but to beat and comb or dress it, and subsequently discharge it from the machine, substantially as specified.

Also, the use in this particular class of machines the sectional driving gear *l*, as made not only with an arc of teeth, but with an auxiliary tooth, supported by a spring, arranged with respect to such arc substantially in manner and for the purpose as hereinbefore explained.

No. 47,605.—EDWIN REYNOLDS, Mansfield, Conn., assignor to himself and BENJAMIN GAGE, Boston, Mass.—*Machine for Cutting Nails*.—May 2, 1865.—This invention consists in the arrangement of a series of pairs of cutters, whereby a wide sheet of metal can be cut at each operation into as many nails as the united length of which will reach across said sheet, and without any lateral movement thereof, and the heads and points of the nails cut therefrom alternating in opposite directions with each cut of the machine.

Claim.—As an improvement in nail-cutting machines their organization with two pairs of cutter heads, each one of which carries two or more cutters, the whole being so arranged as to operate across the entire width of a sheet of metal, to cut from the end thereof simultaneously two or more nails, without giving to the nail plate any other movement than its progression or feed.

No. 47,606.—WM. T. SLOCUM, assignor to JAMES S. MASON & Co., Philadelphia, Penn.—*Manufacture of Metal Boxes*.—May 2, 1865.—This improvement consists in forming on one end of the narrow strip which constitutes the lid of the box a pointed triangular spur, and a short distance behind it in the body of the strip another by cutting a V-shaped slit, with its base towards the end, and turning both spurs up to a right angle with the body of the strip. The spurs are then inverted in corresponding transverse slots in the other end of the strip, and both then straightened out to be near their original position, and forming a lock joint.

Claim.—Connecting together the ends of a strip A, by inserting the lips *a a'* at one end of the strip through the slots *e e'* at the opposite end, and bending them down against the inner side of the slotted end, when the said lips and slots are formed substantially as described.

No. 47,607.—**ABBIE J. SMITH**, Litchfield, Conn., administratrix of the estate of A. P. SMITH, deceased.—*Pneumatic Churns.*—May 2, 1865.—This invention consists in the application of a double acting bellows, operated by a crank and pitman connected with the driving shaft, in combination with a hollow vertical shaft, which receives the wind from the bellows and forces it down into the cream, and distributes it through a series of small apertures in the underside of a tub placed centrally on the vertical hollow shaft, at right angles, so that when rotated it forms one of the beaters to agitate the cream as well as to distribute the air through it.

Claim.—First, the double-action bellows, operated by a crank and pitman from the driving shaft, the vertical rotating hollow shaft having holes in its lower bearing to receive the wind from the bellows and distribute it in the cream, in the manner herein described.

Second, the valve *i i* in the recess *h*, and the air chamber *g* in combination with the induction holes *o o* in the bearing of the hollow shaft F, for the purposes set forth.

Third, the horizontal air tube I, with its openings *n n*, in combination with the beaters *m m*, operating in the manner herein described, for the purposes specified.

No. 47,608.—**J. N. ADAMS**, Birmingham, Iowa.—*Corn Planter.*—May 9, 1865.—This invention relates to a corn planter of that class in which the seed-distributing apparatus is connected with or attached to wheels, and it consists in a novel construction and arrangement of said seed-distributing apparatus, whereby the plungers, working in pairs, convey the seed to the ground and press it into the soil.

Claim.—The plungers F placed at the outer side of the wheels B, and provided with the notches or seed cells *b*, in connection with the springs K, hoppers G, and inclined planes or surfaces H, all arranged to operate substantially as and for the purpose herein set forth.

No. 47,609.—**LEONARD ATWOOD**, Norwich, Conn.—*Oil-boring Apparatus.*—May 9, 1865.—This invention consists in the construction and combination of a pile driver and drill for boring oil and other wells, with devices to operate, hold, and rotate the drill rod, and in combination with the latter, which consists of a hollow tube or rod to force water by any usual process down through the hollow rod to the bottom of the well, so that the debris or detritus may be expelled therefrom.

Claim.—First, the combined pile driver and boring apparatus, when made, constructed, and operated in the manner and for the purpose herein set forth.

Second, the combination of a hollow tube and drill attached thereto, through which water can be forced by any usual power when said tube, rod, or drill has at its lower end slots or holes through which the water is forced into the well, expelling therefrom the debris or detritus from the well upon the outside of the drill rod or tubes, when the same is combined with the gear wheels C6 C5, drill rotating apparatus F *e f g*, when constructed in the manner and for the purpose herein described.

Third, the movable cross-head G, pitman rods I, guides G', and standards B, in combination with the levers J, in the manner and for the purpose herein described.

Fourth, the adjustable stops H H, in combination with the levers J J, in the manner and for the purpose herein described.

Fifth, the hinged clamps K K, in combination with the cross-piece U and drill rod D, in and for the purpose herein described.

Sixth, the movable collar V in drill rod D, and combined therewith, and with the arm F, ratchet and pawl *g*, friction roller *e*, and curved plate E, in and for the purpose herein described.

No. 47,610.—**EDWIN P. BAUGH**, Philadelphia, Penn.—*Mode of Manufacturing Superphosphate of Lime.*—May 9, 1865.—This invention consists of a tank, with an apex, near which is a vessel containing sulphuric acid. The bones, &c., are shovelled in through said aperture, and a stream of sulphuric acid allowed to flow in at the same time. The mass, after being converted into the superphosphate of lime, is discharged, and is ground by a roller, after which it is ready for use.

Claim.—First, converting bones and other offal and guano into superphosphate of lime, by causing the same to be thoroughly mixed with an acid in a closed or nearly closed tank, substantially in the manner described.

Second, the combination of the spiked roller and concave, or other equivalent, disintegrating mechanism with the said tank.

No. 47,611.—**EDWIN P. BAUGH**, Philadelphia, Penn.—*Method of Treating Manure.*—May 9, 1865.—This invention consists in passing the gases arising from burning fuel through the material to be treated. To accomplish this a chamber, having a chimney and hopper, is provided with rollers, carrying endless belts of wire gauze or similar material.

The chamber is provided with a fireplace and door. The material is supplied through the hopper, and passed from one belt to another, and is finally deposited on the floor of the chamber, near the door.

Claim.—Drying the sewerage of cities, poudrette, guano, and similar substances used as fertilizers, by passing through a mass of the material to be dried the products of combustion from any adjacent fireplace.

No. 47,612.—CHARLES WILLIAM BETZELL, Philadelphia, Penn.—*Trusses.*—May 9, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—First, the pad *a*, formed with a prolongation *b*, and fitting the inguinal region in such a way and having such a shape that the movements of the thigh or body cannot move it from its proper position, as herein set forth.

Second, the spring *d*, when employed in connection with the pad *a*, in the manner and for the purpose herein described and represented.

Third, the strap *b'* extending from the prolongation of the pad between the thigh and across the gluteal muscle, and hitched or fastened to the button *c* on the spring *d*, for the purpose of preventing any upward movement of the pad, substantially as set forth.

Fourth, the strap or girdle *e f*, occupying a position above the crest of the hip bone, extending across the abdomen, and fastened to the button *a'* on the pad *a*, to prevent the displacement of the pad in a downward direction, and operating in connection with the strap *b*, to prevent lateral displacement.

No. 47,613.—JESSE N. BOLLES, Baltimore, Md.—*Coupling Shafts of Boring Tools.*—May 9, 1865.—This mode of coupling is applicable more particularly to tubular shafts, and consists in threading the end of each tube on the inside to the extent of about one inch and a half, and upon the outer surface to the extent of four inches or thereabouts, the former being left-handed and the latter right-handed. The two tubes are screwed upon a hollow internal nipple until they meet and make a close joint, and this joint is afterwards covered by a lock nut about four inches long, which in turn is supported at one end by a jam nut, from which radiate a series of wings which serve to keep the tube or rod central in the hole made by the drill.

Claim.—The adaptation of a safety joint to either round, square, hollow, or solid boring, or drilling rods (and the various tools connected therewith) for boring or drilling rods used in the construction of artesian wells, oil wells, and for other purposes, so adjusted with right and left-hand threads, or outer and inner screws of different sizes (whether right or left-hand) with nipple, lock nut and collar, so as to render disconnection of the rods impossible while in operation, as herein described, or any other mode substantially the same, which will produce the intended effect.

No. 47,614.—WILLIAM H. BOYLE, Cazenovia, N. Y.—*Corn Planter.*—May 9, 1865.—This invention relates to a device for planting corn in hills and in check rows, and it consists in the employment or use of two slides in connection with a drop bar, operated through the medium of its own gravity or a spring and wiper wheel, or cam driven from one or both wheels of the machine, whereby the corn may be dropped at equal distances apart with certainty and precision.

Claim.—The two slides *E E* provided with the shoulders or projections *c* and acted upon by the springs *b*, in connection with the drop composed of the pivoted block *I* in the slide *G*, acted upon by the wheel *L* provided with an arm *i*, and all arranged to operate in the manner substantially as and for the purpose set forth.

No. 47,615.—T. W. BROWN, Cambridge, Mass.—*Ash Sifter.*—May 9, 1865.—This invention consists of a square wooden box, in which is an ordinary reciprocating sieve. This box has a hinged removable cover with a handle on top, and at the back of the box and beneath the sieve is a door through which the ashes may be removed.

Claim.—The combination of the cover *B*, hinged at *e*, and having a downwardly projecting front *A'*, the sieve *E*, handle *F*, and back door *D*, all the said parts being constructed and arranged as and for the purpose herein specified.

No. 47,616.—F. C. BROWNELL, East Orange, N. J.—*Ink Well.*—May 9, 1865.—This invention relates to an improvement in ink wells for school desks, by which the well can be locked and unlocked by means of a screw driver, or similar instrument, and at the same time fastened to the desk or table.

Claim.—First, constructing an inkstand so that its lid or pen-hole cover cannot be opened without moving both vertically and horizontally, or in two different directions, substantially as set forth.

Second, constructing an ink well so that its lid or cover for the pen-hole may be locked or unlocked by means of a key or other suitable instrument, substantially as and for the purposes specified.

Third, the use of an oval-shaped flanged ring or socket, in combination with an ink well or its cover or top, constructed so as to be fastened to or loosened from a desk by turning, substantially as specified.

Fourth, constructing an ink well whose top or cover can be fastened to or loosened from a desk or socket by turning, with a lid or pen-hole cover so constructed that it may be used as a means of turning the same, substantially as and for the purposes set forth.

No. 47,617.—L. D. BUNN, Morristown, N. J.—*Refrigerator*.—May 9, 1865.—This invention is clearly set out in the claim.

Claim.—First, a refrigerator constructed with double air-inclosing walls, and adapted for refrigerating meats and other articles, when the exterior surface of the air-inclosing double wall is covered with felt, cloth or flock, or other similar material, substantially as and for the purpose described.

Second, the arrangement of chamber G, ice-chamber E, and a cooling apartment F, for containing the articles to be refrigerated, substantially as specified.

No. 47,618.—PETER S. CARHART, Collamer, N. Y.—*Cultivator*.—May 9, 1865.—This invention consists in connecting a plate to the shares of a cultivator, and attached to a rod at one end, and at the other to a lever, for the purpose of adjusting the depth of penetration of the shares into the ground.

Claim.—The adjustable pivoted soles or plate D, attached to two or more of the shares B of the cultivator, and arranged with levers F, or their equivalents, substantially as and for the purpose specified.

No. 47,619.—THOMAS H. CLARK, St. Louis, Mo.—*Boiler Furnace*.—May 9, 1865.—In this furnace several boilers are arranged in a horizontal plane and surrounded by flues made concentric in their cross-section with the bottoms of the boilers, and which extend beneath said boilers lengthwise, and are separated from each other by partitions extending part way up the sides of the boiler in the chamber between each pair. A channel in the front part of furnace extends at right angles through partitions and flue passages, and is supplied with external air to assist combustion by ducts from a supplemental channel. A chamber in the rear extending the width of the furnace, and supplied with cold air, receives the products of combustion, whence they flow back and forth through the boiler and escape.

Claim.—The combination in a boiler furnace where several boilers are arranged in the same horizontal plane, of flues B made concentric in their cross-section with the bottoms of the boilers, and which extend beneath the boilers in the direction of their length, and are separated from each other by ridges A, with the transverse channels C C', and air channels D D E E', substantially as above described.

No. 47,620.—JOHN CLUTE, Cohoes, N. Y.—*Knitting Machine Burr*.—May 9, 1865.—This invention consists in the use of wings or sinkers, provided with a parallel projection or tongue, in combination with a wheel or bush, furnished with a series of oblique radial slots and with a circular groove turned or otherwise produced in the rim of the wheel from the inside or outside in such a manner that the shoulders of the wing formed on the sides of the tongue bear against the bottom of the radial slot, and the tongue fits into the circular groove, and by these means the said wing is held securely in its position, and very little solder is needed to fasten it to the wheel or bush. The wings can be punched out, and if the radial slots are cut in to the same depth precisely, no turning of the wings is required after the same have been secured in the wheels.

Claim.—First, making the wings of a knitting machine burr with shoulders *d* and parallel centre tongues *c*, substantially as and for the purpose set forth.

Second, the combination of the shoulders *d* and parallel tongues *c* of the wings, with oblique radial slots *a*, and a circular groove *b* in the wheel A, said groove being turned in the wheel either from the inside or outside, substantially as and for the purpose described.

No. 47,621.—EBENEZER DANFORD, Geneva, Ill.—*Steam Engine*.—May 9, 1865.—This invention consists of a bed plate which has upon each end of it two hemispheres, one above and the other below the plate; that portion of the plate which is between the hemispheres being cut away so as to leave a free communication between the two. Located centrally upon the upper hemisphere are two cylinders in which is a single acting piston upon which the steam acts as it is generated in the lower hemisphere, which is accomplished by placing the whole structure directly over a furnace in which a fire is kindled and heating them to the required temperature, when by the action of the pumps, which are worked by the engine, a given quantity of water is injected which is immediately flashed into steam and acts upon the piston as above stated, and this operation is repeated at each stroke of the pistons.

Claim.—First, attaching the hemispheres (or the upper and lower chambers of other form) to the upper and lower sides of the bed plate.

Second, placing the generator immediately over the fire, with the cylinder in immediate connection therewith, when the said generator is used as a chamber in which a portion of water is flashed into the steam for the purpose described.

Third, the combination of the generator, the cylinder and the interposed slide-valve, which is actuated so as to open and close the passage S at the specified times, for the purpose described.

No. 47,622.—JOHN R. DAVIS, Bloomfield, Iowa.—*Corn Planter*.—May 9, 1865.—The object of this invention is to produce a contrivance whereby the runners of a corn planter may be more readily adjusted to work at any required depth, and effectually held in either of the various positions to which it may be raised or lowered.

Claim.—In combination with the wheel frame A, runner frame B, rigid tongue D, and rigid lever E, the lever F, fulcrumed by the link *e* to the rigid lever E, connected loosely at its lower end to the frame A by the link *f*, and held at its upper end by the notched bar G *g*, spring I', and catch *f*, all the said parts being constructed and arranged to operate in the manner and for the purposes herein specified.

No. 47,623.—ALVAH D. DREW, Dixon, Ill.—*Pattern for cutting Boots*.—May 9, 1865.—This invention consists of two pieces of sheet metal of rectangular form connected together by hinges, and two other pieces of the same material attached to and on the former, in such a manner as to be capable of being adjusted laterally, one of the over pieces having a foot portion provided with a wing connected to it by means of hinges.

Claim.—An adjustable pattern composed of two parts or plates, connected together and arranged substantially as shown, for the purposes of cutting leather for boots, in the improved or patented form or style specified.

No. 47,624.—L. DUBERNET, New York, N. Y.—*Portfolio Stand*.—May 9, 1865.—This invention consists in a portfolio stand, the side wings of which can be turned down and adjusted in any desired inclination, in such a manner that whenever it is desired to examine the contents of one or more of the portfolios resting on the stand, one or both wings can be turned down to a horizontal or inclined position, and the portfolio can be opened without removing it from the stand, thereby saving much labor and time, and much tear and wear to the portfolio.

Claim.—A portfolio stand A, with folding side wings *c*, made adjustable by spring catches and serrated segments, or their equivalents, constructed and operating substantially as and for the purpose set forth.

No. 47,625.—JAMES P. EGAN, Zanesville, Ohio.—*Lamp Burner*.—May 9, 1865.—This invention consists in a combination of a plate with an oblong opening, a corrugated lip on each side flaring flame guides, and a cap or deflector, arranged so as to be applied to the top of a wick tube.

Claim.—The combination of the plate A, provided with openings *l*, and an oblong opening *a*, with a corrugated lip *a**, at each side of the latter; the curved or floating channels or guides B B, and the cap C, having openings *d* at its sides, and a slot *c* in its upper or face side, all constructed and arranged to be applied to a wick tube of a lamp, to operate substantially as and for the purpose herein set forth.

No. 47,626.—WILLIAM B. EMERY, Albany, N. Y.—*Cotton Gin*.—May 9, 1865.—The object of this invention is to enable the ribs to be fitted to the saws with greater facility and to be adjusted individually when necessary; and, by means of the scannions and adjusting screws, to permit the hopper to be moved to the right or left, when all the ribs require to be moved in either direction.

Claim.—Fastening the ribs of the breast to slotted plates or bars, in the manner and for the purpose substantially as described.

No. 47,627.—ROBERT and HENRY V. FARIES, Indianapolis, Ind.—*Steam Generator*.—May 9, 1865.—This invention consists in the arrangement of circular and semicircular pipes secured together with bolts, and provided with transverse openings in the eyes which form the communication between the adjacent sections of pipes and give a free passage to water and steam through the entire structure. These coils are arranged one within the other and the whole covered with a casing which terminates at the top in an up-take for the unconsumed products of combustion. The grate is placed within the interior coil, and a portion of each coil is cut away to allow of access to it. From the furnace the products of combustion pass around the pipes upon all sides, and finally pass up through the up-take, and are discharged into the atmosphere.

Claim.—First, a steam generator constructed of rings of pipes A, communicating with each other through transverse holes or eyes *a*, in the manner and for the purpose substantially as set forth.

Second, the combination of two or more coils A D, communicating with each other by eyes *a b'*, and pipes *c d*, substantially as and for the purpose described.

Third, the deflecting plates *f g*, in combination with the coils A D, applied and operating substantially as and for the purpose specified.

Fourth, the dovetailed flanges *i'*, and frame *i*, in combination with the pipes A, and fire door F, constructed and operating substantially as and for the purpose set forth.

No. 47,628.—REUBEN FINK, Batavia, Ill.—*Carriage Jack*.—May 9, 1865.—The object of his invention is to obtain a simple and efficient jack, which may be applied to the axles of

either light or heavy wheel vehicles, and both to the front and back axles of the same vehicle, for the purpose of raising the axles to admit of the ready removal of the wheels.

Claim.—First, the lever C, in connection with a fixed bearing or a sliding one F, bar D, and notches *b*, in the base A, all arranged substantially as and for the purpose specified.

Second, the cord or chain E, connected to the bar D, and lever C, substantially as and for the purpose set forth.

No. 47,629.—WILLIAM GASKILL, Cincinnati, Ohio.—*Hemming Guide.*—May 9, 1865.—The pieces composing the double volute are united near the interior of the scroll; the inner one has a prolongation extending beyond the outer one, and which, in connection with the wings of each piece, serve to spread the cloth and prevent its entering the scroll in an uneven or puckered condition.

Claim.—First, the hemming guide or scroll composed of the attached interconvoluted and winged plates A *a*, and B *b*, for imparting a double tuck or fold to the edge of the stuff, substantially as set forth.

Second, the plate A *a* and B *a*, and the central prolongation G, frame *d*, combined and operating as set forth.

No. 47,630.—WILLIAM GASKILL and GEORGE H. KNIGHT, Cincinnati, Ohio.—*Hemming Guide.*—May 9, 1865.—The object of the abruptly swelling head F is the more effectually to secure the smoothing of curls, creases, or wrinklets in the cloth before it enters the hemming scroll. By screwing the head nearer to or further from the scroll, or by reversing its ends, it may be adapted to different kinds and thicknesses of material.

Claim.—First, the provision at the receiving end of a hemming scroll of the abruptly shouldered axial head or knob F, of diameter greater than that of the outer convolution of the scroll, for the automatic cross crimping of the cloth edge, in the act of entering the scroll, substantially as set forth.

Second, a hemming scroll, provided, at its receiving end, with the screw-threaded axial prolongation *f*, having the adjustable head or knob F, as set forth, or its equivalent.

No. 47,631.—RICHARD J. GATTING, Indianapolis, Ind.—*Battery Gun.*—May 9, 1865.—This gun belongs to the class of many-barrelled field pieces, and consists of a series of barrels mounted on a central shaft or spindle and revolved by suitable gear wheels and hand crank. The charges or cartridges are automatically fed into the chambers of the barrels successively, and the several hammers are so arranged in connection with the barrels, that the whole operation of loading, closing the breech, discharging, and expelling the empty cartridge cases, is conducted while the barrels are kept in a continuous revolving movement.

Claim.—First, making the series of barrels with their appropriate locks and cartridge cavities to revolve on an axis, while the requisite motions to perform the loading directly into the rear end of the barrel, exploding, and the cartridge case retracting operations, are retained by the impingement of points on the revolving mechanism, upon fixed spirals, cams, or inclined planes; these several operations being performed consecutively without stopping the rotation of the barrels, when the gun is in operation.

Second, the locks, figures 12 and 13, which revolve with the barrels and breech, and are operated by the cam faces and springs during their revolution.

Third, the cam ring, figure 5, which is rigidly attached to the diaphragm of the stationary casing, and which, by means of its cam faces, controls the longitudinal reciprocating motions of the locks by means of the lugs and the impingement of the butt ends of the lock upon it, substantially as described.

Fourth, the caps to be placed over the cavity in the carrier to shut off the feed, substantially as described.

No. 47,632.—HARVEY GOEBEL, New York, N. Y.—*Hemmer for Sewing Machines.*—May 9, 1865.—The centre guide is solid and tapering towards the delivering end of the scroll, thus not only forming at its junction with the scroll a positive guiding angle, which restrains the cloth from folding upon itself beyond the required degree, but also serving to stretch out and smooth the cloth as it enters the scroll.

Claim.—In combination with a cone-shaped scroll, the centre guide C, constructed and operated as and for the purposes specified, substantially as described.

No. 47,633.—HENRY A. GOUGE, Brooklyn, N. Y.—*Apparatus for Ventilating.*—May 9, 1865.—Attached to the wall of a room, or inside the wall, or outside, and communicating with the external air, is a tube with an opening near the floor; at a point above is a chamber in which a gas jet is burned, and, under the burner, a diaphragm formed of four pieces of metal or other suitable material converging towards and uniting with each other around the gaspipe. The circulation flows through the lower opening, and up, around, and over the diaphragm into the shield above the gas burner and through the tube. In the pipe above this chamber are any desirable number of openings and registers.

Claim.—First, the apparatus described, when constructed to promote ventilation, with substantially the parts, operating in substantially the manner explained.

Second, the inclined plane, current controller E, arranged substantially as and for the purpose shown.

No. 47,634.—**DAVID M. GRAHAM**, Evansville, Ind.—*Apparatus for Generating Gas from Petroleum*.—May 9, 1865.—This invention consists of a generating vessel surrounded by a casing, and communicating with an oil reservoir by means of a pipe. Directly under the generator is an ordinary gas burner, which is connected with the reservoir, and also the pipe leading from the gas holder. The generator is heated by means of the burner, which is supplied with oil from the reservoir, and when sufficient gas has been generated the supply of oil is cut off from the burner, and the gas is turned on and ignited. The gas is collected in reservoirs, and from thence supplied to different parts of a building.

Claim.—First, heating the generating chamber A from the oil in the receiver C, through an ordinary gas burner a' , for the purpose of generating gas for the continuation of heat by gas alone from the gasometer D through and by the same burner, substantially in the manner as herein set forth.

Second, the receiver C, gas burner a' , and pipe b , in combination with the generating chamber A, whereby the same is heated by the oil, substantially in the manner and for the purpose as herein set forth.

Third, the gasometer D, piping or tube c , and gas burner a , in combination with the generating chamber A, whereby the same is heated by gas, substantially in the manner and for the purpose as herein set forth.

Fourth, the cylindrical chamber B, in combination with the generating chamber A, whereby the heat is condensed and retained around the same, substantially in the manner as herein set forth.

Fifth, the gasometer E, in combination with the generating chamber A, whereby an additional power is given to force the gas through distributing pipes, in the manner as herein set forth.

No. 47,635.—**LORING M. GUTEAU**, Batavia, N. Y.—*Horse-shoe*.—May 9, 1865.—This invention consists in constructing a horse-shoe of V-form in its transverse section, so that a sharp edge will be formed all around the bottom of the shoe, in order to prevent slipping and to avoid the use of calks; and having the shoe composed of two equal parts, connected at their front ends by a joint, which is at the centre of the front part of the hoof, in order to admit of the shoe expanding under the growth of the hoof; the shoe being formed with oblique holes through which the nails pass from the inner side of the shoe into the hoof; the heads of the nails being above the sharp bottom of the shoe.

Claim.—First, a horse-shoe constructed of V-form in its transverse section, substantially as described.

Second, constructing the shoe of two parts A A, of V-form in their transverse section, and connected by a pivot or joint to admit of the expansion of the shoe under the growth of the hoof, as set forth.

Third, the oblique nail holes d , in combination with the transverse V-form of the shoe and the two parts thereof connected by pivot or joint, substantially as specified.

No. 47,636.—**SAMUEL HARRIS**, Rochester, Mich.—*Rotary Steam Engine*.—May 9, 1865.—This invention relates to the arrangement of parts which consist in a cup-shaped disk mounted on a shaft, and a shaft similar to the above, except that it is made hollow and has protruding from its inner ends two or more arms crossed at their outer ends, through which the steam passes and impinges against buckets on the inner periphery of the disk above referred to, inside of which these arms revolve. This arrangement causes the disk to revolve in one direction, while the arms revolve in the opposite one, by which means the direct force of the steam is applied to the disk and the reactionary force is exerted upon the arms, and both are used to drive the machinery. Provision is made for admitting steam to the hollow shaft through a stationary pipe, so arranged as to prevent leakage of steam between the two.

Claim.—First, the combination of the arm F with the shaft D, constructed and operating substantially as described.

Second, the arrangement of the arms E E' on the shaft D with the cupped disk C, its buckets and flange C', the whole constructed and operated substantially as described.

No. 47,637.—**MARTIN HAYDEN**, Rochester, Mich.—*Seed Planter*.—May 9, 1865.—In this machine a pinion, connected with the draught wheel, moves by a wrist pin two levers. One lever draws out from the seed box a little cup, which is carried by the dropping tube and inverted by means of a pin running in a slanting slot. The other lever forces a plunger through the seed tube. This plunger, by means of a cam, opens and shuts a valve in the tube.

Claim.—First, the adjustable or movable bar X provided with the tooth u , in combination with the pinion G having a vacant or absent tooth and provided with a notched plate H, for the purpose herein set forth.

Second, the lever I, arranged and combined with the pinion G, plunger rod K, valve shaft N, and seed cup Q, to operate substantially as and for the purpose specified.

Third, the placing of the seed cup Q on an axis e provided at one end with a crank i , in connection with the curved slot j in the bar k , for the purpose of tilting the seed cup, as described.

Fourth, the combination of the valve M, plunger rod K, seed cup Q, when arranged to operate in the manner substantially as and for the purpose set forth.

No. 47,638.—AMARIAH M. HILLS, Hockanum, Conn.—*Lamp Shade*.—May 9, 1865.—This invention relates to a shade or reflector for an ordinary portable lamp, to relieve the eyes from the flame and to throw the light down upon the work or article looked upon. The object of this invention is to obtain a shade which may be readily applied to and detached from the lamp, and one which will not render the room so dark as the ordinary shades in use.

Claim.—A lamp shade, composed of paper or other suitable material, made in the form of a frustum of a cone or other approximate shape, and fitted on a horizontal metallic rim or band, which is secured to a vertical extension support, having a clamp at its lower end to fit upon the neck or socket of the lamp-burner thereof, substantially as herein set forth.

Also, the particular manner of constructing the clamp, as herein shown and described, to wit: of a spring, bent so as to form rather more than a semicircle, and having levers or finger pieces attached for the ready adjustment of the clamp to the lamp or burner, as described.

No. 47,639.—A. A. HEATH, West Greenville, Penn.—*Harvester*.—May 9, 1865.—This invention relates to an improvement in the sickle-driving mechanism, whereby the machine is rendered capable of being readily turned and backed, and the parts rendered durable and not liable to catch the cut grass or grain as the machine is drawn along in order to perform its work. The invention also relates to a means for raising and lowering the finger bar and sickle, and to the construction and arrangement of the sickle and manner of applying the pitman thereto.

Claim.—First, the combination of the collar *b* of the bevel wheel H, pinion shaft G G, and clutches I I, arranged substantially as and for the purpose herein set forth.

Second, the caster wheel C, attached to the frame O, applied to the main frame A of the machine, substantially as shown, in combination with the lever P applied to the machine, substantially as shown, to operate in the manner as and for the purpose specified.

Third, the combination of the pitman N, pendulous bar X, standard W, link *n*, and sickle *y*, arranged and operated as and for the purpose described.

No. 47,640.—E. HODGKINS, Carthage, N. Y.—*Washing Machine*.—May 9, 1865.—This invention consists of a rocking or oscillating tub, divided in the centre by vertical bars, in combination with stationary arms, to which are attached gratings, against which the clothes are beaten by the rocking of the tub.

Claim.—An oscillating tub, constructed and operated as described, in combination with radial arms E and fixed slats *b* and grating *a* with pivots F F, as above set forth.

No. 47,641.—JAMES HOLLINGSWORTH, Chicago, Ill.—*Cultivator*.—May 9, 1865.—In this machine the forward end of the plough beam is of steel, and by its elasticity brings the plough in place after being turned to either side. The rock shaft for elevating the rear of the plough beam is so arranged that the operator may use either his hand or his foot, at pleasure, or may use both.

Claim.—First, the use of a spring shovel beam, which will admit of a lateral swinging movement of the shovels, substantially as described.

Second, constructing cultivator shovel beams of wood and metal, substantially as described.

Third, the rock shaft E provided with loose arms *c d* and lever E, for enabling the attendant to elevate the shovel beams singly or together, at pleasure, substantially as described.

No. 47,642.—NELSON HOMES, Laona, N. Y.—*Mop Head*.—May 9, 1865.—This invention consists in the means for moving the adjustable bar or jaw of the mop head, whereby the same may be readily moved by securing the mop in the head and releasing it therefrom, and at the same time preventing it from being moved casually.

Claim.—The screw C, in connection with the nut B and sleeve G, the latter being provided with ratchet teeth *c*, and arranged on the part F of the screw rod with a spiral spring H, the part F being provided with slots and notches to receive the spurs of the sleeve, and connected with the jaw I, as shown, and the jaw provided with ratchet teeth *b*, all arranged substantially as and for the purpose set forth.

No. 47,643.—WALTER W. JEROME, Rochester, N. Y., and LEWIS K. COLE, Syracuse, N. Y.—*Lock Valve for Canal Gate*.—May 9, 1865.—This invention consists in moving the rods which open and close the valves of lock gates by means of levers, to each of which is firmly fastened a wheel, so that the bolt which forms the fulcrum of said levers shall pass through a hole in the centre of the wheel, with two grooves in its edge, each groove to contain a chain, one end of which is attached to the wheel, and the other end to a projection on the rod, in such manner as that when the lever is turned the rod shall be moved so as to open and close its valve.

Claim.—The combination and arrangement of the wheel W, the two chains C C' provided with screw shanks and nuts, the rod R, and the lever L, constructed and operating in the manner and for the purposes described.

No. 47,644.—JAMES D. JONES, Pittsburg, Penn.—*Horse-rake.*—May 9, 1865.—This invention relates to the construction and arrangement of the several parts as indicated by the claim.

Claim.—The arrangement of the flexible seat *g*, levers *r s* and *t*, ratchets 11 and *j*, adjustable set screw *n*, regulating link 5, axle *a*, wheels *b* and *b'*, and teeth *l*, the whole being constructed, arranged, and operating substantially as and in the manner herein described and for the purpose set forth.

No. 47,645.—M. KLEEMAN, Columbus, Ohio.—*Setting and Adjusting Glaziers' Diamonds.*—May 9, 1865.—This invention consists in making the shoe adjustable upon the bar, so as to guide the diamond at the proper slope; and in making a cavity in one side of the shoe to guide the diamond in curves.

Claim.—First, making the shoe adjustable on the diamond-holding bar, substantially as and for the purposes described.

Second, the furrow *k* on the shoe, substantially as and for the purpose set forth.

Third, the gauge *g*, in combination with the pin or pins *h* projecting from the bar *b*, substantially as and for the purpose described.

No. 47,646.—THOMAS W. KNOX, New York, N. Y.—*Conductor's Check-box.*—May 9, 1865.—This invention consists of a box to receive checks issued to passengers by officers and conductors on railroad cars and other conveyances, and which is so arranged that its contents cannot be removed without exposure.

Claim.—First, a conductor's check box, whose top E is perforated, as shown at *f*, to receive passengers' tickets, whose bottom *f* is hinged, so as to be capable of being opened; both the top E and bottom F being inclosed respectively by outer covers B B', substantially as above described.

Second, the springs *a a* on either side of the slot or perforation *f*, in combination with the partition D of the cover B, substantially as and for the purpose above described.

No. 47,647.—ADOLPH KOEHLER, Holyoke, Mass.—*Harness Saddle-tree.*—May 9, 1865.—This invention consists in securing the check-rein hook between the seat and the tree by means of a lug or projection passing through the leather at the upper surface of the tree, combined with a screw, flush with the under surface of the tree, and in the combination with the latter screw of another screw passing through a lip placed at the rear of the tree and into a pendant projection, for the purpose of securing the rear part of the tree.

Claim.—Securing the check-rein hook G between the seat C and tree A by means of the lug or projection *a*, combined with the screw E, as described.

Also, in combination with the screw E, the screw D passing through the lip *b* and into the pendant projection *c*, for the purpose of securing the rear part of the seat to the tree, as described.

No. 47,648.—T. S. LA FRANCE, Elmira, N. Y.—*Governor.*—May 9, 1865.—This invention consists in the use of the semicircular springs hinged at the top of the governor spindle, in combination with three belts, two of which are fastened to the central portion of the springs in such a way that they can be adjusted nearer to or further from the centre of motion; the third one is connected to the lower ends of both springs and also to the end which passes up through the centre of the spindle and which rises and falls with the ball or weight. Any increase of speed above what is proper causes the centrifugal force of the ball connected to the central portion of the springs to carry out that portion of them, and this causes the lower ball to rise and with it the rod to which the governor valve is attached, and the valve is closed to the requisite extent, and upon any diminution of the speed the ball or weight is in turn brought into requisition, and by its weight and the force of the springs combined the valve is opened.

Claim.—First, the hinge joints *c*, in combination with the springs E E, spindle C, balls G G, and weight F, constructed and operating substantially as and for the purpose described.

Second, the screw studs *g*, or their equivalents, in combination with the balls G G and springs E E, substantially as described, so that the distance of the balls from the centre of rotation can be regulated at pleasure.

Third, the combination of the springs E E, balls G G, weight F, and rod *f*, all constructed and operating substantially as and for the purpose set forth.

No. 47,649.—WM. E. LANE, Peekskill, N. Y.—*Kingsbury's Coal Stove.*—May 9, 1865.—This invention consists in applying to the stove, known as Kingsbury's, and patented April 12, 1859, a semi-jacket, with tubes leading from the sides up through the products of com-

bustion to the top of the heater, the semi-jacket extending to a point above the holes leading into the said tubes.

Claim.—The combination of the semi-jacket C' with the empire heater of G. J. Kingsbury, for the purpose and in the manner substantially as set forth.

No. 47,650.—EDWIN A. LELAND, New York, N. Y.—*Gas Cooking Stove.*—May 9, 1865; antedated April 26, 1865.—This invention consists of a square stove of tin or sheet iron, having openings in the top for cooking utensils. Beneath every opening is a gas burner, which brings the flame in direct contact with the bottom of every cooking utensil. In the middle of the stove is a baking chamber, surrounded on every side by flues for the passage of the heat, which is generated by a gas burner beneath said chamber. All these burners are supplied by a series of conducting tubes, and can be used either separately or in conjunction.

Claim.—First, the employment in a gas cooking stove of one or more burners, arranged directly under the oven, in combination with flues below, at the sides, and on the top of the oven, substantially as herein specified.

Second, in combination with the burners under the oven, and the flues under and at the sides thereof, the setting-in of the upper part of the oven, substantially as shown at *d e*, in Fig. 2, whereby the heat is enabled to be radiated downward on to the contents of the lower part of the oven, as herein set forth.

Third, the employment of a system of burners so applied in the lower and upper parts of a gas cooking stove containing an oven that the products of combustion from the lower burner or burners pass through the upper burner or burners, and the latter is or are supplied with air through the former, substantially as herein specified.

Fourth, the arrangement of the upper burners and the partition *h* in relation to each other and to the set-in upper partitions *d e* of the sides of the oven, substantially as herein described, whereby the products of combustion from the lower burner are caused to pass over the horizontal parts *d* of the set-in portions, and so to produce a downward radiation of heat on the contents of the lower part of the oven, as herein set forth.

No. 47,651.—H. W. LIBBEY, Cleveland, Ohio.—*Explosive Shell.*—May 9, 1865.—This shell contains two longitudinal chambers concentric with each other, the interior one being contracted at its middle, somewhat after the form of an hour-glass.

Claim.—The shell A, having two chambers B and C when the side walls of the latter spring from the further and outer extremities of the former, forming a double cone-shaped chamber, constructed at the centre.

No. 47,652.—GEORGE MARSHALL, New York, N. Y.—*Pump.*—May 9, 1865.—The novelty of this invention consists in the combination of parts recited in the claim.

Claim.—The combination of a perforated hollow piston C, tubular piston rod D, centrally perforated disk valve F, and a pump cylinder which is constructed with a chamber B beneath it, and a valve *c* leading into it beneath the piston, substantially as described.

No. 47,653.—B. MARSTELLER, Wolf Creek, Penn.—*Liniment.*—May 9, 1865.—This invention consists of a mixture of alcohol, tincture of wild indigo, American ipecacuanha, inner bark of white elder, opium, oil of sassafras, oil of hemlock, red cedar, spirits of turpentine, capsicum, and gum camphor.

Claim.—The within described composition for a liniment, made in the manner set forth.

No. 47,654.—ROBERT MCGRATH, Philadelphia, Penn.—*Fluid Ejector.*—May 9, 1865.—This invention consists in the employment of an air condenser placed above the ground and outside an oil well. To the condenser is attached a pipe extending down the well tubing. To the end of this pipe is attached a perforated circular pipe, which permits the escape of a sufficient quantity of condensed air to force the oil to the surface of the earth.

Claim.—The reservoir for compressed air and its connecting pipe, with stop-cock attached, and the ring pierced in form, as described, at the bottom of the well.

No. 47,655.—JOSEPH MILLS, Reading, Ill.—*Cultivator.*—May 9, 1865.—In this machine long jointed tooth standards are connected with a front bar by rods, and double up free from the ground by turning the axle. The distance between the two inner ploughs is varied by double screw rods and nuts.

Claim.—First the vertically adjustable and jointed posts D D, and the vertically adjustable, jointed, and swinging posts E E, in combination with the rods K, for the purpose of guiding and adjusting the shovels, substantially as described.

Second, the rotating axle B in combination with the jointed posts D D E E, substantially as described.

Third, the double screw rod F and swinging nuts G in combination with the swinging posts E E, substantially as described.

Fourth, the standard M in combination with the posts D D E E and the axle upon which they are mounted, substantially as described and for the purpose set forth.

No. 47,656.—JOSEPH W. NORCROSS, Middletown, Conn.—*Casting Tackle Blocks*.—May 9, 1865.—This invention consists in a device for forming the mould in which the different parts of the tackle block, as the hook and ring thereof, with the block, can be cut at once, or the ring cut in or through the eye of a hook which has been previously cut.

An intelligible description would exceed the limits of a brief, and require besides a reference to the drawings.

Claim.—The within-described apparatus for forming the mould for casting the eyes of a tackle block, and the eye of a hook, or any other two eyes or rings together, or any equivalent means, constructed and operating substantially as herein set forth.

No. 47,657.—N. P. OTIS, Yonkers, N. Y.—*Canal Propeller*.—May 9, 1865.—This invention consists in the application to a canal boat of one or two wheels mounted on the end or ends of a shaft, which has its bearings in rising and falling slides moving in segmental guideways, and to which a rotary motion is imparted by an engine in the interior of the boat, in combination with a track extending on the side of the canal throughout its entire length, in such a manner that by the action of said wheel or wheels on the track the boat can be propelled with comparatively little power, and without any external power such as usually employed.

Claim.—First, the combination of the rack J, wheel I, pulleys C E, and chains D, operating substantially as and for the purposes set forth.

Second, in combination with the above, mounting the shaft which carries the driving wheel or wheels in slides moving in segmental guideways, substantially as and for the purpose described.

Third, the flanged guide wheel K in combination with the rising and falling slide *b*, rack J, and boat A, constructed and operating substantially as and for the purpose specified.

No. 47,658.—LEVI N. PARKS, Winchendon, Mass.—*Mode of Fastening the Heads to Spools*.—May 9, 1865.—This mode of securing the head is designed not only to facilitate the removal of a broken one and the substitution of a new one, but by reason of a flange on a metallic cap a larger surface is obtained for attaching the head, and hence it can be secured more firmly, with less liability to be broken.

Claim.—The combination and arrangement of the metallic cap A with the body B, the head C, and the gudgeon E of the spool, the said cap being fastened to the head, and to the gudgeon, and to the body, by means substantially as described.

Also, in combination with the body B, head C, metallic cap A, and gudgeon E, applied together as specified, the metallic disk D, arranged on the external surface of the head, and so as to receive the gudgeon, as specified.

No. 47,659.—C. M. and G. RICHARDS, Harpersville, N. Y.—*Animal Power*.—May 9, 1865.—This invention relates to that class of animal powers in which an inclined tread is used, and has for its object simplicity of construction and a ready adjustment of the tread-wheel as circumstances may require.

Claim.—The frame J hung upon one or more journals and provided with arms *d e*, which constitute bearings for the shaft I of the treadwheel H, to admit the adjustment of the latter, in the manner herein described.

Second, in combination with the suspended frame J *d e*, the bar or lever C provided with friction rollers *f f*, and attached to the frame J when used in connection with a treadwheel H, for the purpose specified.

Also, the mode of constructing the framing of the machine, to wit, of two metallic sides connected by wooden reaches, braced by a transverse metal bar E, which serve as an inner bearing for the shaft D, from which the power is taken, substantially as set forth.

No. 47,660.—T. C. RICHARDS, New York, N. Y.—*Cigarette*.—May 9, 1865.—This invention consists in making the tip or mouth-piece of a cigarette of bamboo or ratan.

Claim.—Manufacturing the mouth-pieces of cigarettes of ratan or bamboo, in the manner and for the purposes described.

No. 47,661.—SAMUEL S. RITTER, Philadelphia, Penn.—*Stud and Button*.—May 9, 1865.—This invention relates to a stud the two disks of which are capable of being detached and connected, so that in putting it into the bosom or sleeve it will only be necessary to insert the stem or shank through the button-hole, and then apply the detached disk to the opposite side.

Claim.—Providing a stud and button with a spring or springs *a* and a notch or notches *b*, permitting the two disks A A to be coupled and uncoupled at will, substantially as and for the purpose explained.

No. 47,662.—E. P. RUSSELL, Manlius, N. Y.—*Horse Power*.—May 9, 1865.—This invention consists in the peculiar arrangement of the parts, and will be understood by reference to the claim and engraving.

Claim.—The combination and arrangement of the driving wheel B with the conical rollers C and the taper screw D, when constructed, arranged, and operating in the manner described and for the purpose of forming a horse power.

No. 47,663.—THOMAS SHAW, Philadelphia, Penn.—*Spring*.—May 9, 1865.—This invention consists in punching in the lower side of the plate slots or grooves, and at the same time forming upon the opposite side nibs or projections by means of a die. When the plates are put together to form the spring, the nibs fit into the grooves, so as to prevent any lateral movements in the plates, and the grooves are made long enough to permit the spring to work up and down freely.

Claim.—Forming the nib under the groove in the manner set forth, for the purpose specified.

No. 47,664.—P. B. SHELDON, Prattsburg, N. Y.—*Flower Stand*.—May 9, 1865.—This invention consists in the employment of one or more sets of radial arms, secured on a vertical standard or shaft, so arranged as to turn horizontally, and to be adjusted up and down to adapt the arms to any position of the flower stand, while at the same time, when thus adjusted, the arms shall be retained in proper position against accidental turning by means of corrugations upon the surface of the plates from which the arms radiate.

Claim.—Providing the bearers *b b b* of the arms and their support *D* with radial flutes and corrugations, or their equivalent, for the purpose of retaining the arms in place at any adjustment thereof, and also allowing them to turn when necessary action is applied, substantially as herein specified.

No. 47,665.—J. N. STANLEY, Brooklyn, N. Y.—*Kiln for Burning Brick and Pottery Ware*.—May 9, 1865.—This invention consists in a flue or flues placed centrally within the chambers, so arranged that the products of combustion from the furnaces placed around the lower parts of the kiln pass directly through the burning chamber, and then descend through the central flue, and through the same to the smoke-stack. A horizontal flue extends to the smoke-stack, and is made to communicate with one or more central flues.

Claim.—The employment in a kiln for burning brick, pottery ware, and like articles of a flue or flues, placed centrally or thereabouts within the burning chamber of the kiln, and arranged in such a manner that the products of combustion from the furnaces, which are placed around the lower part of the kiln, will pass directly upward through the mass of bricks, pottery ware, or other articles placed in said burning chamber, and thence descend through the central flue or flues down to a horizontal flue, and through the same to the smoke-stack.

Also, a horizontal flue *E* extending to the smoke-stack, when said flue is used and made to communicate with one or more vertical or central flue or flues in a kiln for the purpose of utilizing the heat which passes from said flues.

No. 47,666.—MICHAEL JOSEPH STEIN, New York, N. Y.—*Sewing Machine*.—May 9, 1865.—This machine is designed for sewing the soles upon boots and shoes, where the same are turned inside out for the purpose. The platform which supports the sewing mechanism is centred on the driving shaft, and may be raised or lowered by a rack to bring the operative mechanism into proper position relatively to the channel in the shoe where the line of stitching is to be made, the rest passing into this channel and returning the shoe in position. The table supporting the work is also adjustable vertically. A motion is given to the needle in entering and passing through the cloth similar to that in hand-sewing.

Claim.—First, mounting the sewing mechanism upon a platform or frame which oscillates upon the driving shaft, substantially as herein set forth.

Second, the rest *R* applied in combination with the sewing mechanism, supported by the hinged platform *G*, substantially as and for the purpose set forth.

Third, giving to the needle, in addition to its usual motion for penetrating and withdrawing from the material, a slight falling and rising motion, by means substantially as herein described, or any other equivalent means, so as to depress its point while entering the material to be sewed, and raise the same when passing out of said material, for the purpose set forth.

Fourth, the hinged adjustable gauge *H*, applied in combination with the rest *R* and needle *n*, substantially in the manner and for the purpose set forth.

Fifth, the last supporter *I*, with a series of sockets *l*, in combination with a sewing mechanism, constructed and operating substantially as and for the purpose set forth.

Sixth, the vertically-adjustable table *E*, in combination with the last supporter *L*, and with the sewing mechanism secured to a hinged platform *G*, substantially as and for the purpose described.

Seventh, the combination of the hinged oscillating thread guide *t*, looper *l*, and needle *n*, constructed and operating substantially as and for the purpose set forth.

No. 47,667.—J. M. STONE, North Andover, Mass.—*Drawing Frame Rolls*.—May 9, 1865.—To avoid the expense incident to the wearing away of the bearing ends of the shafts of such rolls as have an endwise as well as a revolving motion, (like those in Chase and Stone's patent of March 29, 1864,) the shafts are made in sections, and either projecting, end piece, or section can be removed and a new one substituted. These end-pieces are secured to a flange which is screwed to the head of the rolls; each head having a central shaft hole into which the inner end of these pieces sink, so that all parts of the shaft are in line. The rolls are made of tin, are hollow and braced at intervals by interior heads.

Claim.—The improvement in the construction of drawing frame and other similar rolls, substantially as specified.

No. 47,668.—DANIEL TAINTER, Worcester, Mass.—*Carding Machines*.—May 9, 1865.—By this arrangement the leading-in cylinder can be removed for the purpose of being cleaned, ground, or repaired without the necessity of first removing the burr cylinder and its guard, and working cylinders can be used against the main cylinder, under the leading-in cylinder, with but little inconvenience or delay to the operator in putting in or removing the same.

Claim.—First, the combination with the main frame of a machine for carding wool and cotton of a supplemental sliding frame for supporting the feed-rolls, burr, and leading-in cylinder, and operated by rack and pinion, as and for the purposes set forth.

Second, the combination with the sliding frame H of the racks b, pinions L, and crank shaft d for sliding in and out the frame H, substantially in the manner herein described.

No. 47,669.—J. L. TARBOX, New Orleans, La.—*Illuminated Sign*.—May 9, 1865.—This invention consists of a grooved frame to receive a glass plate covered by metal stencils, held in place by a confining strip between the lines of letters.

Claim.—The changeable illuminated sign herein described, consisting of a grooved or rebated frame B, glass plates D, movable letter plates C, and confining strip d*, all constructed and employed as and for the purpose specified.

No. 47,670.—JOSEPH S. TODD, Macon City, Mo.—*Air-tight Coal Stove*.—May 9, 1865.—This invention consists of an annular metallic plate fitting closely between a basket grate and the cylinder of the stove, at a point about half way up the side of the grate; just below the plate is an aperture in the stove to admit air into the fire chamber.

Claim.—The combination of an air-tight sheet-iron stove, with the basket-shaped grate and the horizontal cast-iron annular plate g, as and for the purposes set forth.

No. 47,671.—E. J. TOOF, Fort Madison, Iowa.—*Hay Elevator*.—May 9, 1865.—This invention relates to a device for elevating articles, and is more especially designed for stacking hay and grain. It consists in the use of a single pivoted beam and a single rope applied to a framing, all arranged so that the mass to be raised will be elevated and deposited in the proper place by a single movement of the beam.

Claim.—First, the pivoted beam or pole C, provided with a rope D, in connection with and inclined guide bar E, all being applied to a suitable framing A, and arranged to operate in the manner substantially as and for the purpose set forth.

Second, the adjustable plate or stop F on the rope D when used in connection with the pivoted beam or pole C and enclosed bar E, for the purpose specified.

Third, the short inclined plane or notch f at the under side of the inclined bar E, for the purpose specified.

No. 47,672.—ISAAC N. VORIS, Pescadora, Cal.—*Shingle Machine*.—May 9, 1865.—In this machine the saw revolves on a shaft journaled in a stationary frame, and the block is clamped in a swinging frame, which is advanced to the saw by a rack bar operated by a pinion from the saw driving mechanism. The block is clamped in its frame by an eccentric roller, and fed after each stroke by means of a cord which operates a rock shaft, pawls, and ratchet wheels, the latter being on the shafts which carry the fluted clamping rollers.

Claim.—First, the swinging frame D, provided with the clamp rollers H F, arranged as shown and operated, through the medium of the rack h, on bar R, the pinion C, levers S T, and the grooves i i in bar R, substantially as and for the purpose set forth.

Second, the eccentric roller J in combination with the spring I, sliding bar G*, lever K, and fluted rollers H F, for clamping or holding the bolt, as set forth.

No. 47,673.—JAMES WENSLEY, New Brunswick, N. J.—*Means for Carrying and Operating the Shuttle in Sewing Machines*.—May 9, 1865.—The shuttle has a grooved tongue the whole length of the face, which supports it in a fixed dovetailed groove in which it travels. A reciprocating slide carries a rocking lever, having pins at each end, one of which is always inserted in a hole in the shuttle; this lever is rocked to operate the pins by means of a third pin thereon, playing in an inclined groove.

Claim.—The combination of the slide H, pivoted traveller I, pins d e f, slot M, horizontal groove 1 and 3, and inclined groove 2, employed in connection with the shuttle B, supported and guided by the tongue o, all the said parts being constructed and arranged to operate as herein specified.

No. 47,674.—GEORGE WRIGHT, Washington, D. C.—*Linchpin*.—May 9, 1865.—This invention consists in providing a safety linchpin, so as to render it almost an impossibility to be displaced from its position in the axle accidentally, at the same time allowing it to be readily removed or put in place by hand.

Claim.—First, the safety or embracing arm D.

Second, the arm D in combination with the pin A, constructed and operated substantially as described, for the purpose set forth.

No. 47,675.—JOHN ZIMMERMAN, Royalton, N. Y.—*Cooking Apparatus*.—May 9, 1865.—This apparatus may be made of tin or sheet metal, and consists of a central chamber encircled by a perforated plate, and having a perforated bottom, through which steam is admitted to the viands placed in the chamber, the whole being surmounted by a lid and surrounded by an exterior casing; it is intended to be placed over a vessel of hot water which rests in a hole in a stove. Various cooking utensils are provided, by means of which all ordinary culinary operations may be performed.

Claim.—First, the combination of the inner perforated receptacle with the exterior shell or casing and the boiler, substantially as described.

Second, the general arrangement of the containing vessel, consisting of the perforated receptacle and its outer casing and the cooking utensils, as described and represented, adapted for special and characteristic purposes therein.

No. 47,676.—GEORGE W. BENTLEY, assignor to himself and CHARLES G. HINE, New York, N. Y.—*Manufacturing of Blacking Boxes*.—May 9, 1865.—The box is constructed by first making the rings, which constitute the body or side of the box, of a plain strip of sheet-metal of the proper width, and turning inwards, one edge of each at right angles to the body of the ring, and forming a flange, against which the disks, which constitute the bottom and top of the box, and which are inserted from the inside, rest; a groove is then sunk in each ring close to the disk, of sufficient depth to bind against it firmly and hold it in place.

Claim.—First, the manufacturing of boxes or cases formed of tin or sheet metal, with heads of wood or other suitable material, turning in at a right angle all round a portion of the metal to form a seat or shoulder for the end of wood, or other suitable material, inserted within the metal after said seat or shoulder has been formed.

Second, inserting the heads of wood, or other suitable material, within the strips of metal previously soldered and provided with the seats, as shown, and creasing the metal for the purposes described.

No. 47,677.—JOHN S. BICKFORD, Tuckingmill, Great Britain, assignor to JOSEPH TOY, Simsbury, Conn.—*Fuse for Blasting*.—May 9, 1865.—This invention consists of a fuse, prepared in the following manner: A strand of cotton is steeped for a few minutes in nitric acid, and washed and dried. It is then steeped in a mixture of equal parts of nitric and sulphuric acids, the nitric acid having a specific gravity of 1.14: it is then washed, dried, and soaked for a short time in silicate of potash, and again dried, after which it is prepared in the same manner as the ordinary fuse.

Claim.—The employment in a fuse, as a substitute for gunpowder, of a central strand or core of gun-cotton, substantially as and for the purpose herein described.

No. 47,678.—HENRY L. BUCKWATER, Kimberton, Penn., assignor to himself, T. A. BUCKWATER, Kimberton, Penn., and E. PRICE, Phoenixville, Penn.—*Washing Machine*.—May 9, 1865.—This invention is fully set out in the claims.

Claim.—First, the convex roller bed B, in connection with a reciprocating roller C, composed of grooved slats, arranged as shown, and controlled or guided in its movement by the slightly curved guides E E, substantially as and for the purpose specified.

Second, the swivel heads or guide rollers D, constructed and applied to the rubber, and fitted on the guides E E, substantially as and for the purpose set forth.

Third, the combination of the convex roller bed B, reciprocating rubber C, guides E E, and swivel heads or guide rollers D, all arranged to operate substantially as and for the purpose specified.

Fourth, the combination of the grooved bottom plate B' and grooved rollers B with a reciprocating rubber, all being constructed and arranged to operate as herein set forth.

No. 47,679.—EDWARD DUNSCOMB, assignor to WILLIAM F. PERKINS and L. L. FULLER, Boston, Mass.—*Apparatus for Carburetting Air*.—May 9, 1865.—This invention consists of an air holder working in an annular space within a proper vessel. Within this vessel is also a cylinder, provided with a series of perforated cones and perforated diaphragms. The air from the air holder is forced down through a tube and rises up within the cylinder, passing through the perforated cones and diaphragms. In this cylinder it is charged with hydro-carbon vapor, and escapes through the tube to be burned. The hydro-carbon liquid is supplied through a pipe.

Claim.—First, the employment of the two air-forcing bells, filling alternately and automatically, thus supplying a constant air-blast, as hereinbefore set forth.

Second, the arrangement and application of the cones and inverted cones *a a'*, *a2*, &c., placed base to base and apex to apex, with the lines of perforations *b b'* (Figs. 6 and 7) alternating from centre to circumference, essentially in manner and to operate as before explained.

Third, the application of the air tube E in the generator to conduct the air through the top of the generator to the recess T at the bottom, to operate as before described.

Fourth, the recess T at the bottom of the generator, making an air cushion, as before described.

Fifth, taking the gas from the top of the generator through the air-bell C by means of an air-tight joint made by the annular cup O and the inverted thimble P, (Fig. 5.) substantially as hereinbefore described.

No. 47,680.—HIRAM W. HAYDEN, Waterbury, Conn., assignor to HOLMES, BOOTH & HAYDEN.—*Lamp*.—May 9, 1865.—This invention consists in corrugating the wick tube in its interior surface.

Claim.—Making the wick tube corrugated or fluted with channels in its interior surface, substantially as and so as to operate as specified.

No. 47,681.—EDWARD M. LANG, Westbrook, Me., and ISAIAH GILMAN, Portland, Me., assignors to themselves, JOSEPH L. WINSLOW, and E. HERSEY.—*Lamp*.—May 9, 1865.—This invention consists in the combination of an inner and outer cone with slots, one being wider and the other narrower at the apex than at their ends respectively, supported by conductors of various sizes and forms, and surrounded by a removable jacket.

Claim.—The above-described combination, as well as the arrangement of the wick tube E, the two cones A B, the metallic annular conduit C, the conductors D D, and the supports D'' D'', or the equivalent of the latter.

Also, the combination of the removable jacket F with the two cones A B, the ring C, and the wick tube, arranged and connected substantially as specified.

Also, the contraction of the mouth of the inner cone at its middle, or its expansion in opposite directions therefrom, in combination with the expansion of the mouth of the outer cone at its middle, or its diminution in opposite directions therefrom, in manner substantially as represented and hereinbefore described.

No. 47,682.—EDWARD MURRAY, New York, N. Y., assignor to FREDERICK WUESTHOFF, Newark, N. J.—*Skate*.—May 9, 1865.—This invention consists in a movable runner combined with a link and adjustable heel screw, and with a sliding cam plate, which operate clamps acting upon the sides of the boot sole to secure the same.

Claim.—The combination of the movable runner *c*, link *h*, and heel screw *k*, with the sliding plate *e* and clamps *f f*, taking the sides of the sole of the boot, as specified.

No. 47,683.—S. P. OCHILTREE and E. C. JOHNSON, assignor to S. P. OCHILTREE, W. S. WEIR, N. P. BAYMOUNT, Monmouth, Ill.—*Saw-filing Machine*.—May 9, 1865.—This invention is too complicated to allow an intelligible description to be given within the limits of a brief, and without referring to the drawing.

Claim.—First, the shaft M, provided with one or more toothed plates N N' N'', and attached to the under side of the slide L, to which the saw clamps are secured, in connection with the pawl or arm E' and lever D', the latter being operated by the cam C, or its equivalent, for the purpose of feeding the saw underneath the file, as set forth.

Second, providing the lever D with an adjustable fulcrum *r*, and having the pawl or arm E' slotted longitudinally, with a set screw F' at its rear for the purpose of regulating the movement of the pawl or arm to suit the size of the teeth of the plates of shaft M, as described.

Third, the lever A', operated substantially as shown, with spring B' applied to it, and connected with the rod Y, having the plate X attached for the purpose of raising the file during the backward movement of the same, and a spring keeping the file pressed down during its forward movement, as set forth.

No. 47,684.—JOHN STEELE, Buffalo, N. Y., assignor to LAWREN C. WOODRUFF, CORYDON KARR, and himself.—*Mode of Pressing Damp Clay*.—May 9, 1865.—This invention consists in forming cells or perforations in the wet clay by means of spurs or pins, to be retained until sufficient pressure has been employed to render the clay self-sustaining in form, but withdrawn before the final pressure is applied; to leave apertures, into which the air and moisture escape from the clay; and in the method of applying the pressure to the clay equally upon both sides by means of platens.

Claim.—The mode herein described of pressing damp clay or other plastic material, to admit of the escape of the air and moisture therefrom before the final pressure is imparted, substantially as and for the purposes described.

Also, the method of pressing the clay for bricks, tiles, and other purposes, by applying the pressure simultaneously from two opposite directions, by means substantially as shown and for the purposes described.

Also, ventilating the mould by means of the perforations *m m* in one of the parts thereof, which is exposed while being filled, but removed before the pressure is applied, substantially as set forth.

No. 47,685.—DAVID B. TETER, Batavia Station, Iowa, assignor to himself and SAMUEL C. DICKINSON, Van Buren county, Iowa.—*Mode of Adjusting Bands on Hand Spinning Machines*.—May 9, 1865.—The pulleys at the end of the track, and over which pass the bands, are free to be turned in the arc of a circle, and are secured in the desired position by a nut; the band passing over one of the pulleys is not endless, but is severed, and its two ends are secured by pins to the periphery of the pulley, and pass around it in opposite directions, thus avoiding any liability to slip.

Claim.—The method of adjusting bands in spinning machines by means of screws and nuts, in combination with the manner of attaching the band to the pulley T, as and for the purposes described.

No. 47,686.—JOHN E. TRAVIS, assignor to himself and ELON FRANCISCO, Greenville, Ill.—*Gang Plough*.—May 9, 1865.—This invention consists in a combination of the plough frames and their ploughs with a fixed frame by means of a fulcrum pin or fixed joint. Also, in an arrangement of levers and connecting links and bolts for raising the plough frames.

Claim.—The combination of the plough frame B and its attached ploughs with the fixed frame A, by means of a fulcrum piece X, or other similar hinged joint, substantially in the manner and for the purpose herein set forth.

Also, the employment of the levers t and t' , with their fulcrums l and l' , and their connecting links e and e' , and their bolts f and f' , when combined with the frame B, substantially as and for the purposes set forth.

No. 47,687.—WILLIAM TUNSTALL, assignor to THEODORE H. CONKLING, New York, N. Y.—*Loom*.—May 9, 1865.—By the rocking motion of the frame, the strain exerted on the warp threads by the operation of producing the web is materially reduced. The selvage warp threads have an up and down motion independent of the motion of the harness. The stop motion devices are actuated by the giving out or breaking of the weft thread at either end of the shuttle race.

Claim.—First, the combination of the shaft k , worms g h , wheels i j , rollers a a' d d' , rocking frame b , arm b_2 , and cam b' , when constructed and arranged to operate as herein specified.

Second, the belts l_2 l_3 and drums l' in combination with the crank l_5 and the heddle cords l_4 , constructed and operating substantially as and for the purpose set forth.

Third, the devices above described for effecting the stop motion, arranged substantially as and for the purpose specified.

No. 47,688.—ETHAN ALLEN, Worcester Mass.—*Metallic Cartridge*.—May 16, 1865.—The base of the cartridge has a central aperture with an interior annular flange, forming a short tube, which is designed to receive a percussion cap provided with a flanged or enlarged base to support it when inserted into the opening at the rear of the said cartridge.

Claim.—First, making the base of the cartridge shell with an opening and a flange b , in combination with grooving out the base B, whereby the body of the cap, as well as the flange which contains the fulminating powder, are well supported, and a sure explosion insured, substantially as described.

Second, the combination with the case A of a base B, provided with three flanges a b and c .

No. 47,689.—GEORGE ANDERSON, Salem, Oregon.—*Making Sheet-metal Boxes*.—May 16, 1865.—This device consists of five leaves hinged side by side, the middle one constituting the bed or bottom, the two adjoining ones on either side, and the outer ones of half the size being intended to clamp and bend the sides and top of the box. To one end of the middle leaf is hinged a block or mould, the four sides of which correspond in shape and size to the leaves by which it is to be surrounded. In operation the mould is held upward nearly vertically by a spring until the sheet to be bent is adjusted on the leaves, when it is brought down and secured by a spring latch. The hinged leaves are then, by means of arms attached thereto, and a treadle, brought up against the sides of the mould and the outer half leaves pressed over the top thereof, and the bending of the sheet completed.

Claim.—First, the mould A in combination with the form C, the latter being composed of the plates a f g g , connected by hinges e h , and the mould being attached to the plate a of C by a hinge B, all arranged substantially as and for the purpose set forth.

Second, the spring D in the described combination, with the hinged block A, for raising the same automatically, as explained.

Third, the arms k k , in the described combination, with the hinged plates F F, for the purpose specified.

No. 47,690.—JONATHAN BAILEY, East Troy, Wis.—*Snap Hook*.—May 16, 1865.—This invention consists in constructing a snap hook with a sliding bolt working through projections thereon, and kept in a closed position by a spiral spring coiled around the same so as to prevent its accidental detachment.

Claim.—The combination of the sliding bolt with the snap hook and spiral spring coiled around the bolt as described, for the purposes set forth.

No. 47,691.—STEPHEN S. BARTLETT, Providence, R. I.—*Harvester*.—May 16, 1865.—This invention relates to the arrangement of means for regulating the pressure of the inner shoe or heel end of the cutting apparatus on the ground, and will be understood from the claim.

Claim.—The combination, with the shoe D, of the pivoted spring brace E, fixed spring brace G, lever H, and rack f , all arranged in relation to the main frame, as and for the purposes described.

No. 47,692.—STEPHEN S. BARTLETT, Providence, R. I.—*Mowing Machine*.—May 16, 1865.—This invention will be understood from the claim and engraving.

Claim.—The use of the socket f , cast with the pole plate, in combination with the adjustable standard K, for supporting and adjusting the seat, substantially as herein described.

No. 47,693.—WILLIAM E. BATES, Elmore, Ill.—*Cultivator*.—May 16, 1865.—In this invention swinging levers, to be operated by the foot, are so connected with the forward and rear shovel standards, and so pivoted to the laterally-moving mechanism that one movement of the foot adjusts in the same line both shovels.

Claim.—The swinging levers Q Q connected substantially as described, with the forward and rear shovel standards, which are pivoted in such relation to the frame and laterally-moving mechanism that the two shovels thus connected are caused, by the action of the treadle, to approach to or recede from the corn in concert, as described and represented.

No. 47,694.—J. LOWDEN BEADLE, Ashland, Pa.—*Ventilation of Mines*.—May 16, 1865.—In this invention the circulation through the downcast shaft and air passages in the mine is caused by a fan blower in the upcast shaft. Alongside the breasts are temporary air courses, constructed as the work progresses, of plank and timber, through which the air circulates about the points where the miners are at work, and thence to the upcast shaft. These air courses are broader at base than at top, and are sufficiently large to allow the miners to pass through in going to or returning from their work.

Claim.—The use of the fan as an exhauster of the impurities of mines, or for the purpose of creating a partial vacuum in the working parts thereof, in combination with the system of air courses herein represented and described.

No. 47,695.—AUGUST BICKEL, Philadelphia, Penn.—*Crutch*.—May 16, 1865.—This invention consists in the use of a cup made of vulcanized India-rubber, which is screwed over the point of the crutch when it is used indoors; also, in the use of a perforated thimble, which, when the point is not covered, is screwed over its screw thread and thus protects it from injury.

Claim.—The employment of a removable buffer D, in combination with the spur B, fixed rigidly in the lower part of the crutch staff A as described, the said buffer being constructed so as to be applicable over the spur, in the manner described and for the purpose specified.

Also, the employment of the removable guard thimble C, in combination with the spur socket E on the lower end of the crutch staff A, as described, the same being constructed so as to be applicable in the manner and for the purpose set forth.

No. 47,696.—LYMAN R. BLAKE, Boston, Mass.—*Constructing Boots and Shoes*.—May 16, 1865.—In shoes not made as "turns," it has been necessary to use an inner sole upon the bottom of the last, to which sole the vamp is "lasted" or temporarily secured. It has been the practice to make such inner soles nearly of the size of the outer sole, so that the fastenings by which the outer sole and vamp are secured together have passed through the inner sole also. To make a shoe without "turning" it, and so that the inner sole can be removed if desired, (it being of the nature of a filling and not an integral part of the structure,) is the object of the invention, which consists in the employment in "lasting" the vamp of an inner sole made so narrow that the permanent fastenings of the outer sole will not enter the inner sole, which is, however, made wide enough to receive the fastenings used to "last" the vamp.

Claim.—The new process of constructing a shoe, substantially as set forth.

No. 47,697.—M. BONNEY, Mantua, Ohio.—*Machine for Measuring and Counting Shingles*.—May 16, 1865.—The object of this invention is to measure and estimate the number of shingles by machinery, and it consists of a reciprocating lever to which is attached suitable fingers, that take hold of and force under a wheel that revolves by passing the shingles under it that are to be counted, all secured to a proper frame. To the shaft of this wheel is attached a worm wheel which operates a pinion or index wheel so that, when shingles shall have passed under the periphery of the large wheel to cause the index wheel to make one revolution, they will count a thousand.

Claim.—The measuring wheel F and recording index I K, in combination with the slide G, hooks m and c c, dog g, and adjustable arms D D, arranged and operating as and for the purpose set forth.

No. 47,698.—EDWARD BUCKLIN, JR., Pawtucket, R. I.—*Clothes Dryer*.—May 16, 1865.—This invention consists in a rod fitting into a socket in a stationary post and arranged to slide in a socket without being allowed to turn, in combination with radiating arms extending from a sleeve which swivels on the upper end of the said longitudinally sliding central rod, and with braces hinged at one end to the arms.

Claim.—The longitudinally sliding rod E forming the guide for the revolving sleeve or swivel D, in combination with folding arms C, hinged braces b, ring B, and post A, constructed and operating substantially as and for the purpose set forth.

No. 47,699.—JAMES BREWER, Albany, N. Y.—*Cultivator*.—May 16, 1865.—In this invention the central pair of plough standards are secured by swivel hinges and have adjustable stirrups for the feet and for the knee, to aid in adjusting the ploughs.

Claim.—First, securing the central pair of cultivator standards to the plough beams by

means of swivel hinges for the purpose of admitting them to be moved in a vertical as well as in a lateral direction, substantially as and for the purpose specified.

Second, in combination with the laterally movable standards *O*, adjustable stirrups *r*, substantially as and for the purpose specified.

Third, in combination with the laterally movable standards *O*, the extension pieces *p* and knee stirrups *s*, for the purpose of enabling the ploughman to operate the ploughs by hand or foot, substantially as and for the purpose specified.

No. 47,700.—FERDINAND E. CANDA, Chicago, Ill.—*Railroad Car Brake*.—May 16, 1865.—This invention consists in applying an eccentric or cam wheel to the lower end of the windlass, by which the car brakes are operated; also in providing such eccentric or cam wheel with a band for distributing the pressure and in combining this device with other parts of a car brake.

Claim.—First, the belt *a* when used for distributing the pressure on the wheel *b*.

Second, the combination of the eccentric wheel or cam *b* and the belt *a* with the connecting rod or chain *c*.

Third, the arrangement of the shaft *m*, eccentric wheel or cam *b*, belt *a*, and the ratchet and pall *i* and *h*, all being arranged and operating substantially as set forth and specified.

No. 47,701.—JOSEPH CASEY, Washington, D. C.—*Device for Heating and Conveying Petroleum*.—May 16, 1865.—This invention consists in providing a pipe of suitable diameter for conveying the oil from any number of wells. Inside this pipe a tube is arranged which connects at different points along the line with the steam tubes therein, the requisite amount of heat being provided to keep the oil limpid and allow it to flow freely for any required distance. Before entering the conduit the oil is raised into measuring tanks, from which it passes through a tank having a pipe in it which is kept filled with steam, so that the temperature of the oil is raised to some extent before entering the conduit.

Claim.—First, the combination of steam generators, tanks, the conduit pipes and the steam pipe and their various connections, for conveying the oil or petroleum from the wells to the receiving, gauging, and heating tank, for raising it there to the proper temperature, and from thence conveying it to any required distance in the conduit pipes into other tanks, and maintaining its temperature while passing through the same by means of the small steam pipe and its connection with the generators.

Second, the arrangement of the small steam pipe or tube within the conduit pipe, whereby the introduction of steam into the small pipe will apply and communicate such an amount of heat directly to the oil, petroleum, or other substance in its flow and passage through the conduit pipe as will keep it in a fluid and flowing state and prevent the deposit and accumulation of the sediment or residuum of the oil or petroleum in the conduit pipes, it being held in solution by and carried off with the petroleum.

No. 47,702.—SALEM COPELAND, Worcester, Mass.—*Guard Fingers for Harvesters*.—May 16, 1865.—This invention will be understood from the claim and engraving.

Claim.—First, coring out the rear of the guard finger, in combination with fastening the steel plate by a short rivet, to secure lightness and greater uniformity in the metal thickness of the guard, in the manner herein described.

Second, coring out the rear of the guard finger, in combination with supporting the bridge *g* by an inclined brace *h*, substantially as and for the purpose described.

No. 47,703.—J. CRELLIN, Marshalltown, Iowa.—*Horse Hay Rake*.—May 16, 1865.—This invention relates to that class of rakes known as "revolving" or "tumbling" rakes. The teeth are constructed of two longitudinal strips of wood, secured to opposite sides of the head, and fastened together at their ends by metal tips. The draught bars are braced obliquely, the braces being grooved to bear upon the extremities of the head, which is made cylindrical for the purpose. There is a combination of frame levers and springs, by means of which the rake is unlocked and allowed to revolve, and again automatically locked in working position.

Claim.—First, the constructing of the teeth of two longitudinal parts *a a*, attached to opposite sides of the rake head *A*, and connected at their ends by metal tips *b*, substantially as described.

Second, the oblique braces *C*, attached to the draught bars *D* and arranged to rest or bear upon the cylindrical portions *c* of the rake head *A*, as set forth.

Third, the arrangement and combination of the frame *I*, pivoted to the outer part of the bars *E E* and the pendent frame *G*, the two frames aforesaid being connected by a rod *H*, and the frame *G* connected by springs *h h* with the bars *E E*, substantially as and for the purpose set forth.

No. 47,704.—JOHN H. DOOLITTLE, Ansonia, Conn.—*Machine for Making Clasps from Sheet Metal*.—May 16, 1865.—This invention consists of two pairs of revolving dies, adjustable to or from each other, as well as longitudinally on their axes. The first or forward pair cut out from the sheet and separate from it and from the waste a row or strip of blanks connected together, and feed them, by means of a bridge between the two, to the second pair of dies, by which they are bent to the proper shape, and are cut off and separated from each other.

Claim.—The combination of two or more sets of rotary dies to cut out and form the blanks, when constructed, arranged, and operating substantially as described.

Also, making the sets of dies adjustable, substantially as described, for the purpose of registering differently and adapting the machine to different kinds of work, as hereinbefore described.

Also, making one or both sets of the above-described dies adjustable in the direction of their axes, substantially as described, for the purpose of setting the dies in line, one set with another, as set forth.

Also, the employment, in combination with the female die *b*, of a sustaining and disengaging guide plate *W2* as its equivalent, substantially as and for the purposes set forth.

Also, in combination with the rotary dies *c d*, the series of clearing figures 4 5 6, the whole arranged and operating as specified for the purpose set forth.

Also, in combination with the cutting-out dies *a b*, the cleaver and chute *h*, and deflector *i*, arranged to operate substantially as set forth.

No. 47,705.—G. W. DOTY, Ravenna, Ohio.—*Siphon Bottle.*—May 16, 1865.—This invention consists of a bottle provided with a cork through which pass two India-rubber tubes. One of the tubes is attached to a glass tube, which extends down into the bottle, the said tube being turned up at its lower end to prevent the sediment from entering and going over with the decanted liquid.

Claim.—The tubes B and D, in combination with the tube E and bottle, when connected and arranged substantially as described.

No. 47,706.—EBEN EDWARDS, Boston, Mass.—*Heating and Cooking Range.*—May 16, 1865.—In this invention the range proper is arranged in front of a chamber built of masonry, in which are flues for economizing and radiating the heat. In front of this and a little above the range is an oven. By the sides of the fire-pot are smoke chambers, and the products of combustion flow thence up and through the chamber surrounding the oven, and by a pipe in its rear into a drum at top and in the back of the flue chamber, and thence to the exit pipe. A pipe from near the fire chamber extends at a right angle at the back of this flue chamber, and communicates with the above-named drum. There are two horizontal tubes in either side of the range, one above the other, on one side the ends being open to the air. These serve as bearings for the grate journals, and admit air above or below the point of combustion.

Claim.—The above-described arrangement of the lateral conduits M M, the radiating drum K, the air-heating chamber P, the fireplace A, the smoke chamber B, the oven and its flue space G, connected with the fireplace and the radiator, as specified.

Also, the combination of the tubes V W leading out of one end of the fireplace and through the air chamber with the grate shaft, the fireplace, and the journal bearings *x x* at the opposite end of the fireplace, the whole being substantially as specified.

No. 47,707.—WILLIAM H. ELLIOT, Plattsburg, N. Y.—*Cylinder Pin of Revolving Fire-arm.*—May 16, 1865.—In this invention the centre pin, on which the cylinder revolves, is made but slightly longer than the cylinder, and is provided at either end with a short cross head, the rear end of the pin being also furnished with a flat arm, which plays between the rear of the cylinder and the breech of the frame. A slot opening on one side from both the front and rear sockets of the pin, permits the cylinder and its centre pin to be inserted into the frame laterally, the cross heads of the pin passing into the said slots, and when in position a slight rotation of the pin by means of its rear arm serves to lock the same after the manner of a bayonet joint.

Claim.—First, locking the cylinder into the frame by turning the base pin upon its axis, substantially as set forth.

Second, providing a base pin, which locks the cylinder by being turned upon its axis, with a catch *d*, to prevent its from being turned back by accident, substantially as described.

No. 47,708.—THOMAS FARNSWORTH, Cleveland, Ohio.—*Mangle.*—May 16, 1865.—This invention consists in the rollers being hung in hangers that work in connection with slotted frames or standards, and their combination with folding tables and an endless apron on rollers, the tension being kept up by springs.

Claim.—First, the arrangement of the hanger J and rollers A B, in combination with the spring *m*, screws *d*, and gearing G H, substantially as and for the purpose specified.

Second, the springs P and rollers *k*, in combination with the tables O P and apron R, when arranged and operating in the manner and for the purpose described.

No. 47,709.—WILLIAM C. FISHER, Charlestown, Mass.—*Sash Supporter.*—May 16, 1865.—This invention consists in cutting away the corners of the window sash next the bottom of the grooves in which they slide, and attaching metal boxes, in which, at the bottom, is arranged a lever, and at the top a presser block. The said lever is suspended upon a fulcrum at its centre, one arm projecting upward and the other downward. In front of the downward end the metal box is cut away, so that the end of the lever may be pressed out into

notches in the side of the frame by means of springs, fastened to the back of the lower end, and against the other side of the box. The presser blocks are also pressed out against the upper part of the inside of the frame, which prevents the sash from rattling and keeps the joints tight.

Claim.—The levers *D* and notches *d*, operating substantially as described, for the purpose set forth.

Also, the presser blocks *e*, when used as an adjunct to the levers *D*, operating substantially as described, for the purpose specified.

No. 47,710.—E. F. FRENCH, New York, N. Y.—*Corn Huskers*.—May 16, 1865.—This invention consists in adding to the rollers commonly used two upright plates, or corrugated scrapers, placed directly underneath to prevent the husks from winding around the rollers.

Claim.—The employment or use of the plates or scrapers *G*, in connection with the rollers *F F*, arranged and applied to operate substantially as and for the purpose herein set forth.

No. 47,711.—JACOB FRICK, Philadelphia, Penn.—*Shutter Fastening*.—May 16, 1865.—In this invention metal plates are fastened upon the inside of the shutters opposite to each other. One plate has a spindle projecting inward from it, upon which is pivoted an arm, which has upon its other end an eye through which another spindle passes, having on its inner end a lug or lever and upon its opposite end a flat-head, the shoulders of which are planes inclined in opposite directions. The said flat-head passes through an oblong opening in the plate upon the opposite shutter, the lever being held in a horizontal position, when, by turning the lever downward to a vertical position, the inclined planes engage with other inclines upon the opposite side of the plate, and draws the shutters together very tightly.

Claim.—The plate *B*, its arm *D*, spindle *E*, its head *g*, and inclined shoulders *x x*, in combination with the plate *A* and its slot *X*, the whole being arranged, operated, and adapted to shutters, substantially as and for the purpose herein set forth.

No. 47,712.—GEORGE H. GARDNER, New York, N. Y.—*Revolving Fire-arm*.—May 16, 1865.—In this invention the pistol is provided with double cylinders, one immediately behind the other, one of the chambers in the forward cylinder being bored through, so as to act as the barrel for the rear cylinder. A catch is so arranged that either cylinder may have its charges successively fired before or after the other.

Claim.—First, the employment or use of two or more cylinders presented in the same direction, one behind the other, and arranged in combination with one and the same hammer, substantially as and for the purpose set forth.

Second, the slide *I*, applied in combination with two cylinders *C C'*, and hammer *H*, constructed and operating substantially as and for the purpose described.

Third, the spring catch *k*, applied in combination with the two cylinders *C C'* and slide *i*, substantially as and for the purpose specified.

Fourth, firing the charges of the rear cylinder through the front cylinder, substantially as herein specified.

Fifth, the grooved-headed button *j* of the slide *i*, constructed and adapted to operate as a sight, as herein explained.

No. 47,713.—MILTON GILMORE, Morning Sun, Iowa.—*Cooking and Heating Stove*.—May 16, 1865.—This invention consists of a stove, provided with a hood, with a sliding door in front glazed in any suitable way. The fire pot is in the centre of the stove, with a direct draught, if required, or indirect, through flues over the oven, on either side of fire pot, down sides and underneath, and at the back of the stove, to exit-pipe. There are also flue passages in the double plates at the sides, on the back, and top of the hood. Suitable dampers control the draught, so that the radiation of heat can be easily regulated.

Claim.—First, the flues, leading from the fire pot *F* around ovens *O O* and between the plates forming the sides and top of the hood to exit-pipe, in connection with dampers *h h* and *p p*, in the manner and for the purpose set forth.

Second, the manner in which the fire pot is placed with grate and pit, as described.

Third, the combination and arrangement with fire pot *F*, of apertures 2 and 4 and dampers *p p*, substantially in the manner and for the purpose described.

Fourth, the hood of the stove, constructed and arranged with the flues wholly extending around side and top, in connection with the dampers *h h*, substantially in the manner and for the purposes described.

Fifth, the apertures *A'* in the top of a stove, with side and top flues, and an illuminated sliding shield *D' D'*, in combination with the fire pot *F*, in the manner and for the purpose set forth and described.

No. 47,714.—ALEXANDER N. GLASS and HENRY W. BARTOL, Philadelphia, Penn.—*Centrifugal Draining Machine*.—May 16, 1865.—This invention consists in increasing the thickness of the revolving plate at the edges, and forming a groove in the thick part to receive the wire-gauze. By this means the wire-gauze is prevented from being injured by the scoops used in removing the sugar from the bottom.

Claim.—In centrifugal draining or drying machines, the thickening of the perimeter of the

bottom plate of the revolving cylinder, and forming a groove, recess, or shoulder therein, so that the bottom of the wire-gauze cylinder may rest therein and below the surface over which the instrument is moved in scooping out the sugar, by which means it is protected from injury, substantially as herein described.

No. 47,715.—ALEXANDER GRILLET, Philadelphia, Penn.—*Combined Implement for Detaching and Replacing the Parts of Small Arms.*—May 16, 1865; antedated May 1, 1865.—This device is so constructed that by means of two arms pivoted together the same carrying studs, the main-spring, can be retracted. A nipple wrench, worm, screw-driver, &c., are also attached, making one compound implement.

Claim.—First, the two arms A and B, hinged to each other and provided with the studs herein described, or the equivalents to the same, the whole being arranged for acting on the main spring of the fire-arm, substantially as described.

Second, the two arms A and B in combination with the movable stud *b*, its screw for carrying the wiper and the ball screw, and tumbler punch *e*.

Third, the combination of the two arms A and B with the cone and nipple wrench *a* at the end of the arm A.

Fourth, the screw-driver C and band punch *d* hung to a pin on the arm B, as set forth.

No. 47,716.—GEORGE HALL, Morgantown, West Va.—*Bread Slicer.*—May 16, 1865.—This invention consists in a peculiar arrangement of levers and links applied to a knife, and used in connection with a bed-piece, whereby the knife is made to operate with a drawing cut.

Claim.—An implement or device for cutting or slicing bread, meat, and other substances, composed of levers and links applied to or connected with a knife and bed-piece, in the manner substantially as described.

No. 47,717.—WILLIAM H. HARTMAN, Fostorio, Ohio.—*Motive Power.*—May 16, 1865.—In this invention rotary motion is produced by means of a pendulum similar to a clock movement.

Claim.—First, the special arrangement of the arms E F and plates I J in combination with the pinions *m n*, gear P, and disks H, when arranged and operating conjointly as and for the purpose set forth.

Second, the combination with the above plate *b*, pendulum C, springs *d*, in combination with the wrist *a* and arms E F, when operating conjointly as and for the purpose specified.

No. 47,718.—ROBERT HATRICK, Paterson, N. J.—*Tire-fastener.*—May 16, 1865.—This invention consists in forming a wedge-shaped dovetail recess in the edge of the tire, in which is fitted the corresponding-shaped head of a bolt, the shanks of which passes diagonally through the felly of the wheel, and is tightened by a nut on the opposite part inside. When the tire is without an inwardly projecting flange, the bolts are placed one alternately on each side of the felly.

Claim.—First, the arrangement of the felly A, tire C, and bolt E, as described—that is to say, the bolt passing or extending into a notch in the edge or cheek of the tire, and extending obliquely through the felly of the wheel, thereby securing the tire in position, as hereinabove set forth.

Second, so constructing the tire C and the head of the bolt E that the latter shall be dovetailed into the former, so as to resist lateral pressure in either direction, as set forth.

Third, the combination of the longitudinally wedge-shaped section of the bolt E with a wedge-shaped recess in the tire, substantially as and for the purpose set forth.

Fourth, the combination of a dovetailed recess in the felly A with a dovetailed recess in the tire C, and with a head so formed upon the bolt E as to fit both of said recesses, substantially as and to the effect above stated.

No. 47,719.—JOHN M. HAYWARD, Boston, Mass.—*Ambulance.*—May 16, 1865.—A saddle is provided with a socket of the shape of an inverted wedge, which receives the corresponding wedged-shaped legs of a stretcher. These legs extend downward through the socket so as to bear firmly against the side of the saddle. The socket is provided with an opening to allow of the passage of braces, which extend under the body of the stretchers for the purpose of giving it additional strength.

Claim.—Attaching the stretcher C to the saddle by means of the wedge-shaped legs *b* and corresponding socket *a*, substantially as set forth.

No. 47,720.—B. H. HEITMANN, Hoboken, N. J.—*Anchor Tripper.*—May 16, 1865.—This invention consists in certain devices for tripping the anchor of a vessel, whereby much time and labor is saved in throwing it off from the rail, it being only necessary to raise a lever which rests upon the rail in order to disengage both the shank painter and the ring stopper at one movement.

Claim.—The anchor-tripping device above described, consisting of the rotating bar or keeper D, with its troughs *f f* and the latches *c c*, constructed and operated substantially as above set forth.

No. 47,721.—JOSHUA HENDY, San Francisco, Cal.—*Blow Pipe*.—May 16, 1865.—In this invention the mouth-piece is at right angles with the eduction pipe, and is provided with a check valve. An elastic bag is fitted to a short pipe near the extreme end of the mouth-piece, and directly opposite the eduction pipe, as a reservoir to hold the air, the flow of which is controlled by a stop cock in the eduction pipe.

Claim.—The combination with the pipe A of the valve F, tube C, and elastic air chamber D, all constructed and arranged as and for the purposes specified.

Also, the combination with the pipe A of the valve F, tube C, and elastic air chamber D, and stop-cock H, when constructed and arranged as herein described.

No. 47,722.—WILLIAM HENDERSON and J. W. FOWLE, Boston, Mass.—*Starting Horse Railway Cars*.—May 16, 1865.—This invention consists in an arrangement of devices by which a ratchet, fixed upon one of the axles of a street car, may be operated by the foot of the driver, and also in a peculiar mechanism for engaging and disengaging the ratchet pawl for the purpose of assisting the horses in starting the car.

Claim.—The combination of the ratchet pawl, ratchet lever, foot rod, and lifting spring, when arranged to operate together, substantially as set forth.

Also, the combination of the rod *i*, spring *n*, rocker plate *k*, and rod *l*, for effecting the engagement and disengagement of the ratchet and pawl.

No. 47,723.—C. P. HEWETT, Kingston, Wis.—*Railroad Car Axle*.—May 16, 1865.—This invention consists in constructing a railroad car axle of two separate parts, connected by a sleeve in such manner that one part of the axle with its wheel, may rotate independently of the other.

Claim.—The combination of the axles A A with their circumferential grooves *c c*, the sleeve B, the pins *d d*, with their set screws *e e*, and the lubricating orifice *f*, substantially as described and represented.

No. 47,824.—LAWRENCE HOLMES, Paterson, N. J.—*Boring Wells*.—May 16, 1865.—This invention consists in a machine, the principal characteristic of which is that its driving gear rotates about, and its working parts are arranged around a central hollow shaft, concentric and parallel with the axis of the drilling tool, and the interior of which may be considered as a neutral or dead centre of the machine.

Claim.—First, in a machine for drilling oil wells, or other drilling operations, in which a jumping motion is given to the drill, so arranging and applying the driving wheel or other wheel or device, through which power is applied to produce the jumping motion, that it rotates about a hollow shaft or axle through which the drill-rod passes, substantially as herein described.

Second, the combination of the sleeve M, or its equivalent, fitted to slide upon the drill rod or bar D, or the tube E, from which it is suspended, the grippers L L, the shafts I I, and the cams K K, the whole arranged and operating substantially as herein described.

Third, the employment for lifting and jumping the drill or boring tool by means of a rope and grippers, or a tube E, clamped to the rope, but adjustable lengthwise thereon as the tool descends, substantially as herein specified.

Fourth, in combination with the longitudinal groove *h* in the tube E, from which the drill or boring tool is suspended by a rope, a pawl *i*, so applied to the driving wheel G, or other device from which the rotary motion of the tool is obtained, as to provide for the release of the said rod, bar, or tube, to allow the rope to relieve itself or be relieved of excessive twist, substantially as herein described.

Fifth, the combination of the hollow central shaft C, internally toothed driving wheel G, shafts I I, pinions J J, cams K K, sleeve M, or its equivalent, and grippers L L, the whole arranged and operating substantially as and for the purpose herein specified.

Sixth, the arrangement of the standard B, the fixed hollow upright shaft C, through which the drill-rod passes, and the driving wheel G, substantially as herein described, whereby a clear space is left all around the said wheel to permit it to be operated by means of beams or capstan bars, as herein set forth.

No. 47,725.—B. B. HOTCHKISS, New York, N. Y.—*Packing Projectiles for Rifled Ordnance*.—May 16, 1865.—The Hotchkiss projectile is provided with a cap of the same diameter with the main body, and connected with the main body by means of a lead casting placed between. Within the cap, and between it and the head of the main body, is a cavity, about one-fourth of the width of which is taken up by a disk of pine wood. When the projectile is fired out of a gun, the force of the explosion drives the cap forward with such force as to render liable the fracture of one or both parts. The elasticity of the wooden disk, by gradually arresting the motion, saves the parts from fracture.

Claim.—The employment of the soft disk or cushion D, in combination with a Hotchkiss projectile, and arranged to operate in connection therewith, substantially in the manner and for the purpose herein set forth.

No. 47,726.—HENRY M. HOUSE, Washington, D. C.—*Movable Joint for Tables*.—May 16, 1865.—This invention consists in arranging two plates of metal so that when they are screwed on the part of the article to be joined their faces will be at right angles with each other. Upon the back of one plate there are two hooks, having in them slots; upon the back of the other is a stud, which has a mortise corresponding with the slots in the other plate. When the two plates are put together a key is driven through the mortise and slots, holding them tightly together.

Claim.—The combination and arrangement of the parts, which consist of the plate A, with the mortised stud B attached, a hooked flanch D, and a tapering key C, the same being applicable for fastening all movable joints in the manner described, for the purposes herein set forth.

No. 47,727.—S. R. and W. S. HUNTER, Cortland, N. Y.—*Boring Apparatus*.—May 16, 1865.—This invention consists in an apparatus for sinking wells, and simultaneously lining the same with suitable tubing, so that the drilling rod shall be at all times protected from contact with the material through which the well is sunk, and the water will find free inlet to the well so soon as the stream is reached.

Claim.—The combination of a boring or drilling tool *a* with the lower end of a cylinder or tube A B, and with a detachable drilling rod E, for the purpose of boring and bottoming a well, when said cylinder or tubing is smaller in diameter than the upper end of the tool *a*, and is made to rest thereon, substantially in the manner herein set forth.

Also, the combination of the hand lever G with the frame-work M N, the drill-rod E, and tubing B, arranged and constructed substantially in the manner and for the purpose herein set forth.

No. 47,728.—WILLIAM H. HUNTER, Bridgeport, Ill.—*Corn Planter*.—May 16, 1865.—In this invention, the seed-slide is operated by a hinged forked-lever. This lever is operated by adjustable and removable cams upon the spokes of the single draught-wheel.

Claim.—First, adjustable slide B, constructed, arranged, and operated substantially in the manner and for the purpose described.

Second, jointed or hinged lever T, reel P, and vertical standard N, constructed and operated substantially in the manner and for the purpose set forth.

Third, the blocks or cams L L, attached to the spokes of the wheels by set screws when said cams are made adjustable or movable, in combination with the hinged lever T, rod P, vertical standard N, as specified.

No. 47,729.—WALTER HYDE, New York, N. Y.—*Boring Wells*.—May 16, 1865.—The objects of this invention are to operate the drill-rope, to provide facilities for arresting the motion of the drill without stopping the machinery, and also to provide facilities for changing the action of the motor force (that of operating the drill) to that of withdrawing it.

Claim.—First, the combination of the reserve rope drum L, the sheave J, the vibrating lever G, and its pulley F, the upper pulley C, the rope D, drill-stock and tripping cams, so that all the motions of the drill-stock are governed through the medium of a continuous rope.

Second, attaching the end of the drill-stock to a continuous rope, which is paid out as is required, by the settling of the drill in the well, in connection with devices by which the rope is swayed or retracted to give the reciprocating motion to the drill-stock, and with devices by which the drill-stock is withdrawn without detaching the rope or stopping the motion of the prime motor.

Third, the lever U, in combination with the plate V, or other detail for arresting the motion of the vibrating lever.

Fourth, in connection with the subject-matter of the second claim, the lever W, as a means of changing the action of the motor from a drill-operating mechanism to a drill withdrawing mechanism.

No. 47,730.—MELVIN JINKS, Dansville, N. Y.—*Mop*.—May 16, 1865.—This invention consists in the use of certain devices designated in the claim, for the purpose of forming a wringing mop.

Claim.—The bars *d* and *g*, the handle A, the sleeve *b*, and the rods C C, the whole arranged as and for the purpose herein specified.

No. 47,731.—JOSEPH JOHNSON, New York, N. Y.—*Fruit Jar*.—May 16, 1865.—This invention consists in providing a fruit jar with a protecting frame composed of two side pieces of wood or other material, connected together by the pieces, and the cover is kept in its place by means of the screw passing through the piece.

Claim.—First, enclosing the inner or tin can A within a casing G H I J wider than the can A, so as to protect it from the pressure of the adjacent cans in being filled, without the necessity for closing the remaining faces of the casing, all substantially as and for the purposes herein set forth.

Second, the screw D, or equivalent mechanical device, in combination with a detachable and protecting case, and adapted to compress the cover C and the can A firmly together, and

to release the same, as described, substantially in the manner and for the purposes herein set forth.

Third, in combination with a protected can A, locking together the parts of the protecting envelope, by inserting the ends of the cross-pieces G and H into channels in the parts I and J, at a considerable distance from the ends of the latter, so as to strengthen the envelope and protect the head of the thumb screw D, or its equivalent, by the projecting ends of I and J, substantially as herein set forth.

No. 47,732.—W. J. JOHNSON, Newton, Mass.—*Flour Sifter*.—May 16, 1865.—This invention consists in combining with a common hoop-sieve, a rotating scraper, moved by a shaft and crank, for the purpose of agitating and forcing the flour through the sieve, for family purposes.

Claim.—Combining with a common hoop-sieve, a rotating scraper D, actuated and guided by the shaft E, crank F, and bar C, or their equivalents, substantially as and for the purpose described.

No. 47,733.—HENRY S. KASSEBAUM, New York, N. Y.—*Portable Lantern*.—May 16, 1865.—The nature of this invention consists in the construction of a portable lantern, with pasteboard top and bottom, and sides of folded paper or muslin.

Claim.—The folding sides, in combination with the top and bottom, and handle for carrying the same, substantially as described and for the purposes set forth.

No. 47,734.—GIBBONS L. KELTY, New York, N. Y.—*Window Shade*.—May 16, 1865.—On the surface of window shades, are affixed ornaments of paper or muslin, on which printed or embossed figures may be executed, if desired, so as to form additional ornaments of great beauty, at a trifling expense.

Claim.—Manufacturing muslin window shades, with paper or other suitable material attached to the surface of such shade, and forming the ornaments to the same, or receiving printed or embossed designs, as specified.

No. 47,735.—W. W. KITHLEMAN, Bloomfield, Iowa.—*Hames-fastening*.—May 16, 1865.—This invention consists in a pivoted loop-catch, applied to one of the parts of the hames, in connection with a perforated link, which is pivoted to the other part of the hames, and has its free end passed through the loop-catch, and retained by means of the tongue of the loop.

Claim.—First, the link D with oblique slots through or in it, in the manner and for the purpose described.

Second, the combination of the groove *d*, shoulders *e*, and slots or holes *c c*, in the manner and for the purpose described.

Third, the loop-catch *c*, constructed as described, for the purposes set forth.

Fourth, the combination of the hames, loop catch, and link D, constructed, applied, and operating substantially as herein described.

No. 47,736.—JOHN LACY, Chicago, Ill.—*Horse Rake*.—May 16, 1865.—This invention consists in making the arms of the axle vertically adjustable, and in supporting the foot rack by which the rake is filled, by braces, which are also vertically adjustable.

Claim.—First the arms G of the axle, when provided with a projection and holes *i i*, for raising or lowering the axles.

Second, the foot rack F F and *a*, when supported by braces provided with holes for raising and lowering it.

Third, the combination of the foot rack F F, braces H H, and treadle E, with the axle A, all being arranged, constructed, and combined, substantially as set forth and specified.

No. 47,737.—W. BARNET LE VAN, Philadelphia, Penn.—*Pump*.—May 16, 1865.—This invention relates to an improvement in the construction of pump pistons, for the purpose of rendering cupped leather packings more durable by sustaining them in correct form and position, when in use; and also of a combination of valves therewith, for easy access for inspection and cleansing.

Claim.—The plunger B, composed of the parts J K L M N O and P, as described.

Second, the channel-way D E, and valves F and G, arranged in relation thereto, as drawn and described.

No. 47,738.—JUDAH LEVY, Philadelphia, Penn.—*Hoop Skirt*.—May 16, 1865.—In this invention the hoop passes through a pocket on the inside of the vertical tape. A strip of skirt wire then clamps the tape to the hoop on the outside, said clamping strip being held to the hoop by the clasps.

Claim.—The strip D, of steel or other elastic material, secured to the hoop A by the fastenings E, or their equivalents, and arranged in respect to the tape B and its loop or hole *a*, as set forth, for the purpose specified.

No. 47,739.—THOMAS LINDSAY, Montville, Conn.—*Rag Engine for Paper Making Machine*.—May 16, 1865.—The claim defines this invention.

Claim.—Giving an endwise reciprocating motion to the beater of a pulping engine, in addition to its usual motion, substantially as above described.

No. 47,740.—JOSEPH L. LOWRY, Pittsburgh, Penn.—*Construction of Ordnance*.—May 16, 1865; antedated April 29, 1865.—This invention consists in forming a cannon of two or more cast-iron cup-shaped shells or cylinders of equal thickness, and different qualities of metal, varying in degrees of density, placed one within the other, the interstices between the same to be filled up by a suitable composition to become solid and transmit the strain. A cavity is left around the vent to allow it to expand without producing any injurious effects.

Claim.—Forming cannon or heavy ordnance of two or more cast-iron cup-shaped shells of equal thickness and different qualities of iron, varying in degrees of density, placed one within the other, and secured in the manner shown, the inner and longest one being of very hard iron, (to prevent cutting by the shot,) and least expansible, while the exterior and shortest one is of softer and very tough expansible cast-iron, to support the inner one, and aid in resisting the explosive force of the powder.

Second, forming a cavity or chamber around the vent-tube, so as to allow of its expansion without affecting the body of the gun.

No. 47,741.—GEORGE M. MORRIS, Roxbury, Mass.—*Spring Bolt-catch*.—May 16, 1865.—This invention consists in arranging in the place of the ordinary cam a friction roller, so that the bevelled side of the bolt will strike it when the door is being shut, in the same manner as it strikes the cam in the ordinary way, the roller driving the bolt back with much less friction.

Claim.—The spring bolt-catch plate, made with the bolt and roller recesses, and having the friction roller and the extension for supporting it, the whole being arranged substantially as hereinbefore explained.

No. 47,742.—HERBERT A. MORSE, Canton, Mass.—*Machine for Cutting Tobacco*.—May 16, 1865.—In this invention, the knife, that is raised by a lever, and toothed sector, has a single guide-frame, and is kept in position by a parallel bar and projection.

Claim.—The combination of the single guide-frame A, guide-bar D and its projections or guides, with the knife C, the lever B, the toothed sector *e*, and the rack *d*, the whole being substantially as specified.

No. 47,743.—A. PRESCOTT NASH, Weymouth, Mass.—*Boot Leg*.—May 16, 1865.—This invention consists in the manufacture of boot legs, by making them corrugated in the direction of their length, for the purpose of improving them in appearance, and they are so stiffened as to prevent their breaking down and wrinkling. The invention is particularly adapted to the manufacture of legs from very light leather.

Claim.—A boot leg when corrugated, substantially as and for the purpose specified.

No. 47,744.—WATERMAN L. ORMSBY, Jersey City, N. J.—*Bank-note Engraving*.—May 16, 1865.—This invention consists in making a continuous line by a repetition of dots; also a circular figure by repeating figures or numbers, or any geometric figure by the same process.

Claim.—First, the process by which lines for note engraving are formed, consisting in the repetition of a dot, substantially as and for the purposes specified.

Second, the process by which a circular figure for note engraving is produced by the repetition of a number, figure, or word, to form each circle of a series of concentric circles, substantially as specified.

Third, the process herein specified, by which a geometrical or mosaic figure for note engraving is formed by the repetition of letters, words, designs, or figures, around a series of separate centres, substantially as specified.

No. 47,745.—WATERMAN L. ORMSBY, Jersey City, N. Y.—*Apparatus for Engraving Metallic Plates*.—May 16, 1865.—This invention consists of a series of bed plates, having a sliding and rotary adjustment by means of screws, and a circular, engraved hammer fixed to an adjustable fulcrum, by means of which a great variety of figures can be spaced and repeated in a variety of forms with great accuracy and speed.

Claim.—First, a circular hammer having several designs in relief around its edge in combination with the dog *g*, substantially as specified.

Second, raising or lowering the back end of the design hammer, substantially as specified, for causing the design on the hammer to coincide with the surface of the plate, as set forth.

Third, the plate *e*, adjustable as specified, in combination with the plate *c* and design hammer, for the purposes of adjusting said hammer, as set forth.

Fourth, the combination of two circular beds *o w*, with the right angled slides *s u*, forming a universal bed for adjusting the position of the plate to be engraved, as set forth.

Fifth, the universal bed for carrying and adjusting the plate as aforesaid, in combination with the design hammer, substantially as and for the purposes specified.

No. 47,746.—NELSON PALMER, Hudson, N. Y.—*Threshing Machine*.—May 16, 1865.—In this invention the grain is passed to the threshing cylinder, transversely by a toothed cylinder provided with a guard for preventing the breaking of the straw. The straw after

leaving the threshing cylinder is carried up transversely by the straw carrier, and delivered in good condition for binding.

Claim.—First, the method herein specified of threshing grain transversely by the combined action of the feeding device, the corrugated cylinder and the curved rubber, as set forth.

Second, a revolving cylinder armed with teeth or spikes, in combination with the guard *g* for feeding in the straw or stalks transversely to the threshing mechanism, substantially as specified.

Third, the guard *g*, in combination with the feeding cylinder *h*, threshing cylinder *b*, and concave rubber *c*, substantially as specified.

No. 47,747.—WILLIAM H. PECKHAM, New York, N. Y.—*Railway Chair*.—May 16, 1865.—This invention has for its object the firm clamping and holding of railroad rails at their points of junction by movable jaws, in connection with one or more screw bolts and nuts.

Claim.—The railroad chair herein described for clamping and holding the contiguous ends of rails, the same consisting of a movable jaw or jaws made to form close bearings with the sides of the rail, by means of one or more screw bolts and nuts, arranged and operating as described.

No. 47,748.—WALTER S. PHELPS, Columbus, Ohio.—*Steam Engine*.—May 16, 1865.—This invention consists in a vertical cylinder, with a cross-head attached to the piston-rod thereof, so arranged that a connecting rod extends from each end of it to a central shaft upon which are wheels that work into a pinion, placed upon the propeller or main shaft, the axis of which is directly below the cylinder, and in a line with the axis thereof. The vertical connecting rods are connected together by a parallel rod extending from one to the other end, by which means they are always kept in their proper positions.

Claim.—The arrangement of the vertical cylinder connecting rods, crank shafts, and propeller or power shafts herein recited.

No. 47,749.—EDWIN H. REYNOLDS, Rising Sun, Md.—*Foot Stove*.—May 16, 1865; ante-dated May 9, 1865.—This invention consists in a foot stove of oblong shape, having the top plate of the lid perforated, and the under plate arched at the centre; an oil reservoir is placed at the bottom of the box with a central depression, to which is connected a lamp burner with a perforated cylinder surrounding it, and passing through a diaphragm extending across the stove above the reservoir; perforations in the side of stove above and below this diaphragm admit air for combustion.

Claim.—The reservoir E, burner F, with its cylinder G and the partition H, the whole being arranged in respect to the case A, and the openings *a* and *b* in the latter, substantially as and for purpose specified.

No. 47,750.—LOUIS SHULTZ, Buffalo, N. Y.—*Medical Compound*.—May 16, 1865.—This invention consists of an extract made of the following materials: four bushels of malt, four ounces of hops, six ounces of onions, four ounces of Irish moss, and eight ounces of Iceland moss.

Claim.—A medical compound, composed of the ingredients herein mentioned, combined substantially in the manner and proportions herein set forth.

No. 47,751.—JOHN W. SIMONTON and O. T. STRUBLE, Taylorville, Ind.—*Rotary Steam Engine*.—May 16, 1865.—The object of this invention is the use of steam in a rotary engine for propulsion in a more economical manner, or to more advantage than usually attained. Its novelty consists in the combination of the abutment, reversing valve, and the arrangement of a series of chambers with the eduction passages.

Claim.—First, the combination of the revolving valve D D', with the abutment R R, having induction ports through it, substantially as described.

Second, the arrangement of the chamber C A and B, and the eduction passages H and F, substantially as shown and described.

No. 47,752.—WM. T. SLOCUM, Philadelphia, Penn.—*Smoking Pipe*.—May 16, 1865.—This invention consists of a pipe with the usual bowl and receptacle for "oil," beneath the stem the latter being so divided by a partition that the smoke from the tobacco must pass from one portion of the stem into the receptacle before again entering the stem, and so that the moisture from the upper end will collect in the receptacle, and not be permitted to enter the bowl.

Claim.—The stem B, with its partition *a*, projection *l*, and openings *x* and *x'*, in combination with the detachable reservoir F and bowl A, substantially as and for the purposes specified.

No. 47,753.—FRANCIS F. SMITH, Collinsville, Conn.—*Plough Casting*.—May 16, 1865.—This invention consists in the construction of the share, land-side and mould-board of ploughs, of iron faced with steel by first casting the two metals in the form of an ingot, one surface being of iron, and the other of steel, and afterwards heating and rolling this ingot into a plate of the proper thickness, and cutting and bending the same to the proper form.

Claim.—As a new manufacture, plough plates made of semi-steel or iron plated or faced with cast-steel.

No. 47,754.—WILSON H. SMITH, Birmingham, Conn.—*Packing Projectiles for Rifled Ordnance*.—May 16, 1865.—A cylindro-conoidal shot is provided upon its rear end with a concentric projection of a smaller diameter, upon which is fitted a packing ring, in which are transverse grooves. A cap bears against the packing ring upon the concentric projection. Between the head of the cap and the head of the projection is an empty space of a width equal to the sum of the width of the grooves in the packing ring, so that when the shot is fired by the force of the explosion the cap is driven forward just far enough to close all the grooves, and force the packing ring out just far enough to enable it to take in the grooves of the gun.

Claim.—The employment, in combination with a projectile of a corrugated or grooved packing, and a follower or tail piece, the whole arranged to operate in the manner and for the purpose substantially set forth.

No. 47,755.—C. EDWARD SNEIDER, Baltimore, Md.—*Breech-loading Fire-arms*.—May 16, 1865.—In the breech is a chamber forming a continuation of the bore to receive the cartridge, of such external shape as that the flange of the cartridge projects so as to admit of being firmly grasped by the fingers, and thus facilitating the removal of the exploded shell. The hinge upon which the barrel turns in being opened for the insertion of cartridge is a cam lug of such form as during the opening movement of the barrel to force a pin occupying a hole in the breech up against the striking face of the hammer, and thus throw the hammer back far enough to cause the trigger to engage with a safety notch, and to prevent the exploding pin as it is slid back by the cartridge during its insertion from striking the hammer. These devices are for the prevention of premature explosion.

Claim.—First, the backward projection A of the charge chamber, constructed as described to permit the ready removal of the cartridge shell with the thumb and finger, in combination with the chamber D', inclosing the said projection A, while in position for firing.

Second, in combination with the above, the pin or screw *d*, employed to start the shell of the exploded cartridge during the opening movement of the gun, substantially as described.

Third, the pin G, in combination with the cam lug F, the two operating in the act of turning the barrel to throw the hammer to the point at which the safety notch engages with the trigger to retain the hammer in a retracted position, and thus allow the exploding pin I to move freely to the pressure of the base of the cartridge during the closing movement of the barrel, substantially as set forth.

No. 47,756.—HOWARD TILDEN, Philadelphia, Penn.—*Flour Sifter*.—May 16, 1865.—This invention consists of a cylindrical case of tin, within which, at its axis, is placed a shaft, so as to revolve freely. Upon said shaft is affixed a rubber, consisting of four radial arms, forming in reality two diametrical arms, to the under sides of which are attached semicircular rubbers. These rubbers work in a hemispherical sieve of a diameter nearly equal to that of the cylindrical case. The flour is poured in at the top of the case, and the shaft with the rubbers being revolved, the flour is ground between the rubbers and the sieve.

Claim.—The combination of the case A, the concave sieve B, the cross beam C, the horizontal cross arms D D, bottom E, spout F, base G, slide H, flange I, the rubber scrapers J J J, radial arms K K K K, the shaft and crank L, as and for the purpose set forth.

No. 47,757.—CHARLES B. TUCKER, of Cambridgeport, Mass.—*Bed Bottom*.—May 16, 1865.—This bed bottom consists of a series of steel spring bars arranged longitudinally of the bed frame, one end of each spring bar being rigidly confined, and the other being free upon a roller. When the bars are depressed by the weight of a sleeper the roller relieves the spring of any friction wear and noise that might otherwise be produced.

Claim.—The improved spring bed bottom so constructed of the springs C C C and the rollers *h h h*, arranged and combined together with the frame A, substantially in manner and so as to operate as hereinafter specified.

No. 47,758.—EDWARD A. TUTTLE, Brooklyn, N. Y.—*Latch*.—May 16, 1865; antedated May 5, 1865.—This invention consists in giving to the bevel of the latch bolt a greater extension, by means of a web or fin projection, from the inner surface of the bolt, and for which a channel or groove is made in the surface of the door. In thus increasing its length the bevel is of course made correspondingly more obtuse, and the bolt thus offers less resistance to the force applied to retract it as it sticks against the housing in the catch.

Claim.—The bevelled tongue C, or its equivalent, applied to a lock or latch, substantially as shown and described, for the purpose set forth.

No. 47,759.—STEPHEN WILCOX, jr., Westerly, R. I.—*Hot Air Engine*.—May 16, 1865.—This invention is of the class in which fire is subjected to pressure, and the gaseous products of combustion are passed through the working cylinder. The cut-off mechanism which regulates the admission of hot air to the cylinder is made adjustable, so as to cut off early or late in the stroke, as may be desired. The effect of cutting off early is to

accumulate pressure in the interior of the engine, for as soon as the supply is cut off a less amount of gas escapes through the eduction valves than when the supply is continuous. The heat of the furnace is increased in consequence of the higher pressure of the air therein. Therefore, when it is desired to increase the heat of the furnace, it is only necessary to adjust the mechanism so that it will cut off early. Hot and cold air are automatically admitted in the proper proportions. The heat due to compression is absorbed and utilized. The engine may be relieved from pressure preparatory to replenishing the fire, or the like.

Claim—First, in combination with an engine in which the combustion is conducted under the working pressure, the employment of an adjustable cut-off mechanism, arranged to operate therewith, substantially in the manner and for the purposes herein set forth.

Second, the controlling chamber Q, orifice *q*, and screw plug *i*³, arranged relatively to the piston *P*, and to the induction valve I and its connections, substantially as and for the purpose herein set forth.

Third, the combination of thermostat R T, or its equivalent, with the regulating valve U, the two channels H and H', and the engine A *a*, the whole being so arranged as to automatically control the proportions of air relatively to the gaseous products of combustion actuating the engine, substantially in the manner and for the purpose herein set forth.

Fourth, the pump V and pipes *r*⁴ and G, or their equivalents, arranged relatively to the compressing parts A *a* and heating parts B, &c., or their equivalents, substantially as herein described, so as to cause the water to perform the several functions in the manner herein set forth.

Fifth, the arrangement of the inhaling valve F and lever W, or its equivalent, substantially as and for the purpose herein set forth.

Sixth, connecting the circular door X to the hinged bar or arm L, by the hollow bolt *z* and stem *z*¹, or their equivalents, so that the door may be readily released and ground, and again secured, in the manner substantially as herein set forth.

Seventh, the guard lips X' and Y' arranged relatively to the door X of the furnace, and to the ground surfaces on the same, and on the door frame Y, substantially as and for the purpose herein set forth.

No. 47,760.—C. H. WILDER, Argyle, Wis.—*Breast Pump*.—May 16, 1865.—The claim and engraving explain the nature of this invention.

Claim.—First, the application to the mouth of a breast pump of a supporting screen, constructed and operating substantially in the manner and for the purposes set forth.

Second, the employment or use of an extension mouthpiece D applied in combination with the supporting screen and with the suction pipe of a breast pump, substantially in the manner and for the purpose described.

No. 47,761.—MORGAN WILLARD, Cincinnati, Ohio.—*Hoisting Machine*.—May 16, 1865.—This invention consists of two hollow columns with a continuous female screw upon the inside of each, and slots through the sides of said columns extending throughout their whole length. Within each column in the line of its axis is a revolving shaft bearing a worm arranged to slide up and down upon said shaft, and engaging with the screw upon the inside of the column. These worms support a platform or "dumb waiter," which is thus made to ascend or descend as the shafts within the columns are rotated.

Claim.—The hollow columns G G, with the continuous thread or screw D', and the continuous slots or openings in or through the sides of said columns G G extending throughout their length, in combination with the bolt or worm D, with the shaft or rod C, all arranged, actuated, and combined, substantially as set forth and described.

No. 47,762.—J. B. WOOLSEY, Bloomfield, Iowa.—*Hame Fastener*.—May 16, 1865.—This invention consists in a spring for a hame fastener formed of a flat metallic spring secured to the boss by pintles projecting through its sides, the spring tapering about midway of its length, and its reduced end passing through a slot or perforation in the catch of the fastener.

Claim.—Combining the spring *c* with the catch C, in the manner and for the purpose as described.

No. 47,763.—E. M. WRIGHT, Wilmington, Ohio.—*Churn Dasher*.—May 16, 1865.—This invention consists in the employment of oblique stops on the lower side of the oblique wings of the dasher, the obliquity of the stops being in the opposite direction to that of the wings themselves.

Claim.—The stops *d d* arranged upon the lower surfaces of the dasher wings, substantially as and for the purpose herein specified.

No. 47,764.—CHARLES B. BRISTOL, assignor to himself, WILLIAM W. HUGHES, WILLIAM H. ANDREWS, and L. J. BRISTOL, New Haven, Conn.—*Snap Hook*.—May 16, 1865.—This invention consists in a harness snap in which the tongue is combined with the spiral spring, the latter working upon the tension principle, and the fulcrum pin cast in one of the ears, and a recess or cavity so arranged as to be closed after the spring has been introduced.

Claim.—First, the combination of the tongue *g* with the spiral spring (Fig. 4) when the spring works on the tension principle, and rests in a recess (as *r*) in the rear end of the tongue, substantially as described.

Second, the combination of the fulcrum pin *n* with the tongue *g* when the pin *n* is cast in one of the ears, and the recess or cavity is fitted to be closed, substantially as herein described.

No. 47,765.—EBENEZER BROWN, assignor to S. E. BROWN, South Boston, Mass.—*Metallic Thill Holder*.—May 16, 1865.—This invention consists in making the thill holder, usually made of leather, of iron, and in casting the two loops for the tug strap and the girth in one piece with it, and the tug-strap buckle attached thereto.

Claim.—First, casting the tug-strap loop and the shaft-girth loop in one with the thill holder, substantially as and for the purpose described.

Second, casting the tug-strap buckle in the metallic thill holder, substantially as set forth and for the purpose described.

No. 47,766.—ROBERT H. DAVIES, assignor to himself, JAMES W. LANDELL, and THOMAS J. YOUNG, Philadelphia, Penn.—*Steam Engine*.—May 16, 1865.—This invention consists in arranging a heater for the feed water between the cylinder and the boiler, one end of which heater is made fast to the boiler, while the other end rests upon it only. In the rear of the heater a saddle is secured to the boiler, upon which the pedestals which support the main shaft are placed. This saddle is detached from the heater, and the whole is so arranged that the expansion of the boiler does not affect the engine at all so far as strain consequent upon such expansion is concerned.

Claim.—First, the heater *D*, used as a bed plate, detached from the supports of the pedestals *E* and fixed to the boiler in such a manner as to prevent the expansion of the boiler from putting a strain upon the engine, substantially as shown and described.

Second, the arrangement of the saddle *F*, cylinder *B*, side bars *C*, heater *D*, and boiler *A*, substantially as described.

No. 47,767.—JAMES ECCLES, assignor to himself and ROBERT KERSHAW, Philadelphia, Penn.—*Machinery for Oiling Wool in Carding Machines*.—May 16, 1865.—In this invention the drum revolves within the reservoir. The piece of cloth so hangs that the drum in revolving is wiped by the cloth, from the pendent edge of which, outside the reservoir, the oil drips upon the wool on the feed apron.

Claim.—Lubricating wool by means of a strip or apron of suitable textile fabrics, to which a continuous supply of lubricating material is transferred from a reservoir by means of a drum or roller, or its equivalent, all substantially as set forth.

No. 47,768.—JOHN MARTINO, assignor to STUART & PETERSON, Philadelphia, Penn.—*Coal Sifter*.—May 16, 1865.—This invention consists of a sieve with a handle and spout arranged in respect to the ash chamber and grate of a cooking stove, so that it will readily catch the ashes falling from the grate, and by its aid said ashes may be sifted, and the cinders deposited in the fireplace without permitting the dust to escape into the room.

Claim.—The sieve *G*, its handle *h*, and spout *f*, arranged in respect to the ash chamber *R* and grate *a* of a cooking stove, substantially as and for the purpose herein set forth.

No. 47,769.—JAMES M. JAY, assignor to W. H. ALEXANDER & Co., Canton, Ohio.—*Machine for Making the Spindles of Wagon Axles*.—May 16, 1865.—The object of this invention is to make the spindles of axles by machinery, at the same time cut the groove for the skein and the linchpin hole. It consists, also, of a conical revolving hollow cutter, with a shoulder cutter on the base of the cone feed gear to move the axle to the cutter, and a grooving cutter, which at the proper time is brought in contact with the dressed spindle of the axle and cuts the groove for the skein and a linchpin borer, all operated by a series of sequent and automatic movements, that complete the spindle on one end of the axle at a single operation.

Claim.—A machine for turning the journal or spindle for cutting the groove therein, and for boring the linchpin holes of wooden axles, the same being combined and arranged to operate in the manner and for the purpose substantially as set forth.

Also, in a machine for cutting journals or spindles on axles, the revolving tapering cutter-head, with its cutters *e e'*, as and for the purpose described.

No. 47,770.—GORDON MCKAY, Boston, Mass., and LYMAN R. BLAKE, Quincy, Mass., assignors to GORDON MCKAY aforesaid.—*Turned Shoe*.—May 16, 1865.—This invention consists in a boot or shoe, as a new article of manufacture, when made up inside out, and with chain stitches, which pass squarely through the sole and vamp, and without having any cut or gash made in the sole, on or from its inner surface. By this construction the whole of the material in the sole is made available for wear, while in all other turned shoes the amount of wear is diminished by the cut which in them is made in their inner surface.

Claim.—As a new article of manufacture, a boot or shoe made as a "turn," with the vamp and sole, united with chain stitches passing entirely through the material, both of the vamp and sole, and with the chain of the stitches upon the inside of the article when in its finished state.

No. 47,771.—GEORGE H. MEEKER, assignor to LACY, MEEKER & Co., Bridgeport, Conn.—*Riding Saddle*.—May 16, 1865.—This invention consists in making the saddle skirts with projections, to partially support the calves of the legs, by swaging the leather skirts, filling the cavities with sawdust, &c., and covering the inner side of the skirt with leather.

Claim.—The forming of the projections, or calf and thigh supports, on the skirts of a riding saddle, by means of swaging, substantially in the manner as herein shown and described.

No. 47,772.—JOSEPH MONTGOMERY, JAMES MONTGOMERY, and EVAN DAVIS, Baltimore, Md.—*Grain Separator*.—May 16, 1865.—This invention consists in placing revolving shafts just over, and using them in combination with, the fan screen.

Claim.—The revolving rake shafts C, in combination with the fan screen e, substantially in the manner and for the purposes herein set forth.

No. 47,773.—CHARLES R. OTIS, assignor to himself and NORTON P. OTIS, Yonkers, N. Y.—*Steam Hoisting Apparatus*.—May 16, 1865.—This invention consists in applying to a hoisting apparatus an automatic stop motion, in such a way that the engine which propels it can be stopped, or its motion reversed, at any time during the up or down movement of the platform. This is accomplished by attaching to the valve of the engine a device, to be operated by the drum, driven by the engine by means of gearing and a shaft. A clutch is so arranged that when the platform arrives at a certain point, or when the engine has made a certain number of revolutions, the clutch operates to close the valve, and thus prevent the admission of steam to the engine, and its motion is arrested at any given point.

Claim.—Combining the stop-valve of the engine of a steam hoisting apparatus with the shaft h of the main drum, or with any other shaft or counter shaft of the hoisting apparatus, by means of a stop motion constructed, applied, and operating substantially as herein specified.

No. 47,774.—JAMES N. PEASE, Panama, N. Y., assignor to M. HARRIS and R. G. BUSH.—*Clothes Wringer*.—May 16, 1865.—This invention is explained by the claim and engraving.

Claim.—The two fixed gears E F, in connection with the wrist e and slotted crank G, or their equivalents, all arranged and applied to the rollers of a clothes-wringing machine, to operate in the manner substantially as and for the purpose herein set forth.

No. 47,775.—JOHN H. VICKERS, Worcester, Mass., assignor to himself and L. W. POND, of same place.—*Revolving Fire-arm*.—May 16, 1865.—Within the chambers of the cylinder of a revolving pistol are inserted removable thimbles for the reception of metallic cartridges. To the under side of the barrel in front of the cylinder is attached a stem of the same diameter with the thimbles. The thimble is pushed upon the stem after the charge is fired, and the stem forces the empty cartridge from the thimble.

Claim.—The application to the barrel of revolving fire-arms of a hinged stem E, for supporting the thimble, and cleaning it when removed from the cylinder A, substantially as and for the purpose described.

No. 47,776.—WILLIAM W. W. WOOD, Philadelphia, Penn., and JOHN L. LAY, assignors to DONALD MCKAY, East Boston, Mass.—*Submarine Explosive Shell*.—May 16, 1865; antedated February 25, 1865.—In this invention a cylindrically formed shell is provided with a solid or heavy bottom, and an air chamber at its top, separated from the explosive charge by a loose diaphragm, for the purpose of retaining the shell or torpedo in a vertical position, and giving an upward direction to the exploding charge. A bail weight, supported by a removable pin, to which the operating cord is attached, is allowed to fall through a suitable tube within the shell, and thereby ignite a percussion priming, when it is desired to effect the explosion.

Claim.—First, a submarine shell or torpedo composed of a casing of any desired form and of any suitable material, so charged with explosive compound as to leave air space within the shell, for the purpose specified.

Second, the use within the shell of a yielding wad or diaphragm for separating the charge of the explosive compound from the air chamber, substantially as and for the purpose described.

Third, the employment, for igniting the charge, of a weight, so arranged within or adjacent to the said casing, and so combined with the retaining and releasing device herein described, or any equivalent to the same, that the said weight can be released at pleasure, and be permitted to fall on any substance ignitable by percussion.

No. 47,777.—LYSANDER WRIGHT, assignor to WRIGHT & SMITH, Newark, N. J.—*Scroll Sawsing Machine*.—May 16, 1865.—This invention consists in a combination of the levers, between which the saw is hung. A spring over the upper lever, which tends to raise the saw, and a strap which is attached to the lower lever, passing between the two rollers, and attached at the other end to the periphery of a segmental wheel, upon an arm leading to a shaft, upon which are treadles by which motion is communicated to the saw.

Claim.—The arrangement of lever A, segmental wheel B, pulleys C C, strap D, levers G G, and hooks E' E'', spring I, connected to lever G by link K, when operated by treadles J' J'', substantially as described and for the purposes set forth.

No. 47,778.—P. M. A. LAURENT, St. Nazaire, France.—*Sextant.*—May 16, 1865.—This invention consists in devices for lengthening perpendicularly to the plane of the instrument, according to the requirements of the instruments, one or other, or even both of the direct or reflected images of the terrestrial objects or heavenly bodies, the distances of which are under measurement. This is done by means of an elongating glass, which is a converging or diverging cylindrical lens, placed normally upon the instrument, and perpendicular to the course of the luminous rays of the body to be elongated.

Claim.—First, elongating perpendicularly to the plane of the reflecting instrument the apparent image from one of the heavenly bodies, or objects from which may be measured the angular distance, in the manner set forth.

Second, the elongating lens or glasses, combined according to the above described conditions, and, in combination therewith, the above-described modification of the plane form of mirrors of reflecting instruments, as set forth.

No. 47,779.—NATHAN THOMPSON, Abbey Gardens, St. John's Wood, England.—*Stoppers for Jars and Bottles.*—May 16, 1865; patented in England January 4, 1865.—This invention consists of a stopper formed in two parts. The hook is secured to the lower part of the stopper, and has attached to it a lever bearing upon the inner part, by means of which the two parts are drawn together when the stopper is in the jar, and the rubber ring compressed and spread out so as to fit the mouth of the jar.

Claim.—First, constructing stoppers of an elastic ring, interposed between two parts, which are so combined with the lever that the parts may be moved to or from each other by the lever, as above described.

Second, forming the upper part of a stopper, so constructed, with a projecting ring of larger diameter than the mouth of the bottle or other article to which the stopper is to be applied.

Third, a recess in said top for the lever to lie in.

Fourth, connecting the lever to the lower part of the stopper by a hook, as above described.

No. 47,780.—JOHN D. MURPHY, Pottsville, Penn.—*Railroad Car Wheel.*—May 16, 1865.—The tread of the wheel and the spokes are made of wrought iron. The latter are riveted when hot to the former, and the hub is cast around flattened and expanded opposite ends of the spokes. The casting is effected by pouring a stream of melted metal over the ends of the spokes, and allowing it to pass freely away from them, until they have attained a high degree of heat. The mould is then allowed to fill, and the metals to unite with each other.

Claim.—First, constructing the rim, or tread, and the spokes of wrought iron, and attaching the same to each other before the hub is cast, by riveting the spokes when hot to the rim, and casting the hub around the flattened and expanded opposite ends of the spokes, substantially as set forth.

Second, pouring a stream of melted metal over the flattened and expanded ends of the spokes, and permitting it to pass freely away from them, until said expanded ends shall have attained to a high degree of heat, and then allowing the mould to fill and the metals to unite with each other, substantially as specified.

No. 47,781.—ALBERT ALDEN, New York, N. Y.—*Brush.*—May 23, 1865.—This invention consists in the use of notched, segmental plates or jaws, secured to the head of the brush, and operating in combination with the pivot connecting the brush handle to the head, and with a spring catch, in such a manner that by the action of the spring catch and notched plates, the handle can be brought into any desired inclination.

Claim.—The notched, segmental plates B, in combination with the head A, handle C, and with the pivot *a*, and spring catch *b*, all constructed and operating in the manner and for the purpose set forth.

No. 47,782.—GEORGE AMBROSE, New York, N. Y.—*Hoisting Apparatus.*—May 23, 1865.—This invention consists in an apparatus for elevating building material in the construction of houses, and is so arranged that the most laborious part of the operation can be performed by horse or steam power.

Claim.—First, a hoisting apparatus which employs an elevator C, adapted for receiving and holding in place hods, or other portable vessels, guideways A A, pulley rope *e*, pulleys *a b*, and drums *e f g*, together with a brake, all arranged and operating substantially as described.

Second, providing the elevator C with racks, which are adapted for receiving and retaining in place portable hods *s s*, substantially as described.

Third, spring latches *m m*, and levers *n n*, in combination with the guides A A, and elevator or hod rack C, substantially as described.

No. 47,783.—JOSEPH H. ASH, Brooklyn, N. Y.—*Kitchen Range Boiler*.—May 23, 1865.—This invention consists principally in providing a bottom and top of cast iron, having two flanges around the rim at right angles to the bottom, and forming a groove into which the cylinder, forming the sides or body of the boiler, is inserted and securely soldered.

Claim.—The improvement herein described in the manufacture of copper boilers, the same consisting in forming in each head of the boiler a suitable groove or channel, having parallel concentric walls perpendicular to the bottom extending entirely around the same, in which the body of the boiler is placed and soldered in any proper manner, substantially as above described and for the purposes specified.

No. 47,784.—ALBERT BALL, Worcester, Mass.—*Machine for Lubricating Bullets*.—May 23, 1865.—This invention is intended to expedite the filling of the grooves of Minie bullets with grease. The balls, placed in a suitable opening in a horizontal chamber or tube, are successively carried forward by a reciprocating plunger to a point beneath a cylinder containing the lubricating material, which is forced through a small orifice into and around the groove or grooves of the balls by means of a piston pressed down on the lubricating cylinder.

Claim.—First, the combination with the cylinder or proper receptacle for holding the bullet of an opening to admit the lubricating matter to the groove in the bullet, and a vent hole for the escape of the air, substantially as described.

Second, the combination with a cylinder or chamber for holding the bullet of a reservoir or reservoirs for holding the lubricating substance, and a plunger, or its equivalent, for forcing the lubricating matter while cool into the grooves in the bullet, substantially as set forth.

Third, the combination with the bullet cylinder C of the piston D and valve H, substantially as described.

Fourth, the construction and arrangement of mechanism in such a manner that bullets may be sized and their groove or grooves filled with a lubricating substance at one and the same operation.

No. 47,785.—SILAS D. BALDWIN, Chicago, Ill.—*Shears for Marking Cattle*.—May 23, 1865.—This invention consists in providing shears with several adjustable cutters inserted in the same blade. These cutters have conical edges, and cut into a slot beneath.

Claim.—First, the adjustable blade I, when provided with a conical-shaped edge so as to give it a shear cut.

Second, the slot *h* in the back of the blades I and J, in combination with the screw *b*.

Third, the combination of the conical-edged blade I, handles A and B, with the set screw or guard D, to regulate the width and depth of the incision.

Fourth, the plate F, provided with the projection G, and slots *c d* or *e*.

Fifth, the conical blade H in combination with the projection G.

Sixth, placing two or more shear blades on a single arm of a pair of shears.

Seventh, in combination with the cutting devices herein described, the adjustable blade or die J, in the manner and for the purpose set forth.

Eighth, the lubricating depository or cup C, when attached to the handle or arm of a pair of shears.

Ninth, the combination of the slotted plate F, blades I or H, spring E, and guard D, with the handles A and B.

No. 47,786.—JOHN A. BASSETT, Salem, Mass.—*Gas-burner*.—May 23, 1865.—This invention consists of a burner, with a single straight row of holes, in combination with a short adjustable chimney.

Claim.—A burner, for burning carburetted air or gas, having the parts arranged and constructed substantially as herein described and set forth.

No. 47,787.—HERMAN BERG, Union Hill, N. J.—*Gas-burner*.—May 23, 1865.—This invention consists in the combination of a chamber holding pulverized charcoal, &c., with an aperture and spring valve in a gas-burner.

Claim.—A gas burner, provided with a chamber *c* containing pulverized carbon or other absorbent material, and with a spring valve *g* closing up on an aperture *f* by the pressure of the gas, substantially as and for the purpose set forth.

No. 47,788.—ANDREW BLACK, New York, N. Y.—*Rendering Pan*.—May 23, 1865.—This invention consists of a pan set in a furnace, which is provided with two flues, the lower one communicating with the fireplace by means of apertures, which may be closed when desired by dampers. The pan is provided with a perforated false bottom, and in the space between the bottom and false bottom is arranged a rotary stirrer. Above the false bottom is a hollow rotary shaft provided with arms. The pan is provided with a light cover, to which are suspended two plates, the upper one being provided with gutters. The interior of the pan communicates with a condenser which is connected with a drain or sewer. The vapors as they pass through the condenser are condensed by means of cold water supplied by perforated boxes.

Claim.—First, the radial openings *a a*, sliding dampers *b b*, and split horizontal circular flues *D E*, the whole arranged in relation with each other, and with the fireplace and pan, substantially as herein described, for the purpose set forth.

Second, the combination of the perforated false bottom *G* and the rotary stirrer arranged between the said false bottom and the bottom proper of the pan, substantially as and for the purpose herein specified.

Third, providing a melting pan, with a cover *N*, having an outlet to a drain or sewer, but otherwise closed, substantially as herein described.

Fourth, the employment in combination with the cover of a melting pan having only an outlet to a drain or sewer, of a system of collecting plates *R R*, gutters *n n q*, or other equivalent surfaces, for the collection of condensed steam or other vapors eliminated from the melted fat contained in the said pan, and the conveyance of the same to the outlet of the cover, substantially as herein specified.

Fifth, in combination with the cover of a melting pan having only an outlet to a drain or sewer, a condenser arranged between the said outlet and the drain or sewer, substantially as and for the purpose herein set forth.

No. 47,789.—CHARLES D. BLINN, Port Hudson, Mich.—*Bed-bottom*.—May 23, 1865.—This invention consists in a peculiar construction of a spring bed-bottom, the elasticity of which is produced altogether by wooden slats connected to each other and to the bedstead in such a way that the frame of the bed-bottom is affected by pressure on any part of it, and its different parts are made to bear a share of the load.

Claim.—The bed bottom above set forth, constructed substantially as herein described.

No. 47,790.—CHARLES T. BOARDMAN, Pawtucket, R. I.—*Steam Boiler*.—May 23, 1865.—This invention consists of two cylindrical boilers arranged side by side, and one inclined tubular boiler arranged below the near portions of the cylindrical boilers. The object of this arrangement is to provide for the collecting and retaining of the sediment contained in the water in the coolest portion of the generating apparatus. It further consists in the arrangement of an air duct and mixing chamber for the admission of air from the ash pit to mix with the gases of combustion, these arrangements being peculiar to this boiler.

Claim.—First, the arrangement of the two cylindrical boilers *A A*, the tubular boiler *B*, and the laterally inclined connecting water legs *C C*, substantially as and for the purpose herein specified.

Second, in combination with the two cylindrical boilers *A A*, tubular boiler *B*, and walls *D D* of their setting, the pier *E*, and connected parallel upright walls *F*, arranged substantially as herein described.

Third, the gas and air-mixing chamber *H*, bridge wall *I*, and air duct or ducts *b*, in combination with each other and with the bridge wall *J*, pier *E*, and ash pit *4*, substantially as herein set forth.

Fourth, the combination of the boilers *A A B*, fireplace *G*, mixing chamber *H*, side flues *d d*, and return flue *g*, the whole arranged substantially as and for the purpose herein specified.

No. 47,791.—JOSEPH N. B. BOND, New York, N. Y.—*Automatic Boiler Feeder*.—May 23, 1865.—The object of this invention is to so regulate the ingress of water to the boiler that the exact quantity requisite shall at all times be admitted, irrespective of the pressure of steam or the action of the engine. Its novelty consists in the combination and arrangement of the expansible pipe with the tank and boiler.

Claim.—The expansible pipe *B*, arranged in combination with the tank *E* and boiler *A*, substantially in the manner and for the purpose set forth.

No. 47,792.—GEORGE B. BRAYTON, Boston, Mass.—*Steam Engine*.—May 23, 1865.—This invention consists in providing a valve constructed in the ordinary form, except that it has ports entering it from its ends, which ports are supplied with separate and auxiliary valves which are controlled by the action of the governor, and perform the function of cut-off valves. This improvement is adapted to an oscillating engine, and the main valve is operated from a rock shaft running directly through the steam-chest, which shaft has an arm on its outer end and which is held in a fixed standard, and the motion is produced in the valve as a consequence of the oscillation of the cylinder. The oscillation of the cylinder also brings the arms of a rocker shaft, to which the cut-off valves are connected, in contact with an expansible cam attached to the governor, and by which their motions are controlled.

Claim.—First, the variable and self-adjusting cut-off, arranged and operated by the governor as described, for equalizing and rendering uniform the action of steam-engines.

Second, the combination with the ordinary slide or *D*-valve of auxiliary steam ports and slide valves, under the arrangement and for operation in the manner substantially as set forth.

Third, the method herein described of connecting the oscillating arm with the slide or *D*-valve, affording yielding connection so as to admit of the valve reciprocating along the plane surface of, and in contact with, the valve face.

Fourth, the method herein described of operating the auxiliary valves, hung upon the end of an inlet balance beam by means of a rocking lever, yet so as to admit of traverse motion of the balance beam, together with the main valve, substantially as shown and described.

Fifth, regulating the action of the auxiliary or cut-off valves by means of the cam, expansible by the action of the governor, substantially as set forth.

No. 47,793.—ABEL BREAR, Saugatuck, Conn.—*Oil Ejector*.—May 23, 1865.—This invention consists in combining with the pipes, which convey the air to and the oil from the well, a nozzle, having an annular space around it for the reception of the air, and a passage on one side of the same for guiding the air into the central or oil ejecting tube. This nozzle also has an aperture through the bottom for the admission of the oil, and this aperture extends around the nozzle with the exception of the space occupied by the air-induction passage. The air used is forced down to the instrument through the outer pipe which surrounds the oil pipe, and all heat created by compressing the air, or by the use of steam, is made available for preventing the oil from congealing in the induction pipe.

Claim.—In combination with my arrangement of the oil or discharge tube and the blast tube of an ejector, the lower socket A constructed with a central passage *a* right through it, and with an annular cavity by surrounding the said passage and communicating with the nozzle *c*, arranged within the said passage, substantially as and for the purpose herein specified.

No. 47,794.—JACOB BUZBY, Philadelphia, Penn.—*Preventing and Removing Scale in Steam Boilers*.—May 23, 1865.—This invention consists in using a solution of gambar to remove the scale in steam boilers; by keeping such a solution in the boiler constantly the formation of new scale is prevented.

Claim.—The use of gambar for removing scale from steam boilers as described.

No. 47,795.—WILLIAM CANNING, New York, N. Y.—*Evaporator*.—May 23, 1865.—This invention consists of a semicircular trough surrounded by a steam jacket, and provided with a series of rotary disks attached to a hollow shaft, closed at one end and opened at the other. The liquid to be evaporated is placed in the trough, and steam is let into the jacket; the shaft is caused to revolve, and at the same time a current is made to circulate over the surfaces of these disks and through the hollow shaft, in order to carry off the moisture from the liquid adhering to the disks.

Claim.—First, the construction of the rotating disk or disks of a rotary evaporator of a conical or dishing form, substantially as and for the purpose herein specified.

Second, the arrangement of such disks in such manner that they overlap each other upon a hollow central shaft, in which there are openings between the said disks, substantially as and for the purpose herein set forth.

No. 47,796.—STEPHEN D. CARPENTER, Madison, Wis.—*Ship Defensive Armor*.—May 23, 1865.—This invention consists principally in the facing of the armor by the use of perforated plates, with dovetail corrugations, the plates being chilled to harden them. This, and a special arrangement of staples and bolts, constitute the invention.

Claim.—The wrought-iron or steel perforated plates, with dovetail corrugations and the chilled cast-iron facing and backing, with the attached staples, all for the purposes and substantially in the manner herein described.

No. 47,797.—P. G. CHASE, Berlin, Wis.—*Bed Bottom*.—May 23, 1865.—This invention consists of a series of slats in a camber or bow form, with tension springs beneath them, to aid in returning them to the bow form after being relieved from depression.

Claim.—The improved spring-slat for bed bottoms or analogous purposes, consisting of a camber slat B, in combination with the spring tension rod D connected to the slat at or near its ends, for the purpose of increasing its power of resisting depression, substantially as described.

No. 47,798.—ANNING S. CHITTENDEN, Bergen county, N. J.—*Identifying Ticket for Railroads, &c.*—May 23, 1865.—In this invention a photograph of the holder of the ticket, with other necessary description, rules, &c., is enclosed in a convenient form for carrying in the pocket.

Claim.—The combination of the several parts herein described to form an identifying railroad or other ticket, substantially as herein set forth and for the purposes described.

No. 47,799.—JOHN M. CLARK, Dayton, Ohio.—*Broom*.—May 23, 1865.—This invention consists in the construction of a wrapper of flexible or yielding material, which serves to wrap and firmly secure in place the broom corn, and at the same time affords means for retaining the handle without the aid of a socket; also in the use of two or more ribs, by means of which the wrapper may be compressed so as to retain the broom corn in proper form.

Claim.—The thin, elastic and yielding wrapper represented in Figure 1, constructed and applied to the brush and handle of a broom, in combination with the ribs *e e*, in the manner substantially as, and for the purpose described.

No. 47,800.—F. F. CORNELL, jr., New York, N. Y.—*Baling Press*.—May 23, 1865.—The novel feature in this invention is the travelling sides of the follower, which make a tight press box.

Claim.—First, the formation of a close chamber in the press by means of the travelling sides of the chamber, substantially as described.

Second, the side slip N, in combination with the travelling sides of the press, for facilitating the removal of the finished bale from the press, substantially as described.

No. 47,801.—SOMMERS CROWELL, Philadelphia, Penn.—*Iron Railing for Fence.*—May 23, 1865.—This invention consists in casting the palings with recesses on each side, having the open side of the recesses on one side of the palings alternating with those on the other side, thereby forming openings without the use of cores, for the reception of the horizontal bars.

Claim.—Constructing the palings B, with the recesses C on each side, having the open side of the recesses on one side of the palings alternating with those on the other side, thereby forming openings, without the use of cores, for the reception of the horizontal bars A, substantially in the manner hereinbefore described.

No. 47,802.—EPHRAIM CULVER, Shelburne, Mass.—*Washing Machine.*—May 23, 1865.—This invention consists of a chest, divided, by means of slotted boards, into three compartments. A beater, perforated with holes, is arranged to slide back and forth in the middle compartment. The fabrics to be cleaned are placed in the middle compartment with the beater, and as they are moved to and fro by the beater, jets of water are thrown upon them through the perforations of the compartments.

Claim.—The combination and arrangement of chest O and lid B, with perforated division boards c c, and beater D, and wheels E E E E, and lever i, and connecting rod h, operating in the manner and substantially as above set forth, for the purpose specified.

No. 47,803.—JOHN A. CURRAN, United States army.—*Percussion Fuze for Explosive Shell.*—May 23, 1865.—In this invention a spring bolt is held by a detent in the base of the shell, which detent is released on impact by the action of a pendulous plunger. The bolt goes forward and strikes a cap on a nipple, near the base of the chamber.

Claim.—The combination of the plunger h, spring i, detent spring j, weight k, and arm o, when constructed and arranged to operate as and for the purposes herein specified.

No. 47,804.—HENRY H. DANIELS, Philadelphia, Penn.—*Boring Tools for Artesian Wells.*—May 23, 1865.—This invention consists of certain plates, levers, and a guided bar, the whole constructed and arranged for joint action, and forming an instrument whereby detached boring tools or implements jammed in artesian wells may be withdrawn therefrom. The invention further consists of a modification of the said instruments to be used for withdrawing pipes from wells.

Claim.—First, the instrument composed of the plates A and A', levers B and B', and guided bar D, with its projections i i, the whole being constructed and arranged in the manner and for the purpose herein described, and illustrated in Figs. 1, 2, and 3.

Second, the modified instrument composed of the plates A and A', levers B and B', guided bar D, with its pins g g, or their equivalents, the whole being arranged and operating substantially as and for the purpose herein set forth.

No. 47,805.—JULIUS C. DICKEY, Saratoga Springs, N. Y.—*Rock Drill.*—May 23, 1865.—This invention consists in making a rock drill for artesian wells of circular form, with a circular cutting edge of steel, or its equivalent.

Claim.—The drill A, with a circular cutting edge, in combination with the recess C, for the purposes set forth.

No. 47,806.—CHARLES DISSTON, Philadelphia, Penn.—*Saw-setting Machine.*—May 23, 1865.—This invention consists in an arrangement of machinery whereby the saw can be made to receive part of the set required by a tooth, at the first blow of the hammer, after which a continuation of the machine lowers the back of the saw and increases the angle thereof with the face of the hammer at the second blow, which finishes the set. It also consists in a peculiar arrangement of devices whereby the saw is fed along upon the anvil.

Claim.—First, in combination with the hammer and anvil of a saw-setting machine, the automatic mechanism herein described, or the equivalent to the same, for supporting the back edge of the saw and elevating and lowering the same, in the manner and for the purpose specified.

Second, the feed lever O, in combination with the cam H and spring g, or their equivalents, whereby the within described movement is imparted to the said lever, for the purpose specified.

Third, the ledge or projection d and plate e, arranged in respect to the anvil, as set forth, for the purpose described.

No. 47,807.—JOHN A. DODGE, Auburn, N. Y.—*Harvester.*—May 23, 1865.—This invention consists in the form and construction of the main frame, the arrangement of the gearing and shafts, the construction of the stirrup, which connects the finger beam with the main frame, and the particular arrangement of means for keeping the reel belt taut.

Claim.—First, the main frame A, when cast in one single piece, in the form and manner described.

Second, in combination with the main frame A', as described, the arms B and C projecting from the front and rear inner corners, for the purpose described and set forth.

Third, in combination with the frame A, the combination and arrangement of the wheels *e* and *f*, the geared wheels *g* and *h*, and the shafts *c* and *d*, when the shaft *c* is placed beneath the shaft *d*, for the purpose of placing the pitman wrist as nearly in line with the cutter bar as possible.

Fourth, in combination with the arm C and the pulleys J and *a*, the lever H, situated and operating as described.

Fifth, in combination with the main frame of a harvesting machine and the lifting bar *b*, the stirrup L, as described and set forth.

Sixth, the self-adjusting pulleys pivoted at the foot of the reel post, substantially as and for the purpose set forth.

No. 47,808.—M. B. DODGE, New York, N. Y.—*Apparatus for Grinding and Amalgamating Ores.*—May 23, 1865.—This invention consists in an improved method of attaching the shoes to the muller. The shoes are provided with a projection which extends up through slots in the plate and between lugs in the upper side of said plate. These projections have pins passing through them, by means of which they are secured to the plate. The shoes are provided with guide pins which work in holes in order to keep them in position.

Claim.—The attaching of the shoes to the muller by pivots, or in such a manner that they will work or adjust themselves from a centre or from a hinged or pivoted point with or without springs, substantially as set forth.

No. 47,809.—WILLIAM H. ELLIOT, Plattsburg, N. Y.—*Breech-loading Fire-arm.*—May 23, 1865.—In this invention a rolling or oscillating breech piece has a brace so pivoted to it as to resist the recoil of discharge, while it allows the hammer to be cocked only when thus securely locked in position, and when the hammer is cocked the brace is in like manner prevented from being released. When the brace is tilted and the hammer drawn back with the swinging breech, the trigger is thrown out of action. The main spring is pivoted to the swinging breech.

Claim.—First, the combination of a hammer *d* with a swinging breech plate *c* and a brace *e*, when these devices are pivoted together, substantially as described.

Second, attaching the main spring *k* to swinging breech plate *c* by means of a pivot *u*, substantially as and for the purpose herein specified.

Third, so arranging the attachments of a main spring to a hammer and to a swinging breech plate that the power of the main spring shall tend to throw the breech plate forward when the chamber is closed, and to throw it back when the chamber is open, substantially as herein shown.

Fourth, operating upon the point of the trigger to prevent it from catching into the full cock notch by means of cam S, when both the breech plate and hammer are thrown back together as herein described.

Fifth, so constructing and operating the hammer and brace in combination with a swinging breech plate that said hammer and brace cannot both be moved at the same time, substantially as and for the purpose herein set forth.

No. 47,810.—JOHN FOX, Philadelphia, Penn.—*Composition for Lining Petroleum Barrels.*—May 23, 1865.—This invention consists of a composition of three parts of potash, one part of sulphur, one part of common salt, two parts of hydraulic cement, and three parts of water.

Claim.—The composition made substantially as above described, for sealing barrels and other vessels set forth.

No. 47,811.—GEORGE H. FULLER, Pawtucket, R. I.—*Manufacturing Watch Keys.*—May 23, 1865.—This invention consists in making the pipe part of a small piece of sheet metal bent into a cylindrical shape. A short piece of wire is then inserted in one end of the cylinder, leaving enough projecting therefrom to form a shank for the pipe; and in the other end of said cylinder is a square punch or mandrel of the proper size. The cylinder is then put into a die and swaged into the shape desired, and the punch withdrawn.

Claim.—Making a winding key or key pipe in the manner and on the principle substantially as herein described.

No. 47,812.—WILLIAM W. GRIER and ROBERT H. BOYD, Hutton, Penn.—*Drill Bit.*—May 23, 1865.—This invention consists in making the cutting edges of the drill of the ordinary shape, and afterwards serrating them, giving said cutting edges the appearance of rows of saw teeth.

Claim.—A drill or bit having the notch or recess at its central point, as above described, in combination with the serrated cutting lips *a' a'*, substantially as shown and described.

No. 47,813.—**BENJAMIN GRIFFIN**, Lawrence, Mass.—*Sheep Rack*.—May 23, 1865.—This invention consists in providing a sheep rack with covers in combination with swinging side and trap doors.

Claim.—The covers C, the swing doors E, and the trap doors H, for the purposes herein set forth.

No. 47,814.—**MARTIN R. GRISWOLD**, Watertown, Conn.—*Machine for Making Tobacco Pipes*.—May 23, 1865.—This invention consists in a spindle on which are dogs to hold the pipe from turning when placed thereon, and attached to an oscillating frame which turns partially over, a wheel attached to the spindle is thrown in gear with another in motion and revolves the spindle, and thus presents the body of the pipe to revolving cutters which cut and dress the body of the pipe to its required size and shape. And it also consists in a carrier so constructed that by placing the unfinished pipes thereon it feeds them to the spindle, there to be fed up to the cutters by the oscillating frame.

Claim.—First, the combination of the spindle E, constructed and operating substantially as described, with the cutter B, as and for the purpose specified.

Second, the carrier L, constructed and operating substantially as described with the spindle E, combined as and for the purpose specified.

No. 47,815.—**ALBERT HALL**, New York, N. Y.—*Toy Spring Gun*.—May 23, 1865.—This invention consists of a device for throwing torpedos by means of an India-rubber strap or loop.

Claim.—The receiver E, spring C, and trigger D, constructed and arranged and combined with each other and with the slatted barrel B, substantially as herein specified.

No. 47,816.—**SAMUEL HALL**, New York, N. Y.—*Blind Fastening*.—May 23, 1865.—This invention consists, first, in attaching to the blind by a pivot a metal plate having upon its outer end an eye or socket so arranged that it will surround the pintle and female part of the hinge; in the lower edge or socket are notches cut at the proper place, so that when the blind is swung out the notches will drop down and grasp upon the upper edge of that part of the hinge which supports the pintle and holds the blind fast; and second, of a hasp for fastening the blind when shut, which consists of an ordinary plate hinged at one end to the blind, and having a hole in the other, which drops over a pin in the window frame; a hook pivoted upon the window frame hooks around the pin above the plate, and the other end of the hook passes under the sash, which holds it from unlocking.

Claim.—The fastener a, constructed substantially as described, for the purpose specified.

Also, in combination with the window sash B, the hasp lock or its equivalent, constructed substantially as and for the purpose specified.

No. 47,817.—**WILLIAM HALL**, Brookline, Mass.—*Lock*.—May 23, 1865.—In this lock the stub of the bolt is in two parts; that next to the tumblers being so attached to the bolt as to permit to the latter a slight longitudinal movement which will cause the other part of the stub to be deflected laterally and catch into a notch in the edge of an adjacent fixed plate. Another improvement is a device for throwing the cogged and gated tumblers out of gear with the cog wheels upon the knob spindle to permit of a new combination, which consists in attaching the former to a movable plate, and, when the tumblers are properly arranged, sliding said plate laterally by means of a key, by which the stubs are caused to enter the gates. In addition to this the key, while moving the plate and tumblers, lifts up the end of a lever, which, entering a notch in the edge of the bolt, prevents the latter from being retracted and the tumblers from being displaced, while a new combination is being effected.

Claim.—First, fastening the hub by means of the right-hand screw H' through the case of the lock, and the left-hand screw H'', or vice versa, combined with the check nut v.

Second, making the stump in two parts, S and S'.

Third, the peculiar arrangement of the lever L and the key T, so that at the time the cog-wheels are thrown out of gear the bolt shall be immovable.

Fourth, the hollow adjusting screws g, g', g'', g''', all of which operate substantially as described, and for the purpose set forth.

No. 47,818.—**JAMES H. HANCHETT**, Beloit, Wis.—*Pulverizing Tailing from Gold Washers*.—May 23, 1865.—This invention consists in a driving pinion and shaft, to which is rigidly attached the upper grinding surface, and it revolves with the shaft; the lower grinding surface, which revolves upon the lower part of shaft, has an axis, but by the interposition of pinions it revolves in an opposite direction to the upper grinding surface, by means of which the effective space of the grinding surfaces is double what it would be if only one surface moved.

Claim.—First, the grinding disk C, constructed as shown, and provided with the shaft B, having the feather b thereon, as and for the purpose set forth.

Second, the grinding disk D, provided with the internally geared flange d, constructed and operating as and for the purpose herein set forth.

Third, in combination with the disks C and D and shaft B, the gear wheels F and E E E, when all the parts are arranged to operate as and for the purpose herein set forth.

No. 47,819.—HERMAN HAUPT, Cambridge, Mass.—*Drilling and Boring Machine*.—May 23, 1865.—This invention consists of a cylinder, containing a piston, whose rod projects through both heads, and carries internally or externally one or more drill bars. With the cylinder is combined as usual a valve chamber and valves preferably balanced to equilibrate pressure, and operated automatically by connection with the piston rod. Around each drill bar (and in the rear of the cylinder and back of the piston rod if it be hollow, and if the drill bar passes through the piston rod) is arranged a mechanism which is called a gripper box, to firmly grasp and hold said bar during its receding movement, while during part of the advance of the piston, and when at or about the end of the stroke, to release the same, thereby allow of its self-adjustment in accordance with the penetrability of the rock. Rotary motion is imparted to the drill rod at each stroke of the piston by means of a stud operating in a helical or oblique slot in the casing of the gripper box, or by any other equivalent arrangement.

Claim.—First, the employment in machinery for drilling or boring rocks or other hard substances, operated by steam or other elastic fluid, of a momentum feed, as described, *i. e.*, a mechanism to firmly connect the piston rod with the drilling tool or tool holder in such a manner as that the hold shall be suddenly and automatically released at or before the completion of its forward stroke, to allow of the self-adjustment of the tool in relation to the rock, in accordance with the penetrability and the progress of the work, substantially in the manner set forth.

Second, in steam drills, or drills operated by air or other elastic fluid, the combination with a hollow piston rod, when used as a tool holder, of a gripper box, arranged in the rear of the cylinder and back of the piston rod, substantially as set forth.

Third, in a drill, operated by steam or other elastic fluid, the momentum feed, as described, when applied to the translatory movement in combination with a positive rotary feed of the drilling tool, and whether the two feeds are simultaneous, reciprocating, or intermittent in their action with respect to each other, substantially as set forth.

Fourth, the arrangement concentrically with the drill or tool of the gripper box, containing a series of wedges held in place to firmly grasp the tool through the agency of a spring, in combination with a stationary anvil ring forward of the gripper box, for operation as set forth.

Fifth, in combination with the gripper box, operating as described, the arrangement for driving the wedges home against the tool, to grasp the same with the full head of steam or the actuating power by causing the rear end of the hollow piston rod to butt against the heads of the wedges, as described.

Sixth, in combination with the gripper box, constructed and arranged as described, the follower to expand the wedges for the purpose of releasing the drill tool or tool holder, substantially as set forth.

Seventh, recessing the stationary cheek or anvil ring so as to leave projecting studs corresponding to similar studs in the forward end of the gripping box, in such manner as that the momentum feed shall be alternated by blows under full head of steam, substantially as set forth.

Eighth, in combination with the means described for producing rotary motion of the tool, the auxiliary ratchet and dog, or the mechanical equivalent thereof, for the purpose of preventing the tool from turning back after each rotation, substantially as set forth.

No. 47,820.—WELLS HENDERSHOTT, Batavia, N. Y.—*Railroad Chair and Coupling*.—May 23, 1865.—This chair consists of a base plate with square flanges. In the centre of and upon this plate meet and rest the ends of two rails. Between one flange of the plate and the rail on each side is a splice piece breaking joints with the ends of the rails. Through said base plate and splice pieces, and also through long slots in the flanges of each side of the rails, pass bolts, connecting them with the cross-ties.

Claim.—Making a rail chair and coupling with a base plate *g g* with square flanges *f f* for the side pieces to rest against, with side or splice pieces *b b* having squared shoulders *h h*, said splices and base being bolted or spiked to the cross-tie through long slots in the flanges of each side of the rail or bolts, may be secured by a key, all constructed substantially as described and for the purpose herein set forth.

No. 47,821.—B. B. HILL, Chicopee, Mass.—*Embossing and Seal Press*.—May 23, 1865.—This invention consists of a fly between the bed and die, so as to allow the parts of envelopes, &c., beneath the flap to be protected from the impression.

Claim.—The employment of the fly *h*, arranged between the die *n* and bed *a*, substantially as and for the purpose described.

No. 47,822.—J. S. HOARD and C. M. MILES, Vineland, N. J.—*Fruit Basket*.—May 23, 1865.—This invention consists of a fruit basket composed of any suitable thin material, such as paper, bark, or veneers of wood, the body of which is made by interlocking the two edges which come together when the material is bent to a conical or circular form, the bottom being made by dropping a circular piece of suitable size down into the basket.

Claim.—The above-described berry and fruit basket, constructed as above set forth, as a new article of manufacture.

No. 47,823.—**JULIUS HOEFER**, New York, N. Y.—*Apparatus for Cooling Beer*.—May 23, 1865.—This invention consists of a frame supporting two tanks, one containing beer and the other containing water. A hollow gutter extends from the tanks to the bottom of the frame. The beer is allowed to flow into the gutter at the top, and the water is caused to circulate in the hollow space from the bottom to the top, where it escapes through a pipe.

Claim.—Cooling beer or other liquids by causing the same to flow downward in the open hollow of the metal pipe E, and by causing the cold water to rise upward in the enclosed space of said pipe E, substantially in the manner and for the purpose described.

No. 47,824.—**MARTIN HORTON**, Brooklyn, N. Y.—*Carpenters' Gauge*.—May 23, 1865.—This gauge is provided with a stationary brad of ordinary construction on one side, and a movable slide, provided with a bead, on the opposite side of its shank, in such a manner that the gauge can be readily set for measuring the width and thickness of a board at the same time. The head is adjustable by means of a wedge, which can be readily fastened and unfastened. An additional adjustable brad on that side of the shank which contains the slide acts in combination with the brad in said slide, as a mortise gauge.

Claim.—The adjustable brad *f* in combination with the brad *d* in the slide *c*, arranged and operating substantially as and for the purpose described.

No. 47,825.—**BENONI H. HOWELL**, New York, N. Y.—*Composition for Lining Barrels*.—May 23, 1865.—This invention consists of a composition of six parts liquid glass and one part of pulverized charcoal.

Claim.—The composition specified, for lining barrels for petroleum, &c.

No. 47,826.—**GEO. WOLSEY HUBBELL**, Derby, Conn.—*Apparatus for Japanning*.—May 23, 1865.—This invention consists of two boxes attached to oscillating bars in such a manner that their positions may be changed alternately. The boxes are filled with the articles to be japanned, and the japanning fluid poured in one of the boxes; the fluid is then allowed to flow into the other box, through a flexible tube, without disturbing the articles in the first box.

Claim.—The plan of drawing off or removing the liquid japan from the articles japanned, keeping said articles stationary, whether this is effected by means of the mechanism hereinbefore described, or by means of a pump, syphon, or any mechanical process whereby the liquid japan is removed from said articles, leaving them stationary.

No. 47,827.—**R. B. HUGUNIN**, Cleveland, Ohio.—*Device for Covering Rollers for Wringers*.—May 23, 1865.—This invention consists of two clamp plates hinged on their under sides. Above the hinged parts each plate is semi-cylindrical in shape. The clamping plates having been opened to their fullest extent, the sheet to be used as a covering is inserted between them, its sides resting upon projections on the clamping plates. The edges of the sheet having been firmly clasped by screw blades on the inner sides of the clamping plates, the roller to be covered is laid upon the sheet and the clamping plates are then closed, the roller and its enveloping sheet being forced down into the semi-cylindrical projections before mentioned, where the sheet is completely wrapped around the roller and may be secured.

Claim.—The clamp plates A A, moving or folding blades B B, and projections C C, substantially as and for the purposes specified.

No. 47,828.—**ANDREW HUNTER**, Solano county, Cal.—*Apparatus for Separating and Concentrating Ores*.—May 23, 1865.—In this invention two troughs are in the form, and suspended as the common stroke-table, so that they may be vibrated by the crank, and with a jerking motion, by means of the spring; across the tables are troughs to receive the ore pulp and distribute it by means of a perforated bottom; also smaller troughs which receive water to be distributed in like manner. The form of the top of the tables, which are amalgamated, is first inclined, then horizontal, and then again inclined.

Claim.—The formation of the troughs B B, with metallic bottom, alternately inclining and level, as shown by line *a b c d*, substantially as described, and for the uses and purposes set forth.

Also, the combination of these troughs with the troughs E E G G, stop-cock H, hangers D D', spring S S, or their equivalent, by adjustable connecting rods I, giving an oscillating and vibrating motion, all substantially as hereinbefore set forth.

No. 47,829.—**EDWARD E. KILBOURN**, New Brunswick, N. J.—*Knitting Machine*.—May 23, 1865; patented in France January 6, 1864.—This invention is designed as an improvement on Kilbourn's machine, patented April 9, 1861. It consists of a straight frame, and knits sheets of fabrics so shaped, and with selvage edges, as to be ready to be sewed up into the form of stockings. The knitting commences at the top of the leg, the fabric being made of uniform width for a given distance; it is then automatically narrowed for the ankle by withdrawing some of the needles and transferring their stitches to adjacent needles; the knitting proceeds again uniformly of this reduced width until reaching the heel part, when the central knitting is suspended, and side strips only are simultaneously knitted for the

purpose of forming the heel, after which the knitting of the central part is resumed to form the upper part of the foot and toe; the sole piece being next formed by taking from the needles the two heel strips and placing them together, and again knitting towards the toe; the requisite narrowing being effected at the proper stages. The edges not thus united in the machine are sewed together by hand; namely, the seam up the back, and the sides of the foot piece.

Claim.—First, the combination of the carriage of a travelling needle in a knitting machine, with the mechanism for moving it past the other needles of the machine in such manner that it can be readily disengaged from said mechanism and re-engaged therewith, substantially as set forth.

Second, the combination of the instrumentality through which the pattern mechanism operates over the travelling needle, or upon the instrumentalities for withdrawing or replacing the regular needles, with the carriage of said needle, or of said instrumentalities, substantially as set forth.

Third, the arrangement of the movable cam plates in a knitting machine above the devices which they operate upon, substantially as set forth.

Fourth, the arrangement of the pattern mechanism of a knitting machine above the needle carriage, substantially as set forth.

Fifth, the combination of the pattern barrel of a knitting machine with mechanism for changing its relationship to the device upon which its pins operate, substantially as set forth.

Sixth, the arrangement of the pins of a pattern barrel in two helical lines, commencing at the opposite ends of the barrels, substantially as set forth.

Seventh, the combination of a cam for restoring the withdrawn needle with a carriage, substantially as set forth.

Eighth, a needle bed divided into divisions, which are so combined with the machine that a division may be displaced and replaced, substantially as set forth.

Ninth, the combination of a removable division of the needle bed, with instrumentalities for counterbalancing its weight, substantially as set forth.

Tenth, the combination of a removable division of the needle bed with a needle holder, substantially as set forth.

Eleventh, the combination of a travelling needle with a needle bed, divided into divisions, one of which may be displaced and replaced, substantially as set forth.

Twelfth, the combination of a transferring prong with a needle bed divided into divisions, one of which may be displaced, substantially as set forth.

Thirteenth, the combination of a removable division of the needle bed with its support by devices which permit a transverse movement, substantially as set forth.

Fourteenth, the combination of a series of reciprocating needles with two thread guides, one of which can be thrown out of gear when a single strip of work is being knit, the whole operating substantially as set forth.

Fifteenth, the combination of the thread-guide carriage with catches that connect and disconnect it with the mechanism for imparting motion to it, substantially as set forth.

Sixteenth, the combination of the needle carriage with two sets of bumpers for operating two thread guides, substantially as set forth.

Seventeenth, the combination of the sinkers at the inner side of a division of the needle bed, which remains in place, with a lifter, substantially as set forth.

Eighteenth, the depression of the yarn between the thread guide and the last needle fed with yarn, by an instrumentality which is separate from the thread guide, and effects the depression substantially as set forth.

Nineteenth, the combination of the thread-guide carriage with devices for gripping the yarn which are independent of the thread guide.

Twentieth, the combination of the needle-cam bar with a movable cam block operating to withdraw one of the needles to a less extent than the others, substantially as set forth.

Twenty-first, the combination of the under supports of the needles of a knitting machine with devices which permit their adjustment laterally, as set forth.

Twenty-second, the combination of the stocks of the under supports with a rock shaft, substantially as set forth.

No. 47,830.—D. W. HUNT, San Francisco, Cal.—*Horse Power*.—May 23, 1865.—This invention relates to a means employed for regulating the speed of the horse power, whereby a steady and uniform motion of the same is obtained. This speed-regulating mechanism consists of a ball governor combined with a brake, the latter being arranged to operate against the fly wheel of the machine. It also consists in the use of an endless platform, whereby the same is rendered rigid or inflexible in one direction, and at the same time rendered flexible in the other or opposite direction, and a brake attachment for stopping the machine in case the belt of the same should break.

Claim.—First, the ball governor J, in combination with the toggle M and shoe O, the latter being attached to a swinging bar N, or its equivalent, and placed in relation with the balance wheel E, all being arranged and applied to a horse power, substantially as and for the purpose herein set forth.

Second, the endless platform D, provided with chains P P, constructed of cast-iron links *j*, having longitudinal grooves *k* to receive plates *l*, which are attached to the links by rivets *m*, substantially as herein set forth.

Third, the brake or stop attachment, composed of a pulley Q bearing on the belt H and attached to the lever R, in combination with the shoe S interposed between the short arm *u* of said lever and the pulley G, to operate in the manner substantially as and for the purpose herein set forth.

Fourth, the cams *w w* on the shaft V in the supplemental frame T, in connection with the pawl W and the perforated wheel V' or its equivalent, for adjusting the inclination of the frame A and endless platform D, substantially as described.

Fifth, hanging the frame A in the supplemental frame T by means of journals *b' b'* attached to the sides of the frame A underneath and in line with the balance-wheel shaft B'', substantially as and for the purpose herein set forth.

No. 47,831.—SARAH J. A. HUSSEY, Cornwall, N. Y.—*Table for Hospitals*.—May 23, 1865.—This invention consists of two upright standards, with a cross-board for a seat, provided with foot rests; above the seat is another cross-board for a table, suitably located, and above the table is a head rest for the support of the sitter's head when leaning it forward. The table is provided with a drawer and swinging shelf. The head-rest, table, and seat are adjustable at different elevations by means of pins fitting in holes in the standards.

Claim.—The above described adjustable table, in combination with the head rest, substantially as set forth.

Also, the foot rest and drawer book-holder, in combination with the table, as specified.

No. 47,832.—GEORGE W. HYATT, Auburn, N. Y.—*Shears for Cutting Iron Bolts*.—May 23, 1865.—This invention consists of a pair of shear bars, pivoted to a cross-bar, at their cutting end; at the other ends are duplicated levers to give power, and their operation is such that in the act of cutting off the rod, one of the cutters will have a shearing movement cross-wise of the rod.

Claim.—The shear bars B B, pivoted to the bar A, as shown, for the purpose already described.

No. 47,833.—JACOB B. HYZER, Janesville, Wis.—*Stove Pipe Drums*.—May 23, 1865.—In this invention, an outer and inner cylinder form a chamber in which are vertical plates extending part way up, and in which are apertures; between the inner cylinder and smoke-pipe is an air-chamber, partly open at bottom, and wholly at the top. A damper in the smoke-pipe, and near the bottom of the drum, directs the flow of smoke into an opening communicating with the outer chamber, and here the flow is so directed by the flanges as to circulate over and round the drum, down to an aperture just above the damper, on inside of the pipe; the open damper allows a direct circulation.

Claim.—First, a heat radiator, when constructed and arranged substantially as herein described and set forth.

Second, the combination of ascending and descending flues and an inner hot-air space with a straight flue regulated by a single damper, substantially as described.

Third, constructing the radial plates with a series of orifices or holes, substantially as and for the purpose set forth.

No. 47,834.—CHARLES G. IMLAY.—Philadelphia, Penn.—*Fruit Jar*.—May 23, 1865; antedated December 6, 1864.—This invention consists of a glass stopper provided with an aperture in its centre, which is closed by a plug. The joint between the stopper and the jar is rendered air-tight by means of a rubber gasket, the stopper being held tight against it by a screw cap, which fits into screw threads upon the neck of the jar.

Claim.—First, the use of the metal screw cap *c*, for the purpose of locking any form or variety of glass stopper upon a glass jar, as described.

Second, the glass stopper and cap *v j*, when fastened by screw thread to the jar, in the manner described.

Third, a metal cap, whereby inclined slots in the cap and by projections or lugs, or portions of screw thread in the neck of the jar, it locks a glass stopper to a glass jar, and the same when no glass stopper is used.

Fourth, the use of the hollow tube plug *v k*, and plug *v x*, (with two apertures at its base,) for locking the aperture inside of the jar, as described.

Fifth, all and each of the described and figured stoppers, when used in combination with my locking caps.

No. 47,835.—HIRAM A. KIMBALL and ANDREW J. LAWRENCE, Philadelphia, Penn.—*Artificial Arm*.—May 23, 1865.—The fingers are opened and shut by means of a forked lever running into each other from a cross-bar in the palm, said cross-bar being moved to and fro in the direction of the thickness of the hand, by means of two elbow levers having their fulcrum in the wrist, said elbow levers being operated by a strap extending up the arm, and communicating with another strap outside of the arm, by which motive power is applied. The arrangement is such that the motive power may be applied when the forearm is in any posi-

tion : and that the forearm may be set and held in any desired position. A non-elastic strap passes around the opposite shoulder from that which supports the artificial limb, and one end of this strap is buckled to an elastic strap to which are buckled the socket straps.

Claim.—First, the arrangement of the levers b , b' , j , j' , and a , in combination with the spring h , to open and shut the fingers, in the manner substantially as above described.

Second, the lever s , by means of which the motive power acts upon the fingers when the forearm is in any position, said lever being constructed and arranged substantially as described.

Third, the bars τ and τ' , in combination with the catch y , and rest A , whereby the forearm is set and held in any desired position, the whole constructed and arranged substantially as described.

Fourth, the employment of the elastic strap D , by which the artificial arm is held in position without chafing or confining other parts of the body, substantially as described.

No. 47,836.—J. W. KIMBALL, Boston, Mass., and JOHN MAHADY, Cambridge, Mass.—*Shoulder Supporter*.—May 23, 1865.—This invention consists in attaching to or around the shoulders, straps or braces, which are united behind, and connected by another strap to the back of the chair.

Claim.—A combination of shoulder straps, with an attaching strap, substantially as and for the purpose described.

No. 47,837.—T. S. LAMBERT, Peekskill, N. Y.—*Double Window*.—May 23, 1865.—This invention consists in providing an inside double window, composed of an upper and lower sash, sliding in the stop of the outer window, and made to press against the sash by a strip of paper, cloth, rubber, or other material that thus obstructs the passage of air, and serves also to sustain the sashes when raised or lowered. The front of the stop is also furnished with a moulding or strip, applied so as to cover the material behind the stop, so that the whole has a neat finished appearance.

Claim.—The combination of the convertible stop F and its moulding I , and the sashes G and H , with the frame A , in the manner and for the purpose substantially as set forth.

Second, the combination of the material k , with the stop F , the moulding I , the sashes G and H , and the frame A , in the manner and for the purpose substantially as set forth.

No. 47,838.—GEORGE LEACH, Elmira, N. Y.—*Rotary Fan*.—May 23, 1865.—This invention consists of a fan so constructed that a steady and uniform blast is produced, having an equal strength and volume on a given line from the fan case, for the purpose of separating light from heavy grains, in grain-separating machines.

Claim.—The combination of the fan shaft and the disk, with wings attached thereto.

Also, the described taper-form of wings in combination with the disk, substantially as described.

No. 47,839.—GEORGE LEACH, Elmira, N. Y.—*Fanning Mill*.—May 23, 1865.—This invention consists of a grain board placed above the upper sieve, and made adjustable, so that the falling sheet of grain enters the blast from the fan at a given point, and by this means effects a separation of the light from the heavy grain.

Claim.—The slide board k , whose front edges are adjustable and operative for the purpose described, at all points longitudinally of the effective length of the sieve g' , in combination with the notched adjusting handle i .

No. 47,840.—JOEL LEE, Galesburg, Ill.—*Farm Gate*.—May 23, 1865.—This invention consists in the employment of a swivel guide with a friction wheel, and the arrangement of the several parts therewith.

Claim.—First, the swivel guide and friction wheel, for the purposes set forth.

Second, the combination of the gate A , the post B , the stop C , the block H , and the cap I , with the swivel guide and friction wheel, all arranged substantially as and for the purpose specified.

No. 47,841.—ANDREW J. LOOMIS, Madrid, N. Y.—*Burglar Alarm*.—May 23, 1865.—This invention consists of a plate properly secured to a door, and having upon it a nipple upon which a percussion cap is to be placed. A hammer is pivoted on a shaft upon which is wound a spiral spring, which constantly tends to project the hammer towards the nipple. A plate is secured to the door post, which holds the hammer ready to strike the cap, and give the alarm as the door is opened.

Claim.—The combination of the plate A , the hammer with its axial shaft E and spring F , the catch G , the whole arranged substantially as described, and applied in the manner and for the purpose specified.

No. 47,842.—WALTER K. MARVIN, New York, N. Y.—*Lock*.—May 23, 1865.—The lock embodying these improvements is too complicated in its structure to admit of an intelligible description without particular reference to the drawings.

Claim.—First, the combination with the movable stump and movable tumblers, of a system of leverage, arranged substantially in the manner herein described, so as to prevent detection of the position of the gates or notches in the tumblers, as herein set forth.

Second, in permutation locks, having rotary tumblers or wheels, the friction brake or brakes, in combination with the eccentric, arranged and operated substantially in the manner and for the purpose set forth.

No. 47,843.—EDWARD MAYNARD, Washington, D. C.—*Button Holder*.—May 23, 1865.—This invention consists of a metallic blank, formed either into a cylindrical shank with tongues at both ends to be folded over on the upper side of the button and the under side of the cloth, or into a cup to be set into the upper shell of the button, the said cup being provided with tongues on its bottom part, to be folded over on the under side of the cloth.

Claim.—A metallic collet or base for the buttons, having tongues or points stamped out centrally therefrom, substantially in the manner and for the purpose herein set forth.

Also, as a new article of manufacture, metallic fasteners for buttons, formed of a polygonal or cylindrical shank, having tongues or points projecting from the ends thereof, substantially in the manner and for the purpose herein set forth.

No. 47,844.—B. H. McNULTY and WM. MCKERN, Mansfield, Ohio.—*Process for Tanning*.—May 23, 1865.—This invention consists in subjecting the hides to the action of the tanning liquor in air-tight vessels, under heavy hydraulic pressure. To effect this the hides are placed in a close vessel, which is provided with a rotary stirrer, and the tanning liquor is forced into said vessel by means of a force pump attached to the pipe.

Claim.—First, the tanning process herein described, the same consisting in agitating the liquid by a rotary dasher E, or equivalent mechanical means, while under pressure within the vat, substantially as and for the purposes set forth.

Second, the apparatus used in the above process, comprising the vat A, lid A', packing a, nozzle D, braces or retainers C, and dasher E, combined and arranged in the manner herein described and represented.

No. 47,844.—HENRY MITCHELL, Richmond, Ind.—*Cook Stove*.—May 23, 1863.—In this invention, from the rear of the fire chamber the flue passes down between the front plate of the stove and front plate of the oven, under and behind the oven, up into the space between the top plate of the stove and the top plate of the oven, where a metal plate extends obliquely from one side across, and diverts the flow around it to the chimney flue, which is situated at the side of the stove, and near the fire chamber. By opening the damper in one side of the partition plate at the back of the fire chamber, a direct draught can be established.

Claim.—The combination and arrangement of the plate C containing the damper B at the upper front corner of the oven with the flues I J and K, and the location of the guide plate A, and of the pipe H, by means of which the heat is taken by the shortest and most direct route entirely around the oven.

No. 47,846.—S. J. MITCHELL, St. Louis, Mo.—*Lightning Rod*.—May 23, 1865.—The object of this invention is to produce a lightning rod which will conduct the fluid with more certainty to the conductor or main rod, while it also presents a great number of attaching points, or a large attracting surface without increasing the difficulties of construction or the cost.

Claim.—The separator or division of the main point A into two bars, connecting by means of branches d with the stem B of the rod, substantially as described.

No. 47,847.—F. H. MOORE, Boston, Mass.—*Device for Pulling on Boots*.—May 23, 1865.—The object of this invention is to produce a substitute for boot straps, and it consists in providing an aperture or apertures in the boot leg for the insertion of one or more fingers for pulling on the boot; the said aperture or apertures being protected from tearing or from being otherwise injured by surrounding their edge or edges with a border made of metal or other suitable material; also in forming said border on its inner, or outer, or both faces of the boot leg, raised up or rounded, so as to protect the fingers from injury.

Claim.—First, forming one or more apertures in the leg of boots or shoes, and providing the edge of such aperture or apertures with a convex border or flange, in the manner substantially as hereinbefore described, and for the purposes set forth.

Second, as an article of manufacture, boot or shoe legs having, for the purposes set forth, one or more bordered or flanged apertures, substantially as herein described.

Third, as an article of manufacture, a boot or shoe, the legs of which, for the purpose of pulling on said boots or shoes, are provided with one or more bordered or flanged apertures, substantially as described or set forth.

No. 47,848.—S. C. MOORE, Boston, Mass.—*Friction Match*.—May 23, 1865.—The burning substance is placed on one end of the splint and the igniting substance on the other, so that in order to ignite the match the splint must be broken in two and the two prepared ends rubbed together. In this way the walls of rooms are saved from the defacement caused by rubbing matches on them, and there is always a surface on which to strike the match.

Claim.—Putting the lighting or burning substance on one end or side of the splint or match and the lighting or igniting substance on the other end or side of the splint or match, substantially as described.

No. 47,849.—**OLIVER MORSE**, Needham Lower Falls, Mass.—*Bed Plate for Paper-mill Engines*.—May 23, 1865.—In this invention the main part of the bed always remains in the same position, and may be secured in its place, while the steel knives as they wear away may be raised and adjusted firmly to the required elevation, and always kept projecting above the interposed layers of wood, and the latter prevented from being worn away.

Claim.—So applying the grinding plates or knives to the bed as to allow of their being raised or lowered relatively thereto, substantially as hereinbefore set forth.

Also, the combination of the steel grinding knives with the clamp bar, when the latter are constructed with a series of slots, substantially in the manner and for the purpose hereinbefore set forth.

No. 47,850.—**JOEL MOULTON**, Boston, Mass.—*Rock Drill*.—May 23, 1865.—The object of this invention is to construct a drill which as the shaft is lifted for a stroke shall be turned so as to cause the cutting face to descend in a new place, causing the drill to turn without the revolution of the stock.

Claim.—First, causing the drill to revolve by means of the collar C, carrying projections which traverse oblique grooves in the position to be rotated in combination with the ratchet teeth D and pawls E, as described.

Second, the described dress to the face of the reamer, consisting of serrations or teeth which run in the reverse direction on the different sides.

No. 47,851.—**IRA F. MUNSON**, Washington, D. C.—*Musical Instrument*.—May 23, 1865.—This invention consists in the construction of violins, &c., from sheet gelatin.

Claim.—First, the use of glue, gelatin, or other analogous substance in the manufacture of musical instruments or parts of such instruments, for the purpose of obtaining increased volume of tone and sonorousness, substantially as described.

Second, uniting parts of musical instruments together by means of the material of which such parts are composed, for the purpose of obtaining homogeneousness, substantially as described.

Third, the use of water-proof composition in the manufacture of musical instruments or parts of instruments, substantially as described.

No. 47,852.—**JOHN L. OTIS**, Florence, Mass., and **SAMUEL L. OTIS**, Manchester, Conn.—*Knitting-machine Needle*.—May 23, 1865.—In this invention the sliding latch, when the needle is drawn back after receiving the yarn, is raised over the point of the hook to allow the discharge of the old loop; a stop holds the catch in proper position to receive the yarn for a new stitch, and to permit the old loop to slip over its point, whilst it is buried in a groove in the needle; the needle and slide being of the same thickness, operate in the same slot of the needle bed, while the cam causes the curved point of the hook to rise and fall to effect the reception and casting-off of the loop.

Claim.—First, the recess *d* in the needle shank, to operate in combination with the stop *c* on the latch, substantially as and for the purpose set forth.

Second, making the needle and latch of one thickness, and operating them in the same slot of the needle bed, as specified.

Third, the stop *e* and curved point of the latch, in combination with the cam *g*, constructed and operating substantially as and for the purpose described.

No. 47,853.—**O. S. PARMENTER**, Providence, R. I.—*Machine for Ornamenting Jewelry, Plate, &c.*—May 23, 1865.—This invention consists of a shaft carrying in one end an engraver's tool, the edge of which is chisel-shaped, and adjusted centrally therein, and against which the material to be ornamented is held. A rapid vibratory motion is given to the shaft by an arm or lever therein, connected by a rod to a crank on a rapidly revolving driving shaft. The pin of the crank is made adjustable to or from the centre to give more or less vibration to the shaft carrying the tool.

Claim.—The machine for ornamental engraving, constructed and operating in the manner and on the principle substantially as described.

No. 47,854.—**FRANKLIN P. PEREGOY**, Indian Valley, Cal.—*Shafting*.—May 23, 1865.—This invention consists in providing a guide and journal for horizontal and upright shafting, so arranged by means of rollers as to overcome a large amount of friction, especially when applied to the stem of stamps used in quartz mills.

Claim.—The combination and arrangement of the guide blocks C C C C, with the set screws G G, and the friction rollers D D D D.

Also, the manner of connecting the two sections by means of the slideways H H, substantially as set forth.

No. 47,855.—**S. M. PRENTICE**, Southington, Ohio.—*Seeding Machine*.—May 23, 1865.—This invention consists in mounting the rear end of the seed box upon a spring for the purpose of securing a steady and uniform supply of seed to the feed wheel.

Claim.—The seed box or hopper D, resting at its back end upon a spring F, substantially as shown, and for the purpose of feeding and supplying the seed uniformly to the distributing wheel C, as set forth.

No. 47,856.—CLARISSA PRESTON, Detroit, Mich.—*Corset*.—May 23, 1865.—This invention consists in combining with a corset a bustle, provided at the lower part thereof in the rear with an extension brace, so arranged horizontally that it can be easily adjusted to the body of the wearer. The extension brace is adjusted to the requisite width by a hook catching in different slots or other convenient means.

Claim.—A combined corset and supporter, arranged with hooks or clasps *a* in front, and made to lace in the rear, and provided with a bustle *B* and extension brace *g*, substantially as and for the purpose set forth.

No. 47,857.—O. E. RANDALL, Lewiston, Maine.—*Horse Rake*.—May 23, 1865.—This invention consists in the combination of several parts designated in the claim, from which in connection with the engraving it will be readily understood.

Claim.—The combination of the bars *F*, arms *i*, shaft *E* and teeth *G G*, all constructed, arranged, and operating substantially as set forth.

No. 47,858.—S. G. RANDALL, New York, N. Y.—*Mode of Propelling Railroad Cars*.—May 23, 1865.—This invention consists in the employment or use of a pipe extending under the railroad track, and provided with a number of outlets at suitable intervals, in combination with a moving reservoir attached to or connected with a passenger car, and furnished with suitable mechanism for propelling itself and the car, in such a manner that through the pipe compressed air may be introduced into the reservoir at any point on the road, and the car can be supplied with a cheap and reliable motive power.

Claim.—The air-supply pipe *a*, provided with suitable spouts *b*, and applied in combination with the movable reservoir *C* and car *A*, substantially in the manner and for the purpose set forth.

No. 47,859.—T. K. REED, North Bridgewater, Mass.—*Boots and Shoes*.—May 23, 1865.—This invention consists in the construction of turned shoes, by which the whole thickness of the sole is made available for wear, and by which the shoe is made by the appearance of a seam around the edge of the sole, to resemble the best kind of hand-made welted work. It also consists in sewing to the sole the piece to which the vamp is united, instead of forming said piece out of the material thereof, by cutting into the inner surface of the sole.

Claim.—A boot and shoe having the construction substantially as specified.

No. 47,860.—C. B. RICHARDS, Hartford, Conn.—*Adjustment for Optical Instruments*.—May 23, 1865.—This invention consists in so supporting and guiding on one or more anti-friction wheels that part of an optical instrument which is made movable, for the purpose of effecting its focal adjustment, that the movements of this said part may be produced by a smooth friction roll, which is pressed against a smooth surface formed on the movable part.

Claim.—The employment in combination with the adjustable parts of an optical instrument of one or more anti-friction wheels, and a friction roll, operating to effect the adjustment to focus, substantially in the manner hereinbefore clearly described, for the purpose set forth.

No. 47,861.—D. M. ROBERTSON, East Boston, Mass., and JASON A. BIDWELL, Boston, Mass.—*Machine for Shaving and Nicking Wood Screws*.—May 23, 1865.—This invention consists in a vibrating adjustable saw frame, by means of which the saw for nicking the screw head is presented to the head at the proper moment, does its work, and moves away again to permit of the operations of turning, which are done in the ordinary manner of turning screw heads.

Claim.—The vibrating adjustable saw frame *R*, in combination with the link *T* and cam *T*, which operate the frame and move the saw, as described.

Also, the rotating saw *S*, in combination with the right and left hand screw nuts, arranged to adjust and hold the saw opposite the centre of the arbor *E*, substantially as described.

No. 47,862.—HERMAN ROETTGER, Philadelphia, Penn.—*Solar Camera*.—May 23, 1865.—This invention consists in the mode of pointing the instrument towards the sun, and in moving it to follow the sun's course. Also in constructing different sized boxes with grooves to hold the enlarged pictures.

Claim.—First, a camera stand constructed with two adjustments at right angles to each other, for the purpose of following the path of the sun by a single motion, substantially as shown and described.

Second, the grooves *k k m m*, in combination with a rigid camera box, as shown and described, for the purpose set forth.

Third, the double chamber *S* and *B*, when used to form a rigid camera box provided with slide grooves, as shown and described.

No. 47,863.—D. B. ROGERS, Pittsburg, Penn.—*Car Truck Frame*.—May 23, 1865.—This invention consists in suspending the weight of car bodies upon levers or supports, so arranged as to bring a horizontal or longitudinal pressure upon the springs, instead of the usual vertical one.

Claim.—The sustaining beam, made substantially as described and for the purposes set forth.

Second, the suspending or resting of car bodies, substantially as described and for the purposes set forth.

No. 47, 864.—JOHN B. ROOT, New York, N. Y.—*Screw Propeller.*—May 23, 1865.—This invention consists in constructing the operating faces of screw propeller blades with a hollow curvature in the direction in which the propelling force is exerted, for the purpose of making the propeller collect the water from its periphery, draw it toward its axis, and discharge it in a compact column in a direction parallel with its axis, thus producing the best propulsive effect. To effect this object the pitch of the propeller is gradually diminished from the peripheries of the blades toward the centre. It is found desirable to make the propeller with a large hub to receive the forward pressure produced by the concentration of the water toward the axis. In order to prevent the eddying of the water in rear of this hub, and to enable it to pass off freely, the rear portion of the hub is made of conical form.

Claim.—First, a screw propeller the blades of which have a curvature forward or in the direction of the revolution, combined with such a hollow curvature of the faces as is produced by a diminution of the pitch from the periphery toward the axis of the propeller, substantially as herein specified.

Second, the hollow rearward conical extension C of the hub, attached to the body B thereof, by being fitted into a groove *i* in the body, and secured by a central bolt *f*, which passes through the said extension and is screwed into the end of the propeller shaft, substantially as herein described.

No. 47, 865.—J. F. SEVERENCE, East Bridgewater, Mass.—*Machine for Cutting Leather.*—May 23, 1865.—This invention consists in the combination of a presser bar and its knife-holding recess with a feed wheel and knife, of two slides with the presser bar and its knife-opening, and a stationary arm arranged with respect to a feed roller; and also of a gauge with the upper slider and the presser bar, when combined with a feed wheel.

Claim.—The combination of the presser bar F, and its knife-holding opening *h*, with the feed wheel C, or the same and a knife K, substantially in the manner and so as to operate therewith, as specified.

Also, the combination of the two sliders E L, and their clamp screws, or the equivalent thereof, with the presser bar F, its knife-holding opening *h*, and a stationary arm D, arranged with respect to the feed wheel C, substantially as hereinbefore set forth.

Also, the combination of the gauge *m* with the upper slider L, and the presser bar F, when combined with a feed wheel in manner and so as to operate therewith and with a knife, substantially as hereinbefore explained.

No. 47, 866.—JOHN SHEFFIELD, Pultneyville, N. Y.—*Water Meter.*—May 23, 1865.—This invention consists in adopting the principles of construction of the ordinary central discharge water wheel, to the purposes of a water meter.

Claim.—The combination of the wings *a*, shaft D, gate *h*, and inlet passage O, all arranged to operate substantially as specified.

No. 47, 867.—JOHN SMITH and E. M. NUTTER, Feltonville, Mass.—*Game Board.*—May 23, 1865; antedated March 3, 1865.—The game is called by the inventors the "battery game," and is played on a board made in imitation of a fort and surrounding grounds, having a pit to contain marbles, and dotted lines from a pivot gun in the fort. The gun is revolved, and whenever stopped in line with one marble, it must be removed, when stopped in range with two, the game is against the gun, and the marbles removed into the fort.

Claim.—The game board, as constructed, with the rotary cannon, the battery, and the cavities, arranged substantially as described.

No. 47, 868.—JOHN Y. SMITH, Alexandria, Va.—*Boring Well.*—May 23, 1865.—This apparatus consists of a vertical cylinder, placed directly over the well, operated by steam; a hollow piston rod, or an arm attached to a solid piston rod, moving a rope of hemp or wire, to which the boring tools are attached; also in a mechanism for producing a continuous rotation of the rope in one direction, which also rotates the drum around which the rope is wound, and a mechanism for producing a self-adjusting automatic feed, which also serves to regulate the blow. And it further consists of a means of rotating the drum, to withdraw the tools and return them with great rapidity.

Claim.—First, in combination with a steam cylinder, whether arranged concentrically or eccentrically with said cylinder, a gripper box or other instrument, to intermittently hold and release the rope or cable, substantially as and for the purposes set forth.

Second, the combination with steam cylinder and gripper box, arranged as described, of a mechanism for intermittently rotating said box while firmly holding the tool, substantially as and for the purposes set forth.

Third, a mechanism for producing intermittent rotation of the rope continuously in the same direction, in combination with a mechanism for simultaneously untwisting the rope, substantially as set forth.

Fourth, in combination with a gripper box or the mechanical equivalent thereof, for rotating the rope continuously in the same direction, a drum around which the rope is wound, when said drum is hung in a frame revolving in the manner and for the purpose set forth.

Fifth, the method herein described of producing a self-adjusting automatic feed of the rope.

Sixth, the method herein described of regulating the force of the blow, substantially as set forth.

Seventh, the means herein described, or the mechanical equivalent thereof, for producing self-adjusting automatic feed, which also serves to regulate the force of the blow.

Eighth, the method herein described of rotating the drum to withdraw the tools and return them with great rapidity, substantially as set forth.

No. 47,869.—JOHN Y. SMITH, Alexandria, Va.—*Safety-valve Rubber*.—May 23, 1865.—This invention consists in the employment in the valve used for such purposes of a disk, made of sheet metal or composition, of a resistance to the pressure upon its surface equal to that which is calculated to be the limit of pressure to which the boiler may with safety be imposed, but which will be broken should any considerable increase of pressure arise from any cause; in which event a free passage for steam to escape into the atmosphere is opened. Combined with this valve is a stop-cock, located below it, which, in case the disk is broken, may be closed, to enable the person in attendance to stop the escape of steam, so that a new disk may be placed in the valve, and the work of the engine be resumed. To prevent closing this cock when the engine is in use a pendent rod passes through the aperture in the cock extending down into the valve case far enough to accomplish that object.

Claim.—First, combining with a safety valve, constructed in the usual manner as described, a metal disk of a resistance calculated to explode under a pressure exceeding that of safety.

Second, the construction of the valve of three parts, substantially as herein described and for the purposes set forth.

Third, in combination with a safety valve, constructed and operating as described, the stop-cock, for the purpose set forth.

Fourth, in combination with a valve and valve case, provided with a stop-cock, as described, the pendent rod fast to the disk, substantially as set forth.

No. 47,870.—JOHN Y. SMITH, Alexandria, Va.—*Rock-drill*.—May 23, 1865.—The object of this invention is to construct a drill which can be easily made and kept in working order, sharpened, or ground, and is calculated to penetrate the rock or other hard substance with great ease and rapidity, requiring no reamer, boring a truly circular hole, not being liable to tighten its joint in the socket, so that there is no danger of its getting detached from the auger stock.

Claim.—First, a rock drill, composed of three or more cutting blades, when recessed in the centre or at the point of intersection of said blades, substantially as set forth.

Second, forming the cutting edges of a three or more bladed rock drill, by bevelling one side of said blades in such manner as to tend to rotate the drill when striking a blow and to tighten the screw-joint, substantially as set forth.

Third, forming cutting edges upon the recessed portion of the blades, substantially as and for the purpose set forth.

No. 47,871.—JOHN Y. SMITH, Alexandria, Va.—*Oil Ejecter*.—May 23, 1865.—This invention consists in the combination of two tubes and a series of valves, so arranged that the well is divided into compartments, and the oil is raised from one to the other, beginning at the lower one, by means of steam or compressed air, which is admitted to the compartments through the inner pipe, which is caused to revolve in its place, thus bringing apertures made in its sides to register with corresponding apertures in the valves through which steam is admitted into the chambers, where it condenses and forms a vacuum, and the oil enters the orifice in the valve seat, and lifts the valve off its seat, in which position it will remain until an equilibrium is established, when the valve sinks to its seat, and the oil is retained to be acted upon by the next in the series of the vacuum-forming chambers.

Claim.—First, the combination with a suitable main tube and stationary valve seats, of a central revolving steam or air cylinder, provided with suitable valves, constructed and operating substantially as hereinbefore described, so that the steam or air is ejected into the space surrounding said cylinder, in the manner and for the purposes set forth.

Second, in combination with the above, the employment, at suitable intervals, and interposed between the sections of the outer tube, of valve chambers for the admission and retention therein of the liquid raised by the injection of steam or other elastic fluid, substantially as set forth.

Third, in combination with the interior cylinder and surrounding valve chambers, the slip-joint attachment, so as to admit of the perfect, yet easy, vertical adjustment of the valves into their respective seats, substantially as set forth.

Fourth, in combination with two concentric cylinders, making the valves and valve seats in the form of spherical caps, or uniting the cylinder sections by ball-joint attachments, so as to yield to lateral adjustment, substantially as set forth.

Fifth, in valve chambers constructed as described, and in combination with hemispherical valves, forming annular channels, in the manner and for the purpose set forth.

Sixth, the employment in an apparatus for raising liquid by direct action of steam and in combination with and as a lining of the steam cylinder of a hemp hose, whether or not boiled in linseed oil, substantially as set forth.

Seventh, the combination of a steam cylinder closed at the base with a hinge trap or valve, operated by a cord or rod in the manner and for the purposes set forth.

Eighth, in combination with a spherical valve, the employment of a steam deflector shield, operated substantially in the manner and for the purpose set forth.

No. 47,572.—MOORE SMITH, assignor to himself and P. W. WELLINGTON, Worcester, Mass.—*Horse-rake*.—May 23, 1865.—This invention relates to the combination of devices identified by the claim, and will be readily understood by reference to the same and the engraving.

Claim.—The combination of the tilting rake head A with the clutch G, clutch projections *g* and *d*, clutch lever E, and cam I, when constructed and operated substantially in the manner and for the purposes stated.

No. 47,573.—ROBERT SPENCER, New York, N. Y.—*Apparatus for Treating Ores*.—May 23, 1865.—This invention consists of a furnace, provided with ore chambers, open at both ends, and communicating at one end with another chamber. These chambers are so arranged that they can be rotated, and are coated with enamel, which is not affected by the heat or by the action of the gases generated. The chamber communicates with a condenser, and the condenser with the chimney. The ore is shovelled into the chamber, and falls on the inclined bottom. It then passes into the chambers where the sulphur is driven off, and finally drops into a bath placed under the outer ends of the chambers. A current of air is kept constantly passing through the chambers and through the condenser into the chimney.

Claim.—Protecting metallic vessels which are used in the process of roasting ores by coating their exposed surfaces with a fire-proof enamel, substantially as described.

No. 47,574.—ROBERT SPENCER, New York, N. Y.—*Apparatus for Treating Ores*.—May 23, 1865.—This invention consists of a furnace, provided with rotating ore chambers and a hot-water chamber above said ore chambers. The amalgamating chamber is placed within another chamber, and is connected to the sides of the furnace at the top, forming gutters. The gutters communicate with a chamber by means of inclined gutters, and the ore is fed in a chamber, and passes down through desulphurizing chambers and falls into a water bath. It is then placed in a hopper, and enters the amalgamating chamber, where it is kept constantly agitated by means of stirrers. The chamber is kept filled with water by means of a pipe, and the muddy water passes off from the amalgamating chamber into the gutters, and from thence into a chamber where the mud is allowed to settle and the water is filtered, and again conveyed to the hot-water chamber.

Claim.—First, applying a series of revolving or oscillating wings or paddles within a vessel E, which is constructed with a central ridge *a*, over which the currents of mercury are interrupted in their passage from one side of the vessel to the other, substantially as described.

Second, the use of a double concave bottom amalgamating vessel, having revolving agitators arranged within it, substantially as described.

Third, the receiving troughs *c c*, in combination with a perforated cover E to the amalgamating vessel, substantially as described.

Fourth, conducting the waste water from the amalgamating vessel into the chamber D, substantially as described.

Fifth, the feeding vessel H in combination with two or more movable cylinders B, communicating with said vessel, substantially as described.

Sixth, the use of a water chamber D, partially surrounding an amalgamating vessel, whether it is mounted over a furnace or not, substantially as described.

Seventh, the combination of one or more rotating or oscillating cylinders B with an amalgamating vessel and a furnace C, substantially as described.

No. 47,575.—LE ROY S. STARRETT, Newburyport, Mass.—*Meat Cutter*.—May 23, 1865.—This invention consists in a combination of knives, operated by a crank and levers, and a rotating tub, so that the meat is cut uniformly and expeditiously.

Claim.—First, the combination of the walking beam I, pitman H, crank shaft E G, pawl A, rack P, and rotary bed O, arranged and operated as specified.

Second, the combination of the horizontal plate K, pendent rods *g*, knives L, rods L L, and guide rod M, constructed and arranged in the manner and for the purposes described.

No. 47,576.—J. M. STONE, assignor to himself, G. L. DAVIS, and G. A. WILEY, North Andover, Mass.—*Lathe Fastening*.—May 23, 1865.—In this device the bolt which holds the tool rest to the slide, which moves lengthwise of the lathe bed, has in its lower end and beneath the

surface of the slide a mortise in the transverse direction of the lathe; the bottom of the rear side of the said mortise is an inclined plane. Through this mortise, and running nearly to the front of the slide, is a bar, having a corresponding inclined plane. At the front side of the slide is a handle having a stem running in to, and the said bar screwing into it. The said stem passes through a clamp mortised into the slide, and having a slight movement, so that by turning the handle to draw the inclined plane to tighten the tool slide, it at the same time forces the said clamp against the lathe frame, and holds the slide tight.

Claim.—Clamping the piece *c* to the piece *b*, and this to the way or frame *a*, by one adjustment, the construction and operation being substantially as described.

No. 47,877.—THOMAS SUMMERFIELD, New York, N. Y.—*Method of Securing Bushes for Bunges to Barrels.*—May 23, 1865.—This invention consists in clenching the nails which secure the bush to the barrel after the barrel has been completed, by means of a tool bent as shown in the engraving, and made with a flat head on one end and a grooved head on the other.

Claim.—Securing metallic bushes for bunges in barrels by means of nails clinched in the inner side of the stave by the lever anvil, substantially as set forth.

No. 47,878.—J. A. TALPEY, Somerville, Mass.—*Hoisting Apparatus.*—May 23, 1865.—This invention consists of two shafts, on each of which is a sprocket and a gear wheel, the two latter meshing with each other. The proportion between the diameters of the gear and sprocket wheel on one shaft differs from the proportion between the diameters of the gear and sprocket wheels on the other shaft, in order that by overhauling the endless chain which is connected with the teeth of the two sprocket pulleys, the block bearing the weight to be raised and connected by the chain with the sprockets may be raised or lowered as desired. The lower sprocket wheel is applied so that it may be thrown out of connection with the upper one and locked so as to prevent retroaction.

Claim.—The improved tackle or hoisting apparatus, consisting of two sprocket pulleys arranged, constructed, and geared together, and operating in conjunction with the endless chain and the loose block, substantially as specified.

Also, so applying the lower sprocket pulley that it may be disconnected from the upper one and keyed or fashioned in position, in the manner and for the purpose substantially as set forth.

No. 47,879.—J. B. TARR, Chicago, Ill.—*Keel for Ships and Other Navigable Vessels.*—May 23, 1865.—This invention is designed for vessels navigating the lakes, and which are often compelled to sail in shallow waters, and it consists in a keel which expands laterally on each side of the centre of the vessel's bottom so as partially to enclose a large body of water on either side.

Claim.—The horizontal keel *c* when constructed and applied as herein specified so that its upper surface will be nearly parallel with the ship's bottom and its edge on the lee side will present an acute angle to the water, while the ship is careened to any extent.

No. 47,880.—EDWIN THURSTON and JAMES R. LEDYARD, Covington, Ky.—*Car Truck.*—May 23, 1865.—This invention consists in constructing and using iron bolsters with cast end-pieces or housings put together in such a manner as to stiffen or brace the arch bars and lower bolster and serve as a guide for the top bolster to work in.

Claim.—First, the construction and use of skeleton iron bolsters B and C, which admit of great strength and durability, and can be used either as centre bearings or side bearings.

Second, the construction and use of the cast end piece A, which serves to stiffen or brace arch bars and lower bolster; also serves as a guide for top bolster to work in, and in connection with bolster, forming a truck, combining strength, durability and lightness with ease of access in all its parts for repairs.

No. 47,881.—W. B. TREADWELL, Albany, N. Y.—*Base-burning Stove.*—May 23, 1865.—In this invention the fire pot terminates at the flue point with an angular extension, so that there is a passage between it and the bevelled edges of the fire brick in the upper chamber. The products of combustion flow into a chamber back of this angular projection, into which the exit pipe opens at the top, and the draught pipe at the bottom, and circulate downwards and upwards through the stove, and pass off near the top; or by opening a damper in the exit pipe, they may flow from the chamber directly to the chimney.

Claim.—First, the fire pot C, with the flaring-lipped extension *e f d*, in combination with a base-burning stove, which has a coal-supply magazine G, substantially as and for the purpose set forth.

Second, the combination of the flaring-lipped extension *e f* with the bevelled brick E, substantially in the manner and for the purpose described.

Third, the arrangement of perforated valve I, chamber K, flues J and H, and the branch flue N, with a base-burning stove, constructed substantially as described, for the purpose set forth.

No. 47,882.—G. L. TURNER, New York, N. Y.—*Machinery for Coiling Springs.*—May 23, 1865.—This machine consists partly of a mandrel for coiling spiral springs when coils do not

lap each other, as conical volute springs. The head is fitted into a socket provided for its reception in a rotating arbor, and the opposite end of which is provided with a journal fitted to a bearing provided for its reception in a sliding arbor. The mandrel is furnished with a flat collar of hardened steel, and the rotating arbor with a hardened steel bushing for the reception of such collar. The mandrel is provided with a head block of wrought iron or steel, the object of which is to secure the bar of which the spring is to be formed to the mandrel during the coiling operation, and to keep the bar edgewise during the operation, or in whatever position is desired.

Claim.—First, in machines for coiling steel springs, whether used for coiling volute, spiral, or other steel or metallic springs, the employment and use of the collars *b* and *b'*, on the mandrel, and the bushing *C* and *C'*, in the socket of the rotating arbor, which receives the mandrel, in combination with the mandrel *E* and the rotating arbor *C*, substantially as and for the purposes above described.

Second, in machines for coiling spiral springs, the employment and use of a base or head block, such as that shown at *G*, or its equivalent, with holding or gripping devices, such as those herein shown and described, or their equivalents, in combination with the mandrel *E*, the worm *P*, the guide *n*, and the collar *M*, when used for producing spirally-formed springs, with parallel ends on the said mandrel, substantially as and for the purposes above set forth.

Third, in machines for coiling metallic springs of a spiral form, the employment and use of a movable collar, such as that shown at *M*, or its equivalent, in combination with the worm *P*, the mandrel *E*, and the guide *n*, when used for the purpose of making that end of the spring which is next to the said collar perpendicular to the axis of the mandrel, substantially as and for the purpose above set forth.

Fourth, the employment and use of a guide, such as that shown at *n*, or its equivalent, in combination with the mandrel *E*, the worm *P*, and the collar *M*, when used for the purpose of suddenly checking the diagonal movement of the end of the bar, and of keeping in its necessary vertical position—that is to say, at right angles to the mandrel, and guiding it at right angles with the face of the mandrel preparatory to forming that end of the spring parallel, substantially as and for the purpose above described.

Fifth, the worm *P*, or its equivalent, in combination with a coiling mandrel, when used for coiling spiral springs, substantially as above described.

Sixth, in machines for coiling spiral or other steel springs, the employment and use of a friction band *T*, or its equivalent, in combination with the spring *T*, the worm shaft *P*, and the frame *P*², or their equivalents, when used for the purpose of coiling metallic springs, substantially as above described.

Seventh, the employment and use of adjustable guides, such as those shown at *W* *W'* *S* and *S'*, or their equivalents, in combination with the sliding table *U*, or their equivalent carriage, and when used for the purpose of keeping the width of the bar vertical, and of guiding it diagonally between the threads of the worm and the face of the mandrel during the process of coiling the spring, substantially as herein set forth.

Eighth, the distance gauge *X*, or its equivalent, applied upon the sliding tube *U*, or other equivalent carriage, to operate substantially as above described.

Ninth, the employment and use of the cams *R* *R*, in combination with the frame *P*² and the worm *P*, the office of said cams being to elevate and hold in proper position the frame *P*² and the worm *P* during the operation of coiling spiral springs, substantially as above set forth.

Tenth, the employment and use of the collar *42*, constructed as shown, and secured adjustably to the sliding arbor *D*, in combination with the cap lever *Q*, constructed as shown, for the purpose of holding the said arbor stationary during the operation of coiling volute, spiral, or other metallic springs, substantially as above described.

No. 47,883.—**ROSSELL WAKEMAN** and **J. L. BALLANCE**, Port Deposit, Md.—*Cutting and Pressing Hay, &c.*—May 23, 1865.—This invention consists of a feed cutter, a stamping apparatus, a screw and follower, and a vertical double rotating adjustable platform, containing two press boxes, so that while one is being filled with cut hay the contents of the other can be pressed into a compact bundle, and discharged from the press through openings, one in each side of the box.

Claim.—First, the hay cutter, so combined with a hay press, and so arranged and operated as to discharge the cut hay into the pressing box, in combination with an automatic stamping or packing apparatus, substantially as and for the purposes herein set forth.

Second, the manner of fastening the doors of the packing or pressing boxes, as herein described.

Third, the combination of machinery herein described, for pressing cut hay into bales.

No. 47,884.—**JAMES WATSON**, Cliff Mine, Mich.—*Apparatus for Washing Ore.*—May 23, 1865.—This invention consists of a long rectangular trough, suspended by hooks, and provided with stops at suitable distances apart, on the inside of the trough. These stops consist of strips of wood extending from one side of the trough to the other, and kept in place by posts. A vibrating motion is imparted to the trough by means of a cam working against the end of a beam. The ore is supplied through the aperture in the chute.

Claim.—The use of a long tie or trough, suspended so as to vibrate against a revolving cam or other device for giving to it a vibrating shock, in combination with a series of movable stops, constructed and arranged substantially as and for the purposes hereinbefore set forth.

No. 47,885.—AMOS WESTCOTT, Syracuse, N. Y.—*Attaching Cranks to Machinery.*—May 23, 1865.—This invention consists in so constructing a crank that by turning it in one direction the crank is fastened to the shaft, and by turning in the opposite direction the crank is taken off.

Claim.—A crank, constructed with the hole *c* and slot *D*, Fig. 1, in the arm thereof, in combination with the flat-shanked screw *B*, Fig. 1, by which it can be attached to the shaft, substantially as above described.

No. 47,886.—ELBRIDGE WHEELER, Feltonville, Mass.—*Rolling Mill.*—May 23, 1865.—This invention consists in uniting the ends of the rolls that project beyond the housings with an adjustable yoke to prevent them from springing apart; also in fastening the sections of dies or rings upon the shafts by means of screw threads cut on the shafts themselves, and a nut run thereon, so that the screw shall expand with the shaft as the latter expands; and also in countersinking one side of the die ring and forming a shoulder on the next adjacent die ring to fit into it, so as to prevent the formation of a fin upon the metal which is being rolled.

Claim.—Uniting the projecting ends of the rolls or shafts by means of a link or yoke, substantially as and for the purpose described.

Also, the holding of the sections of dies or rings or their shafts, by means of screw threads cut upon the shafts, and a nut or nuts run up against them, substantially as described.

Also, the fitting together of the sectional rings or dies by means of countersinks upon one, and a projection upon the next adjacent one, to break the joint between them, and thus prevent the forming of a fin upon the article being rolled, substantially as described.

No. 47,887.—THOMAS WHITSON, Woodstock, Ill.—*Stove-pipe Drum.*—May 23, 1865.—In this invention the chamber at the bottom is divided by partitions into three parts, and connected by pipes with an upper chamber, also divided into three parts, so that when the damper in the direct or central flue passage is closed the draught passes up at the sides of the lower chamber and through the outer pipes into the upper chamber, and down the inner pipes to the lower chamber and thence up the central or main pipe to the exit flue.

Claim.—A heat radiator for use in connection with a stove, consisting in a base *B* and top *E*, provided with the partitions *C* and *F*, connected by the flues *H* and *J*, and return flues *L*, and provided with the valves *D* and *G*, and with or without the transverse pipes *K*, substantially as described.

No. 47,888.—MOSES G. WILDER, West Meriden, Conn.—*Forming Tubes of Sheet Metal.*—May 23, 1865.—This invention consists in forming tubes of thin sheet metal, the blanks of which are of greater breadth than the perimeter of said tubes, which, when bent, are compressed in a die into the perimeter corresponding to the circumference of the tube.

Claim.—The process of forming tubes of thin sheet metal by compressing blanks of greater breadth than the development of the perimeter of the required tube into that perimeter, substantially as set forth.

No. 47,889.—WARREN H. WILKINSON, Springfield, Mass.—*Valise for Artillery Harness.*—May 23, 1865.—This invention consists in a valise made with a hollow or concavity, to fit to and upon the top surface of the saddle of the horse. The valise is made with side fastenings and two straps attached to the bottom.

Claim.—The improved artillery valise, as made with the hollow or concavity *a*, to fit and rest upon the seat of the saddle, substantially in manner as described.

Also, the combination and arrangement of the bottom or girth straps *c e*, with the valise made with the arched or concave bottom, as described.

Also, the combination and arrangement of the four side eyes *b b b b*, and their straps *c c c c*, with the valise, made with the arched or concave bottom, as described.

No. 47,890.—CHARLES J. WOOLSON, Cleveland, Ohio.—*Cooking Stove.*—May 23, 1865.—In this invention a curved iron plate has one edge resting upon the division or fire plate below its upper edge, and the other upon a top oven plate, at a little distance from the fire plate, so that the escape of the products of combustion is regulated in such a manner as to protect the fire plate and top oven plate.

Claim.—A detachable curved iron plate, when arranged in relation to the oven and fire plate of cooking stoves, in the manner and for the purpose set forth and described.

No. 47,891.—JACOB B. BAILEY, New York, N. Y., assignor to SAMUEL E. BAILEY, Springfield, Mass.—*Curtain Fixtures.*—May 23, 1865.—This invention consists of a ring-shaped clamping bracket, receiving the end of the curtain roller and resting thereon with sufficient

friction to prevent the weight of the curtain from turning the roller. The roller is provided with ring flanges at the ends, which are slipped upon the roller, and the cord by which the curtain is wound up is attached directly to the roller.

Claim.—First, the ring socket *c*, receiving the end of the curtain roller, in combination with the clamping piece *d*, introduced and actuated as and for the purpose specified.

Second, a flanged spool, with an opening through its centre for the curtain roller, the said spool being retained in place by attaching the cord, substantially as specified.

Third, a contractile India-rubber band, applied substantially as specified, to create friction for preventing the weight of the curtain turning the roller.

Fourth, a curtain roller, in which friction is applied to sustain the curtain in any position, in combination with two cord spools wound in opposite directions, for the purpose and as specified.

No. 47,892.—GEORGE W. BENTLEY, assignor to himself and CHARLES S. HINE, New York, N. Y.—*Machine for Manufacturing Boxes of Sheet Metal.*—May 23, 1865.—In this machine the forming wheel or mandrel, carrying the ring or cylinder of sheet metal for the body and lid of the box, is pivoted on the wrist of an adjustable crank, by which means its relation to the upper wheel or die is regulated. This arc is on the end of a shaft parallel with the axis of the lower mandrel, but is allowed a slight adjustability to or from the same vertically, and is geared thereto, which cause their peripheries to move together, and the ring being put upon the mandrel, and the upper wheel pressed down by a lever or treadle, the operation of turning the flange or forming a groove in said ring is the same as in machines in common use for that purpose.

Claim.—First, in combination with the frame *F*, provided with the shafts *a* and *i* and lever *h*, the burr wheels *c k p* and *q*, when the same shall be constructed and operated substantially as shown, for the purposes specified.

Second, the adjustable bearing *m* with its adjuncts, when the same shall be combined, substantially as shown, for the purposes specified.

No. 47,893.—GEORGE F. BLAKE, Medford, Mass., assignor to himself, PETER HUBBELL, and JOB A. TURNER, Boston, Mass.—*Water Meter.*—May 23, 1865.—This apparatus consists of two parallel cylinders surmounted by a water chamber, and resting upon the main water ways. The eduction ports are in the bottom of the cylinders, and the water passes to them from the water chamber above by water ways made through the bodies of the plungers. The valve cups are made in the bottom of the plungers, which are kept from turning in their respective cylinders by means of pins received into longitudinal grooves in their surfaces. A registering mechanism of any suitable kind is attached and operated by the reciprocation of the plungers in the usual way.

Claim.—First, so constructing the plungers or pistons of water meters that they shall perform the function of valves, and thus do away with the necessity for independent valves and their connections, substantially as specified.

Second, in combination with the foregoing, making the plunger at each cylinder control the supply and exhaust of its twin or opposite cylinder, in the manner described.

Third, passing the supply water through the body of the plungers by means of water ways, arranged and operating substantially in the manner and for the purpose set forth.

No. 47,894.—WILLIAM M. BRYANT, assignor to himself, JOHN R. ELVANS, and JOHN B. WHEELER, Washington, D. C.—*Whiffletree Irons.*—May 23, 1865.—This invention consists in constructing whiffletree ferrules with a shouldered stem, which is cylindrical for a portion of its length, and oblong or T-shaped for the remainder thereof. The broad portion of the stem can be turned round to a position which will permit it to enter the slot or eye of a trace, and after it has passed through the said eye may be turned back and around to a position at right angles to the length of the slot or eye.

Claim.—First, constructing the ferrules *A*, for swingle or whiffle trees, with the stops or shoulders *d e* and inclined or bevel *f*, substantially in the manner and for the purpose described.

Second, in combination with the subject-matter of the first clause of the claim, the turning stem *B*, with its locking pin *j*, substantially as described.

Third, in combination with the subject-matter of the first and second clauses of the claim, the screw fastening *k*, substantially as herein described.

No. 47,895.—WILLIAM ENNIS, assignor to himself and OSBORNE MACDANIEL, New York, N. Y.—*Fire-Pot for Stove, &c.*—May 23, 1865.—The object of this invention is to construct a fire-pot for burning superheated steam, so arranged that the steam is both generated and superheated in the fire-pot itself, whereby an independent boiler is dispensed with. To attain this end the fire-pot is made in hollow metal sections, so divided by partitions that three chambers are formed. The one in which the steam is generated is connected by pipes with another chamber and the superheater, and the third is perforated to discharge the superheated steam into the burning fuel, and is connected with the superheating chamber by a pipe also.

Claim.—First, the method of generating steam in the fire-pot retort itself, as and for the purpose herein described.

Second, the construction of the steam generator A, combined with the feed-pipe *a*, leading into the steam chamber *m*, and the escape-pipe *b*, leading into the superheater B, as and for the purpose herein described.

Third, the combination of the steam generator A, the superheater B, and the distributors C C, connected with the pipes *a* and *c*, as and for the purpose herein described.

Fourth, the construction of a retort, divided by partitions into chambers or sections, formed of one or more pieces, as and for the purpose herein described.

No. 47,896.—W. H. HART, Meriden, Conn., assignor to himself and GILBERT ROGERS, of the same place.—*Oiler*.—May 23, 1865.—This device is intended more particularly to be a pocket oiler. Its sides are made of any elastic metal, and are slightly oval or rounded, and are soldered together. To the top of these plates is attached a nut having an inside screw thread for a tube, and an outside screw thread for a cap to fit tightly over the tube. When the cap is removed the oil is forced out through the tube by compressing the elastic sides of the oiler.

Claim.—First, the construction of an oiler, substantially as described, having two oval sides, so that the double spring consequent upon the described construction of the same may be obtained, substantially as set forth.

Second, the construction of an oiler with the double spring in the two sides, in combination with the use of the rubber in the top of the cap, and pressing upon the tube, substantially as set forth, using for that purpose any suitable metal or material to accomplish the desired result, or that will produce the intended effect.

No. 47,897.—HENRY HOWSON, assignor to WILLIAM WHARTON, jr., Philadelphia, Penn.—*Well Boring*.—May 23, 1865.—This invention consists of certain mechanism, to be used in boring for oil, its main advantage being its ready applicability to the boring of wells, and to the raising and lowering of boring tools. It combines simplicity, cheapness, lightness as regards construction, rapidity of action, economical and judicious disposal of power, and lateral turning of the boring bar without the aid of an attendant.

Claim.—First, the combination of the crank I, its pin and the lever Q, with the drill rod or rope of well-boring apparatus, the whole being arranged and operating substantially as set forth for the purposes specified.

Second, the arrangement substantially as described of the driving shaft H, its winding barrel J, the clutch K or its equivalent, cog wheels L and M, or equivalent driving gear, the crank shaft *h* and beam Q.

Third, the lever T, adapted to the boring rod or drill rope, and constructed for grasping and releasing the same, substantially as set forth.

Fourth, the said grasping and releasing lever in combination with the bent or curved guides V V or their equivalents, whereby the said lever is caused to turn laterally to a limited extent, in the manner and for the purpose described.

Fifth, the combination of the said grasping lever with the chain or cord *g*, or the equivalent to the same.

No. 47,898.—E. C. C. KELLOGG, assignor to himself and JAMES E. COLEMAN, Hartford, Conn.—*Stocks for Holding Screw Cutting Dies*.—May 23, 1865.—This invention consists in making the opening in the plate with inclined sides, and the ends of the dies with corresponding inclines, and arranging upon the side of the plate upon which the opening is widest, two plates transversely, each with two oblique openings through which they are held to the stock by screws; these oblique slots are so arranged that the plates approach or recede from the centre of the dies sufficiently to cover their ends and hold them in place, or uncover and release them as desired, by being wound laterally in one direction or the other.

Claim.—First, the slotted plates D D' and screws *e e' e'*, in combination with each other, and with the stock and dies, substantially as and for the purpose herein specified.

Second, the cavity *b* in the handle *a'* having a female screw thread *e''* at its mouth, in combination with the pin wrench E having a male screw thread *e'''* near its head, substantially as and for the purpose herein specified.

No. 47,899.—E. C. C. KELLOGG, assignor to himself and JAMES E. COLEMAN, Hartford, Conn.—*Tool for Opening Boxes*.—May 23, 1865.—This invention consists in arranging upon one end of a handle or lever a screwdriver, and a pair of jaws to be forced into the board upon each side of the nail head for displacing the wood, and upon the other end of the lever a jaw so hinged upon a fulcrum, that also forms another jaw, in such manner as to drop into the indentations aforesaid around the nail head, and grasping so as to draw the nail out. Near the same end, upon the opposite side of the lever is arranged a shaving apparatus for shaving off old directions.

Claim.—The within described instrument, constituting a box opener and a scraper, having the parts arranged and combined as herein set forth.

No. 47,900.—E. H. LEWIS, assignor to himself and N. BALDWIN, Kingston, N. Y.—*Machine for Polishing and Dressing Stone*.—May 23, 1865.—This invention consists in the

use of a slide with adjustable clamps and stops, combined with a plate of cast iron, forming the guide for the slide, which moves up and down, and a hand lever serving to put the slide in motion.

Claim.—The slide C, with adjustable clamp D and stops *d*, in combination with the plate A and hand-lever E or its equivalent, constructed and operating substantially as and for the purpose set forth.

No. 47,901.—THOS. J. LOVEGROVE, assignor to himself and HENRY BALDWIN, Philadelphia, Penn.—*Casting Pipes.*—May 23, 1865.—This invention consists in pouring a sufficient quantity of metal in a cast-iron cylindrical mould, which is then allowed to roll down a plane of sufficient inclination to give a rapid rotary motion, by which a centrifugal force is generated, distributing the molten metal evenly over the interior surface of the mould, and continuing it long enough for the metal to become cool.

Claim.—First, making hollow castings by rolling the mould containing the molten metal down an inclined plane, substantially in the manner described.

Second, the combination of flanges on a rotating mould with a railway, for the purpose of giving the mould a parallel movement, as set forth.

No. 47,902.—W. H. and G. W. MILLER, Meriden, Conn., assignors to EDMUND PARKER, of the same place.—*Breech-loading Fire-arms.*—May 23, 1865.—The breech block is hinged to the top or side of the barrel, and is provided with a wedge-shaped projection, which fits a corresponding recess in the cone seat, so as to admit of the conversion of a muzzle-loader to a breech-loader, without change in the construction of stock, lock, or hammer. The breech block is held in position by a spring catch at the end opposite the hinge.

Claim.—First, the breech block C, hinged to the top or sides of the barrel A, and provided with a wedge-shaped projection *a*, to fit in a corresponding recess in the cone seat, all the said parts being constructed substantially as herein specified, so as to admit of a conversion of a muzzle-loading to a breech-loading gun without change in the construction or arrangement of the stock, lock, or hammer.

Second, the combination of the spring bolt *e*, ridge *f*, and groove *g*, with hinged breech-block C and barrel A, constructed and operating substantially as specified, and employed to sustain the recoil in form.

No. 47,903.—WILLIAM H. NOYES, assignor to himself and CHARLES H. WHEADON, Homer, N. Y.—*Thill Tug.*—May 23, 1865.—This invention consists of two parts connected by a joint, the tug being provided with a lining or inner ring of leather to prevent the abrasion of the thills; the lining ring being capable when worn by use of being removed from the tug, and replaced by a new one.

Claim.—A metallic thill tug composed of two parts *a a*, connected by a joint *b*, and provided with a chafing ring E, substantially as herein shown and described.

No. 47,904.—EDWARD PHIFER, Trenton, N. J., assignor to himself and JAMES M. GROVER, Lawrenceville, N. J.—*Cultivator.*—May 23, 1865.—In this invention an adjustable frame is combined with one adjustment for the tooth, and a separate adjustment for the shank, both adjustments being flexible when changing the position of the cultivator tooth, and rigid when the tooth is at work.

Claim.—First, the combination in a cultivator of longitudinal frame pieces, adjustable at both ends to cultivate any width of row, with an axle on wheels adjustable to any width of furrow, substantially as and for the purpose described.

Second, the combination of an adjustable frame, with one adjustment for the tooth, with a separate adjustment for the shank, when both are flexible when changing the position of the cultivator tooth, and rigid when the tooth is at work, substantially as and for the purpose described.

Third, the combination in the cultivator of one or more rigidly held teeth or ploughs, with an adjustable mechanism, substantially as described, whereby the driver can control at pleasure the operation of the teeth, singly or in series, as set forth.

No. 47,905.—GEORGE REHFUSS, assignor to the AMERICAN BUTTON-HOLE SEWING MACHINE COMPANY, Philadelphia, Penn.—*Sewing Machine.*—May 23, 1865.—This invention consists of a button-hole machine in which is employed an ordinary eye-pointed perforating needle, an eye-pointed loop carrier, which carries its own thread from beneath the table upwards through the button-hole, and above the cloth, and a notched arm which plays around the needle by means of a pin and spiral groove, and so catches the lower thread and spreads it beneath the point of the needle. Each thread-carrying device has a guard, one projecting below and the other above the table, the upper one serving to protect the lower needle, and also to prevent the edge of the button-hole opposite to that which is being worked from crowding over the opening, the lower one serving both to protect the upper needle and to deflect its loop to one side, so that the lower needle may enter it. There is also a novel arrangement of devices for delivering and taking up the slack of the upper thread.

Claim.—First, the arm I, with its notched projection *k*, or its equivalent, when arranged

to vibrate round the needle to operate on the thread held by the loop carrier *m*, substantially as described.

Second, the sleeve *H*, with its spiral opening *i* and arm *I*, in combination with the needle bar *D* and pin *f*, the whole being arranged and operating substantially as and for the purpose described.

Third, the guard *n* arranged on the plate *L*, in respect to the looper *m*, substantially as set forth, for the purpose described.

Fourth, the rod *E* and lever *G* in combination with the needle bar *D* and its spiral spring *a*, the whole being arranged and operating substantially as and for the purpose set forth.

No. 47,906.—KARL SCHOU, assignor to himself and G. H. HULL, Lafayette, Ind.—*Surveying Instrument*.—May 23, 1865.—This invention relates to a surveying instrument which serves to record the distance between two or more points on the surface of the ground, and also to trace on a strip of paper the distance and the general formation of the ground between said points.

Claim.—First, a surveying instrument, provided with a wheel *B*, index *l*, cylinder *E*, and tracing device or pencil, substantially in the manner and for the purpose set forth.

Second, the method herein described of adjusting the speed of the paper cylinder according to the grade or formation of the ground over which the instrument is drawn, consisting of the pendulum weight *J*, carriage *F*, friction disk *t*, wheel *r*, and cog wheels *a y z*, or any equivalent means.

Third, the method of regulating the motion of the pencil or tracing mechanism according to the formation of the ground, substantially as herein set forth, consisting of the wheel *s*, friction disk *c'*, pinion *f*, cog wheels *g' i'*, and toothed rack *a'*, or any other equivalent means.

Fourth, the combination of the pendulum weight *J*, carriage *F*, cog wheels *s r*, friction disks *c' t*, paper cylinder *E*, rack *a'*, with tracing device and index *k'*, all constructed and operating substantially as and for the purpose set forth.

Fifth, the elbow lever *o' o** in combination with the pendulum weight *J* and carriage *F*, applied substantially as set forth, so that a motion of the pendulum weight in either direction causes the carriage to move towards the centre of the wheel *r*.

No. 47,907.—ALBERT A. WILSON, Green Point, N. Y., assignor to himself and HOFFMAN ATKINSON, Rouseville, Penn.—*Coupling Shafts to Boring Tools*.—May 23, 1865.—This mode of coupling consists in forming a round hole in the end of one shaft and a tenon upon the end of the other, and inserting the latter into the former and fastening them thus by means of a key which is passed transversely through both. A hollow sleeve, slotted so as to permit the insertion of the key, surrounds the joint thus made, and which, after the key is inserted, is screwed up on one of the shafts so as to bring its slot out of line both longitudinally and transversely with the end of the key, thus preventing the latter from working loose.

Claim.—First, providing the sleeve in connection with any two parts of the stem or shaft of tools, and arranging the same in combination with the key, substantially as and for the purpose described.

Second, the combination of the screw thread *g*, shoulder *e*, shoulder *a*, and sleeve *C*, in the construction of the coupling ends of well bored shafts or stems, substantially as and for the purpose herein described.

No. 47,908.—JAMES HODGES, of Penny Hill, Bagshot, England.—*Excavator*.—May 23, 1865; patented in England June 17, 1865.—This invention relates to a machine for excavating, and at the same time manufacturing peat for fuel, and it consists in the employment of devices and processes explained by the claim.

Claim.—First, the excavating of peat or other substance by means of rotating screw excavators, one or more arranged with shield and scraper, or their equivalents, all placed on or connected with a floating vessel, or a carriage mounted on wheels, substantially as described.

Second, the squeezer composed of the rotating cylinder, provided with pockets and a series of pressure rollers, or their equivalents, when used in connection with the screw excavator, for the purpose specified.

Third, the pulping machine, composed of the perforated diaphragms and revolving knives, arranged within a suitable case, to operate substantially as described.

Fourth, the combination of the screw excavators, endless elevators or carriers, squeezing device, and pulping mechanism, all arranged on or applied to a floating vessel, or a vehicle mounted on wheels, substantially as and for the purpose herein set forth.

No. 47,909.—ANATOLE A. HULOT, Paris, France.—*Printing Ink*.—May 23, 1865.—This invention consists in employing a composition of glue, honey, water, and glycerine, as a vehicle for the colors used, instead of the varnish or oil used in the manufacture of ordinary printing ink.

Claim.—First, the manufacture of typographic ink capable of being washed out when printed on movable adhesive and postage stamps, labels, or designs, requiring to be dated, signed, marked, or otherwise written upon with common ink, as hereinbefore described.

Second, the application of the said typographic ink to the printing of typographic or cop-

per-plate stamps of all kinds, either with delible black or with fast colors: and to relieve stamps with colored grounds and delible vignettes for envelopes to bank notes and other documents, where it is required to prevent the printing from being washed out.

Third, the application of the said typographic ink to imitate water-color pictures with one or more colors, and printed on paper or vellum, and also to printing in tinctorial colors on silk, cotton, wool, and other textile fabrics.

No. 47,910.—F. W. SHIELDS, Westminster, England.—*Telegraph Posts*.—May 23, 1865; patented in England October 6, 1864.—These posts are metallic, preferably of angle iron. Each post is in two parts—the one to be driven into the earth, and the other to be fixed upon the first and sustain the wire. The lower piece is pointed to facilitate its insertion in the earth. The lower end of the upper piece is secured to the upper end of the lower piece by means of screw bolts, rivets, or welding.

Claim.—The construction of telegraph posts of separate parts, one of which is suitable for being driven into the ground, while the other is provided with means for securing the insulator, and is suitable for being attached to the part in the ground, substantially as herein described.

No. 47,911.—HOSEA P. ALDRICH, Spencer, Mass., assignor to himself and GEORGE JENKS.—*Waxed-thread Sewing Machine*.—May 30, 1865.—The claim defines the nature of the invention.

Claim.—First, heating the pressure pad and cloth plate of a sewing machine, or either of them separately, by steam or otherwise, for the purpose of preventing waxed thread from sticking thereto while passing through the machine, substantially as and for the purpose specified.

Second, enclosing the tension wheel, or other tension device of a sewing machine, over which the waxed thread passes in a heated chamber or casing, for the purpose of preventing waxed thread, which passes around it, from sticking thereto, substantially as herein described.

Third, combining with the steam chest of the wax receptacle D, the casing which contains the tension wheels, substantially in the manner and for the purposes specified.

Fourth, the combination, with the wax receptacle D and its steam chest *a*, the pipes G O K, hollow pressure pad B, and hollow cloth plate C, substantially as and for the purposes specified.

No. 47,912.—HOSEA P. ALDRICH, Spencer, Mass., assignor to himself and GEORGE JENKS.—*Thread-waxing Device for Sewing Machine*.—May 30, 1865.—The chimney of a lamp is surrounded by a close water chamber formed within the wax box; this heated water keeps the wax in the fluid state: an outlet pipe from the water chamber permits the escape of steam or air; the rod guide, under which the thread passes to be immersed in the wax, is tubular, and thus allows the passage through it of a belt to secure the whole apparatus to a sewing machine; the wax thread passes out through a rubber or cork plug susceptible of any desired compression, for the purpose of depriving the thread of superfluous wax, and rendering it smooth.

Claim.—First, the combination of the wax receptacle A with the water tank D, water jacket E, and chimney C, substantially as and for the purposes described.

Second, attaching the wax receptacle to the sewing machine by passing a rod through the hollow tube I, which tube performs the function of a thread guide for immersing the thread under the surface of the wax, substantially as herein described.

Third, the combination of the tube L, India-rubber plug O, and screw M, substantially as and for the purposes described.

Fourth, making the India-rubber plug O convex at both its ends, in combination with socket of tube L, and that on screw M, substantially as and for the purposes set forth.

Fifth, the application to thread-waxing devices of the tube L, when constructed as and for the purposes described.

No. 47,913.—LEWIS J. ATWOOD, Waterbury, Conn.—*Shade Holder for Lamps*.—May 30, 1865.—This invention consists in fastening the springs by passing them through slots, and securing them by eyelets or rivets, and in combination therewith having the ring stiffened by corrugation.

Claim.—First, the combination of mortises and rivets, or eyelets, with the springs for securing the latter to the ring, as set forth.

Second, in combination with the springs for holding the lamp shade upon the chimney, the ring formed of thin sheet metal, stiffened by corrugations running around it, for the purposes and as specified.

Third, securing the exterior ring by projections from the springs, in the manner set forth.

No. 47,914.—ALBERT B. AUER, Babcock Grove, Ill.—*Compound for Removing Scale from Boilers*.—May 30, 1865; antedated April 27, 1865.—This invention consists of a composition of catechu, salt, saltpetre, and ground flax-seed.

Claim.—First, the compound herein described, composed of gum-catechu, salt, and salt-petre, substantially as and for the purposes specified.

Second, in combination with a compound for removing boiler incrustations, the employment of flax-seed, as and for the purposes herein described.

No. 47,915.—FREDERICK BALTZ, New York, N. Y.—*Desk.*—May 30, 1865.—This invention is set forth in the claim.

Claim.—The arrangement and combination of the levers B C and D, with the desk and cover of the desk, or table, and with the furniture, in such a manner that the opening or shutting of the cover or door will pull the desk outwards or inwards, substantially in the manner and for the purpose described.

No. 47,916.—JOHN M. BARTLETT, Harmer, Ohio.—*Potato Digger and Separator.*—May 30, 1865.—In this machine the potatoes are taken up by means of a scoop, and separated from the soil by an endless apron, from whence they are deposited upon a screen, where the small ones are separated from the large ones. The potatoes are delivered into a sack from the screens.

Claim.—First, the combination of the iron frame A2, scraper E, endless apron or chain F, main shafts G, spur H, with gearing, as stated, or their equivalents, by means of which the machine is made to dig and automatically separate potatoes, as set forth.

Second, the platform X, in combination with the chute Y, and sacking device X', in the manner and for the purpose set forth.

No. 47,917.—CALEB BATES, Kingston, Mass.—*Apparatus for Applying Paint to Stencil Plates.*—May 30, 1865.—This invention consists of a revolving brush, fed with color from a hopper or reservoir, carried on a truck made to travel over the stencil plate.

Claim.—First, the apparatus herein set forth, for applying paint or ink to stencils, constructed and operated substantially as above described.

Second, the plate I, for compressing the brush at the time it receives paint or ink from the hopper, substantially as above described.

No. 47,918.—G. W. BEARDSLEE, College Point, Long Island, N. Y.—*Coupling Conducting Wires.*—May 30, 1865.—In this invention, the two strands of wire, which it is desired to connect, pass through two disks of metal, which are placed face to face, and of hard rubber, in a tube, the wires of each strand being separated and spread out radially on the face of each disk. Between each disk and the top and bottom of the tube is placed a tube of vulcanized rubber, and a washer of metal, which, owing to the elasticity of the rubber, insure close contact of the disks. The tube is closed by a screw plug of rubber.

Claim.—For effecting the insulating coupling or union of electric conductors, the combination of the metallic disks, or the equivalents thereof, on the conductors, the coupling tube and nut, or its equivalent, and the elastic plug interposed between the metallic disks and the coupling tube and nut, substantially as and for the purpose specified.

No. 47,919.—HORACE BEERS, Brookfield, Conn., assignor to SMITH & BURHAM.—*Hay Spreader.*—May 30, 1865.—In this machine, the teeth are arranged spirally about a revolving head piece, one end of which has its bearing in a movable journal box, operated by a hand lever for throwing it in and out of gear. This construction, and the combination of several devices designated in the claim, constitute the invention.

Claim.—The employment of the revolving head piece D, provided with spirally-arranged teeth, in combination with the supporting pieces E E', and with the movable journal box J, all arranged in the manner and for the purposes substantially as herein described and set forth.

Also, the arrangement and combination of the coil springs L, platform M, and lever K, in the manner and for the purposes substantially as herein described and set forth.

No. 47,920.—JOHN BOLES, jr., Boston, Mass.—*Bridge.*—May 30, 1865.—This invention consists in the construction of a truss-bridge, in such a manner that the braces stand in opposite directions, the divergence of which causes the overlap to be nearer together, at or near the bottom of the chord; also of a wire lacing, interposed between the posts, or vertical supports of the frame, to strengthen it.

Claim.—The combination as well as the arrangement of the lacing b, with the truss composed of the posts, top and bottom chords, braces and vertical tie rods, as specified.

Also, the construction of the truss with the arrangement of the several curved braces, and the several curved counter braces divergent with respect to each other, as described, whereby the crossings thereof are increased from the top to the bottom chord, as specified, and in combination therewith, the two tension wires or cables c c, arranged as specified.

No. 47,921.—JESSE BROCKWAY, Oswego, Ill.—*Sorghum Evaporator.*—May 30, 1865.—This invention consists of a pan, placed directly above the furnace, and divided into three compartments, by means of partitions. A heating pan is placed above the level of the pan, directly over the flue leading from the furnace to the chimney. The sorghum juice is heated

to boiling point in the heater, and then runs into the first division of the pan, by means of the conductor. From this division the juice is allowed to flow into the second, through the gate, and from thence in the third division to be finished. The temperature of the third division is regulated by means of a damper.

Claim.—First, in combination with an evaporator, the heater B, constructed and operated as and for the purpose specified, substantially as specified.

Second, in combination with an evaporator, the damper E, constructed and operated as and for the purposes specified, substantially as set forth.

Third, in combination with an evaporator having various compartments, the conductor C, when used as and for the purpose specified, substantially as set forth.

Fourth, in combination with an evaporator having various compartments, the gates D, constructed and operated as and for the purpose described.

Fifth, an evaporator, having sides that overlap the furnace upon which it rests, and extending down the outside thereof, for the purposes specified substantially as set forth.

No. 47,922.—STEPHEN P. BROOKS, Somerville, Mass.—*Piano-forte Action*.—May 30, 1865; antedated May 21, 1865.—In this invention the hammer is balanced on a standard projecting from the key lever, with a peculiarly arranged back catch, &c.

Claim.—The combination of the hammer arm D with the standard C, and fly lifter F, in connection with the escapement on the rail G, substantially as and for the purpose specified.

Also, extending the hammer arm through and in the rear of the standard, in connection with the back catch H, for the purpose of holding the hammer after the blow is struck, as set forth.

Also, placing the back catch H, in the rear of the hammer arm, substantially in the manner and for the purpose specified.

Also, the combination of the standard C, upon the key lever B, the hammer arm D, the fly lifter F, with the button and spring, the escapement g, and the back catch H, substantially as shown and described.

No. 47,923.—H. C. BROWN, Buffalo, N. Y.—*Damper for Stove Pipes*.—May 30, 1865.—Inside a stove pipe is an annular disk, suspended on an axis passing through the sides of the pipe; on either side of this disk is secured a hollow perforated cone, whose base is equal to the opening in the disk.

Claim.—The combination and arrangement of the annular disk C, and hollow perforated cones D D, with the pipe A, substantially as and for the purposes herein specified.

No. 47,924.—HIRAM BROWN, Burton, Ohio.—*Washing Machine*.—May 30, 1865.—This invention consists of beaters that are grooved and curved on their under sides, and also in the mode of attachment and adjustment to the levers, by which they are operated.

Claim.—First, the beaters H, when constructed and arranged as herein specified, in combination with the ribs F, for the purpose set forth.

Second, the slotted arm H, in combination with the arm p, plate n, lip p', and key l, when constructed and arranged in the manner substantially as and for the purpose set forth.

No. 47,925.—GEORGE C. BUNSEN, Belleville, Ill.—*Blasting Rock*.—May 30, 1865.—This invention consists of a device, whereby a hollow space is left below a charge of powder, and between it and the bottom of a drilled hole in blasting, to the end that the explosive effect of the powder may be vastly increased, and that the labor and expense of tamping may be avoided.

Claim.—The application for blasting purposes of a disk a, when used either with a cylinder d, or support c, or in combination with both cylinder and support, substantially in the manner and for the purpose specified.

No. 47,926.—WM. H. BURKHART, Bucyrus, Ohio.—*Harvester*.—May 30, 1865.—To the reel post near its top is attached the upper end of an elastic steel bar. From this point of attachment the steel bar extends downward to near the bottom of the reel post, and as its lower end it makes a short upward curve, so as to form a step. Upon this step is a pulley box with two pulleys arranged to swivel. The chain which turns the reel passes from the wheel attached to the main pulley, thence under the two pulleys on the steel bar before mentioned, and thence to the pulley attached to the reel shaft. The design is, that the elastic steel bar shall yield to the motions of the machine keep the chain on the wheel, and not allow the chain to slacken so as to stop the revolution of the reel, or tighten it so as to break the chain.

Claim.—First, arranging the spring 1, so that it is pendent from near the reel shaft upon the reel post, and so that it supports the pulleys 5 5 near the lower end of the reel post, in the manner and for the purpose described.

Second, the arrangement of the pendent spring 1, swivelling pulleys 5 5, reel shaft 3, pulley 4, and driving chain or cord of the reel, in the manner and for the purpose described.

No. 47,927.—W. B. BURTRIETT, New York, N. Y., and J. P. MCINTOSH, Brooklyn, N. Y.—*Whitewash Brush and Handle Attachment*.—May 30, 1865.—This invention consists in securing a brush handle to a hemispherical portion, which is attached to the brush-stock in such a manner that the brush can be adjusted and secured rigidly at any desired angle, with respect to the handle, or removed from the handle at pleasure.

Claim.—First, securing a handle to a brush by means of a screw fastening, which is applied to the rounded portion D, constructed substantially as described.

Second, the adjustable section C, having a screw formed on it, in combination with a hemispherical slotted speed D and ferrule B, substantially as described.

No. 47,928.—SAMUEL CAMERON, Pittsburg, Penn.—*Die for Spike Machine.*—May 30, 1865; antedated May 17, 1865.—The two metallic blocks, which form the main portion of this die, are each made hollow, to allow water to be introduced into them for the purpose of keeping them cool. The abutting surfaces of the two blocks, instead of being plain, as is usual in dies of this character, are each rebated longitudinally to a depth equal to the diameter of the spike, and extending rather more than half-way across its surface, and the two are placed with the shoulder of one lapping over that of the other and resting upon the bottom of the rebate, leaving thus between the two rebated surfaces in one direction, and between the two shoulders in the other direction, a longitudinal opening corresponding in shape to that desired for the spike, which is to be square for a portion of its length immediately below the head, and concave upon each of its four surfaces the balance of its length, excepting the point. In the end of one of the blocks is arranged what is called a "clip," upon which the point of the spike is formed, which clip may be removed at pleasure and substituted by another, so as to give any desired shape to the point of the spike, and at the same time cheapen the construction and repair of the die.

Claim.—The use of dies for spike machines made to overlap each other, each having two convex operative faces at right angles to each other, one such face being horizontal and the other perpendicular, for the purpose of making spikes with fluted shanks, substantially as described.

Also, the use of a removable clip for forming the point of the spike, so constructed, as hereinbefore described, as that its operative face may be ground down, from time to time, whenever it may be necessary to dress off the head of the die, so as to compensate for the reduced length of the die, and thereby obviate the necessity of using new dies when the head end of the die becomes worn, substantially as hereinbefore set forth.

Also, the use of dies for spike machines having plain operative faces for a short distance below the head of the spike, and convex operative faces elsewhere, for the purpose of making a fluted spike with the square neck, substantially as described.

No. 47,929.—J. R. CARR, Ellenville, N. Y.—*Grapnel for Wells.*—May 30, 1865.—This invention consists of a cylindrical case, within which is a movable disk, to the periphery of which are fixed the ends of numerous flat springs, whose tension is toward the centre of the cylindrical case. A spiral spring is situated between the aforesaid disk and the top of the cylindrical case. The instrument is used in the bottoms of artesian wells to recover broken tools. The disk is drawn up against the spiral spring so as to compress it and is then allowed to be driven by the spring downward, whereupon its flat springs embrace any tool that may come in their way firmly enough to pull it up with them as they are withdrawn.

Claim.—The grapnel above set forth for recovering fragments of metal and other refractory substances from the bottoms of wells, constructed and operated substantially as described.

No. 47,930.—JOHN CHILCOTT, Brooklyn, N. Y.—*Boot and Shoe Sole.*—May 30, 1865; antedated May 19, 1865.—This invention consists of a compound sole, formed of an outer sole of India-rubber or gutta percha, and an inner sole of leather; the latter having a projecting margin for the purpose of attaching the sole to the boot or shoe.

Claim.—As a new article of manufacture a compound sole, composed of an inner sole of leather and an outer one of India-rubber or gutta percha, united by sewing or other means, with a projecting margin of leather, consisting simply of a portion of the inner sole, substantially as herein set forth.

No. 47,931.—JOHN CHILCOTT, Brooklyn, N. Y.—*Mash Tun.*—May 30, 1865; antedated May 15, 1862.—The mash tun is provided with strainers, which are closed by sliding gates. A trough or basin extends nearly around the mash tun, and is provided with a discharge tube near its bottom. After the mashing operation, the wort is drawn off through the strainers into the trough, leaving the husks in the mash tun.

Claim.—The collecting trough or basin C, strainer *d d*, and gates or shutters D D, in combination with each other and with the mash tun, substantially as and for the purpose herein specified.

No. 47,932.—JOHN B. COCHRAN, Brooklyn, N. Y.—*Slide Valve.*—May 30, 1865.—This invention consists in communicating the motion of the rod to the valve through the medium of a vibrating lever made fast to the valve at its lower end, while the upper end is free to vibrate between two stops placed upon a rod which runs through the steam chest above the valve rod and parallel with it. This rod has a right and a left hand screw cut upon it, and the stops above referred to are fitted to it in such a way that upon revolving the rod the stops are made to approach or recede from each other, thus regulating the motion of the

upper end of the lever and the point at which the valve shall cut off steam from the cylinder.

Claim.—First, the combination of the valve stem C with the lever G whose lower end is pivoted to the back of the valve, and whose upper end is movable, so that the fulcrum, by means of which the valve is moved to and fro, is a movable one for each throw of the valve, substantially as above described.

Second, the combination of the rod H and its nuts *c c*, operated as set forth, with the lever G, substantially as described.

No. 47,933.—ISAAC E. CRAIG, Cleveland, Ohio.—*Steam Generator.*—May 30, 1865.—This invention consists in the combination of the generator with a blower and pipes, through which the steam passes from the generator through the boiler to the space below the grate, and in which it is so far decomposed as to afford the requisite amount of oxygen for the support of combustion. The blower receives its motion from the engine, and steam is admitted to it directly from the generator, and is forced into the pipes leading to the furnace by the piston placed in the cylinder of the blower.

Claim.—First, the pipes D and E, when in combination with the boiler and furnace, as and for the purpose herein set forth.

Second, the blower C, when in combination with the pipes D and E, together with the boiler and fire-box, substantially as set forth.

No. 47,934.—AMORY DAVIDSON, Clinton, Mass.—*Washing Machine.*—May 30, 1865.—This invention consists in the peculiar manner in which the legs of the beaters are constructed to give them a reciprocating motion.

Claim.—The slots J J and K K in the legs G G, in combination with the shaft L and wheels P P, substantially as and for the purpose described.

No. 47,935.—BIRAM C. DAVIS, Herkimer, N. Y.—*Tack Driver.*—May 30, 1865.—This invention consists of an inclined plate serving as a hopper, by which the tacks fall into an inclined guide open at the bottom which causes the tacks to fall with their points downward. Two dies direct the tacks, and a slide forces a tack under the driver, which is held up by a spring. A stroke from a mallet on the driver sets the tacks in the place intended for them, very rapidly.

Claim.—First, the descending incline plate A and guide B, as shown and for the purpose described.

Second, the driver C, slide D, bent arm E, dividing slide F, expanding dies H H, the whole being arranged substantially as described and for the purpose set forth.

No. 47,936.—JOHN DAVIS, Alexandria, Va., *Steam Pressure Gauge.*—May 30, 1865.—The object of this invention is to register the pressure of steam within a steam generator with unerring certainty, irrespective of the increase or diminution of heat to which the steam pressure gauge may be exposed. It also consists in the combination of a pendulous weight with a steam-pressure gauge, and the arrangement of the pendulous weight, piston, rack, cog wheel, sector, toothed wheel, bracket, and roller.

Claim.—First, the pendulous weight J, when used in combination with the steam pressure gauge, and getting into the gauge, the method being unnecessary to describe, it being a well known one adopted in all similar cases. These will be seen at the lower end indications of such packing.

Second, the combination and arrangement of the pendulous weight J, piston F, rock G, cog wheel M, sector L, toothed wheel O, bracket N, friction roller H, substantially upon the principle and in the manner as herein set forth.

No. 47,937.—J. P. DAVIS, Middletown, Conn.—*Moulding Core.*—May 30, 1865.—This invention consists in constructing the skeleton or frame around which the sand core is moulded with a flange at each end, which fills the core box, and which flange has attached to it a handle for the purpose of lifting and removing the core when formed.

Claim.—A skeleton arbor for green sand core, constructed with supporting plates *a a* and handles C C, arranged as herein specified.

No. 47,938.—B. A. EARL, Media, Penn., and HENRY HOLCROFT, Philadelphia, Penn.—*Apparatus for Oiling Wool.*—May 30, 1865.—In this apparatus the shaft has such a motion as to carry over and immerse the wire gauze for a short time in the lubricating material, and then permit it suddenly to fly back and strike with its arms against the edge of the trough, and thus sprinkle the oil upon the wool or the endless feed band.

Claim.—The combination of a box or reservoir B containing lubricating material with a shaft F, carrying a strip of wire gauze, or its equivalent, and having the within-described movement imparted to it by the devices herein described, or the equivalents to the same, for the purpose specified.

No. 47,939.—HORACE EVERETT, Philadelphia, Penn.—*Metal Cans or Boxes.*—May 30, 1865.—This invention consists in forming the hook joint in constructing cans in such a manner that instead of the projection caused thereby being on the outside, as in the ordinary way, its outer surface is made even with the periphery of the cylinder or body of the can.

Claim.—A metal can or box having a body secured by a lap joint, the projection formed by which is arranged on the inside of the can, as and for the purpose herein set forth.

No. 47,940.—MOSES G. FARMER, Salem, Mass., and GEORGE F. MILLIKEN, Boston, Mass.—*Line Wires for Telegraphs.*—May 30, 1865.—The nature of this invention is explained by the claim.

Claim.—As a new article of manufacture a telegraph wire, re-enforced for the purpose of strength with a core or cover of iron or steel, the wire being made by drawing a compound bar of the two metals.

No. 47,941.—R. B. FITTS, Philadelphia, Penn.—*Process for Treating and Compounding Marl.*—May 30, 1865.—This invention consists in treating night-soil with sulphuric acid and mixing the mass with marl. The whole is then allowed to remain undisturbed for a few days, and then salt cake, animal charcoal, and gas lime are added, and the mass is thoroughly dried and packed in sacks for use.

Claim.—First, the employment of sulphuric acid in combination with night-soil for acting upon the marl, substantially in the manner described and for the purpose specified.

Second, in combination with the marl, night-soil and acid, treated as described, the addition of the salt cake, gas lime, and animal charcoal, substantially in the proportions and manner described and for the purpose specified.

No. 47,942.—PHILO M. GILBERT, Kewanee, Ill.—*Gang Ploughs.*—May 30, 1865.—In this invention the parallel and adjustable plough frame rests upon and is pivoted at the end of a rectangular frame upon the axle. This plough beam moves laterally on the axletree by means of a rack, pinion wheel, and lever, and is lifted out of the ground by bent levers connecting with a treadle.

Claim.—First, the combination and arrangement of the plough beams D D, the connecting adjustable straps *ff*, and the removable pivoted connection Z, with the tongue O, as and for the purposes herein specified and described.

Second, the combination of the plough beams D D, the jointed lever I J, the supports H, the lever F, and the standard E, arranged and operating substantially as and for the purpose specified and shown.

Third, the combination of the plough beams D D, the reciprocating beam C, the rear support N, and the tongue O, pivoted to said beams, arranged and operating as and for the purposes shown and set forth.

Fourth, the combination of the plough beam D D, reciprocating beam C, the axle A, provided with the slots *a a*, the bolts *b b*, rack *c*, pinion wheel *d*, and lever *e*, arranged and operating as and for the purposes specified.

No. 47,943.—SAMUEL N. GOODALE, Cleveland, Ohio.—*Steam Brakes for Rail Cars.*—May 30, 1865.—This invention consist of steam cylinders placed underneath the central portion of each car, each of the cylinders being provided with two piston heads and rods, to which are attached the rods that operate the breaks. Steam is conveyed to these cylinders through a pipe which passes from the engine and runs directly beneath them and is joined to them by a swivel joint. The steam on entering the cylinder passes between the pistons and forces them apart, and by this means the breaks are applied to all the wheels of the car to which the cylinder is attached. A flexible coupling is provided for connecting the pipes at the point where the cars are coupled together.

Claim.—First, the arrangement of the steam cylinder B, placed within or beneath the centre of each car, and having double piston heads C C', with guide rods E and E' attached to their rods for operating the brakes G, substantially as specified.

Second, coupling the pipes I by means of the hollow pistons K working through stuffing boxes I', as described.

Third, connecting the hollow pistons K by means of flexible tubes, as specified.

Fourth, the arrangement of the pipes I and stop-cocks O, for the purpose specified.

No. 47,944.—SYLVANUS S. GOULD, Worcester, Mass.—*Cloth Dotter.*—May 30, 1865.—This invention consists of an instrument like a fountain pen, composed of a pointed tube, containing a spring valve rod, which allows the flow of ink or die on pressing the point.

Claim.—First, the combination with the body A of the valve rod B, caps C D and valves *d b*, substantially as and for the purposes set forth.

Second, the combination with the caps C and D of the spring *a* and packing *b*, substantially as set forth.

Third, the combination with the valve rod B of the point *h*, and supporting tube *c*, substantially as set forth.

Fourth, making the lower end of the valve rod B with a series of grooves *f*, for the purposes set forth.

No. 47,945.—GEORGE D. GREENLEAF, Three-mile Bay, N. Y.—*Store Pipe Drum.*—May 30, 1865.—Within the drum are four vertical partition plates, forming five flues, which com-

municate with each other and their collars by openings at their ends. By means of deflecting plates on the top or bottom of the vertical plates, in connection with the damper at the top, and one at the bottom, moved by the same rod, the circulation can be diverted around the drum, or by opening the dampers a direct draft may be obtained through the central flue.

Claim.—The combination in heat radiators for stoves of the drum A, flues $a' a'' a''' a'''' a'''''$, arms $d d$, and rod D, substantially as and for the purposes set forth.

No. 47,946.—CHARLES LEE GRISWOLD, Chester, Conn.—*Augers.*—May 30, 1865.—This invention consists in providing double-twisted augers, with pointed floor lips having the spurs and screw for bases, and the points operating on a shorter radius than the spurs.

Claim.—The pointed floor lips, substantially as described.

No. 47,947.—JOHN HABERMEHL, Wheeling, West Virginia.—*Fire Grates.*—May 30, 1865.—In this invention the fireplace above the grate is in the form of a section of a sphere, with its front edge in a plane, inclined relatively with the fire grate; on the top and concentric with the front edge of the upper part of the fireplace is a semicircular sliding damper, pivoted at its extremities; the bars of the grate are curved inwardly at their centres, the curvature increasing from top to bottom.

Claim.—First, a fire space C, above a fire grate A, having its wall in the form of a section of a sphere, with its front edge in a plane inclined relatively with the fire grate, substantially as and for the purpose set forth.

Second, the semicircular sliding damper D, pivoted at its extremities to the forward part of the wall b , and adjusted by the rod e , substantially as and for the purposes set forth.

Third, constructing the fire grate A, with curved bars arranged so as to form an inclined front, substantially in the manner as and for the purposes set forth.

No. 47,948.—JOHN W. HAINES, Somerville, Mass.—*Manufacture of Silvered Glass Ware.*—May 30, 1865.—This invention consists in rendering the space between the walls of silvered glassware air-tight, by covering the aperture leading thereto with a metallic stopper, and securing said stopper with cement.

Claim.—The stoppering of the hole on the bottom of double glassware, silvered with a metallic stopper, as herein described.

No. 47,949.—EMERY E. HARDY, New York, N. Y.—*Harness.*—May 30, 1865.—This invention consists in a channel running under the terretts and check hook through which the tug strap may pass, and be free to slip endwise; also in a slotted plate attached to the skirt of the saddle, having a slide working in it, and in constructing the skirts of the saddle with a metal shell, having wooden edges to which the lining may be tacked.

Claim.—First, the plate A, constructed in the form and manner shown, and connected to the other parts as herein set forth.

Second, in combination with plate A, the blocks B and B', when so arranged as to form the channel for the strap C, and otherwise constructed as described.

Third, the copper plate E when constructed and fastened in place, as shown and described.

Fourth, the slotted plate e , screw h , and nut f , or their equivalents, when constructed and arranged to operate as and for the purpose set forth.

Fifth, the method of securing the terrett F, as shown, whereby an open space or channel is left underneath it for the strap C.

Sixth, the self-adjusting back strap, when arranged to operate in connection with the other parts, as herein shown.

Seventh, in combination with the strap C, the slotted plate e , clamp f and i , and screw h , constructed and operating substantially as described.

Eighth, the hook C, provided with the square shank U, and used in combination with the bolt l' and crupper plate t , as and for the purposes herein set forth.

No. 47,950.—AXEL HAYFORD and AMBROSE STROUT, Belfast, Me.—*Hay Press.*—May 30, 1865.—This invention is limited to the specific arrangement of the ropes and pulleys, and will be understood from the claim and engravings.

Claim.—First, the combination and arrangement of the follower, toggle lever, and two cords, with the capstan, in the manner substantially as and for the purposes set forth.

Second, the combination of the door, catch bar, and a single button with the frame, when arranged substantially as and for the purpose set forth.

Third, the combination of the lever R, the end lining O, and wedged braces P and Q, with the box B, substantially as described for the purposes set forth.

No. 47,951.—S. S. HEMENWAY, Boston, Mass.—*Clothes Wringer.*—May 30, 1865; ante-dated May 19, 1865.—This invention consists in the employment of strengthening bars, uniting the upper ends of the screw bolts, and resting in longitudinal grooves on the upper surface of sockets, whereby the latter are prevented from turning or twisting.

Claim.—An improvement on the clothes wringer patented by Sylvanus Walker, June 17, 1862.

Also, the employment of the cross-slat J, in combination with the detached grooved sockets D D, and screw bolts E E, substantially as set forth and for the purpose described.

No. 47,952.—WM. HOSIER, Washington Township, Ind.—*Churn*.—May 30, 1865.—This invention consists in the employment of dashers and guides, moved vertically by a cog wheel and pitman. The dashers move in guides similar to those of a new frame, moved in the same way.

Claim.—The foam-dash *h*, in combination with the guides *x x* and lower dashes *w w*, when said dashes are arranged as described, and operated by means of the devices attached to one-half of the lid *e*, as set forth.

No. 47,953.—FREDERIC HOWES, Boston, Mass.—*Crupper*.—May 30, 1865.—This invention consists in combining an extension bar, for the purpose of supporting the tail of a horse, and in making the bar adjustable, so that it can be held at any desirable angle with the crupper.

Claim.—Combining with a crupper an extension-bar or piece for the purpose of raising and supporting the tail of a horse, as set forth.

Second, making the supporting bar adjustable, so that it can be set and held at any desired angle with the crupper, as set forth.

Third, the combination of the ratchet ring, extension bar and spring pall, as described.

No. 47,954.—C. JILLSON, Worcester, Mass.—*Wire-Pointing Machine*.—May 30, 1865.—In this device, the hollow mandrel of a lathe is supported in a head which is capable of a laterally vibrating movement, and which has upon it a guide arm projecting over the shears longitudinally, and upon this arm is a sliding guide or rest, through an opening in which passes the end of the wire to be operated upon. The head, with the wire inserted and secured in the mandrel, is adjusted at such an angle to the stationary cutter, that when it is fed forward longitudinally, the wire comes in contact therewith, so as to have given to it the taper required.

Claim.—First the combination with the adjustable stand C, which supports the wire shaft, the swinging arm F, cutter stand I, and hanger or wire support G, whereby the latter is connected with the cutter stand, but moved laterally as the wire is fed forward, substantially as and for the purpose specified.

Second, combining the cutting and holding devices in a wire-pointing machine, with the stand which supports the wire, in such a manner that the machine can be used for simply pointing wire, or for pointing and cutting off the pointed pieces, substantially in the manner described.

Third, the combination of the pivoted stand which supports the hollow wire staff with the sliding table B, for the purpose of adjusting the taper of the wire to be pointed, substantially as and for the purposes specified.

Fourth, securing the wire within its hollow shaft, by application of a slotted eye piece *o*, substantially in the manner and for the purposes specified.

Fifth, the combination of the cutter and stand for supporting the wire in a wire-pointing machine, in such a manner as that the cutter remains stationary during the operation of pointing the wire, substantially as described.

Sixth, the combination of mechanism in a wire-pointing machine, in such a manner as to cause the wire that is being pointed to recede from or approach the cutter, by a simple movement of the standard which holds the wire to be pointed in a line parallel with the ways or base of the machine, substantially as herein described.

Seventh, the combination with arm F, of sliding hanger G, for supporting the wire, substantially as set forth.

Eighth, the combination with arm F, of hanger G, slotted arm K, and guide *u*, substantially as set forth.

No. 47,955.—C. JILLSON, Worcester, Mass.—*Machine for Pointing Wire*.—May 30, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—First, in combination with the hollow wire shaft, the extension grade frame E, sliding block G, and self-adjusting supporting eye *d*, substantially as and for the purpose specified.

Second, the combination with the cutter *s*, the supporting sleeve *r* for adjusting and feeding the cutter, as and for the purposes specified.

Third, the combination with the guide block G, and supporting eye *d*, of the yielding and self-adapting weight H, substantially as set forth.

Fourth, the combination with the arched frame E, of the guide block G, and supporting eye *d*, as and for the purpose set forth.

Fifth, the combination of the circular bed piece P and table O, for supporting the cutter stand R, substantially as and for the purposes set forth.

Sixth, the combination with the table A, of the bed piece P, table O, and operating lever M, substantially as and for the purposes specified.

No. 47,956.—LEWIS W. JOHANNING, JR., San Francisco, Cal.—*Wire Cutting Machine*.—May 30, 1865.—This invention consists in attaching to one of the sides of a quadrant-shaped

bed plate, a machine for cutting the wire, said wire being fed between the cutters, and guided along the circular or curved edge of the bed plate by a flange thereon, to which a gauge is attached, which determines the length of wire to be cut.

Claim.—The combination and arrangement of the plank or platform A, with the stationary cutter C, vibrating cutter D, cam lever F L, curved guide G, and gauge H, the whole constructed as described for the purpose set forth.

No. 47,957.—PAUL W. KEATING, Norwich, Conn.—*Composition for Blacking Leather.*—May 30, 1865.—This invention consists of neat's-foot oil, lampblack, and white wax.

Claim.—The composition of matter, of the ingredients, in the proportions and mixed in the mode above described.

No. 47,958.—GEORGE D. KELLOGG, Troy, N. Y.—*Shoulder Strap Slide.*—May 30, 1865.—This invention consists in slotting each of the shoulder straps attached to the waist belt, which cross upon the back of the shoulders. A stud passes through both slots, without being attached to either, so that it adapts itself to the point of crossing, wherever the motion of the body may bring that point.

Claim.—Connecting the straps with each other at the point where they cross upon the back, in the manner and for the purpose substantially as set forth.

No. 47,959.—D. A. KING and V. N. GARDNER, Livingston, Ky.—*Attaching and Detaching Tops of Vehicles.*—May 30, 1865.—The top of a vehicle of this description is attached to a removable piece in the carriage seat, running lengthwise thereof, and confined in its place in the seat by buttons. When it is desired to remove the top, it is only necessary to turn back the buttons, when the removable piece in the seat to which the top is attached may be removed without difficulty. A false bottom is provided under the removable piece, which may be raised to the level of the latter when it is removed, so as to leave no break in the seat.

Claim.—The mode herein described of attaching the top of vehicles to the movable piece *d*, resting on the false bottom *e*, and sustained by the bearers *f*, and with the movable piece *d*, held in position by the buttons K K, or their equivalents, all constructed and operated as above described and for the purposes set forth.

No. 47,960.—ADOLPH KOEHLER, Holyoke, Mass.—*Saddle-tree.*—May 30, 1865.—This invention consists in casting the tree in one piece, said tree being provided with a recess for the plate to fit in; which plate has a rein hook at its front end, and at the other a loop to receive the back strap. Two screws secure the saddle to the tree; one from above the former, the other from beneath the latter.

Claim.—Casting the saddle-tree in one piece, with a recess *a* in its under side, in connection with the plate B to fit in the recess *a*, and having the check-rein hook *e* at its front end, and the loop *b* to receive the breechen or back strap at its rear end, and the two screws DE to secure the saddle C and plate B to the tree, substantially as set forth.

No. 47,961.—ROBERT H. LECKY, Allegheny City, Penn.—*Jar for Oil Tools.*—May 30, 1865.—This invention consists in furnishing jars for well-boring tools with slides or guides for preventing the surging, wobbling, crooking, and straining action on the points, and which is so common in jars now used.

Claim.—The use of the guides E and C, when used in connection with "jars" for oil tools, said guides being arranged and operating substantially as herein described and for the purpose set forth.

No. 47,962.—ROBERT LEE, Cincinnati, Ohio.—*Sash Fastening.*—May 30, 1865.—In this device a spring latch is pivoted upon the top of the lower sash. The eye of the sash is slotted towards the handle, and the latch is also made hollow between the handle and the pivot. A spiral spring is inserted, so as to bear against the end and the pivot. Upon the opposite sash is arranged a catch, behind which the turned-up end of the latch passes, and is held fast by a shoulder on the catch. When it is desired to release the latch, the handle is pushed inward against the spring.

Claim.—The arrangement of spring latch F and catch J, with their described or equivalent accessories, the whole being combined and operating to form a secure sash lock, substantially as set forth.

No. 47,963.—JOSEPH LEEDS, Philadelphia, Penn.—*Furnace.*—May 30, 1865.—This invention consists of flat smoke flues, a connecting fire chamber, and exit pipe, the orifices in the fire chamber opening in these flues being the whole of the inner diameter of said flues, and in the exit pipe smaller, and of different diameters.

Claim.—Connecting together the fire chamber and the escape flue chamber of furnaces or stoves for air heaters by means of the series of flat smoke or gas flues C C, the said flues being constructed and arranged substantially in the manner described and set forth, for the purpose specified.

No. 47,964.—FREDERICK KILLER, Baltimore, Md.—*Tobacco Pipe.*—May 30, 1865.—This invention consists of a curved tube of soft metal, made so large as to serve as a condensing

chamber, having on its upper surface the bowl, and on the end furthest from mouth-piece is a cap, by unscrewing which and withdrawing the mouth piece, the tube can be cleaned with facility.

Claim.—The above described smoking pipe, as a new article of manufacture.

No. 47,965.—WM. K. LEWIS, Boston, Mass.—*Soldering Iron.*—May 30, 1865.—This invention consists in applying a shield to a common soldering iron, made of a piece of tubing large enough to slip over the iron, and which, after the iron has been heated, is screwed upon a nut arranged upon the end of the handle next the iron, to protect the hand from the heat.

Claim.—A shield applied to a soldering iron, in the manner substantially as shown and described.

No. 47,966.—F. A. LORD, Aurora, N. Y.—*Evaporator.*—May 30, 1865.—This invention consists of a boiler and vat, the boiler being connected to the vat by pipes. The vat is provided with one or more partitions.

Claim.—In evaporating liquids or fluids of any kind, the combined use of a tight or open boiler and an open circulating vat or vats, the two connected by pipes so that the fluid may continuously flow or circulate through the boiler, and through the vat or vats, substantially as and for the purpose herein described and represented.

No. 47,967.—HOSEA LOW, Waukau, Iowa.—*Machine for Cutting Sheet Metal.*—May 30, 1865.—This invention consists in the employment of two pairs of rotary cutters, in combination with a clamp D, made in such a shape that the part which clamps the sheet passes by one pair of cutters, and the other part holds the gauges, the clamp being secured to a rod, which is adjustable in a swivel, inserted in a slide in such a manner that the sheet to be cut can be easily adjusted to the desired position, and two segments of two concentric circles of any desired diameter can be cut out simultaneously. It is also provided with a squaring frame, having a gauge by which the sheets may be held, so as to cut any bevelled shape desired.

Claim.—First, the employment or use for this purpose of any single stationary frame, or of two frames, with the open ends pointed in the same direction, in either case, with two pairs of cutters, whether the frame or frames or the cutters be adjustable towards the working centre, or the centre adjustable towards the cutters, and especially if the cutters are so placed in relation to the centre or swivel that a right line drawn through the cutting points of contact between the cutters will pass through the working centre in any position of adjustment, substantially as herein set forth.

Second, the clamp D and radius bar c, constructed in such a manner as to lengthen and shorten at the centre and the part that clamps the tin so formed as to pass by one pair of cutters or between two pairs of cutters, in combination with any stationary frame or frames, with one or two pairs of cutters, and with or without the gauges, substantially as and for the purpose described.

Third, the gauge k, provided with a longitudinal slot l, in combination with two oblique slots m in the squaring frame E, constructed and operating substantially as and for the purpose specified.

No. 47,968.—THOMAS MAIN, Greenpoint, N. Y.—*Steam Boiler.*—May 30, 1865.—The boiler is vertical. The combustion chamber surmounts the fire chamber. The flues conduct the products of combustion from the combustion chamber down to the bottom of the boiler, and thence to the top of the boiler, passing through the water space and heating the water, and also passing through the steam chamber, and thus superheating the steam.

Claim.—The combination in a vertical steam boiler of the fire chamber B, the enlarged combustion chamber C, surmounting the said fire chamber and surrounded by a water space, the descending flues f, and ascending flues g, passing through the said water space, and the upper flue space e, surrounding the steam dome d, all as herein described.

No. 47,969.—W. C. MCGILL, Cincinnati, Ohio.—*Hoisting and Lowering Weights.*—May 30, 1865.—This device contains an automatic check for preventing any retrograde movement in hoisting weights. This check consists of a spur wheel, surrounding which is an annulus with interior cogs, which take in those of the spur wheel. While the weight is rising, the annulus is concentric with the spur wheel, and communicates the motion of the spur wheel (which receives motion from the crank) to the hoisting drum. When the motion of the crank ceases and the weight begins to exert a retroactive force, the hoisting drum throws the annulus out of its concentricity with the spur wheel, so that the teeth of the former and latter become interlocked, and prevent any retrograde motion.

Claim.—First, the mechanical movement composed of the parts A B C E I and J, or their equivalents, the whole being combined and operating substantially as set forth.

Second, the combination of the spider I, and annulus J, constructed and operating as set forth.

No. 47,970.—J. H. MERRILL, Quarqueton, Iowa.—*Sorghum Evaporator.*—May 30, 1865.—This invention consists of an evaporator divided into two compartments by means of a par-

tion. The compartments are divided by partitions, and communicate with each other by means of openings near the bottom, which is inclined so that the guide will be deeper than where it enters the pan, at alternate ends. The cane juice flows from the pan into the space between, then into the space to the left of one compartment, then into another compartment. From this latter compartment it flows through into another compartment, passing through apertures, in each partition, and is finally discharged.

Claim.—The pan N, in combination with the evaporator D, the whole constructed and arranged as and for the purpose substantially as herein set forth.

No. 47,971.—G. V. MOONEY, New York, N. Y.—*Barometer*.—May 30, 1865.—This invention consists in constructing the case of a barometer of such length as to admit of the insertion of a timekeeper in the top of it, to impress upon the mind of the observer the time of the occurrence of atmospheric changes.

Claim.—The use of the new article of manufacture, designated the “fine registering barometer and thermometer,” made substantially as described and for the purposes hereinbefore set forth.

No. 47,972.—HERMANN MUND, Chicago, Ill.—*Snap Hook*.—May 30, 1865.—This invention consists in providing the hook with a snap, working on a pivot, with a spring bearing upon it. The spring keeps the snap in contact with the end of the hook, and the snap is provided with a thumb piece to admit of its being readily operated upon.

Claim.—A snap D for a hook, provided with or composed of three arms *b c d*, arranged with a spring E within the shank B, and pivoted to the shank, in the manner substantially as and for the purpose set forth.

No. 47,973.—MARTIN NEWMAN, Unadilla, N. Y.—*Edge Plane*.—May 30, 1865.—This invention consists in a guard or diagonal knife, in combination with the blade stock, which is attached to the shank-piece by means of a set screw, so that the knife stock can be moved up and down. This knife slides in grooves in the knife stock, and is secured by means of set screws.

Claim.—The construction of an edge plane with the guard *c*, and the diagonal knife D, in combination with the stock A, substantially as and for the purpose herein set forth.

No. 47,974.—ROBERT S. NICKERSON and JAMES WALLACE, Philadelphia, Penn.—*Hat*.—May 30, 1865.—In this invention, large meshes are made in woven cloth, by withdrawing certain threads, and this exterior is laid upon a more rigid body, also perforated.

Claim.—As an article of manufacture, a hat made of cloth, having meshes substantially as described, and a perforated hat body.

No. 47,975.—C. NORWOOD, Bloomington, Ill.—*Combined Cultivator and Seeder*.—May 30, 1865.—In this machine the seed-box and covering roller are placed upon levers pivoted at the rear end of the machine, and are adjustable vertically. The opening runners are pivoted to the front of the machine, and fastened to and adjustable vertically with the seed-box. A separate frame of cultivating ploughs is adjusted within the first, when required.

Claim.—First, the bars E E, provided with the seed-boxes H H, and rollers G, and pivoted at their rear ends to pendants F at the back part of the framing A, in connection with the bars L L, pivoted at their front ends to the pendants M at the front part of the framing A, and provided at their rear ends with the coulter projections *b*, and the forks *a**, and connected to the seed-boxes H by the links *g*, all arranged substantially as and for the purpose herein set forth.

Second, the arrangement of the bent pivot bars I I, seed-boxes H H, and connecting bars T, substantially as and for the purpose herein specified.

No. 47,976.—S. R. PARKHURST, assignor to EMILY R. PARKHURST, Bloomfield, N. Y.—*Means for Feeding Wool and other Fibrous Material to Picking, Carding, and other similar Machines*.—May 30, 1865.—In this invention the feed cylinder is toothed, the vibrating comb besides cleaning the cylinder, is also cleaned by it, and it carries a rising and falling shell or shelf, which catches and returns to the burring cylinder any locks of fibre which fall from it. Instead of a lick in, and for the purpose of obtaining room for a larger number of workers and strippers, the first stripper is placed contiguous to the burring cylinder, and transfers the wool directly from it to the main carding cylinder.

Claim.—First, the combination of a vibrating comb with a toothed cylinder, for removing wool and other fibre and foreign substances from the teeth of said cylinders, and also cleaning the teeth of said comb, substantially as specified.

Second, the feed rollers *b* and *c*, in combination with the vibrating comb, substantially as specified.

Third, the combination of a feeding cylinder *b*, vibrating comb *c*, and burring cylinder *d*, for the purposes and substantially as specified.

Fourth, the combination of a shell with the vibrating comb and toothed cylinder *b*, for the purpose and substantially as specified.

Fifth, the heads *ff*, connecting bars *g*, and eccentrics, in combination with the vibrating comb, and cylinders *b* and *d*, as set forth.

Sixth, the combination of the burring cylinders *b m*, and strippers *l* and *n*, with the feed cylinder *b*, and vibrating comb *e*, substantially as specified.

Seventh, the combination of the burring cylinder *m*, the stripper *p*, the worker *q*, and the carding cylinder *o*, substantially as specified, whereby the stripper *p* transfers the fibre from the burring cylinder to the carding cylinder, as set forth.

No. 47,977.—WM. PATTERSON, Salem, N. J.—*Road Scraper*.—May 30, 1865.—The scraper is made concave on its face side, and arranged in its bearings so that it can be readily caused to tilt over, discharge its accumulated load, and slide smoothly over it; also in an arrangement of one or more wheels just in advance of the said scraper, and back of the tongue, so that the rear end of the latter and its connections may be supported; in making the bar which connects the tongue and scraper together, in the form of a curve, so that the line of draught may be readily varied in relation to the face of the said scraper. A small carrying wheel or runner is arranged at each end of the scraper, so that its upper edge may be supported above the surface of the ground after it has been tilted over.

Claim.—First, a road scraper, having its scraper proper *A*, made in the curved form, and arranged obliquely to the line of draught, as described and set forth, the said scraper *A* being supported in its place by means of arms *c1 c2* bent downward behind, and hinged or looped to the back of the said scraper *A*, as described, so as to allow the latter to tilt forward from its upright position before the arms, when required, as and for the purposes described.

Second, the arrangement of the adjustable notched lever *f*, in combination with the curved bar *C*, and scraper *A*, as and for the purposes specified.

Third, the curved connecting bar *C*, when arranged in combination with the tongue *D* and scraper *A*, so as to be adjustable at its connection with the said tongue, substantially as described for the purposes specified.

Fourth, the arrangement of the carrying wheels *E E*, or their equivalents, in combination with the scraper proper, *A*, substantially in the manner described for the purpose specified.

No. 47,978.—ROBERT E. PATERSON, jr., Philadelphia, Penn.—*Glass Presser Feet of Sewing Machine*.—May 30, 1865.—In this device, the edge of the cloth guide plate, which guides the edge of the cloth, is permitted to pass under a portion of the presser foot, and thus admit of sewing the narrowest tucks, the guide lying in close proximity to the needle.

Claim.—The glass presser foot, with its longitudinal recess, adapted to receive the edge of the guide plate, substantially as described.

No. 47,979.—C. E. PHILLIPS, Abington, Mass.—*Rolling Pin*.—May 30, 1865.—This rolling pin is provided with an internal receptacle to contain a nutmeg grater, and a pastry cutter. One end of the rolling pin is made of tin or other metal, and is detachable, so as to serve for a circular cutter to give shape to biscuits. To this removable end is attached a handle, also of tin or other metal, so formed as to receive a wooden handle. The tin handle is used for cutting holes in cakes, and the wooden handle for smoothing and scalloping pastry.

Claim.—First, forming a rolling pin at one end or through its whole extent hollow, or with a suitable aperture or receptacle for receiving such implements as are generally used in the manipulation and ornamentation of pastry, &c.

Second, combining with the rolling pin a removable handle, which will also serve as a cutter, as described.

Third, the combination and arrangement of the removable handle and cutter *ff*, with the pastry smoother *h h*.

Fourth, the combination of the rolling pin *a a a*, nutmeg grater *c c*, and biscuit cutter *ff*, as described.

No. 47,980.—DANIEL PREST, Marlborough, N. J.—*Horse Rake*.—May 30, 1865.—This rake is of the class in which the head rests upon the ground, and the teeth project forward therefrom. Two hand levers project upward from a bar in front of, and parallel with the head. When it is desired to discharge the collected load of hay into the windrow, the upward projecting levers are drawn backward, and thereby the teeth are raised into the air to a sufficient distance to bring the load in contact with the clearer fingers, by means of which it is brushed off the teeth and deposited. The teeth may then be returned again to the earth.

Claim.—The combination of the levers *E E* with the bar *D*, clearers *D'*, and teeth *A'*, the whole being arranged to operate substantially as herein described.

No. 47,981.—WM. A. REILLY, Cincinnati, Ohio.—*Lathe Chuck*.—May 30, 1865.—This device consists of a chuck, from the face of which, at right angles, on two opposite sides, projects a stud or standard, through each of which, radially to the face of the chuck, passes a screw, the inner end of each of which forms a centre or pivot, on which the mandril holding the nut to be squared or faced is secured centrally to the axis of the chuck. A dove-tailed groove across the face of the chuck, at right angles to the mandril, admits a corre-

sponding shaped tongue, attached to the bottom of and guiding a sliding carriage, from the surface of which, near one end, projects a movable standard, the angle of which can be adjusted to suit and be pressed against one side of the nut to prevent its turning with the mandril, while the side of the nut parallel to the face of the chuck is being turned off by the cutter secured in the sliding rest, in the ordinary way.

Claim.—The above described lathe chuck, provided with the slide H, arm I, and slide K, with the adjusting screws M and L, substantially in the manner and for the purposes set forth.

No. 47,982.—R. REYNOLDS and CHARLES YOUNG, Stockport, N. Y.—*Horse Hay Forks.*—May 30, 1865.—This invention consists in combining with two hinged tined jaws, two levers for toggle arms, which are straightened out, the jaws being closed and locked in such position; and, also, in placing the hoisting ring out of the centre of the fork, so that the strain upon the hoisting rope will facilitate the opening and closing of the fork.

Claim.—First, the toggle joint and lever D D, in combination with the hinged jaws B B' of the fork A, constructed and operating in the manner and for the purpose substantially as herein shown and described.

Second, the ring C, when the same is arranged on one side of the centre of the fork, and operates in combination with the toggle arms D D and jaws B B', substantially as and for the purposes set forth.

No. 47,983.—D. E. RICE and WM. EVERETT, Detroit, Mich.—*Tube Sheet Cutter.*—May 30, 1865.—This invention consists of a vertical mandril formed at its lower end into a centre or point, upon which it rests or turns when in operation. Upon the lower part of the mandril, and fitting closely thereto, slides longitudinally a sleeve, on the lower end of which is a cross-head, in longitudinal vertical slots in each end of which the cutters are secured and made adjustable to or from the centre, by means of set screws, to suit the different sized holes required. The diameter of the upper end of the sleeve is enlarged sufficiently to allow a screw to be cast thereon, which runs into a nut, constituting an elongated hub of a thumb feed-wheel, the latter secured and turning upon the mandril by means of a collar thereon near the upper end. An inward projecting stud or pin in the sleeve fits in a longitudinal groove in the mandril, and causes the two to revolve together, and allowing a free vertical motion upon the mandril.

Claim.—The sleeve B, arranged to carry the cutters or tools in combination with the spindle A, sleeve B, and hand-wheel C, constructed and operating substantially as and for the purpose described.

Also, the combination of the revolving rest E, with the spindle A, sleeve B, and hand-wheel C, constructed and operating substantially as and for the purpose described.

No. 47,984.—D. C. and L. S. RIGGS, Omaha City, Nebraska.—*Sugar Press.*—May 30, 1865.—This press consists of a metallic box of suitable strength, with perforated sides, so that the molasses expressed from the crude sugar, for which this press is designed, may escape and be collected outside of the box. After the pressure has been carried to a sufficient length, a wedge in the platform, upon which the press box stands, directly beneath the box, is withdrawn, and the sugar, divorced from the molasses it formerly contained, falls through the opening into a box below.

Claim.—The combination of the pressing box F, base block D, and bottom wedge I, constructed and arranged to operate substantially as described.

No. 47,985.—HENRY M. RULON, Monmouth, Ill.—*Car Coupling.*—May 30, 1865.—This invention consists in coupling railroad cars together by a single connecting pin, in connection with peculiarly constructed drawheads, so arranged that they are coupled automatically.

Claim.—First, the coupling pin C, when constructed and operating substantially as and for the purpose set forth.

Second, the combination and arrangement of the coupling pin C, the weight D, and the draw-head A, when all constructed and operating as herein delineated and set forth.

Third, the combination of the draw-head B with the coupling pin C, constructed, arranged, and operating substantially as and for the purpose herein specified and shown.

No. 47,986.—SILAS C. SALISBURY, New York, N. Y.—*Apparatus for the Manufacture of Gas.*—May 30, 1865.—This invention consists of an apparatus for making gas from petroleum. The hydro-carbon is placed in the reservoir, from whence it is conducted by a pipe to the vaporizer. From this vessel it passes to the retort, which is divided into two compartments, the lower one of which is filled with lime or zinc. The vapor passes first through the upper compartment, and then through the lower one, by means of which it is converted into a fixed gas. The gas then passes through the upper compartment, and then through the lower one, by means of which it is converted into a fixed gas. The gas then passes through the tube to the washing vessel, a current of air produced by the blower being forced into the machine along with the gas through the tube. The pipe enters the vessel at the

side and is extended along the bottom in a perforated coil. The vessel is supplied with water through a pipe, and the gas escapes from a perforated coil and passes through the water and enters a chamber. From this chamber it passes to the purifier, which is filled with lime, through the perforations, and from thence through the pipe to the regulator. It then passes down the pipe into the cooler, which is divided by a vertical partition, in the form of a coil. This chamber is partly filled with water, and the gas, in passing over the surface of the water, is cooled and then led to the gas holder.

Claim.—First, the combination of the washing and purifying chambers and automatic regulator, so that the gas passes through them in succession, substantially as described.

Second, the arrangement of the washing and purifying chambers and automatic regulator described, so that they constitute one apparatus, substantially as and for the purposes set forth.

Third, the combination of the washing and purifying chambers and automatic regulator with the cooling chamber, substantially as and for the purposes set forth.

Fourth, the combination of the cooling chamber, constructed substantially as described, with a retort for the production of fixed gas.

Fifth, the purifying chamber C, constructed substantially as described and for the purposes set forth.

Sixth, the combination of the movable vessel or gas receiver *d* with the faucet in the supply pipe 2^a, connecting the vaporizer 2 and retort 3, so as to constitute an automatic regulator of the supply of the vaporized products of the vaporizer to the retort, substantially as and for the purposes set forth.

Seventh, the combination of the movable vessel *d* with the stop-cock of the air-supply pipe, so as to constitute an automatic regulator of the supply of air to the gas, substantially as described and for the purposes set forth.

Eighth, a washing chamber, constructed substantially as described—that is to say, of a vessel in the lower part of which is a conduit for gas, perforated with numerous small holes, so that the supply of gas is finely divided and compelled to enter the water in numerous small jets, substantially as and for the purposes set forth.

Ninth, the combination of a washing chamber, so constructed with an apparatus for producing a current of air to cause the gas to more certainly be passed through the water, substantially as described and for the purposes mentioned.

Tenth, the combination of the cooling chamber, constructed as described, with the washing and purifying chambers, and also with the naphtha fountain, substantially as set forth, so that it can be used as a cooling chamber, and also as a naphtha reservoir or chamber in the production of fixed or vapor gas, substantially as set forth.

No. 47,987.—MATILDA SAVIERS, Wyandott, Ohio, administratrix of the estate of M. SAVIERS, deceased, and W. N. AYERS, Bristolville, Ohio.—*Corn Planter*.—May 30, 1865.—In this machine, the seed slide is operated by a cam wheel on the draught axle, and thrown back into place by a spring on the end of the slide.

Claim.—The reciprocating slide K, provided with the projections *d d'*, arranged to work in relation with the perforated bottoms of the seed boxes J, in connection with the cam M, bar L, and spring N, all arranged substantially as and for the purpose specified.

No. 47,988.—FREDERICK H. SCHROEDER, Bushnell, Ill.—*Corn Sheller*.—May 30, 1865.—This device consists of a stop valve, provided with flexible flanges, and placed where the corn passes from the shelling to the winnowing device.

Claim.—The employment of the stop valve S, provided with flexible flanges, when constructed and operating substantially as herein described.

No. 47,989.—JACOB SEIBEL, Manlius, Ill.—*Gang Plough*.—May 30, 1865.—By means of a lever, roller, and chain, both the front and rear ends of the plough beams may be raised or lowered simultaneously, and thus the ploughs may be readily adjusted to cut furrows of any desired depth. They may also be readily raised up during the operation, for the purpose of avoiding obstructions. If desired, the front end of the plough beams may be lowered first.

Claim.—The combination of the seat I, fulcrumed at J, perforated standard M, the spring K, provided with the pin *a*, the lever L, or its equivalent, for operating said spring and pin, the rod N, and plough beams P, arranged and operating substantially as and for the purposes herein specified and shown.

No. 47,990.—JACOB SEIBEL, Manlius, Ill.—*Corn Planter*.—May 30, 1865.—In this device, two circulating rotating cutters are placed in the rear of the runner, at an angle of 40° to each other.

Claim.—First, the combination of the cutters *x x*, and runners P, arranged and operating substantially as and for the purposes herein shown and described.

Second, the combination and arrangement of the cutters *x x*, the runners P, jointed at the front end, the cross-bar N, standards R, levers H, cross-bar I, and standard J, operating as and for the purpose delineated and set forth.

No. 47,991.—N. S. SHALER, Newport, Ky.—*Air Cooling Apparatus*.—May 30, 1865.—This invention consists of a case containing a series of cells, so arranged as to form a tortuous passage. The chambers are filled with ice, and air or gas is caused to circulate through the passage, by means of a fan.

Claim.—The apparatus, substantially as explained; that is, consisting of the series of cells, the tortuous passage, and the propeller, or the equivalent thereof, arranged in manner and so as to operate as and for the purpose specified.

No. 47,992.—WILLIAM SLATTER, Alleghany City, Penn.—*Ambulance*.—May 30, 1865.—This invention consists in making a two-wheeled ambulance, or carriage, which will overcome the jolting motion of the horse, by attaching the thills to the underside of the axle, and bracing said thills and axles by running braces from the centre of the springs to the thills.

Claim.—Attaching the thills to the underside of the axle, and bracing the thills and axle together by braces running from the centre of the springs to the thills, constructed, arranged, and operating substantially as herein described and for the purpose set forth.

No. 47,993.—JOSEPH SLUSSER, Cincinnati, Ohio.—*Boring Jar*.—May 30, 1865.—This invention consists in making a jar for well boring tools self-clearing at every stroke, so as to prevent particles of rock, or other extraneous matter, from forcing open or spreading the members of the joint.

Claim.—The mode of constructing a well-boring jar, of two pairs of quarter-round bars or sectors, confined to each other by sleeves, and closing each other's interstices in the act of sliding together, substantially as set forth.

No. 47,994.—WM. F. SMELLEY, Vevay, Ind.—*Farm Gate*.—May 30, 1865.—This invention consists of a diagonal brace or truss, pivoted at its lower end, and moving upon a ratchet, at its upper edge, for the purpose of elevating the gate frame, when it has become sagged.

Claim.—The combination of the rack H, with the pivoted truss G, and gate A B C F, substantially as and for the purposes set forth.

No. 47,995.—JOHN W. SMITH, Iowa Point, Kansas.—*Corn Harvester*.—May 30, 1865.—This invention consists in combining with sled runners a movable platform, which is operated by means of a pawl and rack under the control of the driver, said platform being constructed in two parts, hinged to each other, so that when the platform is thrust forward the front end will slide up an inclined plane at the front of the sled, and also in combining with a guide a reel constructed with sloping arms that are capped, and which is free to rotate in one direction by the pressure of the stalks, but is prevented from rotating in the other, by a self-acting ratchet and pawl.

Claim.—First, in combination with the sled runners, the movable platform B, operated substantially in the manner described.

Second, making said platform in two parts, with front end hinged to the main body of the platform, and arranged to move up or down the inclined plane H, in the manner shown and described.

Third, the rule G, constructed substantially as described, and revolved by the pressure of the stalks upon its arms, when used in connection with the guides, for the purpose specified.

No. 47,996.—HENRY STANLEY, Troy, N. Y.—*Rotary Digger*.—May 30, 1865.—In this machine, two parallel endless chains composed of split links rotate upon wooden drums resting on shafts that are adjustable on the frame. The entire frame is raised with the turning of the bent axle; this axle is turned by the pawls operating on a small cog wheel, that meshes into a toothed segment. A locking device holds the machine firmly at any required depth. The digging teeth are socketed into the split links forming the endless apron.

Claim.—First, the combination of the H-formed g, with the tooth links f, provided with lugs h, all being constructed as specified.

Second, having the ends of the teeth made of conical form when fitting into corresponding-shaped sockets in the links, substantially as described.

Third, the lips k to prevent the turning of the teeth, substantially as described.

Fourth, the employment of one or more intermediate shaft supporters H, in combination with the chain rollers, substantially as herein described.

Fifth, the employment of the toothed segment O, in combination with the wheels L, substantially as described.

Sixth, the combination of the lever by which the digging teeth are raised and lowered with the driver's seat, substantially as described.

Seventh, the pawls S T, in combination with the lever R, and ratchet Q, substantially as described.

Eighth, the employment of a locking device V, or its equivalent, in combination with the raising mechanism, substantially as and for the purpose described.

Ninth, the employment of an adjustable driver's seat, in combination with one or more endless chains of digging teeth, substantially as described.

Tenth, the combination of the cranks N N, with the rear roller, substantially as described.

Eleventh, the employment of the raising lever, in combination with the segment, or its equivalent, substantially in the manner herein shown and described.

Twelfth, the adjustable handle of the raising lever, in combination with the raising lever and adjustable driver's seat.

No. 47,997.—JOHN STARK, Waltham, Mass.—*Lathes*.—May 30, 1865.—This invention consists in the method of operating the spring clamping jaws or chuck, and is effected by means of a female screw or nut, working upon and over the head of the mandrel, forcing outward a sliding cylinder, (which is contained in a circular recess in the head of said mandrel,) by means of a collar thereon, the periphery of which extends in front of the thumb-screw. This sliding cylinder surrounds the conically-shaped jaws or chuck, and its outward motion causes the chuck to close.

Claim.—The combination, as well as the arrangement, of the sliding contractor D' and its operative mechanism E and l , with the tubular arbor A and the clamp C , having the cone c , and being fixed to the arbor so as to operate therewith, substantially as described.

Also, the combination of the chamber h and the socket e with the tubular arbor A , tubular clamp, and its contractor D , provided with screws E and l , constructed, combined, and arranged substantially as set forth.

No. 47,998.—JAMES STEPHENSON, Canandaigua, N. Y.—*Time-keeper*.—May 30, 1865.—This invention consists in an escapement by which friction between the detent and the escape wheel is decreased, and regularity and ease given to its motion. The construction and arrangement of the parts will be evident from the claim and engraving.

Claim.—First, a detent, consisting of a cylindrical block D' , formed with a rim d , and adapted to operate in connection with a balance wheel F , to regulate the escape wheel, substantially as and for the purpose set forth.

Second, communicating motion from the detent to the balance wheel, and *vice versa*, through the medium of a segmental rack E' and pinion F' , substantially as and for the object specified.

No. 47,999.—T. P. THORPE, New York, N. Y.—*Exercising Machine*.—May 30, 1865.—In this invention a balance beam is regulated by adjusting springs, so as to exercise children of unequal weight.

Claim.—The springs $P P$, or their equivalent, combined with the walking beam, marked C , and the shaft N , together with the post B , for the purpose herein described.

Also, the device, as a new article of manufacture, as above described, for the purpose herein intended and described.

No. 48,000.—WM. I. TOWNE, Newton, Mass.—*Grate*.—May 30, 1865.—This invention consists in suspending the journals of the grate on rollers.

Claim.—Suspending the journals b of the grate on rollers d , substantially as set forth for the purpose specified.

No. 48,001.—A. E. and I. V. WARNER, Norwalk, Ohio.—*Sawing Machine*.—May 30, 1865.—This invention consists in providing an arrangement of devices, where both a circular and reciprocating saw can be used for cross-cut sawing at the same time.

Claim.—The above described arrangement of the cross-cut and circular saws, when operated substantially in the manner and for the purposes set forth.

No. 48,002.—THOMAS UREN, New York, N. Y.—*Artificial Arm*.—May 30, 1865.—The artificial arm is secured to the body by means of straps passing over the back and under the other arm, and a wing extending in front of the shoulder, without any strap passing across the chest. A cord is attached at one end to the upper arm, and passing thence through the forearm and hand is attached to the thumb and forefinger in such a manner that by depressing the hand, so as to bring the forearm in line, or nearly so, with the upper arm, the forefinger and thumb are opened, while by a forward movement of the stump of the natural arm, the forearm is elevated, and the thumb and forefingers closed. When it is desired to hold the fingers in a partially closed position, that object is effected by means of a cord attached to the fingers at one end, and at the other to a pin upon the outside.

Claim.—The arrangement of the straps for securing the artificial arm to the body and on the stump of the upper amputated arm, without any strap passing across the chest, in combination with the wing of the upper artificial arm, extending in front of the shoulder, substantially as and for the purpose specified.

Also, the means herein described for holding out the covering of the open part of the artificial arm, at the junction of the upper and lower arm, and in combination therewith, substantially as and for the purpose specified.

Also, connecting the turning wrist-piece with the forearm by a turning flute joint, in combination with the two cords attached to the cross-bar in the wrist-piece, and hitched to the forearm and on opposite sides thereof, substantially as and for the purpose described.

Also, the cord which is attached to the upper arm, and passes through the forearm and hand, and is attached to the thumb and forefinger, to open the thumb and finger by simply depressing the hand, so as to bring the forearm in line, or nearly in line, with the upper arm, in combination with the cord to elevate the forearm and close the thumb and finger by a forward movement of the stump of the natural arm, substantially as and for the purpose described.

Also, in combination with the hinged fingers, the employment of a cord or cords attached to the fingers, and which can be hitched to a pin or its equivalent outside, to hold the fingers in a partially closed position, substantially as described.

No. 48,003.—JOHN WEITZEL, Mott Haven, N. Y.—*Locking and Stopping Window Blinds*.—May 30, 1865.—This invention consists in attaching levers or arms, by means of dovetailed grooves therein, to one end of the slat. On the outer ends of each arm is a pin projecting at right angles from the side thereof, and passing through a rod, which answers the purpose of the ordinary slat bar. The inner side of this rod is notched, and a spring dog attached to the stile of the frame catching in said notches serves to hold the slats in any position required.

Claim.—First, the spring catch E and notched rod D, applied in combination with each other, with the stile A and with arms C, or their equivalents, at one end of the slats, and operating substantially as herein specified.

Second, the pivot arms C, each cast of one piece, with its respective pivot c, and with a dovetail groove in one side, substantially as herein described, to enable it to be secured to the slat without nails, screws, or other fastenings.

No. 48,004.—GEORGE WASHINGTON WICKS, New York, N. Y.—*Boring Machine for Artesian Wells*.—May 30, 1865.—This invention consists in constructing the operative parts of drilling machinery so that a drill shall retrace its cutting, and cut a vertical circular hole, and that all the machinery may be drawn out of line of the drill without disturbing it.

Claim.—First, the apparatus described, when constructed substantially as shown, for imparting to the drill the alternate vertical and rotary motions, as described.

Second, spur gear c, with its rods or framework and the slide piece z, in combination with the tripper D and drill Z, operating together substantially in the manner and for the purpose described.

No. 48,005.—LEWIS E. WILLIAMS, Peekskill, N. Y.—*Explosive Shell*.—May 30, 1865.—In this invention the shell is provided interiorly with walls forming radial recesses, and dividing the interior into separate chambers, each of which is designed to contain its own bursting charge. On the first explosion of the powder on the radial recesses, the shell is ruptured into segmental shells, which afterwards explode independently.

Claim.—A series of radial chambers extending from a common central chamber to the inner perimeter of the shot, for the purpose of dividing the interior of the shot into a series of separate and distinct chambers to contain explosive material, substantially as described.

No. 48,006.—D. H. WISWELL and GEORGE W. SHAW, Buffalo, N. Y.—*Drill for Boring Oil Wells, &c.*—May 30, 1865.—This invention consists in constructing an automatic rotating drill, with which to commence from the surface of the ground and drill to any required depth. It also consists in providing a means by which the ropes operating the drill may be kept taut, so as not to be twisted.

Claim.—First, the rotating frame H, in connection with the cross-head F, uprights e e, guides r and m, pawl and ratchet j j, substantially as herein described.

Second, frame H, in combination with pawl N and ratchet M, all constructed and operating in the manner specified.

Third, an automatic rotating drill, constructed and arranged substantially as herein set forth.

No. 48,007.—AUGUST WITTNEBEN, New York, N. Y.—*Sewing Machine*.—May 30, 1865.—This invention relating to the feeding lever, which is above the table, turns on a universal joint; its rear end passes through an opening in a fixed frame having a central hub, about which, and supported by it, revolves a driving wheel or ring, on whose inner sides are several cam projections, which, in revolving, operate on pins, which slide easily in holes in the hub, and thus act upon the end of the feed lever to give the required movement. Means for adjusting the length of feed are also provided. The feed dog screws vertically into the other end of the lever, and may thus be adjusted in height.

Claim.—First, the employment and use of a revolving wheel F, with internal cams acting through movable pins, the lever E, in the manner and for the purpose substantially as described.

Second, the arrangement of the lever E, moving on a universal joint, and combination with the feeding pad I, and operated by the wheel F and the spring rod W, or its equivalent, in the manner as specified.

Third, operating the needle bar P from the end of the lever E, by means of the lever M and rod N, in the manner substantially as set forth.

Fourth, the arrangements of the plate V, on the end of the lever E, for the purpose of regulating the amount of feed, operating substantially in the manner specified.

Fifth, the application of the feeding pad above the material operated upon, when arranged and operated substantially as described.

Sixth, the combination of the revolving ring F, with internal cams, the pins *a' b' c'*, lever E, feeding pad L, spring rod W, lever M, rod N, and needle bar P, when arranged and operating in the manner and for the purpose substantially as set forth and specified.

No. 48,008.—J. P. WOODBURY, Boston, Mass.—*Street Steam Railroad Car*.—May 30, 1865.—The boiler is vertical, and arranged upon the centre of the forward circular platform. The engines are vertical, and placed one on each side of the boiler. The connecting and valve rods pass down through the platform, and connect below it with the driving-crank shaft. The locomotive thus built is combined with a car, so as to form a "dummy." The circular platform carrying the boiler and engines is supported by means of springs upon the truck frame. Both the front and rear ends of the car are supported upon circular truck frames, and between the car and said frames are radial rollers, so as to enable the car to turn sharp curves.

Claim.—First, the combination of the gear wheels C C' (or cranks and rods, as shown in figure 7) on the axles E E, with the crank shaft Y, and pinion B', and vertical boiler S, and engines U U, when constructed and operating in the manner and for the purposes described.

Second, the combination of the friction clutches M' M' N' N' with one or more pinions B and L, and gear wheels C' C' and K' K', in the manner and for the purpose set forth.

Third, the rack W, and pinion V, when combined with the circular platform I, in the manner and for the purpose herein described.

Fourth, the stop-pins *a*, and bolt *b*, in combination with the platform I, in the manner and for the purpose herein set forth.

Fifth, connecting the driving shaft Y rigidly with the circular platform I, by means of the hangers H' H', when constructed and arranged in the manner and for the purpose herein set forth.

No. 48,009.—G. M. WOODWARD, New York, N. Y.—*Air Pump*.—May 30, 1865.—In this invention an arrangement is made to force air into, or exhaust air or gas from a well or reservoir, by the operation of the same cylinder and piston, at option, by changing the position of two cocks on the top of the pipe cylinder.

Claim.—The air pump D, provided with adjustable or reversible valves *b b*, in combination with a receiver A, the latter communicating with the air-pump, and provided with an education tube B, and all arranged substantially as described.

No. 48,010.—JOHN S. ADAMS, Taunton, Mass., assignor to himself and WILLIAM C. DODGE, Washington, D. C.—*Compressing Cartridges around Bullets*.—May 30, 1865.—In this invention it is designed to firmly attach cartridge cases made of paper, or other fibrous material, to Minie bullets, by closely compressing the forward overlapping edge of the cartridge around the grooves of such bullets; it also consists of jaws fitted to the groove of such bullets, connected by bent levers, and operated by a lever handle; an adjustable head or plug receiving the point of the bullet, so as to gauge it accurately to the position of the crimping jaws.

Claim.—First, the jaws or levers C and D, constructed and operating substantially as and for the purpose herein set forth.

Second, connecting the jaws C and D, by the arm *a a*, and strip E, or their equivalents, for the purpose of securing a positive uniformity of motion in the two, by means of one handle.

Third, the shield or plate F, or its equivalent, for the purpose of preventing any lateral movement of the jaw C, and prevent it from being bent laterally, by operating the handle.

Fourth, the cartridge-case rest *n*, to insure the union of the ball and case on the same axial line.

Fifth, the adjustable plug H, arranged as described, for the purpose of adapting the machine to bullets of different lengths.

Sixth, the stop-pin *e*, in combination with the recess or slot, for limiting the movements of the jaws C and D.

Seventh, the washers *i*, in combination with the jaws and face plate B, as and for the purpose set forth.

No. 48,011.—J. A. BASSETT and O. C. SMITH, Salem, Mass., assignors to OLIVER BENNETT, Boston, Mass.—*Air Injector*.—May 30, 1865.—The object of this invention is to inject air into and through burning fuel by means of a current of steam, which is adjustable in its volume. It consists also in the construction of adjustable openings, through which to inject air by means of jets of steam.

Claim.—The injection of air through adjustable openings, constructed as described, into and through burning fuel, by means of the force of a jet of steam used direct from the boiler, or superheated, as may be required.

No. 48,012.—WILLIAM H. BECHTEL, assignor to himself and B. H. BARTOL, Philadelphia, Penn.—*Boring Wells*.—May 30, 1865.—This invention consists in the use of elliptical or oval cog wheels, in combination with the bar or rope used in boring artesian wells, and with its equivalent, for releasing and seizing said bar or rope; it is also designed to obtain, by the aid of elliptical wheels, a differential reciprocating motion for economizing power, and saving time in boring artesian wells.

Claim.—The use, substantially as and for the purpose described, of elliptical or oval cog wheels, in combination with a well-boring bar or rope, and with the mechanism described, or the equivalent to the same, for seizing and releasing the said bar or rope.

No. 48,013.—JOHN BOLES, jr., assignor to G. W. & F. SMITH, Boston, Mass.—*Bridge*.—May 30, 1865.—This invention has reference to what are termed "lattice trusses," or those which have diagonal braces and counter braces crossing one another so as to form quadrilateral openings at the crossings of four such braces. The invention consists in uniting two straight braces, or a straight brace and a counter brace, by curved or arched connections to be fastened to the chord at the union of such braces. It also consists in a combination of a series of diagonal struts with the braces and counter braces, and their quadrilateral openings.

Claim.—The combination of the series of arch connections *a a a*, the stright braces and counter braces, and their chord or chords, the whole being arranged substantially as set forth.

Also, the combination of the series of diagonal upright struts *E E*, with the system of braces and counter braces, and their chords, the whole being arranged substantially as specified.

No. 48,014.—DANIEL CAMPBELL, Elizabeth, N. J., assignor to HENRY SEYMOUR, New York, N. Y.—*Cutter for Bread, Meat, &c.*—May 30, 1865.—This cutter is provided with two screws, one in each end, which pass through parallel oblique slots in a frame. By means of a lever attached to one end of the knife, a horizontal and downward drawing motion is communicated to the knife. The material to be cut is placed upon a carriage, and to this carriage is attached a slide, which is impinged upon by one of the screws of the cutter in its reciprocating motion, and thus made to give sufficient motion to the carriage.

Claim.—First, the application of the knife *D* to parallel oblique slots *C C*, in frame *B*, in connection with the lever *F* attached to the knife frame *B*, all arranged to operate substantially as and for the purpose set forth.

Second, the slide *K*, arranged in connection with the knife *D*, lever *J*, pawl *I*, and rack *e*, on carriage *G*, to operate substantially in the manner as and for the purpose herein set forth.

No. 48,015.—THOMAS CROSBY, Bridgeport, Conn., assignor to AMERICAN WATER-PROOF CLOTH COMPANY, Brooklyn, N. Y.—*Manufacture of Water-proof Fabrics*.—May 30, 1865.—This invention consists in forming a water-proof fabric, by cementing fine felt or woven fabric to a coarse woven fabric, by means of India-rubber, or other vulcanizable gum. The face may be corrugated by means of rollers, so as to imitate Brussels carpet, or the surface may be napped in imitation of velvet carpet. The surface thus prepared can be dyed or printed in the ordinary manner, or the felt may be colored before it is applied, if desired.

Claim.—As a new manufacture, a fabric formed by the combination of a coarse, textile material for a base, with a finer textile material, or with fibrous material, in the form of a bat or felt, a face, united by a coating or sheet of India-rubber, or other gum, or compounds thereof, in the manner and with the result and for the purposes set forth.

Also, as a new manufacture, the fabric having a back or base of flax, cotton, jute, wool, or other textile material, coated or covered with a sheet of India-rubber, or other vulcanizable gums, or the vulcanizable compounds thereof, and having a face of fibrous substances in the form of a bat or felt, or of other textile material, combined and united by pressure, and by the vulcanization of the gums, and dyed and printed, or colored, or stamped, or embossed, for the purposes and in the manner described and set forth.

No. 48,016.—WILLIAM L. DUFF, Quincy, Ill., assignor to HENRY C. BANKS.—*Paper Collar*.—May 30, 1865.—This invention consists in a collar, having its lower part slitted, so that the portion at the back will pass outside of the cravat, and secure it in its place.

Claim.—A collar, having its lower part slitted, so that portions at the back will pass outside of the cravat, in the manner and for the purpose substantially as set forth.

No. 48,017.—SAMUEL F. GAMAGE, assignor to himself and N. M. DOW, Boston, Mass.—*Pipe Tongs*.—May 30, 1865.—In this device, the fulcrum pin is adjustable in a longitudinal slot in one of the jaw levers, and from one side of the head of said pin projects, at right angles thereto, a shank or arm, threaded to form a screw, which lies partly in and longitudinally with the slot. Against a shoulder, formed by a socket at the outer end of the slot, for the reception of the outer end of the screw, abuts a milled nut, surrounding the screw, and operating thereon, which by turning, moves the fulcrum, so as to enable the jaws to be adjusted to suit pipes or tubes of different sizes.

Claim.—The solid screw and fulcrum, designated respectively by the letters *f g h i*, as operated by the milled nut *E*, applied and arranged in the opening and slot in the stationary jaw lever, substantially in the manner and for the purposes above specified.

No. 48,018.—SAMUEL Z. HALL, Camden, N. J., assignor to himself and GEORGE MOTT, Hoboken, N. J.—*Self-centring Punches*.—May 30, 1865; antedated May 16, 1865.—This invention consists in applying to a centring clamp a hinged box or guide, through a hole in the collar on the top; in this is inserted a hollow cylinder, in which plays the vertical centre punch, the point of which rests on, and whose axis is in line with, that of the bolt or bar held, to be centred in the clamp.

Claim.—First, the arrangement of the guide-socket *F*, which contains the centre punch within a hinged frame, applied in combination with the box, or its equivalent, which contains the centring clamp, substantially as and for the purpose herein set forth.

Second, the arrangement of the guide socket within the said hinged frame to provide for its adjustment, substantially as herein described, to suit the thickness or depth of the head of the bolt, or other headed article.

No. 48,019.—GEORGE W. HERRICK, Stuyvesant, N. Y., assignor to SAMUEL W. GIBBS, Albany, N. Y.—*Globe Stove*.—May 30, 1865.—To the largest circumference of a globe stove is attached a rim, which answers as a foot-rest; above this is a drop-down door, which, when open, is stayed on the foot-rest.

Claim.—The drop-door *C*, in combination with a foot-rest *B*, when applied to a globe stove, in the manner substantially as and for the purpose herein set forth.

No. 48,020.—CHARLES JONES, assignor to himself and CHARLES HODGES, Brooklyn, N. Y.—*Coal-hod, Ash-sifter, and Slop-pail combined*.—May 30, 1865.—This invention consists of an ordinary sheet-iron slop-pail, with the usual bail and lid. In the upper part of the pail is a removable, dish-shaped, perforated diaphragm to act as a sifter; from the upper edge of this diaphragm a small projection rises, which passes through a slot in the lid, and by means of which the diaphragm can be revolved at the same time with the lid.

Claim.—The pail *A*, provided with the cover *C*, in combination with the sifter *D*, constructed substantially as shown, and connected when in use to the cover *C*, by an upright passing through the cover, or an equivalent means; all being constructed of sheet-metal, and arranged to form a combined coal-hod, slop-pail, and ash-sifter, as described.

No. 48,021.—PHINEAS LAWRENCE and GEORGE JEFFEREYS, assignors to themselves and BENJAMIN LAWRENCE, New York, N. Y.—*Copying Press*.—May 30, 1865.—This invention consists in the use of a cam, in combination with a ratchet, wheel, and pawl, in place of the ordinary screw.

Claim.—A copying press formed with a cam lever to act upon the follower, in combination with the ratchet and pawl, for the purposes and as specified.

No. 48,022.—THOMAS LOVEGROVE, assignor to himself and HENRY BALDWIN, Jr., Philadelphia, Penn.—*Casting Shot and Shell*.—May 30, 1865.—This invention consists in casting the molten metal in a hollow spherical mould, and afterwards rotating said mould on a concave or dished surface, having a raised conical centre, until the metal becomes cool enough to be taken from the mould.

Claim.—Casting shot and shell in a spherical mould, and afterwards rotating said mould on a concave or dished surface, substantially in the manner described, for the purpose set forth.

Also, the combination of a rotating concave table having a raised conical centre with a spherical mould rolling freely thereon, as described.

No. 48,023.—MILTON V. NOBLES, Rochester, N. Y., assignor to himself and JOHN C. NOBLES, Rushford, N. Y.—*Rose for Door-knob*.—May 30, 1865.—In this invention a screw sleeve is used in combination with a rose plate, for the purpose of adjusting the length of the spindle between the knobs to the thickness of the door, and it also consists in the employment of a bolt or key inserted from the rear, in a hole made by a semicircular groove across the contiguous surfaces of the male and female screw, to prevent turning when applied to the door.

Claim.—In combination with the screw sleeve and hub, the pin, gib, or key *e*, for holding the two firmly together, when adjusted substantially as described.

No. 48,024.—MILTON V. NOBLES, Rochester, N. Y., assignor to himself and JOHN C. NOBLES, Rushford, N. Y.—*Fastening Door-knobs to their Shanks*.—May 30, 1865.—This device consists of a turning sleeve or thimble, surrounding the shank, against the end of which the end or inward projecting collar of said sleeve presses, and the opening in which corresponds in size and position to that in the end of the shank. Into these openings the spindle is introduced, and by turning the sleeves the sides of the square hole in the collar fit into notches or grooves in the corners of the spindle. The movement of the sleeve is regulated and secured by a spring pin or bolt, which prevents its being accidentally turned when in use.

Claim.—As a fastening for door-knobs and shanks, the combined use of the turning sleeve, catch, and check-pin, with the hub and shank of the knob, substantially as and for the purpose described.

No. 48,025.—MILTON V. NOBLES, Rochester, N. Y., assignor to himself and JOHN C. NOBLES, Rushford, N. Y.—*Fastening Door-knobs to their Shanks.*—May 30, 1865.—This invention consists of a split sleeve surrounding the shank, and secured loosely at the end next to the knob by short pins passing through each half into the shank. This sleeve has on each half an inwardly projecting flange, forming a collar, partly covering the end of the shank, and fitting in a groove or notch in the spindle inserted therein. The row or ring is then placed in the end of the sleeve, and screwed to the door, keeping the collar closed, and securing the knob to the spindle.

Claim.—As a means of fastening a door-knob to its shank, the combined use of a split sleeve, and a ring or ordinary rose plate, with the hub and shank, substantially as herein described and represented.

No. 48,026.—WILLIAM G. OLIVER, assignor to himself, SAMUEL O. BIGELOW, GEORGE H. RENDEL, and DAVID P. BENSON, Buffalo, N. Y.—*Drill for Oil and other Wells.*—May 30, 1865.—This invention relates to the construction of an expanding drill, which may be used in artesian wells, and consists mainly of a drill stock, having an internal inclined surface on which the drill picket works, and a hinged drill pick, which is operated by a vertical or up and down movement, and is thrust outwardly and laterally from the drill stock by gravity to enlarge the bore of the well at such place in its depth as may be desired for the purpose of opening a vein of oil or other liquid not struck in the sinking of the well.

Claim.—An expansion drill, consisting mainly of the drill stock A, hinged drill pick D and connecting bar B, and operated by a vertical or up and down motion thereof, for the purposes and substantially as herein described.

Also, the bottom section E, in combination with the drill stock A, for the purposes and substantially as described.

No. 48,027.—A. W. PARK, assignor to himself and C. J. WINTERS, Norwich, Conn.—*Tool.*—May 30, 1865.—This invention consists in a combination of a hammer, claw, socket, wrench, and screw-driver, in such a manner that the whole together forms at the same time a very serviceable monkey-wrench, with all the advantages of that in common use.

Claim.—The implement above shown, comprising combined hammer claw, monkey-wrench, socket-wrench, and screw-driver, substantially as described.

No. 48,028.—M. RANDOLPH, St. Louis, Mo., assignor to himself, J. PADDOCK, PRESCOTT, and BURNETT, St. Louis, Mo.—*Stave Cutting Machine.*—May 30, 1865.—The object of this invention is to cut a stave from a bolt, and finish it by jointing and crossing, all at the same operation of the machine. It also consists in combining with a reciprocating stave-cutting knife, a device for pushing the cut stave forward to two jointing knives, which work horizontally, and joint the two edges of the stave to the proper shape, after which it is fed on an endless apron to circular saws that cut them to the proper length, and at the same time croze and chamfer the ends ready for use.

Claim.—First, the employment of the plungers *d d*, racks *d d*, and gear-wheels *ff*, or their substantial equivalents, in combination with the cutter frame D, for the purpose of removing the cut staves and depositing them under the jointers, substantially as herein specified and represented.

Second, the arrangement and combination of a double-jointer *g g*, when constructed and adjusted to operate in such manner as to complete the jointing of both edges of the stave at the same time, substantially as herein set forth and described.

Third, operating the jointer *g g* in harmony and conjunction with the cutter-frame D, so that the staves may be cut and jointed without removal from the machine, substantially in the manner herein set forth and specified.

Fourth, the combination of the cutter heads *m m*, with the conveyors *n n*, constructed and arranged to operate as and for the purposes set forth.

Fifth, the combination and relative arrangement of the cutter-frame D, jointer *g g*, cutter heads *m m* and conveyors *n n*, all being constructed and adjusted to operate conjointly, substantially as and for the purposes herein set forth and specified.

No. 48,029.—RENSSELAER REYNOLDS and CHARLES YOUNG, assignors to RENSSELAER REYNOLDS, Stockport, N. Y.—*Horse Hay-fork.*—May 30, 1865.—This invention relates to certain devices by means of which the load of the fork is discharged, and will be understood from the claim and engraving.

Claim.—First, the trigger D, provided with a lip *e*, and applied in combination with the toggle arms B B', and two hinged gripping jaws, A A', in the manner and for the purpose herein shown and described.

Second, the hand-lever C, attached to the arm B', and applied in combination with the jaws A A' and toggle arms B B', in the manner and for the purposes set forth.

No. 48,030.—H. H. SCOVILLE, assignor to himself and E. C. PREBLE, Chicago, Ill.—*Amalgamator*.—May 30, 1865.—This invention consists of a case divided in three compartments by means of partitions. Within the largest portion of the vessel is a wheel constructed with winding passages, all terminating at the centre of said wheel, where they communicate with the interior of the cylinder. In the cylinder is a rotary screw, the blades of which fit closely to the inner surface of said cylinder. The wheel and rotary screw are made to revolve by means of the wheel attached to the shaft, and the ore and fluid metal contained in the vessel are carried by the winding passages to the centre of the wheel, where they are discharged into the cylinder, and carried along by the revolving screw, and are there discharged through the apertures in the head.

Claim.—First, projecting each bucket on a scroll from the discharging eye or hub of the axial shaft, substantially in the manner and for the purpose described.

Second, the arrangement of the chamber *f* and screw *d*, or their equivalents, at the discharge of the scroll chamber, substantially in the manner and for the purpose described.

Third, the cylinder *f* and screw *d*, constructed and working together, substantially in the manner and for the purpose described.

Fourth, the mode of attaching the screw to the machine for submerging the quartz, substantially as herein described.

Fifth, a machine which discharges the quartz from its scroll submerging chamber directly into its screw conveying chamber, substantially as and for the purposes herein described.

No. 48,031.—WILLIAM T. SLOCUM, assignor to JAMES S. MASON & CO., Philadelphia, Penn.—*Manufacture of Boxes*.—May 30, 1865.—This invention consists in making two longitudinal slots near one end of the strip, forming the body of the box, and transverse cuts from the edge near the other end, the depth of said cuts from the edge corresponding to the distance from the edge of the longitudinal slots, and turning up the pieces between said cuts and the end longitudinally, forming ears, which are inserted into the slots in the other end, and then straightened out to their normal position, clamping the two ends firmly together.

Claim.—Connecting the two ends of the strip *A*, by forming on one end of the same the lips *a*, and in the other end the slots *b*, through which the said lips may be passed, and then bent down to one side or the other, substantially as described.

No. 48,032.—JOHN STEVENS, assignor to himself and THEODORE BOURNE, New York, N. Y.—*Cotton Gin*.—May 30, 1865.—The claim and engraving define the nature of this invention.

Claim.—The combination of the large cylinder *B*, small roller *D*, reciprocating plate *G*, feed-board *L*, doffer plate *J*, and pressure roller *F*, all arranged and operating substantially as and for the purposes set forth.

No. 48,033.—EDMUND B. VANNEVAR, assignor to E. B. VANNEVAR & CO., Boston, Mass.—*Means of Closing Ships' Deck and Side Lights*.—May 30, 1865.—Through the frame of a bull's-eye in a vessel's deck passes a staple, to the top of which is hinged the metallic ring which rests around and above the bull's-eye. This staple passes loosely through the bull's-eye frame, so as to vibrate therein to a certain extent, and its lower free end is provided with a screw and nut, so that there is in the staple a hinge at the upper end, and a screw at the lower end, and by means of the latter, in connection with the other screws of the bull's-eye frame, all parts of that frame may be screwed down equally tight.

Claim.—The hinged staple *G*, provided with an adjusting screw *H*, constructed substantially as described, and used for the opening and closing of deck and side lights for vessels.

No. 48,034.—P. J. JAMET, Paris, France.—*Safety Tackle*.—May 30, 1865.—This tackle is intended to be capable of holding in suspension a load at any given elevation, and this it accomplishes by means of a vibratory frame hung in a suitable link of the stationary ring in such manner that immediately upon the cessation of pull upon the rope to raise the weight the rope is swayed into a recess or gorge, and compressed there with a force proportionate to the weight, and immediately upon the resumption of the pull upon the rope, it will be swayed out of the said recess, and the weight caused again to ascend.

Claim.—First, the construction, substantially as herein described, of a safety tackle for the purpose of holding or maintaining weights in suspension during the intervals of pull.

Second, the oscillating frame or block under the arrangement described, so that the pulley or sheaves, together with the rope or cord, perform the function of brake in connection with the cross-head of the hook, substantially in the manner hereinbefore set forth.

Third, the movable cam lever or catch, whether operated by the rope or otherwise, under the arrangement described, so as to prevent brake action, in the manner and for the purpose set forth.

No. 48,035.—WM. A. LEGGO and GEORGE E. DESBARATS, Quebec, Canada.—*Photo-electrotype*.—May 30, 1865.—In this invention the photographic negative is coated with bicromated gelatine, and washed after exposure. It takes a plaster cast while wet, and prints from an electrotpe. The improvement consists in pouring the bicromate solution on the negative.

Claim.—The within-described process of producing upon the surface of any transparent picture, drawing, or manuscript, by the action of light, a mould capable of yielding a cast in plaster or other suitable material, substantially in the manner and for the purposes herein set forth.

No. 48,036.—JAMES ARKELL and BENJ. SMITH, Canajoharie, N. Y.—*Paper Bag.*—June 6, 1865.—This invention consists in scoring the upper edge of the bag, so that the mouth can be folded and closed easily, without danger of tearing.

Claim.—Softening the upper parts of the paper bags and making them pliable, substantially as and for the purpose above described.

No. 48,037.—WM. BAMFORD and J. F. TATE, Jr., Milwaukee, Wis.—*Stove.*—June 6, 1865.—This invention consists of an air chamber, suspended inside the stove concentrically with the outer casing, and above the door for the admission of fuel. The interior of this chamber is connected with the outer air, by one or more pipes in the bottom and top, by means of which a circulation of air is kept up through it. There is a series of pipes running perpendicularly through the chamber, through which the products of combustion pass, by which the air inside is more thoroughly heated, and from the pipes the products of combustion flow off to the exit flue.

Claim.—First, the air chamber E, provided with one or more draught flues L L, discharging into the main pipe or flue D.

Second, the flues L L and pipe I, in combination with an air chamber placed inside of a stove.

Third, the opening or pipe H, when used for passing the outer air through a heated space and into an inner chamber provided with flues, as specified.

Fourth, the air chamber E, flues L L, pipe I, pipe or orifice H, and register G or F, in combination with the outer case or stove A, each of said parts and combinations being substantially as set forth and specified.

No. 48,038.—A. E. BARNARD, Cleveland, Ohio.—*Pipe Coupling.*—June 6, 1865.—In this invention the male section has two lugs projecting on opposite sides at its extremity, one of which enters a corresponding mortise in the wall of the female socket, while a revolving cam in a socket attached to the latter is made to bear upon the other lug, and thus clamp the two sections together.

Claim.—First, the cam F and boss D, in combination with the lugs *d c* and opening *e*, substantially as and for the purpose set forth.

Second, the recessed chamber *f'*, packing J, in combination with the coupling, substantially as and for the purpose set forth.

No. 48,039.—WM. E. BARTON, East Hampton, Conn.—*Buckle Attachment.*—June 6, 1865.—This invention consists in a metallic cap fastener, formed with a curve in the middle to embrace the cross-bar, an aperture for the tongue, ears resting on the strap, and riveting stems cast on said ears, to fasten the strap, the whole being combined with a common buckle.

Claim.—The metallic buckle fastening for fastening buckles to straps, constructed as described.

Also, the said metallic buckle fastening, in combination with buckle and strap, substantially as described.

No. 48,040.—WM. E. BARTON, East Hampton, Conn.—*Sleigh-bell Attachment.*—June 6, 1865.—This invention consists in a metallic holder resting on straps, the strap side being armed with two projecting points, to impinge upon the leather, the bell side having prongs to pass through holes into the bell. The extremity of these prongs is clenched inside the bell, so that the latter may remain loose, and thus shake more freely.

Claim.—First, the within-described metallic bell-holder, cast of brass or suitable malleable metal, having a hole through it to secure the strap, impinging points on the strap side, and on the bell side prongs adapted to enter the bell through suitable holes therein, and hold the same by bending or clenching, substantially as set forth.

Second, the said bell-holder strap and bell, in combination when put together so as to hold the bell loosely and away from the strap, substantially as described.

No. 48,041.—JULIUS BAUR, Brooklyn, N. Y.—*Composition for Lining Oil Barrels.*—June 6, 1865.—This invention consists of a composition of muriatic acid, metallic zinc, glue, water, and glycerine.

Claim.—The employment or use in a compound for lining petroleum packages of chloride of zinc and glue, made substantially as herein set forth.

Also, the use in a compound for lining petroleum packages of chloride of zinc mixed with glycerine, as described.

Also, a compound made of chloride of zinc, glue, and glycerine mixed together, substantially in the manner and about in the proportions herein specified.

No. 48,042.—HENRY BICKLE, Elizabeth City, N. J.—*Power-gaining Machine*.—June 6, 1865.—This invention consists in a specific combination and arrangement of levers, &c., and will be understood by the claim and engraving.

Claim.—The combination of the toggle levers G H I J K L M, working beam C, and fly wheels E R, all arranged and operating as specified.

No. 48,043.—DANA BICKFORD, Boston, Mass.—*Air-Engine*.—June 6, 1865.—This invention consists in combining with the air-pump a reservoir in which the air is to be compressed, and in placing within said reservoir a body of fluid so that the air while being driven into the reservoir shall be caused to pass through the liquid contained therein; also, in combining with the air-reservoir and with the open cylinder and its piston, a vibrating conduit and gate, together with the opening to the cylinder for controlling the admission of air to the same. The piston is moved in one direction by means of the compressed air, and in the other by a spring combined therewith.

Claim.—The combination of the hollow vibrating conduit H and the gate K.

Also, the combination of the lifting spring o, with the piston and cylinder provided with the vibratory conduit H, and gate K, as described.

Also, the combination of the hollow vibratory conduit H, and the gate K, with the air-compressing reservoir A, and the open cylinder M, and the piston N, thereof.

Also, the combination of the vibratory conduit H, and gate K, with the flexible conduit G, and the opening a, thereof, the whole being substantially as and so as to operate as set forth.

Also, the employment of the mass of liquid in the reservoir B, with the air-pump combined therewith, as set forth, and a piston and cylinder connected therewith, and having a conduit H, and gate K, or their mechanical equivalents, as specified.

No. 48,044.—JAMES BIRD, New York, N. Y.—*Hoisting Machine*.—June 6, 1865.—A shaft, keyed in the sides of the frame so that it will rotate, carries loosely upon it two sets of pulleys, one set of three on one side, and a set of two on the other, each set being cast together. One pulley of each set is a gear-wheel, gearing with a cog-wheel on a shaft rotating below. The pulleys being of different sizes, the chain going around them, is taken up quicker by the smaller ones than the larger.

Claim.—The hoisting apparatus constructed substantially as above described, the driving pulley and gear B C, being placed on the same shaft with the hoisting pulleys and their gear-wheel, as above set forth.

No. 48,045.—JAMES BOWERS, New York, N. Y.—*Corset*.—June 6, 1865.—In this invention the stays pass through the pockets in the corsets and have eyelets coincident with those in the corsets, the lacings passing through both.

Claim.—A garment connected by means of lacings or their equivalents passing through the eyeleted stays within a duplicate fabric also eyeleted, all substantially as shown and described.

No. 48,046.—JOHN BRADSHAW and SAMUEL C. WILSON, Albion, N. Y.—*Stove-pipe Damper*.—June 6, 1865.—This invention consists of a ring connected with a circular centre piece by bands rising above and extending below their surfaces, so as to form grooves alternately above and below, through which the products of combustion will flow when the damper is in a horizontal position.

Claim.—The employment of the within damper, cast in the form described, and arranged to operate as and for the purpose specified.

No. 48,047.—C. B. and WILLIAM T. BROWN, Alton, Ill.—*Threshing Machine*.—June 6, 1865.—The various parts of the machine are so arranged that it rests upon two wheels, and can be reached in every part without the use of a platform for the operator to stand upon.

Claim.—A threshing machine mounted on two wheels and constructed and arranged as herein described, so that the operators can stand on the ground, dispensing with the use of a platform.

No. 48,048.—JACOB E. BUERK, Boston, Mass.—*Watchman's Time Detector*.—June 6, 1865.—Upon the face of the rotating dial is placed a dial of paper or card marked with the hours, and also with divisions corresponding to the number of stations. In the face of the dial is a slot, above which is a fixed index. By means of a different key for each station, and in possession of the watchman, a spring point is forced through the slot against the fixed index, and thus the time that the watchman reaches the station is indicated.

Claim.—First, the use of a false revolving dial E, in combination with the stationary index D, and spring points d, constructed and operating substantially as and for the purposes set forth.

Second, producing the perforations on the paper dial or its equivalent from the inside out, instead of from the outside in, as before.

No. 48,049.—JOHN C. BROWN, G. H. SLIMPERT, Pinkneyville, Ill.—*Gang Plough*.—June 6, 1865.—In this invention each of the two parallel plough beams is fastened in front to an adjustable rocking bar. The rear of each beam is raised by a locking lever that is worked upon the upper shaft of an adjustable slotted plate. A caster-wheel is fastened to a short arm which is hinged upon an adjustable side beam.

Claim.—First, the arrangements of the hinged adjustable beam L, with a caster-wheel C, in the manner and for the purpose herein described.

Second, the use of self-locking levers J J, for raising or depressing the ploughs, applied to the adjustable guides *d d'*, substantially as described.

Third, connecting the hooked rocking levers J J to the plough beams by means of bent swinging rods, substantially as described.

Fourth, the laterally adjustable slotted plates *d d'*, applied to the slotted frame G, and adapted to serve as guides for the plough beams F F', and also as bearings for levers which are used to raise and depress said beams, substantially as described.

Fifth, pivoting the forward ends of the plough beams to rocking bars *a a'*, which are arranged one in advance of the other, and applying the ploughs to said beams at about equal distances from their respective pivotal connections, substantially as described.

No. 48,050.—D. P. BUTLER, Boston, Mass.—*Weight-lifting Apparatus*.—June 6, 1865.—In this invention for hygienic purposes, a table is constructed under which weights are suspended on a rod which extends up through the table, and has a convenient handle on it, by which it is lifted.

Claim.—A weight-lifting apparatus having a construction and capability of adjustment substantially as described.

No. 48,051.—D. P. BUTLER, Boston, Mass.—*Weight-pulling Apparatus*.—June 6, 1865.—In this invention for physical exercise a strap is passed over pulleys, in a convenient manner, in front of a platform made to be raised or lowered to suit the height of the person using the same.

Claim.—A weight-pulling apparatus having a construction and provision for adjustment substantially as set forth.

No. 48,052.—JOHN CAIN and A. B. CAIN, Dubuque, Iowa.—*Shank Laster*.—June 6, 1865.—This invention consists of two levers which are crossed and jointed together so as to form two jaws and two handles; the inner parts of the jaws are made of leather, the edges of said jaws extending beyond the toothed or spurred ends of the same.

Claim.—First, the compound jaws *b b' g g'*, when the inner jaws are made of leather or other flexible substances, substantially as described.

Second, extending the edges of the jaws *d d'* beyond the toothed or spurred ends of the jaws *b b'*, substantially as described.

No. 48,053.—THOMAS W. CLARK, Manchester, N. H.—*Washing the Blankets of Printing Machines*.—June 6, 1865.—This invention consists in dispensing with the squeeze rollers of ordinary machines for the purpose, and adding a "doctor" or scraper.

Claim.—The employment or use in the blanket-washing devices of machines for printing fabrics, such as calicoes, delaines, &c., of a scraper or pressure roller to the washing rollers, to operate in the manner substantially as and for the purpose set forth.

No. 48,054.—DENNIS A. DACEY, New York, N. Y.—*Tool for cutting off Boiler Tubes*.—June 6, 1865.—This invention consists in boring out a shaft of the size of the bore of the tube to be cut, and attaching thereto expanding cutters and arranging upon the outside of said shaft a sleeve with a bore large enough to slide over the outside of the tube, to act as a steadying guide, said shaft being inserted into the tube the proper distance, and rotated with a wrench or lever, and the cutters expanded as required until the tube is cut off.

Claim.—The implement herein described, constructed and operated substantially in the manner set forth, for cutting off boiler tubes and for other work.

No. 48,055.—CHARLES H. DANA, West Lebanon, N. H.—*Sheep Label*.—June 6, 1865.—This invention consists of a strip of metal, having the desired label engraved or punched thereon, and is passed through one or two holes in the animal's ear, and the two ends brought together, and pressed flat.

Claim.—The within described link-shaped label for marking sheep, both ends being fastened closely to the ear, in the manner substantially as set forth.

No. 48,056.—DARWIN ELLIS and GEORGE R. STETSON, New Haven, Conn.—*Machine for attaching Balls to Cartridges*.—June 6, 1865.—In this machine the ball is dropped into a receptacle, between the ends of two horizontal spindles, mounted on a suitable frame or bed. The inner end of one spindle passes into an aperture in the receptacle, and comes in contact with the conical end of the ball, the other being in contact with the open end of the metallic cartridge, which is held in an aperture in the inner end of the other mandrel. The machine is then put in motion, and while revolving, a longitudinal movement is also given to the

mandrels towards each other, and the ball forced into the cartridge case the proper distance. A circular revolving tool or crimper is then brought to bear upon the cartridge, immediately over the groove in the ball, and crimps or forces the case into said groove, and secures the two together, they being supported from below by two parallel friction rollers, upon which they revolve.

Claim.—First, the combination of the two shafts *g* and *k*, with the revolving crimper *F*, when the whole is constructed, arranged and fitted to produce the result substantially as herein described.

Second, the combination of the two shafts *g* and *k*, with the receptacle *j*, and the anti-friction rollers *r r*, when they are constructed, located and fitted for use, substantially as herein described.

Third, the combination of the revolving crimper *F*, with the receptacles *j*, and the anti-friction roller *r r*, when the whole is constructed and fitted for use, substantially as herein described.

No. 48,057.—MILTON FINKLE.—New York, N. Y.—*Heddle Frame for Loom*.—June 6, 1865.—In this invention the frame is adjustable to any length desired: the heddles, whether of wire or twine, can be put on or off with facility, and are also relieved of strain when the harness is operated.

Claim.—First, the adjustable heads *C*, constructed in the manner substantially as above described, for receiving the ends of the shafts *A*, and rods *a*.

Second, the combination of the heads *C*, and caps *D*, made and applied substantially as above described.

Third, the stays *D'* with hooks or eyes attached, with or without the connecting rods *B'*, substantially as above described.

No. 48,058.—A. V. and A. F. FLETCHER, Athol, Mass.—*Stove-pipe Damper*.—June 6, 1865.—In this invention the frame consists of an annular piece of iron, cast or otherwise, with a piece across the centre; on a pin through the centre a disk, large enough to cover the aperture, is fixed, and on the other side of the frame is attached a piece of sheet metal of a spiral form. When the damper is turned so as to bring the spiral uppermost, the disk falls on the pin, and a draught is obtained; when the disk is uppermost, it rests upon and covers the aperture.

Claim.—First, the disk *F*, constructed and arranged substantially in the manner shown and described.

Second, the spiral cord *E*, attached to a stove-pipe damper, substantially as and for the purposes herein specified.

No. 48,059.—P. S. HAINES, Newburg, N. Y.—*Carding Machine*.—June 6, 1865.—In this machine the doffer comb has a drawing action on the fibre, and its shaft may be adjusted vertically, to vary the length of its throw, and the period of its contact with the teeth of the doffing cylinder.

Claim.—The combination of the shaft *H*, and comb *C*, with the hanging bearings *N*, and clamping nuts *O*, substantially as and for the purposes above described.

No. 48,060.—JAMES HALL, Dorchester, Mass.—*Mode of applying Covering to Roofs, the Decks of Vessels, &c.*—June 6, 1865.—To the surface of the roof to be covered is applied a coating of thick paint, which is allowed to become partly dry. The cloth is then applied to the painted surface, and a metallic vessel containing live coals is passed over the cloth, causing it to adhere firmly to the paint. A coating of paint may be laid on the cloth if desired, the heated iron being passed over the whole.

Claim.—The application of heated metals to the surfaces of the cloth, in the process of imbedding the cloth in the paint, uniting the cloth to the surface more firmly and smoothly than can be done without the application of heated metals.

No. 48,061.—G. B. HALSTED, New York, N. Y.—*Handle for Tea and Coffee Pots*.—June 6, 1865.—In this invention the handle is constructed of two parts of sheet metal, swaged or struck up and soldered together.

Claim.—As a new article of manufacture, a handle for sheet-metal tea and coffee pots, and other similar sheet-metal vessels, constructed of two longitudinal parts swaged or struck up in any proper or desired form, of sheet-metal, and connected together by solder or otherwise, substantially as herein set forth.

No. 48,062.—JAMES HARSHA, Circleville, Ohio.—*Stone Grinding and Polishing Machine*.—June 6, 1865.—This invention consists in the combination of a carriage, a gate, and an inner frame for the purpose of imparting a vertical, rotary, and two horizontal motions; in a grinder for the transmission of the grinding material to the impinging surfaces; in a scraper attached to the frame, and made tangential to the heel of the grinder.

Claim.—First, the combination of the carriage *B*, gate *D*, and inner frame *J*, operated substantially as described, so as to secure the vertical rotary and two horizontal motions, for the purpose described.

Second, the grinder K, with its orifices, constructed in the manner described, for the transmission of the grinding material to the impinging surfaces.

Third, the scraper S, in the described relational position to the orifices R, in the grinder K.

No. 48,063.—W. H. HARTMAN, Fostoria, Ohio.—*Combined Seeding Machine, Roller, and Drag*.—June 6, 1865.—In this invention an oscillating drag is suspended by chains in front of large rollers. The drag is caused to oscillate by means of a crank driven by a cog wheel on one of the rollers. The drag is provided with a seed box, for the purpose of sowing small seeds. A distributing apron is suspended below the main seed-box, which distributes the seed therefrom in front of the drag, which covers the seed, and the rollers following, smooth down the ground.

Claim.—First, the oscillating drag M, provided with a seed-box V, as and for the purpose specified.

Second, the distributing board K, in combination with the seed-box G, and roller B, when arranged and operating as and for the purpose set forth.

Third, the adjustment of the roller B, in its relation to the drag M, as and for the purpose described.

No. 48,064.—G. W. HATCH, Parkman, Ohio.—*Machine for Gathering and Loading Flax*.—June 6, 1865.—This invention consists in the combination with adjustable side pieces, of a cross piece in the rear of the machine, to which a rake is attached, said rake being provided with spiral springs at its upper ends for the purpose of giving elasticity to the same; and it also consists in the arrangement of a carrier, having a series of elevators passing over rollers, both in front and rear of the machine. The rear roller has a shaft passing through it, to which it is secured by a screw; the object of said screw being to secure or release the said roller or sleeve therefrom or thereto. And it further consists in the combination and arrangement with the rollers of pulleys, over which a band passes, and communicates motion to the carrier.

Claim.—First, the springs *e*, and rake C, attached to the pieces B' d of the frame, and in combination with the adjustable side pieces E, the carrier M, elevators H, and rollers F F', when arranged and operating substantially as and for the purpose set forth.

Second, the roller or sleeve F, and shaft D, in combination with the pulleys m m' and I J, when arranged and operating substantially as and for the purpose set forth.

No. 48,065.—HERMAN HAUPT, Cambridge, Mass.—*Ventilation of Mines*.—June 6, 1865.—This invention consists in the use in mining and like subterranean operations, of steam generators in combination with a vacuum pipe.

Claim.—The use in mining, tunnelling, and other subterranean operations, of steam generators in combination with a vacuum pipe.

No. 48,066.—SAMUEL G. HORNING, Mount Carroll, Ill.—*Cultivator*.—June 6, 1865.—In this invention, a central frame with plough beams is rigidly fastened upon the axle, which is arched in the centre. Two side beams move freely, being pivoted on the axle, and are connected by jointed metallic adjustable braces to two uprights, united by a cross-piece. The uprights move freely upon the axle.

Claim.—The combination of axle B, the bar E, the beams s s, chains t, the beams C C, and braces O and I, the whole constructed and arranged as and for the purpose substantially as herein set forth.

No. 48,067.—HENRY HOWARD, Westfield, Mass.—*Boiler for Steam Heating*.—June 6, 1865.—This apparatus is so constructed that, when placed against corresponding sides of similar boilers, or against perpendicular walls of an enclosing furnace, it shall constitute and partially embrace two or more longitudinal flues, to conduct the products of combustion back and forth over nearly the entire exterior surface of the boiler.

Claim.—The boiler A, for heating water and generating steam, when formed, constructed and arranged substantially in the manner herein set forth.

No. 48,068.—HENRY HOWE, Darlington, Wis.—*Cultivator*.—June 6, 1865.—In this machine, two triangular plough frames are pivoted at one end to a straight bar, extending from the tongue to the rear, and fastened at its middle to the axle. The sides of the triangular frames are pivoted to bars that sustain the seat, and the front ends are connected to the draught equalizer.

Claim.—First, the oblique bars E E, connected to the draught pole D, and to the short parts a a of the axle A, in connection with the bars I I, and driver's seat L, substantially as and for the purpose set forth.

Second, the plough frames F F, connected to the bars E E I I, and shaft K, substantially as shown, and to admit of being operated as described.

No. 48,069.—JOSEPH INGALS, Milton, Ind.—*Grain Drills*.—June 6, 1865.—In this device a spring brace bar is attached to the under side of the drag bar, the end of the spring resting

against an arm which projects from the tooth. The end of the spring and arm are both so constructed, that when the tooth meets with an immovable obstruction, it will move backwards and let the machine pass, when the tooth resumes its former position.

Claim.—First, the spring brace bar *G* attached to the drag bar, and impinging at the curve *h* upon the end of the flange *F*, in the working position of the hoe, and having an incline, upon which the point of the flange rises when the hoe is deflected backward, as described and represented.

Second, the indentation *n* on the flange *F* in which the end of the spring rests, detaining the hoe from further backward deflection.

No. 48,070.—JOHN G. IVES, Springfield, Ill.—*Slide Valve*.—June 6, 1865.—This invention consists of what may be termed a "spool valve," bearing upon each of its enlarged ports a series of rings, with a chamber or space between them and the body of the valve, for the steam, which forces them out into contact with the cage to circulate in. The steam for the above-described purpose is admitted from a cavity formed in the end of the valve to the chamber, underneath the rings, through small apertures formed in the body of the valve.

Claim.—The combination of the sections or rings *E E*, composing the valves, the chamber or space *b*, and the apertures *c*, for admitting steam to the said space *b* from the space *d*, the whole being constructed and arranged to operate in the manner and for the object specified.

No. 48,071.—JOSEF JOHNSON, New York, N. Y.—*Washing Machine*.—June 6, 1865.—This machine is operated by a lever and pounder, and subjects the clothes to a beating or compressing action in a tub of triangular form, one of the sides of the tub being perpendicular, and the pounder being operated by moving up and down along the upright side.

Claim.—As an improved construction of washing machine, the sides 3 and 4 of the tub *A*, arranged as represented, in combination with the lever *C*, and pounder *E*, operating relatively to each other, and to the sides 3 and 4, substantially in the manner and for the purpose herein set forth.

No. 48,072.—ROBERT V. JONES, Canton, Ohio.—*Meat Crusher*.—June 6, 1865.—This invention consists in the employment of cylinders, provided with teeth and longitudinal grooves in a suitable frame, the upper cylinder being mounted in sliding boxes, provided with guide rods and spiral rings.

Claim.—The combination of the roller *C*, rotating in fixed bearings, and provided with a crank *D*, the roller *C*, mounted in sliding boxes *E E*, the guide rods *F F*, and springs *H H*, one of the said rollers being provided with teeth, and the other with longitudinal grooves, and all arranged to operate as specified.

No. 48,073.—BENJAMIN F. JOSLYN, Stonington, Conn.—*Breech-loading Fire-arm*.—June 6, 1865.—In this invention the breech-block rotates horizontally on a vertical pin, and has on its under side a shoulder formed concentrically with the pin, and bearing against a corresponding projection on the supporting stock. A hook attached to the pin, and rotating with it when the breech-block is laterally opened, engages with the spring-catch of a sliding cartridge retractor.

Claim.—First, the breech-block *D*, with its pin *d* and concave shoulder *n*, in combination with a convex shoulder *m* on the stock or frame adapted to the said shoulder *n*, all substantially as set forth.

Second, The block *G*, with its projection *k*, spring-catch *W*, and spring-rod *H*, in combination with the breech-piece *D*, pin *d*, and notched disk *E*, the whole being arranged for joint action substantially as and for the purpose herein set forth.

No. 48,074.—JOHN H. KAVANAGH, Joliet, Ill.—*Submarine Port-hole Closer*.—June 6, 1865.—The water is prevented from running into the port-hole by an India-rubber ring, which, hugging the muzzle of the gun, is placed between two metal plates. The valves or gates of the port-hole are closed by the recoil of the gun, they being connected to the gun-carriage.

Claim.—First, the combination of the outer and inner valves *G* and *G'*, with the outer and inner plates *A* and *B* surrounding the port-hole, constructed and operated substantially as described.

Second, the combination of the valves *G* and *G'* with their axles *I* and *I'*, and scroll springs *L* and *L'*.

Third, the rocking lever cranks *S T U*, and *S' T' U'*, and their combinations with the valve levers *N* and *N'*, and the wheels of the gun-carriage, substantially as described.

No. 48,075.—CHRISTIAN F. KRIAUER, Pittsburg, Penn.—*Shutter Hinge*.—June 6, 1865.—This invention consists in making the hinges with tangs and shanks at right angles with each other, in such a manner that the tangs may be driven into a bored hole in the frame or blind, and the shanks sunk in flush with the edge of the wood, so as to prevent turning; and also of a double pintle, and double projections on the male part, to form a right or left hand hinge.

Claim.—First, a hinge, for window shutters, blinds, &c., composed of tangs and shanks at right angles to each other, and provided respectively with pintles and eyes, substantially as herein shown and described.

Second, in combination with a hinge, so made, the corrugating or roughening of the tangs, substantially as and for the purpose specified.

Third, the double pintle *a*, and two projections *e e* on the part A of the hinge, in connection with the V-shaped projection *i* of part C, all arranged substantially as shown, to admit of the hinges being applied indiscriminately to either right or left hand shutters or blinds.

No. 48,076.—G. C. LAWTON, Syracuse, N. Y.—*Car Coupling*.—June 6, 1865.—This invention consists of a draw-head, provided with a bevelled opening, inclining inward from the sides to the centre, and upward from the bottom to the top; also of a draw-head, provided with a hook-head, so arranged that when two cars are brought together the said hook-head readily slips up the inclination of the bevelled opening, into a slot therein, by which means the coupling is securely effected, even if the trucks are of varying height.

Claim.—First, the peculiarly-shaped head B of the draw-rod A, with its shoulders *c c*, and its extension above, and the sloping position at which it is attached to the draw-rod, constructed, arranged, and operating substantially as described.

Second, the backwardly-sloping shoulders F, in the rear of the gain or slot attached to and projecting from the inner surface of the sides of the buffer-head.

Third, the combination of the peculiarly-shaped and positioned head B, with its shoulders *c c*, with the double and upwardly and backwardly inclining plane E E, and the central gain or slot, open at the top, and the backwardly-inclining shoulders F behind the gain or slot in the buffer-head, all constructed, combined, arranged, and operating substantially as shown and described.

No. 48,077.—C. J. LEGG, Penn Yan, N. Y.—*Corn Husker, Sheller, and Cleaner*.—June 6, 1865.—In this device the discharge spout is divided, and a wing valve inserted, so that one spout may be entirely closed, while the bag is being changed, the other spout meanwhile discharging into the second bag.

Claim.—In combination with the shelling cylinders B D, constructed as described, and provided with the screen G and fan K, the arrangement of the bagging elevator M, with the valve S, the whole operating substantially as and for the purposes herein specified.

No. 48,078.—G. R. LEWIS, Ashtabula, Ohio.—*Machine for Tallying Lumber, &c.*—June 6, 1865.—This invention consists of two disks moving independently on the same axis, and placed upon a horizontal tube, around the circumference of which are a series of numbers, marked from 1 to 100. Attached to each disk is a pointer; the indicator turns on the axis of the machine, and is provided on its under side with a spring arm and catch, which, when the indicator is brought near the cam on the edge of the table, is forced into the teeth of the disk, so that it is carried around with the indicator, but when the indicator is reversed, the teeth escape. By means of cams and pinion the passage of the cam, after the primary disk has revolved, moves the secondary disk one tooth.

Claim.—First, the disks C and D, in combination with the index B, and indicator F, as and for the purpose set forth.

Second, the catch *d*, arm *g*, and spring *b*, in combination with the indicator and disk D, as and for the purpose set forth.

Third, the cam I', with the catch J and pinion G, in combination with the disk C and cam *h*, as and for the purpose set forth.

Fourth, the slide *p* and cam K, in combination with the indicator F and disks, as and for the purpose set forth.

No. 48,079.—C. M. LOOMIS, Hartford, Conn.—*Button*.—June 6, 1865; antedated May 23, 1865.—In this invention a staple enters the cloth from the inside, and its two legs pass through the back disk of the button. The face disk is then laid on, and so pressed as to turn down the legs of the staple within the button, when the perimeter of the face disk, which is larger than the back, is pressed inward, so as to bind the two together.

Claim.—The employment of the staple C, in combination with the disk A, having the curved or concave surfaces inside the button, substantially as and for the purpose herein described.

No. 48,080.—HARVEY L. LOWMAN, Virginia City, Nev.—*Mining Pick*.—June 6, 1865.—This invention consists in forming the eye or socket in which the handle is inserted of an elliptical shape, and the opposite sides of which are parallel to each other, said socket being elongated in the line of its axis, and in combination therewith; the bits or points of the pick merging by curved lines into the central socketed head.

Claim.—As a new article of manufacture, the pick, constructed as herein described; that is to say, with an elliptical socket, the opposite sides of which are parallel to each other, and elongated in the line of its axis, in combination with bits merging by curved lines into the central socketed head, as described and represented.

No. 48,081.—CHESTER M. MANN, Detroit, Mich.—*Propulsion of Street Car*.—June 6, 1865.—The nature of the invention will be understood by reference to the claim and engravings.

Claim.—The arrangement of the lever G, links H H, and cranks I I, in combination with the ratchets L and M, provided with pawls to reverse the motion, and connected by gearing to the driving wheels, for the purpose specified.

No. 48,082.—GEORGE MATHEWMAN and ANTHONY LEININGER, Brooklyn, N. Y.—*Mould for Button Making*.—June 6, 1865.—This invention consists in a lower die composed of two parts hinged together by a pin passing through lugs projecting downward. Recesses to receive the eyes are formed in the said two parts, to one of which is adapted a shelf or projection. The eyes rest upon the shelf. By closing the two parts of the lower die tightly, each eye is held firmly in its proper condition. The melted material is then poured along the line of the eyes so as to cover them. Then an upper die presses the glass. By lifting the upper die and opening the lower die the buttons are readily removed.

Claim.—First, constructing the lower die in separate parts B and C, adapted to close tightly around the neck of the eye E, substantially in the manner and for the purposes herein set forth.

Second, in connection with the above the shelf c, or its equivalent, arranged as represented, and adapted to support the eyes E, and aid in placing them in the die, substantially as herein before set forth.

Third, supporting the parts B C on the bed A, so that the pressure of the upper die G upon the face of the buttons shall cause the parts B and C to be sprung or compressed more tightly together, substantially in the manner and for the purpose herein set forth.

Fourth, the arrangement of the handles b c on the parts B and C, and standing parallel or nearly parallel to the axis D, substantially as and for the purposes described.

No. 48,083.—L. W. MORIAN, New Lisbon, Ohio.—*Bag Holder*.—June 6, 1865.—This invention consists in an apparatus made to be portable, and to have self-adjusting rocking plates for holding the mouth of the bags when they are to be filled.

Claim.—First, a bag holder constructed and operated substantially as above described.

Second, the self-adjusting rocking plates E, for holding the mouth of the bags when they are to be filled, constructed and applied substantially as described.

No. 48,084.—JOHN MURRAY, New York, N. Y.—*Car Spring*.—June 6, 1865.—This invention consists in the peculiar construction and arrangement of the dividing plate between the upper and lower bags; cases which contain spiral springs by which this plate is made to answer the twofold purpose of a base for the upper set of springs and a cap for the lower set, and also to act as a guide to hold both sets in a vertical position, and at the same time to allow play of the springs and sliding of the studs through the plate.

Claim.—The peculiar construction of the division plate C, combined with the boxes, springs, and spindles or studs, by which it is made to answer the twofold purpose of a cap and a base for the two boxes and sets of springs respectively; and at the same time acts as a guide and support to the spindles and allows them the required action, as described.

No. 48,085.—GABRIEL NATCHER, Sidney, Ohio.—*Railroad Signal*.—June 6, 1865.—This invention consists in constructing a lever at right angles to the track, and having an upwardly projecting flange, which is suddenly depressed by the flange of a passing wheel so as to cause a vibration of the lever, and, by means of a connecting wire, oscillate a rock shaft and draw upon a wire which is stretched from pole to pole along the railroad, and connected to bells at suitable intervals, to give notice to an approaching train, or to passengers on crossings, or to communicate the alarm to a point in advance, to which the wires are conducted.

Claim.—The bar L laid transversely to the track and provided with an arm N and counter-balance weight M, for the purpose and arranged substantially as described.

No. 48,086.—WILLIAM NEVINS, Lyons, N. Y.—*Fence*.—June 6, 1865.—This invention consists in forming the sections composing the fence of slats and stiffeners strung upon wires in such a manner as to brace the sections firmly against either a vertical or lateral strain, and also in the method of constructing and arranging the posts.

Claim.—The combination and arrangement of the stiffeners b b, slats a a, and wires c c, substantially in the manner and for the purpose herein set forth.

Also, forming the posts B with the spurs or forks k k and notches m m, said parts being made either entirely of metal, or partially of metal and partially of wood, substantially as herein specified.

No. 48,087.—ALBERT H. NORTH, Naubuck, Conn.—*Steering Apparatus*.—June 6, 1865.—This invention consists in the use of an eccentric wheel operating upon a quadrant, also extending in the circumference of the groove in which the steering rope or chain engages; this, in addition to geared wheels, causing the motion of the wheel. The result is a change of power by change of the speed from the eccentric or cam wheels.

Claim.—The employment of the cam or eccentric wheels C E, operated by proper mechanism, substantially as and for the purpose described.

No. 48,088.—AMOS NUDD, Wampum, Wis.—*Butter-moulding Machine.*—June 6, 1865.—This invention consists of a catch and socket or notch to hold the compressing lever in place.

Claim.—In a butter-moulding machine constructed as described, the catch or hold-fast, consisting of the pawl *f* and notch *g*, arranged so as to operate substantially as and for the purpose set forth, in combination with the matrix or moulding chamber C, the two levers B E, and the expelling plunger B.

No. 48,089.—JAMES OLD, Pittsburg, Penn.—*Deep Well Pump.*—June 6, 1865.—This invention consists in arranging in a deep well pump a spiral spring within the piston to compensate for the hydrostatic pressure in lifting the valve, the same to be graduated according to the depth and the consequent pressure.

Claim.—The use of a spring so placed in combination with the upper valve of pumps for deep wells as to counterbalance wholly or in part the hydrostatic pressure of the superincumbent column of liquid, and insure the opening of the valve on the descent of the piston, substantially as hereinbefore described.

No. 48,090.—S. J. OLMSTED, Binghamton, N. Y.—*Rein Holder.*—June 6, 1865.—In this device two cylinders are used which have roughened surfaces; under these the rein is put; the cylinders are so arranged with cams that the rein cannot be drawn out; the more force used to draw it forward the tighter it is held.

Claim.—As an article of manufacture, the rein holder, constructed substantially as herein recited.

No. 48,091.—AUSTIN B. PAGE, Weaversville, Cal.—*Mode of Raising Sunken Vessels.*—June 6, 1865.—This invention consists in sinking chains at the bow and stern of a submerged vessel by means of a lever in order to facilitate dragging them under the keel by a to and fro motion, and in using the chains alternately, in pairs or singly, to support the hull during the process of raising it to the surface.

Claim.—The combination and arrangement of the lever E and the crutch G, or their equivalent, together with the cross timber I C I H C H F C F and D D D, substantially as and for the purposes herein specified and set forth.

No. 48,092.—CHARLES L. RAHMER, Brooklyn, N. Y.—*Hat.*—June 6, 1865.—In this invention a space is preserved between the spring sweat leather and the hat by means of small washers on spurs, said spurs springing from the sweat leather and passing through the hat body, outside of which they are bent down and then covered by the hat band.

Claim.—A flexible band made of metal or other suitable material, provided with a series of sharp pointed pins or other proper fastening devices, rubber, or other suitable elastic cushions, arranged together substantially as described and for the object specified.

No. 48,093.—JOHN P. RAY, assignor to himself and WESLEY W. RAY, Honeoye, N. Y.—*Sheep Rack.*—June 6, 1865.—This invention consists in the employment of two hinged racks capable of opening to admit the feed, and of closing to compress and hold it; and also a double trough or receptacle on the inside to hold grain, made in two parts, so arranged that in feeding hay they turn back against the sides to leave the central space unoccupied; but in feeding grain close together in the centre, serves to hold the same in proper position to be reached by the sheep.

Claim.—The grain trough or receptacle C constructed in sections *ll*, so arranged as to open and rest against the sides of the box, or to close centrally to feed the sheep, the same being used in combination with the box A substantially as described, in combination with the grain trough, constructed as described.

Also, the double folding and compressing racks B B, arranged and operating substantially as specified.

No. 48,094.—JACOB REDDING, New Castle, Ind.—*Mode of Operating Churns.*—June 6, 1865.—This invention consists of a spring, cord, pulley, pitman, and vertical dashers; the spring is wound up in a box, and, uncoiling, operates the churn.

Claim.—The general arrangement of the vertical dashers C D, pitman F, crank shaft G H, gearing I J K L M, drum S, cord R, pulley Q, and spring box C, all as herein described and for the purpose set forth.

No. 48,095.—W. H. REED, Philadelphia, Penn.—*Button.*—June 6, 1865.—This invention consists of a button being attached by a rivet stuck down upon the face of the button, so countersinking the back of the button as to cause the head of the rivet and back of the button to present a plane surface while clasping the cloth.

Claim.—The button A with its opening *e* countersunk on the under side of the button, substantially as and for the purpose described.

No. 48,096.—ALBERT RHOADES, Pontiac, Mich.—*Churn*.—June 6, 1865.—This invention consists in the application to a churn of a fly wheel having pivoted thereto a lever, said lever being pivoted also to a spring arm attached to the frame of the churn for the purpose of giving power to the same.

Claim.—The combination, with the balance wheel *c*, of the lever *G* pivoted to the crank pin of said wheel and to an elastic arm *b*, in the manner and for the purposes herein described.

No. 48,097.—STEPHEN ROSSMAN, Hudson, N. Y.—*Horse Leg Fender*.—June 6, 1865.—This invention consists of a pad or fender to fit the inside of the knee joint and ankle joint of a horse addicted to interfering; also it consists in an interlining or stiffener, and the insertion of a whalebone strip at the upper end of the fender to prevent the pad from turning round the leg.

Claim.—The former interlining or stiffener, Fig. 5, and the brace *a* when both are enclosed, combined, and arranged substantially in the manner and for the purposes herein described and set forth.

No. 48,098.—PHILIP C. ROWE, Boston, Mass.—*Piston for Pumps*.—June 6, 1865.—This invention consists in the use of a piece of leather, one or more, of cup form, and an elastic cylinder within said cups, placed on the piston rod and arranged with metal disks and nuts in such a manner that the leather cups may be expanded so as to operate tightly within the pump cylinder by compressing the elastic cylinder within them.

Claim.—The elastic cylinder *C*, in combination with one or more elastic leather cups *F*, with disks and nuts all placed on the piston rod and arranged substantially as and for the purpose set forth.

No. 48,099.—ROBERT ROWLAND, New York, N. Y.—*Manufacture of Glucose and White Lead*.—June 6, 1865.—This invention consists in the utilization of the waste vapors and gases evolved in the manufacture of glucose or grape sugar for the manufacture of white lead. The vessels in which the starch, sawdust, &c., are converted into grape sugar are closed by means of air-tight covers, and the vapors of sulphuric acid and the carbonic acid gas evolved are made to act upon the lead, said vapors and gases being conveyed to the lead by means of suitable pipes.

Claim.—The combined manufacture of glucose or grape sugar and white lead in such a manner that both articles are manufactured independently of each other, but that the waste gases and vapor arising from the manufacture of the former are used for the corrosion of lead into white lead, substantially in the manner herein described.

No. 48,100.—CYRUS W. SALADEE, Newark, Ohio.—*Snap Hook*.—June 6, 1865.—This invention consists in providing the hook of the snap with a buckle-shaped guard, to prevent the escape of the ring from the snap.

Claim.—First, the buckle-shaped guard *B*, with or without the spur *c*, in combination with a hook *b*, substantially as described and for the purposes specified.

Second, the buckle-shaped guard *D*, in combination with a hook *b*, substantially as described and for the purposes specified.

Third, the hook *o* on the end of the spring *C*, for the purpose described.

Fourth, the combination of a snap hook *A B* with a buckle *H*, when the buckle is provided with an extra bar *I* for the attachment of a strap.

No. 48,101.—N. C. SANFORD, Meriden, Conn.—*Wheelbarrow*.—June 6, 1865.—In this invention the bottom of the wheelbarrow is made to tilt, and the claim is confined to such bottom and a trussed frame.

Claim.—The combination of the trussed frame and tilting bottom, substantially as and for the purpose specified.

No. 48,102.—WM. G. SAVAGE, Clinton, Ill.—*Cultivator*.—June 6, 1865.—This machine consists of an auxiliary frame pivoted to the main frame at its front ends. Two plough standards are secured by slots, through which longitudinal cross-bars are placed. These standards are elevated and depressed by hand levers, and moved laterally by the turning of the cross-bars in their sockets. The inner frame only reaches to the axle, and is there connected with treadles working in hangers depending from the back side of the axle.

Claim.—The arrangement of the plough standards *G G*, shafts *F F*, and levers *H H*, placed within the frame *C*, which is pivoted within the mounted frame *A*, substantially as and for the purpose herein set forth.

Also, the connecting of the frame *C* to treadles *I I*, in the manner substantially as and for the purpose described.

Also, the combination of the two frames *A C* with the plough standards, treadles, and levers, all arranged to operate in the manner substantially as and for the purpose set forth.

No. 48,103.—E. T. SAWYER, Portland, Maine.—*Sail Clutch*.—June 20, 1865.—This invention consists in the substitution of an iron band for wooden hoops or rope lashings.

Claim.—First, providing on each end of a sail hank or hoop a ferrule, which is constructed substantially as described.

Second, locking the hoop or hank and clasp the rope and the sail by means of a clutch or clasp, constructed substantially as described.

Third, the two-part clasp, constructed substantially in the manner and for the purpose described.

No. 48,104.—GEORGE M. and SAMUEL H. SEWARD, Guilford, Conn.—*Seed Planter.*—June 6, 1865.—This invention consists in so constructing the hopper that it revolves with a disk beneath, combined with a plate and a stationary brush. The hopper is adjusted to or from the draught wheel by a set screw, thus tightening the belt that rotates it.

Claim.—First, constructing the hopper G so as to revolve with the disk E, when the same is combined with the plate D and the brush K, or its equivalent, substantially in the manner and for the purpose described.

Second, adjusting the hopper G, constructing and operating in the manner described by means of the screw P, substantially as and for the purpose described.

No. 48,105.—JOHN SHEFFIELD, Putneyville, N. Y.—*Deep Well Pump.*—June 6, 1865.—In this pump a solid piston rod descends through a hollow piston rod, the solid rod rising higher and descending lower than the hollow one, each carrying at its extremity a coniform valve, which is opened as the rod descends by the sleeve-like piston having freedom to lag far enough for the influx of water, the two rods moving reciprocally.

Claim.—The employment in a lift pump, with two tubular pistons D D', of the rods E F, their lower extremities b b, constituting valves, and bars d d, substantially as and for the purpose described.

No. 48,106.—JOHN Y. SMITH, Alexandria, Va.—*Oil Ejector.*—June 6, 1865.—This device consists of a central pipe, which is used to convey steam to the different sections of the apparatus, and to prevent condensation this pipe is lined with hose. In combination with this pipe are valves and their chambers for the admission of steam from the inner pipe, which is to be condensed for the purpose of producing a vacuum for raising the oil from one section to the other. Valves are also employed for the purpose of controlling the flow of the oil and preventing its return to the lower chambers, after it has been once raised to the higher ones. These valves are operated by cams placed upon a disk, which is fixed upon and revolved with the interior pipe above mentioned, the motion of which is communicated from suitable machinery on the surface of the ground.

Claim.—First, the combination of a pipe or tube in sections of enlarged valve chambers, when arranged immediately between the tube or pipe sections, and concentrically therewith, substantially as set forth.

Second, in combination with a revolving central steam pipe and stationary outer tube, the conical valves upon the former and their valve seats upon the latter, substantially as and for the purpose set forth.

Third, the means herein described of producing condensation of steam in the chambers, for the purpose of raising the liquid or oil, by injecting or dropping a portion of the liquid raised into the said chamber, substantially in the manner herein set forth.

Fourth, the attachment to the revolving central steam pipe of a cam plate, or the equivalent thereof, in combination with steam or projections on the valve, so that by revolving the pipe the valve shall be lifted off its seat for dropping the requisite amount of liquid for condensation of steam, substantially as set forth.

Fifth, in combination with valve chambers constructed and operated as described, the weighted valve covers, so as to close the valve opening if the external pressure of the liquid exceed that from within, substantially as set forth.

No. 48,107.—LYMAN SMITH, Erie, Penn.—*Apparatus for Making Extracts.*—June 6, 1865.—This invention consists of a vessel provided with a false bottom, and connected with a vacuum pan by means of a pipe. The vacuum pan is connected to a steam generator, by means of pipes, and is provided with an outlet pipe and a pipe through which the air is expelled.

Claim.—The combination with the tank A of a vacuum pan F, or other equivalent device for producing a vacuum, substantially as and for the purpose set forth.

No. 48,108.—SAMUEL SPENCER, Groton, N. Y.—*Threshing Machine.*—June 6, 1865.—This invention consists in the attachment of a concave to the regulating blocks, and made adjustable with the elevator of the machine.

Claim.—The concave D, when attached to the regulating and tightening blocks B B, to render it adjustable with the elevator C, when constructed and operated as above described.

No. 48,109.—ARIEL B. SPROUT, Hughesville, Penn.—*Horse Rake.*—June 6, 1865.—This invention relates to improvements in the manner of operating and pivoting the rake and attaching the teeth to the rake head.

Claim.—First, the foot lever E, so pivoted to the rake head as by being depressed to throw the rake from its elevated to its working position, and by being held down with the foot to retain the rake in its working position.

Second, attaching the fulcrum bar F to the cleaners or other rigid parts of the rake by means of straps g, connecting the two parts of a hinge joint, so as to allow a limited amount of vertical play to the bar F, for the purpose described.

Third, in combination with the straps g, the movable rings, or their equivalent, for the purpose of preventing the vertical play of the bar F, relatively to the cleaners, under the circumstances described.

Fourth, the extension in front of the axle of the cleaners G, which support the rake head, so as by their vertical adjustment to regulate the height of the rake head from the ground at a given elevation of the shafts.

Fifth, the rotating notched pintle bolt H h', with grooves therein corresponding to similar grooves on the lug H', for coiling the rake teeth until the requisite force is attained, and for holding the tooth when coiled in position under the action of the nut on the bolt.

No. 48,110.—ALBERT STEDMAN, Homer, N. Y.—*Upsetting Tire.*—June 6, 1865.—In this invention a pair of forked arms are pivoted together in such a manner as to be placed in an upright position in a common vice, the forked arms passing astride of the screw of the vice. Upon the top of the arms is attached the usual apparatus for clamping tire for upsetting. The screwing up of the vice performs the operation of upsetting.

Claim.—The machine or apparatus as a whole, when used in connection or combination with any vice, as and for the purposes above set forth.

No. 48,111.—GEORGE HAYWARD THOMAS, New York, N. Y.—*Carriage Axle.*—June 6, 1865.—This invention consists in forming at or near the outer end of the axle shaft, and extending entirely around the same, a square groove, in which groove, after the wheel has been placed upon the axle, a similar shaped collar or ring, made in two parts and of a greater thickness than the depth of the groove, is fitted. The wheel is brought to a bearing by means of a screw nut placed upon and moving body of the axle, and acting upon the inner surface of the wheels.

Claim.—The mode herein described of securing a wheel upon its axle, the same consisting in the use at the outer end of the axle of a detachable or movable collar or ring, in connection with a nut, the two being arranged together and operating substantially in the manner herein above set forth.

No. 48,112.—J. H. THOMAS and P. P. MAST, Springfield, Ohio.—*Drag Bar for Grain Drills.*—June 6, 1865.—This invention consists in so fastening an arm and lug to the bar, that the arm will always be kept in contact with the upper end of the tooth, even after breaking of the wooden fastening pin.

Claim.—So constructing the arm F and lugs i, that when the pin g is in place the said arm will be maintained in position in contact with the face e, substantially as set forth.

No. 48,113.—EDWIN THOMPSON, Abington, Mass., and L. N. MEARS, Brooklyn, N. Y.—*Manufacture of Machine-sewed Shoes.*—June 6, 1865.—This invention consists in the preparation of a shoe for the sewing process by lasting it and temporarily securing the outer sole to the vamp, without the use of an inner sole. The vamp being formed, the last is placed therein, the edges of the vamp being drawn over the bottom surface of the last, in which position the vamp is held by thin plates or springs, to hold or support the last and vamp together for the outer sole, which is then secured by a number of small tacks.

Claim.—The process or method of temporarily uniting the vamp and sole of a shoe for their subsequent union by stitches, substantially as set forth.

No. 48,114.—JONATHAN G. TIBBETS and W. M. MERRIEL, Jeffersonville, Ind.—*Axle for Wheel Vehicles.*—June 6, 1865.—This invention consists in a construction of the axle as described in the claim whereby the same is rendered strong and durable, and at the same time light and capable of being kept perfectly lubricated, so as to run with but little friction.

Claim.—A divided axle, or one composed of two parts A A', connected by a bridge or skeleton hub, composed of the heads B C D, and brace rods E, arranged and applied to the axle in the manner substantially as and for the purpose herein set forth, and the ends of the parts A A', fitted together by a cone joint.

Also, providing the heads B D with radial openings or air passages, and having said heads bushed with Babbitt metal, substantially as herein described.

No. 48,115.—W. B. TREADWELL, Albany, N. Y.—*Coal Stove.*—June 6, 1865.—In the upper part of this stove is an oven with a double bottom, in which is a hole filled with a double-walled cover. The fire-pot is made of fire-brick and cast iron; a section of the capping of the brick is removable, so that the bricks can be easily reached when necessary. Air chambers surround the fire-pot, and communicate with air chambers in the bottom of the stove, opening to the external air, and also with the double bottom of the oven by the passage

surrounding the combustion chamber. From a chamber around the top edge of the fire-pot, air is jetted on the fire. Through perforations in the upper bottom plate of the oven the heated air circulates, passing off through perforations in the top of the stove.

Claim.—First, a parlor-heating stove, with an oven for cooking purposes, so constructed that hot air circulates in a chamber formed in the bottom of the oven, and also through the chamber of the bottom of the oven, substantially as and for the purposes described.

Second, the construction of the oven, which is a component part of a stove, with a double bottom, a double-walled hole coverer and circulating passages for hot air, substantially as and for the purposes described.

Third, the fire-pot or chamber *C c l f*, constructed as represented in Figs. 1 and 2, and substantially as herein described, for the purpose set forth.

Fourth, the combination of the plate *H*, with removable section *u'*, and a fire-pot having a removable sectional lining *f*, substantially in the manner and for the purpose described.

Fifth, the combination of fire chamber *C*, cavity *g g*, cold-air passage *o o*, and receiver *E*, substantially in the manner and for the purpose described.

Sixth, the cold-air passage, formed by means of plates *b b* and *c*, connected with cavity *g g*, in combination with the ring or receiver *E*, tubes *s s*, and oven *D*, all constructed and arranged substantially as described.

No. 48,116.—ALBERT VAN WAGENEN, Boston, Mass.—*Window Blind*.—June 6, 1865.—This invention consists in the construction of a blind, so as to admit of the ready removal of the slats without dismembering the frame; also, in the adjustability of the slats and the maintenance of them immovable in any position or inclination.

Claim.—First, the method herein described of constructing window blinds so as to admit of the ready removal of the slats, in the manner and for the purpose set forth.

Second, the method described of maintaining the slats of window blinds at any given inclination with respect to the frame by the means and in the manner herein set forth.

No. 48,117.—A. H. WAGNER, Chicago, Ill.—*Seed Drill*.—June 6, 1865.—In this device the upper part of the seed tube is automatically vibrated, and by means of a partition pushes off the seed from the concave trough of the lower part of the seed tube.

Claim.—The vibrating feeding tubes *H*, provided with a partition across the lower end to stir the grain and feed the drilling tubes.

Also, in combination with the vibrating feeding tubes *H*, the receiving cups *R*, with curved inner bottoms to hold the seed until it is pushed off by the vibrating tubes, substantially as described.

Also, the hook on the lever which raises the link from the wrist pin simultaneously with the raising of the drilling teeth.

No. 48,118.—SYLVENUS WALKER, New York, N. Y.—*Vegetable Slicer*.—June 6, 1865.—This invention consists of a piece of tin or other metal so formed and bent that a common table knife can be used with it as the cutter, and the thickness of the slice graduated by a set screw.

Claim.—The guides *b b'*, forming the sides of the knife stock *A*, with the adjustable mouth-piece *B*, and spring *C*, when formed of one continuous piece of metal, substantially as described.

No. 48,119.—CHAUNCEY WALTON, Washington, D. C.—*Cigars*.—June 6, 1865.—Cigars are constructed with a central perforation from end to end, so that they will always smoke freely and burn uniformly; they are provided with a mouth-piece containing sponge or an equivalent absorbent, to retain all nicotine and empyreumatic odor, and to prevent the same from coming in contact with the mouth or lips of the smoker.

Claim.—The new article of manufacture herein described, made in the manner and for the purposes substantially as set forth.

Also, a longitudinally perforated cigar, combined with a sponged mouth-piece, as and for the purposes set forth.

No. 48,120.—H. W. WARNER, Greenfield, Mass.—*Throttle Valve Gear*.—June 6, 1865.—The object of this invention is to operate and control the throttle valve of steam-engines with greater facility and accuracy than with the means commonly used; it also consists in a peculiar arrangement of the female and male screws.

Claim.—The combination and arrangement of the male and female screw *F*, male screw *B*, and nut *E*, for the purpose of operating and controlling the throttle-valve of a steam-engine, substantially as herein set forth.

No. 48,121.—H. W. WARNER, Greenfield, Mass.—*Lever Buckle*.—June 6, 1865.—This invention consists in attaching to the sides of the lever, projections constituting handles, by which the lever is raised and the strap released.

Claim.—The projections or handles *b*, one or more, in combination with the tongue of a lever buckle, substantially as and for the purpose herein set forth.

No. 48,122.—JONATHAN WHEELER, Athol, Mass.—*Boot-jack*.—June 6, 1865.—This device is so constructed and arranged that when the heel of the boot, to be drawn off the foot, is placed between the jaws, the toe of the other foot is brought down upon the platform, and raises its inner end against the under side of a pair of arms, which are thereby raised, this operation causing the heel of the boot to be clamped, when the foot may be drawn out of the boot.

Claim.—The boot-jack herein described, consisting of the fixed platform A, vibrating platform B, supported upon pivot pins C C, and provided with a projection *c*, curved jaws D D, approaching each other longitudinally, arms *a a*, standards *b b*, and slots *d d*, the whole constructed and arranged as set forth.

No. 48,123.—ALBERT WILLIAMS, Norwich, Conn.—*Knob Latch*.—June 6, 1865.—In this device there are two bolts, one an ordinary spring bolt, operated by the knob arbor in the usual manner, and the other a dead-latch bolt, operated from the outside by a key, which is passed longitudinally through the knob and arbor.

Claim.—The arrangement of the slotted arbor with the dead and slide latches and knob, substantially as shown, so that the dead-latch may be operated or thrown back by the insertion of the key through the knob and arbor while the latter is used for operating the slide latch, as described.

No. 48,124.—J. D. WILLOUGHBY, Washington, D. C.—*Device for Steering one Boat from Another Boat*.—June 6, 1865; antedated November 24, 1864.—This invention consists in steering or directing torpedo boats, and the like, from the vessels from which they are despatched, by means of extended cords.

Claim.—Attaching the steering cords *ff* to the cross tiller *c*, or rudder B, and passing them around some point on the boat, so as to cause the tension of either cord to pull the rudder into a position that will incline or steer the boat in the same direction that it is inclined by the tension of the cord, substantially as described and represented.

No. 48,125.—THOS. B. WILSON and WM. R. SHAW, Meadville, Penn.—*Boiler Furnace*.—June 6, 1865.—This invention consists in the arrangement within the furnace of a boiler, of a deflector, which is operated by means of a lever, in such a manner that the air can be directed upon any part of the burning fuel, and thus made to thoroughly mix with the gases arising therefrom. The air is conveyed to this deflector through a conduit formed on the outside of the boiler, and underneath the furnace door, the frame of which is cut away to admit it.

Claim.—First, the deflector C, arranged as shown within the furnace, and operated by means of the hand lever A without, substantially as above described.

Second, the combination of the deflector C with the door space of the furnace, and the air box E, opening into said space, substantially as above described.

No. 48,126.—J. N. WOODWARD and W. HOLDEN, Aurora, Ill.—*Sash for Roofs of Hot-houses*.—June 6, 1865.—This invention consists in covering the upper or outer portion of the sash with sheet metal strips, and using in connection therewith putty or other suitable cement, whereby the sash is rendered perfectly tight and weather-proof, and more durable than in the common mode of glazing the sash.

Claim.—The sheet-metal strips, constructed with gutters *c c*, and employed in combination with the sash A, glass B, and putty or luting *b*, in the manner and for the purposes described.

No. 48,127.—JOSEPH BUCKETT, assignor to himself and L. W. WARNER, New York, N. Y.—*Bread-cutter*.—June 6, 1865.—The cutter is made of circular form, attached eccentrically to a shaft placed on a suitable framing, the cutter working between plates which have an opening made in them, into which the article to be cut is fed to the cutter, the table or frame on which the article being cut is placed having a holder applied to it, composed of a series of jointed plates.

Claim.—The combination with the eccentric circular cutter D, projecting plates E E, shaft B, opening F, of the holder G, composed of a series of plates *a*, connected by joints *b*, substantially as and for the purposes described.

No. 48,128.—MILLS L. CALLENDER, assignor to the CALLENDER LAMP MANUFACTURING COMPANY, New York, N. Y.—*Lamp*.—June 6, 1865.—This invention consists in sustaining the cone by bent supports, to decrease the transmission of heat; also, in a plate extending across the deflector, having an opening with lips, composing an inner deflector, and flame spreaders at its ends, and an elastic ring for opening for the oil, in combination with slide rods to elevate the burner.

Claim.—First, sustaining the cone or deflector by supporters that are bent or folded, to increase their length, for the purpose and substantially as specified.

Second, the plate *h*, extending across the deflector *g*, and having an opening with lips 1 1, composing an inner deflector, and formed with the flame-spreading projections 2 2, as and for the purposes specified.

Third, the elastic ring *a*, with an opening through which to fill the lamp, in combination with the slide rods *c c*, carrying the burner, as set forth.

No. 48,129.—ROBERT DRAKE, Newark, N. J., assignor to himself, JAMES F. BLESS, and DANIEL F. BLESS.—*Sad Iron*.—June 6, 1865.—In this invention, the bottom of the heating chamber has an inclined or curved guiding surface, divided towards the front by longitudinal partitions. The gas strikes on a plate projecting slightly from the under side of the top plate, and thence the products of combustion are thrown over the whole chamber, and find their way to the exit pipe in front.

Claim.—Constructing the bottom of the heating chamber of a sad iron with an inclined or curved guiding or deflecting surface *r s s*, adapted to operate as herein described.

No. 48,130.—JOHN GROSS, Decatur, Ill., assignor to himself and THOMAS K. ALEXANDER.—*Corn Planter*.—June 6, 1865.—In this invention a circular intermittingly rotating plate is provided with openings, in combination with vibrating seed plates; underneath are placed circular gauges for varying the capacity of the holes. The cut-offs are held in position by elastic, horizontal bars.

Claim.—First, the employment or use of the circular intermittingly rotating plates *N*, provided with openings or holes *j j*, in combination with the vibrating seed plates *M*, substantially as and for the purpose described.

Second, the vibrating bars *O*, placed below or underneath the plates *N*, connected with the plates *M*, and receiving their motion therefrom, and provided with pawls *m*, for the purpose of operating the plates *N*, as set forth.

Third, the circular gauge *P*, placed underneath the plates *N*, and arranged substantially as shown, for graduating the capacity of the holes *h* in the plates *M*, as set forth.

Fourth, the arranging of the cut-offs or strikes *d*, with springs or elastic rods *N'*, in the manner substantially as and for the purpose specified.

Fifth, the scrapers *A A*, at the outer ends of arms *R R*, which are connected by rods *t* to treadles *u*, substantially as and for the purpose specified.

No. 48,131.—IRA HOLMES, Moscow, N. Y.—*Petroleum Stove*.—June 6, 1865.—In this invention between and around the edges of two circular plates are oil reservoirs, into which the wicks descend from burners fitting into apertures in the upper plate. Over the burners are inverted conical cylinders, in the top of which are cooking vessels. A flue from the top of each cylinder carries off the smoke, &c., into a central pipe. There is a wire gauze in the lower part of the central pipe, and from each of the oil reservoirs a tube leads into a central pipe, below the gauze, to carry off the gases generated by the heat. The cylinder may have mica doors.

Claim.—First, concentrically arranged lamps or burners, with the rotary platform *A C*, combined and arranged substantially in the manner and for the purpose set forth.

Second, the pipes *b*, leading from each reservoir into the main pipe *B*, carrying off any vapor or gases into the same for safety.

Third, the jacket heaters or cylinders, with side flues *f* discharging into a central pipe *B*, constructed as and for the purpose set forth.

Fourth, the wire gauze *c*, located in the central pipe *B*, above the entrance of pipes *b*, for the purpose set forth.

Fifth, the combination and arrangement of the several parts described, operating in and for the purpose substantially as set forth.

No. 48,132.—HELEN M. JEWETT, assignor to UNIVERSAL SAFETY MATCH COMPANY, Roxbury, Mass.—*Safety Match Holder*.—June 6, 1865.—In this invention the safe is made in three compartments, the forward and larger one to hold a supply of patent safety matches, the second to contain a store of the cards, on which the matches must be ignited, and the third is a receptacle for waste matches. All of these compartments have lids, the lid on the third receptacle being made so large as to overlap the second when they are shut. The igniting cards when in use are attached to the sides of the safe.

Claim.—A safety match box or holder composed of the match pack and waste receptacles *A B C*, and one or more igniting card-holders *D*, the whole being for use as specified.

Also, the match safe made of the three receptacles *A B C*, and one or more card-holders *D*, and having the cover *c* of the rearmost receptacle so constructed as when closed down upon the cover *b* of the pack receptacle it shall entirely overlap it, as set forth.

Also, the match safe as not only made with a match pack, waste and igniting card receptacles, but with separate covers to the waste and pack receptacles, the same being in order that the pack receptacle may be protected from fire or sparks dropped from a match while in the act of being moved over the pack receptacle for the purpose of being inserted in the waste receptacle.

No. 48,133.—WILLIAM MORGENSTERN, assignor to himself and WM. B. WILSTACH, Philadelphia, Penn.—*Breech-loading Fire-arm*.—June 6, 1865.—In this invention the breech-block, which is retracted longitudinally, has a shoulder at its rear end, which, resting in a

recess in the stock, has an abutment against the recoil. The hammer, on being cocked, first raises the rear end of the breech-block out of its seat, and then retracts it sufficiently to allow the removal and insertion of a cartridge. By means of a tripping catch on the breech-block, the said breech-block may be pressed forward to its closed position, without disturbing the set of the hammer, at full or half cock.

Claim.—First, raising the rear of the movable breech from its engagement and retracting it by means of the tumbler lever H, operated by the hammer in the act of cocking.

Second, the lifting and retracting lever H and the tumbler in one piece.

Third, the swinging cam or lever J, constructed and arranged substantially as and for the purpose set forth.

Fourth, the combination of the breech-piece C, cam J, and tumbler lever H, operating in the manner substantially as described.

No. 48,134.—DANIEL REED, assignor to AMOS A. TAYLOR, New York, N. Y.—*Roll for Machines for Preparing Fibrous Material for Spinning, &c.*—June 6, 1865.—In this invention the leather covering hitherto used is caused, by the application of a high degree of pressure, to adhere to the elastic body, forming a united whole, instead of remaining loose thereon, and liable to a friction between them.

Claim.—Covering rolls for preparing materials for spinning yarn and manufacturing cloth with an inner covering of vulcanized rubber, gutta-percha, or other suitable gums, and with an outer covering of leather parchment, paper, or the equivalent of either of these two coverings, being united together in the manner as and for the purpose described.

No. 48,135.—JOHN E. SMITH, assignor to himself and HENRY C. GRIGGS, Waterbury, Conn.—*Buckle.*—June 6, 1865.—This invention consists in making the buckle of three pieces of sheet metal, swaged or cut into shape; one piece forming the frame, having a bar across it, which serves as the stationary part of the hinges, and two projections or rests, another piece forming the tongue, and the third piece forming the hook.

Claim.—The combination of the frame *a* with the tongue *g* and the hook *h*, when the tongue and hook vibrate separately and on independent hinges or joints, though on the same bar, as herein described.

No. 48,136.—CHARLES THACHER, assignor to himself and GEORGE SHOVE, Yarmouth, Mass., and assigned by said THACHER to LUTHER W. CLARK, Boston, Mass.—*Cranberry Gatherer.*—June 6, 1865.—This invention consists of a bottom and two sides provided with fingers and a receptacle behind them. A rake, with the teeth meeting the fingers of the bottom piece, is pivoted near the front part of the receptacle. The fingers are thrust into the vines, and the rake thrust down upon them, and by withdrawing the instrument the berries are stripped from the vines.

Claim.—The combination of the holding comb C with the receiver A, provided with teeth, substantially as described.

Also, the combination of the grate or sieve B, the holding comb C, and the receiver A, provided with the teeth, substantially as described.

No. 48,137.—THEOPHILUS VAN KANNEL, Cincinnati, Ohio, assignor to himself and JOSEPH BEAIRE, Chester, Ill.—*Cherry-stoning Machine.*—June 6, 1865.—This machine is for the purpose of stoning cherries, and consists of devices that force the stone or pits from the pulp, and discharge the pits in one direction and the pulp in the other.

Claim.—First, so applying the needle carrier *g* to a reciprocating slide that the needles *h* will discharge the pits from the pulp and then assist in discharging the pulp from the machine, substantially as described.

Second, in a machine for stoning cherries, which has a rotary driving shaft, giving a lateral motion to the needle carrier in the act of removing the pulp from the basin, substantially as described.

Third, constructing the needle carrier with a nose *g'*, for the purpose substantially as described.

Fourth, the feeder *b*, arranged to work between the hopper A' and the basin *a*, substantially as described.

Fifth, the employment of an elastic perforated bottom for the basin *a*, substantially as described.

Sixth, the arrangement of the hopper A', feeder *b*, basin *a*, and discharging spout A2, so that cherries will be moved from one to the other of these contrivances, deprived of their pits, and discharged from the machine, substantially as described.

No. 48,138.—JAMES W. WESTON and THOMAS B. STANLEY, New York, N. Y., assignors to JAMES W. WESTON.—*Artificial Legs.*—June 6, 1865.—This invention consists in a peculiar construction of bolts for connecting the foot to the limb at the ankle-joint, and an India-rubber spring, made to set between the foot and limb, and perforated to render said rubber less rigid at particular places, so that the foot will yield to inequalities of the ground. Knee pieces or side supports are also employed to relieve the stump below the knee of sudden strain or wrenching.

Claim.—First, a bolt formed with two joints at right angles to each other, and secured to the leg and foot respectively, as set forth, so that the foot cannot turn out of its place, but motion is allowed at the ankle, as specified.

Second, the India-rubber block perforated with holes or formed with cavities at those points where the spring is required to be most yielding, the same being introduced at the ankle joint, as specified.

Third, the side knee-pieces extending from the artificial limb, as and for the purposes set forth.

Fourth, the band for attaching the artificial limb, consisting of the strap *l* and *m* and intermediate laced strap or webbing *n*, for the purposes and as specified.

No. 48,139.—ROBERT WYATT, assignor to himself and W. LARDER, Brooklyn, N. Y.—*Steam Engine.*—June 6, 1865.—This invention consists in connecting the two pistons with a crank outside of the cylinder by means of a piston rod, which is attached to the inner piston, and passes through the outer piston, and which has a longitudinal movement with the inner piston, and a lateral movement with the two pistons. A stuffing-box is provided through which the piston-rod works, and which slides in a slot on the outside of the steam chest, for the purpose of providing for its lateral motion.

Claim.—First, connecting the two pistons B C with a crank outside of the cylinder by means of a piston-rod D, which is attached to the inner piston C, and passes through the outer piston B, and which has a longitudinal movement with the inner piston C, and a lateral movement with the two pistons B C, substantially as and for the purpose herein specified.

Second, the stuffing box E through which the piston-rod D works, attached to the outer piston B, and working in a slot *f* in the cylinder, substantially as and for the purpose herein set forth.

Third, the sliding plate F and its socket F*, fitting the stuffing box E, and working within a groove or guide *g* on the exterior of the cylinder, substantially as and for the purpose herein set forth.

Fourth, the combination of the slide valve M and the two connected slide valves N" N3, the three worked by two eccentrics Q S, and operating as described in relation to a system of ports *o o' o2 o3 p s' s3*, arranged substantially as herein specified.

No. 48,140.—JOHN MARSHALL, Pentonville Road, England.—*Oil Presses.*—June 6, 1865; patented in England October 27, 1863.—In separating oils from seeds and other oil-yielding substances, they are at the same time strained or filtered, the seed being pressed by a hydraulic ram or piston, or any other power, against a hollow plug, the face of which carries a perforated block, provided with layers of wire gauze, perforated metal, textile or porous fabric, or other suitable straining or filtering material.

Claim.—The expression of oil from oil-yielding substances, and the production of oil-cake and other residuary matter by means of a chamber, in combination with a ram and plug and a strainer or filter, these parts being constructed and acting substantially as described.

No. 48,141.—MANUEL J. LOPEZ Y MANOZ, Havana, Cuba.—*Machine for Making Cigarettes.*—June 6, 1865.—This machine smooths the paper, cuts it to the required length, spreads the tobacco and rolls the cigarette, neatly folding the ends of the same. The claim and the engraving fully explain the invention.

Claim.—First, the arrangement of the feeding rollers G G' connected together and pressed together in the manner specified, and worked by means of gearing, in the manner and for the purpose substantially as described and set forth.

Second, the arrangement and combination of the cutting bar K and knife L, worked by means of a segment L', in the manner and for the purpose substantially as set forth.

Third, the manner of working the forming rollers *v w* by the pinions 12 13, in combination with the pinion 14, when said pinions 12 13 form part of the surface of said rollers.

Fourth, the arrangement of the frames X X', swinging upon central slides *y*, attached to the frames of the machine, and secured in place during the operation of the machine by spring levers *r'* and a lever E', acted upon by a cam F' in the manner specified.

Fifth, the arm *q* and the pin *q'* or their equivalent, acting upon the spring levers *r'*, for the purpose of disengaging the same, in combination with the pin or projection *p'*, acting upon an arm *p*, fast to the said frames X or X', for the purpose of swinging said frames around central studs *y*, the whole operating together in the manner and for the purpose described.

Sixth, the wheel W' acting upon the pinion W" and the pinion 5, operating, through the pinions 4 and 6, the forming rollers in the manner substantially as described.

Seventh, the forming levers N attached to a crank shaft O, and operated by teeth 24 25 26, and pins or projections 27 28 29 30 and 31, in the manner and for the purpose substantially as specified.

Eighth, the arm *b* in combination with the spring lever *x* and the cam *n*, in combination with the lever *n'* acting on the crank shaft O and the forming lever N in the manner described and set forth.

Ninth, the lever T acting upon the forming lever N, and operated by arms or cams U and U', substantially as specified.

Tenth, holding the rolled cigarette firmly in its place while the ends of the paper are closed by means of the lever T, operating in the manner specified.

Eleventh, the levers Q operated in the manner specified or its equivalent, for the purpose of turning down the upper parts of the paper at the ends of the cigarettes.

Twelfth, the levers R' R', operating and arranged in the manner and for the purpose substantially as set forth.

Thirteenth, rolling the cigarette by the combined action of the rollers *v v' w'* and a lever N, as described.

Fourteenth, holding firmly the paper while being cut by the action of the knife L by means of the feeding rollers G G', and by the forming lever N, while the latter is acting upon the tobacco, and distributing the same evenly on the paper.

Fifteenth, the combination of the feeding rollers G G', the bar K and knife L, the forming rollers *v v' w'*, the forming bar N, the lever T, the levers Q Q and the levers R' R' when arranged, combined and working together in the manner and for the purpose substantially as set forth and described.

Sixteenth, the construction of the wheels H W' E and W attached to the driving shaft, and operating the different parts of the machine in the manner and for the purpose as set forth.

No. 48,142.—JAMES WOOD, Nottingham, England.—*Lamp Burner*.—June 6, 1865.—This invention consists in a combination of several devices to facilitate the action of a sliding door in the shell of a lamp burner to insert a match.

Claim.—The combination of the door B *e e*, thumb-piece *e**, stops *g h*, (all made out of one piece of metal,) with the guides *f*, the latter being formed of strips or pieces of the shell *a* of the burner, in the manner and for the purpose herein described.

No. 48,143.—PHILO P. STEWART, Troy, N. Y.—*Coal Stoves*.—June 6, 1865.—A chamber surrounding a perforated tube is placed immediately over the top of the fire chamber, for the purpose of bringing a current of atmospheric air in as cold a condition as possible in contact with the smoke and gases from the fire, so that the same shall be arrested and burned.

Claim.—First, the employment of the perforated cone or cap F, constructed, arranged, and combined with the said plates C and D, and with the fire-pot and combustion chamber of a stove, in the manner and for the purposes substantially as herein described and set forth.

Second, the employment of the wire-gauze door P, or its equivalent, in combination with the said perforated cone or cap E or any equivalent therefor, and with the said radiating chamber B', in the manner and for the purposes substantially as herein described and set forth.

Third, the perforated cone or cap E, constructed and arranged in sections *a b c*, with small apertures between each section or division, in the manner and for the purposes substantially as herein described and set forth.

Fourth, the arrangement and employment of the inner vertical tube or conical cylinder L and the outer vertical tube or cylinder E, in combination with the radiating chamber B', and with the horizontal flue *g g*, in the manner and for purpose substantially as herein described and set forth.

Fifth, the arrangement and combination of the vertical radiating tubes or columns G G G G, with the return flues *e* and *f*, in the manner and for the purpose substantially as herein described and set forth.

Sixth, the said flanges *i*, constructed and arranged upon the outside of the said perforated cone or cap E, in the manner and for the purpose substantially as herein described and set forth.

Seventh, the combination of the said perforated cap or cone E or its equivalent, with the air chamber surrounding the chamber of combustion, and communicating with numerous apertures, and the said wire-gauze door P, in the manner and for the purposes substantially as herein described and set forth.

No. 48,144.—JOSHUA G. ALLEN, Philadelphia, Penn.—*Air-tight Stove*.—June 13, 1865.—This invention consists in surrounding the sheet-iron base of an air-tight stove with a cast-iron base, for the purpose of giving it greater solidity and firmness, and also of increasing its capability for ornament without interfering with its air-tight properties.

Claim.—Enclosing the air-tight chamber forming the base of a sheet-iron stove in a case of cast iron, substantially in the manner and for the purpose set forth.

No. 48,145.—JAMES B. AMOS, Lower Chanceford, Penn.—*Grain Drill*.—June 13, 1865.—In this machine the forward axle is pivoted in the centre, and connected at each end with the frame by side links inclining forwards and downwards from the truck, in such a manner that pressure upon either handle guides the drill in the opposite direction. The guano box is furnished with a stationary cleaning blade, along which the seed slide moves by a slot. The rear operating wheel has double tires, the outer one of which is in sections, and can be drawn out from the inner one, and held in position by a nut or wedge, thus enlarging the diameter of the wheel.

Claim.—First, connecting the forward wheels when mounted upon one and the same axle to the truck or frame by means of a central vertical pin, in combination with side links attached to either side of the frame or truck and to the axle next to the wheels, so as to diverge, inclining forward and downward from the truck to the axle, substantially in the manner and for the purpose set forth.

Second, in combination with the cup slide valves, stationary cleaning blades penetrating a longitudinal slot in the valve-bar traversing the cups, substantially as set forth.

Third, in combination with operating the slide valves, the means herein described of enlarging or diminishing the diameter of the said wheel, in the manner and for the purpose herein set forth.

No. 48,146.—MARSHALL L. BABB, Cape Elizabeth, Me.—*Caster for Furniture.*—June 13, 1865.—This invention consists in so constructing the spindle of the caster, and the cylinder in which it plays, that the caster may be inserted, or removed, by pushing or pulling with the hands, and yet be firmly in the socket, so that it will not fall out.

Claim.—As my improvement, the slotted and bulbous-headed spindle *c c*, in combination with the cylinder *b*.

No. 48,147.—THOMAS and JOHN BARBER, Brooklyn, N. Y.—*Stuffing Box for Valve Spindles.*—June 13, 1865.—This invention consists in constructing stuffing boxes for spindles of valves in such a manner as to dispense with the system of packing stuffing boxes with hemp or similar stuffing material, and yet insure a tight joint.

Claim.—First, the combination with the annular valve *E*, socket *B*, and valve stem *D*, of the gland *A* and collar *A'*, when constructed and arranged to operate in the manner and for the purposes herein set forth.

Second, the combination of the guides or snugs *a a*, on the collar *A'*, with the straight sides of the valve-spindle, substantially as above described.

Third, the lubricating device above shown, and its channel *d*, in combination with the socket in which the valve spindle works, substantially as described.

No. 48,148.—WILLIAM S. BELL, Boston, Mass.—*Paper Collar.*—June 13, 1865.—In this invention the band is formed two-fold, and doubled on itself, so that the button holes register, and the upper edge serves to press the collar part out.

Claim.—First, doubling the thickness of the band, and connecting the folds together, substantially in the manner set forth.

Second, folding the collar upon the line *b*, by making the edge *a* the guide in such operation.

No. 48,149.—NOAH BENNETT, Sherman, N. Y.—*Machine for Coring, Slicing, and Stringing Apples.*—June 13, 1865.—This invention consists of devices that can only be understood by reference to the specification and drawings.

Claim.—The combination and arrangement of the piston or follower, raised by a spring, and composed of a driving head *g*, core-depressing projection *h*, and centring point *i*, with the cutting, coring, and stringing device, all substantially as herein specified.

No. 48,150.—WILLIAM BLESSING, Jeffersonville, Ohio.—*Corn Planter.*—June 13, 1865.—This invention consists in connecting the tooth to the seed-box, by means of a screw thread on the end of the former, and having the seed-slide on a line with the plane of the trigger; and also in providing half of the circumference of the aperture in the slide of soft metal, whereby it may be enlarged.

Claim.—First, the tooth *C D*, and seed-box *F f*, secured to each other and to the beam by the operation of a single screw, substantially as set forth.

Second, the obliquely-floored seed-box *F*, connected to the tooth by the oblique boss *f*, and having its slide reciprocated in the plane of the trigger, substantially as set forth.

No. 48,151.—CHARLES B. BROOKS, Auburn, Me.—*Baling Press.*—June 13, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—The wheel *G*, on the upper end of the screw *E*, in combination with the friction wheels *H H*, when the latter are placed in an adjustable loaded frame, and rotated in reverse directions from a shaft *K* driven alternately by a straight and cross belt, and all arranged substantially as and for the purpose set forth.

No. 48,152.—CHARLES E. BROWN, Owego, N. Y.—*Show-case for Cigars and Tobacco.*—June 13, 1865.—This invention consists of a circular case with a glass top or cover, and an opening for a slide or door; within this case is another of circular form divided into several compartments, and arranged to revolve upon its centre, so that each compartment may be brought underneath the door or slide in the outer case, for the purpose of enabling the person purchasing, to select the kind of cigar he wishes, without uncovering the cigars in the other compartments. The door is secured by a lock.

Claim.—A show-case for cigars and tobacco, constructed substantially as herein shown and described.

No. 48,153.—L. C. CHASE, Boston, Mass.—*Method of Attaching Loops to Buckles, &c.*—June 13, 1865.—This invention consists in confining the buckles to straps by clasps, which are slipped on or over the straps into the proper position, and then compressed and partially embedded in the same; said clasps being provided with a prong, to be forced into the strap, and thereby prevent the clasp from slipping.

Claim.—First, confining buckles, loops, and rings to straps, by means of a clasp or band, substantially as and for the objects specified.

Second, constructing the clasp or band in one piece, with the loop, substantially as and for the purpose described.

Third, the prong *f*, in combination with the clasp, substantially as set forth and for the purpose described.

Fourth, constructing one side of the clasp opposite the prong *f*, in two parts, substantially as and for the purpose described.

No. 48,154.—JOHN H. COBURN, Lowell, Mass.—*Shuttle for Looms.*—June 13, 1865.—This invention consists in a method of securing the tips of shuttles, so that they may sustain the violent blows and shocks given to them in weaving, without becoming loose and falling out, and whereby also the shuttle will be strengthened and prevented from being split.

Claim.—Securing the tip of the shuttle, by means of its screw-threaded shank *b*, which screws through the transverse plug *c*, substantially as above described.

No. 48,155.—DANIEL C. COLBY, Claremont, N. H.—*Improvement for Distributing Fertilizers to Growing Plants.*—June 13, 1865.—This invention consists in a distributor, having an inclined bottom, and divided in the centre by a partition, in connection with an adjustable handle, and sliding door, for the purpose of shutting or opening the orifice for the discharge of the contents.

Claim.—The combination of the inclined button *B*, the stay *g*, the temporary partition *J*, and the standard *E*, with the box *A*, as and for the purposes set forth.

No. 48,156.—DANIEL C. COLBY, Claremont, N. H.—*Flour Sifter.*—June 13, 1865.—This invention consists in the manner in which the stirrer is formed for spreading the flour over the sieve, being composed of a bar with strips, and a curved arm, the whole being operated by a crank and handle.

Claim.—The arrangement of two or more strips *E E* upon the underside of the bar *D*, substantially as described, and the combination of the said bar *D*, and the cross piece *F*, as and for the purposes set forth.

No. 48,157.—J. A. COLEMAN, Providence, R. I.—*Machine for Making Clinch Rings.*—June 13, 1865.—In this machine the die which forms the external bevel, and the punch which forms the internal bevel, or countersink, are attached to the end of the sliding plunger. The punch works through the axis of the die with an independent movement, peculiarly related to that of the die, and so that while the two act together, or in conjunction, imparting to the ring the proper form, they act independently of each other in disengaging the finished ring.

Claim.—The method of forming "clinch rings," or other similar articles, by the use of a pin, in combination with a die, both acting in the manner substantially as and for the purpose set forth.

No. 48,158.—JOHN COSFELDT, Philadelphia, Penn.—*Low-water Detector.*—June 13, 1865.—The object of this invention is to avoid the explosion of steam generators by reason of low water in the generator, and to insure notice of the diminution of water to a dangerous degree, by the sound of an alarm steam-whistle. Its novelty consists in the combination and arrangement of the tube, pipe, float-lever, valve, whistle, gauge-cock, blow-off-cock, the pin which passes through the lever, and the pipe.

Claim.—First, the tube *A*, or its equivalent, forming a passage between the interior of the boiler and the pipe *B*, through which the end of the float-lever *H*, or equivalent device, connected to and operating the valve *E*, may project into the boiler, substantially as specified.

Second, the alarm whistle *G*, and the valve *E*, gauge-cock *C*, blow-off-cock *Y*, and float-lever *H*, combined with the four-way pipe *B*, substantially as set forth for the purpose described.

No. 48,159.—JOHN CRANE, Glover, Vt.—*Wool Press.*—June 13, 1865.—This invention consists of two boards, hinged at one side to a frame, so as to be turned up. Having been turned up, wool is to be placed between them. Standards are then caused by a windlass to approach each other between the boards, and compress the wool.

Claim.—First, the machine or combination, substantially as described, the same consisting of the hinged boards *D D*, and their supporting frame, and the screw slides *F F* and standards *E E*, and their operative mechanism, as described. Second, a screw and

Second, the above-described arrangement of the hinged boards, their supporting frame, and the grooved slides F F and standards, and their operating mechanism.

Third, the combination of the sliders G G with the grooved standards E E, and slides F F, when combined with the hinged boards D D, and the mechanism for operating the slides F F, as specified.

No. 48,160.—ELIJAH H. DANFORTH, Jamestown, N. Y.—*Mode for Making Corundum Wheels*.—June 13, 1865.—This invention consists of a cylindrical mould, in which the plastic material of which the wheel is formed is placed; pressure is applied to the piston above, by means of a thumb nut and screw, connecting it with the bottom, and passing through the centre of both.

Claim.—The combination of the base A, on the curb B, &c., as set forth and described, and represented in figure 1, a perspective view.

No. 48,161.—WILLIAM H. DOANE, Cincinnati, Ohio.—*Scroll Sawing Machine*.—June 13, 1865.—This invention relates to improvements in constructing, guiding, and driving the saw stock of scroll-cutting saws; also, to improvements in supporting the driving or crank shaft, and connecting this shaft to the saw stock in such manner that a comparatively long stroke can be obtained at a low table.

Claim.—First, connecting the pitman D to the upper end of a scroll saw stock by means of the conical bearing *b* on the end of the slide *a'* and a bolt *c* passing through the stock, substantially in the manner and for the purpose described.

Second, the combined conical wrist pin and slide *a b* formed on or attached to the saw stock, substantially as described.

Third, the hollow cylindrical stock E in combination with a combined wrist pin and slide, which works in guides at the back of the stock, substantially as and for the purpose described.

Fourth, the arrangement of the back and side guides *n n'* on a plate *k* attached to the table *b*, substantially as described.

No. 48,162.—F. DOELBER, Philadelphia, Penn.—*Tobacco Pipe*.—June 13, 1865.—This invention consists in an elbow of metal, the vertical end of which forms a socket in which either the stem or the bowl may be inserted. The horizontal end of the elbow fits into a socket in the side of a metallic fluid receptacle, the top of which also forms a socket to receive the stem or bowl.

Claim.—The elbow D, provided with a socket *b*, and made to fit in the lateral socket *d* of the fluid receptacle of a smoking pipe, substantially as and for the purpose set forth.

No. 48,163.—JAMES ELDER, Carthage, Ill.—*Whiffletree*.—June 13, 1865.—This whiffletree consists of a singletree, a doubletree, and a trebletree, for the attachment of three horses abreast—one to the singletree and the other two to the doubletree. In order that a disproportionate load may not be thrown upon the single horse, he is attached to the longer arm of a lever upon which the span pull by the shorter arm.

Claim.—The combination of the adjustable lever G, lever J, and rod K, with the trebletree D, for equalizing the draught upon the horses of the team, substantially as described.

No. 48,164.—JAMES FALLOWS, Philadelphia, Penn.—*Sheet-metal Spoon*.—June 13, 1865.—This invention consists in making the handle of two pieces of thin tin, and uniting the edges and ornamenting the sides by stamping dies.

Claim.—A sheet-iron or tin plate spoon or fork, having a hollow handle, constructed and finished substantially in the manner described, as an improved article of manufacture.

No. 48,165.—A. D. FOSTER, Jordan, N. Y.—*Pump*.—June 13, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—The combination and relative arrangement of the valves *v* and *v'*, when rigidly attached to the pivoted lever G, with the hollow piston P, having a head composed of the plates B and C, between which is arranged the disk valve D, which is constructed and operated conjointly with the other parts in the manner shown and for the purpose described.

No. 48,166.—GEORGE H. FOX, Boston, Mass.—*Steam Regulator Valve*.—June 13, 1865.—The object of this invention is to automatically regulate the induction of steam pressure at a given point of delivery to the steam generator furnace, when combined with a steam blower. Its novelty consists in the combination of the valve diaphragm and the inlet and outlet chambers.

Claim.—The combination of the valve *e*, diaphragm *i*, and inlet and outlet chambers, when arranged to operate together and with reference to each other, substantially as set forth.

No. 46,167.—GEORGE DOUGLASS GANSTER, New York, N. Y.—*Concussion Fuze for Explosive Shells*.—June 13, 1865.—This invention a chamber within the fuze-plug, of conical form the door is s.

in either direction, is occupied by two cone plungers, whose bases are separated or held apart by a spring, and between which is placed the percussion priming. On the impact of the shell, in any direction, the two conical plungers are forcibly brought together, and thus ignite the percussion priming. A safety check is interposed between the plungers to prevent accidental explosion, and is removed when the fuze is to be used by a simple adjustment of a wire.

Claim.—The use of two cones D and C, operating in a double-coned chamber, substantially as shown and described.

No. 48,168.—LEWIS S. GILLILAND, Dayton, Ohio.—*Head for Barrels.*—June 13, 1865.—This invention consists in making barrel heads so that they may be lessened or enlarged in order to be placed in or out of the barrel, and consists of segments, with pawl and ratchet and other devices attached to the head for that purpose.

Claim.—First, the removable barrel head, with adjustable segments, arranged and operated so as to be lessened and enlarged in circumference, for the purpose of being placed into and out of the croze of barrels or casks without moving any of the hoops thereon, constructed as described.

Second, the arrangement and use of either the lever ratchet or the holder and thumb screws, or their equivalents, for the purpose of forcing and holding the outer edge of the head into the croze of the cask, substantially as herein set forth.

Third, as a new article of manufacture, the metallic segments G D B with the lever B', the said article being adapted for attachment to and operation with a barrel head, in the manner and for the purpose herein explained.

No. 48,169.—WILLIS GLAZE, Rochester, Ind.—*Wagon Brake.*—June 13, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—First, the connecting of the whiffletrees Q to a bar o pivoted to a rod e which is connected with the lever J for the purpose of relieving the rear wheels of the pressure of the shoes under the pull of the team, as set forth.

Second, the arrangement of the slide K fitted in the guide plate L, lever J, and rods e M, and thimble N, all arranged to operate in connection with the levers E E, substantially as and for the purpose specified.

Third, the combination of the levers E E, rod I, lever J, rod c, slide K, rod M, and thimble N, with the bar O connected by rods P P to the whiffletrees Q Q, for the purpose set forth.

No. 48,170.—WILLIAM R. GREENLEAF, Buffalo, N. Y.—*Oil Ejectors.*—June 13, 1865.—This invention consists in placing any desired number of ejectors in one well at nearly equal distances apart, in combination with chambers or reservoirs so arranged as to divide the well into as many compartments and the column of oil into as many sections as there are ejectors used. Pipes lead from the surface and communicate with each of the ejectors, beginning with the lower one, from which the oil is ejected and forced into the next in the series, in which it is retained until acted upon by the ejector placed therein, and the process is repeated until the oil reaches the surface.

Claim.—The combination of the ejector or ejectors C, or equivalent, with one, two, three, three, or more compartments or chambers A, for the purpose and substantially as described.

No. 48,171.—G. GUNTHER, New York, N. Y.—*Flower Basket.*—June 13, 1865.—In this invention the outside body of the pot is made of ornamented metal plates; within is a metallic cup with a perforated bottom, and beneath is a detachable bottom to hold water that may drip from the cup which contains the plants. The basket is suspended by three cords joined above.

Claim.—A flower basket A with a detachable bottom, made substantially as set forth.

No. 48,172.—PHILLIP HALL, Philadelphia, Penn.—*Filter for Oils, &c.*—June 13, 1865.—This invention consists of a series of vessels placed one within the other, and having their bottoms fitted with conical tubes filled with raw cotton. These vessels are placed within another vessel surrounded by a steam jacket, by means of which heat may be applied if necessary.

Claim.—First, a filter for purifying oils, consisting of a close chamber having a perforated diaphragm top and a diaphragm bottom composed of a number of conical tubes fitted with raw cotton, substantially in the manner described.

Second, the use of raw cotton in conical tubes, substantially in the manner and for the purpose set forth.

Third, the combination of a series of two or more filters, constructed substantially in the manner described for the purposes set forth.

Fourth, the combination of one or more filters constructed substantially in the manner described, with a heating or refrigerating vessel, constructed and arranged substantially in the manner described for the purposes set forth.

No. 48,173.—H. W. HARKNESS and J. C. MACK, Bristol, Conn.—*Ice Scraper.*—June 13, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—As a new article of manufacture, an ice scraper, the bowl or body *a* having an aperture *m* in its bottom, in combination with the knife or scraper *c*, pin or screw *i*, and handle *n*, substantially as and for the purpose described.

No. 48,174.—CONRAD and FREDERICK W. HOFFMAN, Morrisania, N. Y.—*Machine for Cutting off Cigars.*—June 13, 1865.—This invention consists in the combination of an adjustable table and an upper and lower trough with an index or ratchet wheel at one side, and at the other side a hand lever with a knife attached thereto; the lower trough has a head rest at one end, against which the heads of the cigars are placed and made adjustable to suit any length of the same; attached to each side of the machine, and below the lower trough, is a projection fitting up through a slot in the same, for the purpose of facilitating the removal of the cigars.

Claim.—First, the hinged trough or channel plate *C* operated by the knife lever, and arranged in the manner and for the purpose described.

Second, the plate *D* operated by a pin *s* fast to the lever *F*, in combination with an inclined projection *a* fast to the frame, and arranged in the manner and for the purpose set forth.

Third, the movable head piece *E*, in combination with the plate *D*, as described.

Fourth, in combination with the plate *D*, the index ratchet wheel *H*, arranged and operated in the manner and for the purpose substantially as set forth and described.

Fifth, the combination of the marble table *B*, trough *C*, plate *D*, knife lever *F*, and index wheel *H*, when arranged and operating together in the manner and for the purposes substantially as set forth and described.

No. 48,175.—GEORGE W. HOLLEY, Niagara, N. Y.—*Machine for Gathering and Loading Hay, Stone, &c.*—June 13, 1865.—In this invention a rack for hay extends out at right angles to the body of a wagon; it moves vertically upon a shaft geared to another shaft at right angles to it, passing through the body of the wagon. Two tongues are used, the upper one sliding over the other, and at its rear end fastened to a rectangular frame; this frame carries two racks upon its under side that operate the toothed wheels upon the central shaft. The backward movement of the horses forces back the tongue, and through the tongue the rack frame which rotates the central shaft and elevates the hay fork or rack.

Claim.—First, operating devices for elevating hay, stone, or substances of any kind, by means of a backward or retrograde movement of the horses.

Second, the use of two tongues to one wagon, as described, to permit the same to be drawn forward as usual, and adapt the motion of the horses in backing to be transmitted to elevating devices, substantially as set forth.

Third, the slot *h* in the lower tongue *H*, in combination with the eveners *P* and cord *Q*, the whole being employed in the manner and for the purpose stated herein.

Fourth, in a machine constructed as herein described, I claim the combination of the movable rack frame *J* *J*¹ *J*², the cog wheels *G* *G*, the pinion *O*, and the shaft *F*, the whole being constructed and arranged to operate in the manner and for the purpose explained.

Fifth, the lever *S*, in combination with the clutch *T* when employed, to enable the attendant to assist in elevating the hay or stone, as set forth.

Sixth, the neck yoke *R* employed to attach the upper tongue *H'* to the horses, so as to cause said tongue to undergo the backward movement of the horses, as and for the object specified.

No. 48,176.—BENNETT HOTCHKISS, New Haven, Conn.—*Match Splint Cards.*—June 13, 1865.—This invention consists in sharpening or pointing blank matches in sheets or cards, and cutting them partially asunder, but not so much but that the cards will hold together, and as much narrower as the depth of the pointing is in the length, so that, in putting up the cards into shape for dipping and sale, the points project beyond the body of the cards.

Claim.—As a new device of manufacture, making the cards of match splints, substantially as herein described and set forth.

No. 48,177.—JAMES A. and HENRY A. HOUSE, Bridgeport, Conn.—*Chair.*—June 13, 1865.—This invention consists in attaching a stop reel to backs of chairs to make them adjustable as to inclination.

Claim.—The combination of reel *R*, bolt *D*, spring *x*, and cords *T*, operating together, substantially as and for the purpose specified.

No. 48,178.—DAVID G. HUSSEY, Nantucket, Mass.—*Boys' Sleds.*—June 13, 1865.—This is an extension sled, and may be enlarged as desired. To this end the top of the sled is composed of three parts, constructed of a series of parallel slats arranged so that the slats of one part slide between those of another. To one of the parts are attached levers so arranged that the part may be turned to either hand, and thus guide the sled. The brake is also supposed to be of an improved form.

Claim.—First, the constructing or forming of the sled of a plurality of parts attached respectively to the separate frame pieces *a* and *a'*, alternately arranged in one plane, as represented in the drawing, so as to constitute a level floor or bed, and in such manner that said

parts may be extended in a greater or less degree to increase the capacity of the sled as may be required.

Second, the combination of the pivoted steering frame E mounted on a pair of runners C C, and the levers F and H, constructed, arranged, and operating as described in connection with levers I, or equivalent means for actuating the lever H.

Third, the combination of the sliding foot piece L K and *k*, and elastic brake teeth *h h*, all constructed, arranged, and operating substantially as and for the purposes set forth.

No. 48,179.—DAVID G. HUSSEY, Nantucket, Mass.—*Horse Rake*.—June 13, 1865.—This invention relates to the construction of the rake head, and will be readily understood by reference to the claim and engraving.

Claim.—The curved arms *b*, provided with two or more sockets *c* and teeth *d* inserted therein, substantially as described.

No. 48,180.—JACOB B. HYZER, Janesville, Wis.—*Radiating Attachment for Stoves and Furnaces*.—June 13, 1865.—In this invention an outer case encloses in a hot-air chamber a stove and heat radiating attachment constructed with an inner radiating surface and hot-air space. External air entering the outer casing at the bottom is allowed to flow into this inner space, passing between the stove and radiator. The radiator is divided by vertical partitions extending alternately nearly to the top or bottom, so that a circuitous route for the products of combustion is made by closing a damper in the pipe passing horizontally through said space; or, by opening this, they flow through this pipe and the vertical pipe passing through the inner space. Pipes from the top of the outer casing carry off the heat as desired.

Claim.—First, the combination of the flue *g* and damper *h* with the flue *g'* and central smoke-pipe D, substantially as and for the purpose set forth.

Second, the combination of the outer and inner radiating cylinders G and O, and the radial plates *f f'* and *f''*, producing ascending and descending flues, with the inner unconfined hot-air space *c*, ventilated above and below, substantially as and for the purpose set forth.

Third, the combination of the flue L, cylinders G and O, and radial plates *f f' f''* with the flues *g'*, damper *h*, smoke-pipe D, and inner unconfined hot-air space C', when constructed and arranged substantially as and for the purpose set forth.

No. 48,181.—SAMUEL KEELER, Lancaster, Penn.—*Wood-Bending Machine*.—June 13, 1865.—The object of this invention is to bend wood for wagon felloes into shape, and it consists in a strong semicircular frame or former, to which are attached swinging levers, with friction rollers so placed that, as the levers are swung around to bend the wood, the rollers will pass over the timber, pressing it firmly in shape on the former, and when so bent are securely fastened by means of metal straps locked over the bent felloe and secured to the edges of the former.

Claim.—The arrangement and combination of the device C D E H L M and N, as herein described, and for the purposes set forth.

No. 48,182.—R. KEESE, Cardington, Ohio.—*Churn*.—June 13, 1865.—This invention consists in the arrangement of two winged beaters placed opposite to each other between two cross-arms or beaters, and provided underneath said arms with a sweep for the purpose of scattering the cream from under the beaters round in the churn.

Claim.—The rotation winged beaters L, cross-arms or beaters *h*, in combination with the sweep *j*, when arranged and operating as and for the purpose set forth.

No. 48,183.—D. J. KELLOGG, Rochester, N. Y.—*Clothes Dryer*.—June 13, 1865.—This invention consists of a bracket with holes and flanges for inserting rods for holding the clothes to be dried.

Claim.—The stop and retaining flanges *f g*, in combination with the bracket A and clothes bars B, substantially as herein specified.

No. 48,184.—WERNER KROEGER, Milwaukee, Wis.—*Stove-pipe Drum*.—June 13, 1865.—This invention relates to a heat radiator, designed more especially for stove-pipes, to arrest the heat passing through the same, and radiate it into the apartment, so that it cannot escape into the flue with the products of combustion.

Claim.—The cylinder A, provided with the two internal cylinders E E', having long and short plates *c c' d d'* attached to their exterior surfaces, and having disks F G at their ends provided with openings *a e*, all arranged substantially as shown with the dampers G K, to operate substantially as and for the purpose set forth.

No. 48,185.—HENRY A. LEE, Worcester, Mass.—*Planing Machine*.—June 13, 1865.—This invention is designed as an improvement on a machine patented by the said Lee October 13, 1863. It consists in an adjustable automatic pressure stand so arranged that the pressure is the same whether the stand is near to or further from the planing cylinder; and it also consists in an arrangement of devices for adjusting the mouth in the bed plate so that thin stuff can have mouldings cut on their lower corner while the face or sides are being worked.

Claim.—First, the combination, with the horizontal cutter cylinder, of a moulding machine, of an adjustable automatic pressure stand, whereby the pressure of the shoe upon the stuff remains the same whether the stand is removed to or from the cylinder, substantially as and for the purposes stated.

Second, the combination with the adjustable stand L, of pressure bar I, screw shaft P, and weighted levers Q, substantially as and for the purposes specified.

Third, in combination with the adjustable pressure bars K, the adjusting screws P and screw nuts m, operating against the rounded ends of the bar K, as and for the purpose specified.

Fourth, in combination with the stand M the slotted flanges d when secured to the stand T of the cutter cylinder D, to make it adjustable thereon, as and for the purposes specified.

Fifth, in combination with the cutter cylinder E, working under the bed B, the adjustable mouth-piece p in the bed plate, by which mouldings can be cut on the lower corners of the stuff while the sides and face are worked, as herein shown and described.

No. 48,186.—RICHARD LEE, Newark, N. J.—*Leather Dressing Machine.*—June 13, 1865.—This invention consists in a cylinder or drum provided upon its face with a number of rubbers, placed in such a position that every part of the hide shall be operated upon by them in one revolution of the drum. It further consists in a tooth, the action of which is alternating.

Claim.—The rolls or rubbers with their semicircles, tilt springs, and spring bearings constructed in the manner and for the purpose specified, the manner of alternating the action of the table, substantially as shown, and the whole machine with the various parts combined, arranged, and operated in the manner and for the purpose herein above set forth.

No. 48,187.—H. W. LIBBEY, Cleveland, Ohio.—*Incendiary Compound.*—June 13, 1865.—This invention consists of a compound made as follows, viz: Nitric acid and sulphate of baryta are placed in a vessel and well macerated, and sulphuric ether is added, after which spirits of turpentine and nitrate of potash finely powdered are added. The whole is allowed to stand for three days, and the oily substance which rises to the surface is removed and mixed with alcohol. To this is added hydro-carbon oil, and also tar free from water. Collodion may be added to make the compound more explosive. Rags are saturated with the compound and used to fill shells, &c.

Claim.—An incendiary compound composed of the ingredients herein named and compounded in the manner substantially as herein specified and set forth.

No. 48,188.—H. LIBBY, Evansville, Wis.—*Ladies' Boot.*—June 13, 1865.—In this invention the uppers are connected by a webbing with the heel piece, at or near the top of the boot; the heel leather extends on both sides so as to embrace the leg, in front of which it is fastened by strings, buckles, &c.

Claim.—A boot for ladies' and misses' use, made with a heel piece d, and extensions r r, constructed substantially in the manner herein shown and described.

No. 48,189.—JOSEPH H. LITTLEFIELD, Cambridge, Mass.—*Flour Sifter.*—June 13, 1865.—This invention consists in making the shaft of a triangular form with flexible rubbers secured in grooves in the centre of the flat sides of the shaft.

Claim.—The arrangement and combination of the case B B C C, sieve G, the two side pieces D D, and the equilateral triangular shaft A, or its equivalent, provided with the grooves i i, and the elastic strips E E E, substantially as described and for the purpose set forth.

No. 48,190.—WESLEY LOUCKS, Schoharie, N. Y.—*Egg Cooker.*—June 13, 1865.—This invention consists of two plates of metal made to fold together and revolve like a gridiron, in each of which are cup-shaped depressions opposed to each other, in which the eggs are placed to be cooked; and when one side is done it can be turned over.

Claim.—The within described egg cooker as a new article of manufacture.

No. 48,191.—EDWIN LOCKWOOD and GEORGE W. PITMAN, Bordentown, N. Y.—*Car Seat.*—June 13, 1865.—This invention relates to an adjustable car-seat for sleeping cars, and consists in constructing and arranging the back and the seat in such a manner that both may be inclined to suit the occupant when desiring to sleep or to be in an inclined position, and both the seat and back rendered capable of being adjusted or reversed, to suit the direction in which the car is running.

Claim.—The seat B, provided with the adjustable rods C, arranged substantially as shown, in connection with the reversible back H, applied to the seat by means of the bars I G, substantially as and for the purpose specified.

No. 48,192.—O. MALLORY, Rochester, N. Y.—*Grape Box.*—June 13, 1865.—This invention consists in cutting the bottom bevelling from above downwards, and forming the hoop of straw-board paper, which, being moistened, shrinks closely upon the bottom, and holds it fast.

Claim.—As an improved article of manufacture, a grape box composed of an inflexible or wooden bottom B, having a bevelled edge cut under from the face, or inside of the bottom, for the purposes set forth, and being arranged and combined with the straw-board hoop or side A, in the manner shown and described.

No. 48,193.—HERVY MANGER, Philadelphia, Penn.—*Photographic Camera Stand.*—June 13, 1865.—This invention consists of a spiral arrangement of adjusting cross-bars to give a proper inclination to the camera; and when adjusted to become a fixture on the floor on the raising of the casters by means of a cam bar.

Claim.—In combination with the rigid and main supporting frame of a camera stand the hinged beams C C H, endless screw shafts G, and table C, substantially as and for the purposes specified.

Also, in combination with the main supporting frame of a camera stand the hinged beams B C H, endless screw shafts G, L, and table E, substantially as and for the purposes specified.

Also, in combination with the adjustable camera stand herein described the adjustable spring-supporting rods P, whether the same are used with or without caster rolls, substantially as and for the purposes specified.

No. 48,194.—GEORGE MAYLAND, Brooklyn, N. Y.—*Fruit Knife and Nut Pick.*—June 13, 1865.—This invention consists in constructing the spring so as to admit of shutting the knife blade into the handle upon one side, and the nut pick upon the other; a fruit knife blade and nut pick requiring to be so much thicker than the blades of an ordinary knife that they will not shut past each other so readily.

Claim.—As an improved article of manufacture, a combined fruit knife and nut pick, composed of a fruit blade C, and nut pick D, placed in one and the same handle A, at opposite ends thereof, and arranged relatively with a spring B, of such form as to act upon both the blade and back, and admit of the same opening and closing at opposite edges of the handle, substantially as described.

No. 48,195.—CHARLES E. MILLER, Cincinnati, Ohio.—*Broom Head.*—June 13, 1865.—This invention consists of an arrangement of open-work metallic clamps, joined by a detachable hinge at that part most remote from the handle.

Claim.—First, connecting the jaws of a metallic broom head by a detachable or caper hinge or articulation, at the point of the head, or that pulp of the same further from the handle.

Second, in combination with the above the sockets C C, and pintles c c, when formed upon the ends of arms projecting downward from the lower bars D D', as and for the purposes specified.

No. 48,196.—CHAS. T. MILLER, Providence, R. I.—*Ash Sifter.*—June 13, 1865.—This invention consists of a close wooden box, in the upper part of which near the end is a hopper, with a hinged cover, beneath which is suspended a vibrating sieve, moved by a lever on the outside, and inclined towards the end furthest from the hopper; which end of the box is made to open like a door, and has on its inside a shelf so constructed as to deflect the cinders falling from the sieve, and keep them from piling up around the door; there is an inclined plane beneath the sieve which directs the sifted ashes towards a door in the lower part of the box, in the same end as the hopper; the door is closed by a slide.

Claim.—The combination and arrangement in a coal and ash sifter of the hopper B, vibrating sieve G, deflecting board g, inclined ash board c, arranged reversely to the sieve g, and doors D E and F, substantially as and for the purposes described.

No. 48,197.—JACOB MORRIS, Auburn, Mo.—*Hand Corn Planter.*—June 13, 1865.—This invention consists in placing a wooden pin across underneath the seed-dropping device, for the purpose of scattering the seed.

Claim.—The employment or use of the rod or bar H, when used in connection with the two side plates A A', pivoted together and provided with plates I I, and also provided respectively with the hopper E, and the slide F, substantially as and for the purpose herein set forth.

No. 48,198.—JAMES H. M. MORRIS, Reading, Ill.—*Liniment.*—June 13, 1865.—This invention consists of a composition of spirits of turpentine, Seneca oil, sweet oil, tincture of arnica, oil of hemlock, juniper, amber, and laudanum, spirits of ammonia, and gum camphor.

Claim.—The liniment composed of the ingredients compounded in the manner and in the proportions herein described.

No. 48,199.—FRANCIS S. MUNROE, Jr., Grantville, Mass., and THOMAS MASON, Boston, Mass.—*Machine for Printing Paper Hangings.*—June 13, 1865.—This machine consists of a cylinder of elastic surface, having the design to be printed configured upon it. A certain

number of color rolls arranged upon an endless band are made to pass over the surface of this cylinder, upon which they lay the colors evenly. On the opposite side of the cylinder is an elastic pressure roller, between which and the cylinder passes the paper and thus receives the impressions.

Claim.—The endless series of ink rolls *k*, and the tablet *r*, when combined and arranged to operate together, and in connection with the inking apparatus and the elastic printing cylinder *c*, substantially as set forth.

No. 48,200.—AARON B. NOTT, Fairhaven, Mass.—*Detachable Oven*.—June 13, 1865.—In this invention the oven is provided with ledges on its interior surface to support shelves, and is so surrounded by an arrangement of horizontal and vertical partitions as to have on its four sides double-flue spaces through which, by closing the dampers at the top and bottom, the draught passes entirely around the oven. When the dampers are open the draught flows through the exterior flue; vessels for cooking may be placed in the apertures in the top.

Claim.—The combination and arrangement of the oven *O*, the two flues *A G*, the induction and eduction pipes *F F'*, the opening *e*, and the dampers *D d d*, the whole being substantially as specified.

Also, in connection with the oven and its flues, arranged as described, the four ledges *a a a a*, arranged and applied to the four sides of the interior of the oven.

Also, in connection with the oven and its flues arranged as described, the boiler openings *f f f f*, applied to one end and one side of the outer flue case, for the purpose specified.

No. 48,201.—B. F. PARKINSON, Washington, Penn.—*Magazine Fire-arm*.—June 13, 1865.—In this invention, the magazine consists of a looped tube made removable, and is placed within the side of the stock, the cartridges being fed forward by a follower connected to a cord passing over a pulley, and moved upon a spring barrel. A revolving cylinder carries the cartridge into line with the barrel, and a spring pin is so arranged as to throw the revolving dog or pawl of the hammer out of engagement when desired.

Claim.—First, the lowered, removable magazine *B*, constructed and operated substantially as described for the purpose set forth.

Second, the spring pin *a* for releasing the pawl, enabling the arm to be cocked without rotating the cylinder, or rotating the cylinder without the intervention of the hammer or trigger.

No. 48,202.—J. PEABODY, Dixmont Centre, Me.—*Pump*.—June 13, 1865.—In this invention, a vertical pump cylinder has a lateral chamber extending its whole length, and opening upon and into the pump stock. Near the bottom a valve opens into this chamber as the piston descends; as the piston descends, it lifts the top from the barrel and permits the flow into the upper part of the side chamber, and thence upward. The supply is through two ports, with valves opposite the side chamber, the upper ones opening as the piston descends, and the lower ones as it ascends.

Claim.—The arrangement of the valve *o*, the valve chamber *D*, and its discharge passage *b*, with the piston *B*, and its rod *C*, and the pump barrel, its other valves and valve passages, and the eduction passage *L*, the whole being substantially as specified.

No. 48,203.—HENRY PETRIE, Chicago, Ill.—*Hydrometer*.—June 13, 1865.—This invention will be readily understood by reference to the claim and engraving.

Claim.—First, the adjustable bottom 3 and 4, when used for the purposes specified.

Second, a hydrometer with the table *B* attached to the case thereof, substantially as set forth.

No. 48,204.—LOUIS PLANER, New York, N. Y.—*Feed-wheels for Sewing Machines*.—June 13, 1865.—With the feed-wheel of a sewing machine is combined a mechanism for causing the wheel to progress regularly, and for readily adjusting the stitches. This is effected by means of a dog, lever, and arm, provided with an adjusting mechanism.

Claim.—The combination of the shaft *f2*, with its arm *13*, journal piece *7*, arms *6* and *14*, screw *9*, link *5*, arranged and operating together to lift and adjust the presser foot of a sewing machine, substantially as described and for the purposes set forth.

No. 48,205.—LOUIS PLANER, New York, N. Y.—*Feed-wheel for Sewing Machines*.—June 13, 1865.—This invention consists of a link which, without any other fastening, holds together the dog and the feed-lever; by shifting either end of this lever from one to the other of the notches, the firmness of the bite upon the wheel can be varied; and by means of a screw and spring the dog may be adjusted to compensate for any wear. A slide and scale admit of graduating the length of stitch to any measurement desired.

Claim.—First, the combination with the feed-wheel of the slotted link *P*, arranged to grasp the feed-lever and dog, and to hold the dog in proper position upon the flange of the wheel without other fastening, substantially as described and specified.

Second, in combination with a feed-wheel *L*, lever *M*, with its arm *N*, slotted link *P*, and dog *o*, making the apparatus adjustable, substantially as described and specified.

Third, in combination with a feeding mechanism, constructed substantially as described,

the rule or scale upon the arm G of the rocket shaft, whereby the machine can be readily set to sew any desired number of stitches to the inch, substantially as described and specified.

No. 48,206.—LOUIS PLANER, New York, N. Y.—*Feed-wheel for Sewing Machines*.—June 13, 1865.—In this invention the dog is retained in place by the flanges on the wheel and an ear of the feed-lever; this lever is operated upon at its longer arm by a rocking cam, its shorter arm bearing upon, and so actuating the dog. A sliding spring socket on the lever is adjustable by nuts and screws, to vary the extent of motion received from the cam.

Claim.—In combination with feed-wheels of a sewing machine, the dog *c*, lever *a*, and arm *b*, provided with an adjustable mechanism for regulating the feed, substantially as described and specified.

No. 48,207.—JOHN RADDIN, Lynn, Mass.—*Carriage Wheel*.—June 13, 1865.—This invention consists in rendering a wheel elastic, by applying to the end of the spokes a spring or packing of rubber, or other elastic substance, enclosed in a suitable box or socket.

Claim.—First, thimble O in combination with the screw N and elastic packing M, applied to the spokes and fellow of a carriage wheel, substantially as and for the purpose specified.

Second, the metallic thimble P applied to the fellow end of a wooden spoke, in combination with the screw J, packing M, thimble O, and fixed screw N, substantially as shown in figure 3, and for the purpose described.

Third, the fixed screw J in a wooden hub, operating in combination with an internal screw cut in the end of a spoke, substantially as and for the purpose described.

Fourth, the socket W, provided with a clasp entirely surrounding the fellow, when used in combination with a spoke rendered adjustable by means of a screw, and the elastic packing M, substantially as and for the purpose described.

Sixth, the combination of a hollow metallic spoke with a thimble O, screw N, and elastic packing M, substantially as and for the purpose described.

No. 48,208.—GEORGE E. RANDALL, Yaphank, N. Y.—*Holding and Filling Bags*.—June 13, 1865; antedated June 6, 1865.—The object of this invention is to simplify the operation of holding and filling bags with grain, and consists of a device with which one person can perform the usual work of two. The invention will be understood by reference to the claim and engraving.

Claim.—First, the combination of the two shafts C C', fitted with pointed pins *c c*, and furnished with arms *j* and *c''*, the notched lever D, and spring *i*, substantially as herein described, for the purpose of holding and extending open the mouth of the bag.

Second, the lever F, bar E, platform G, and measure H, in combination with each other, and with the devices for holding and extending open the mouth of the bag, substantially as herein set forth.

No. 48,209.—H. D. RICHARDSON, Florence, Mass.—*Lock*.—June 13, 1865.—In this invention the case of the lock is cylindrical, as is also the catch, and they are intended to be fitted into a bored hole. The bolt is composed of two springs lying parallel with each other in a horizontal plane, and having upon their outside edges inclined planes, and upon the ends, hooks to grasp the catch when locked. A slotted slide works over these springs, having lugs corresponding to said inclined planes; one side of the slot in this slide has a rack into which a pinion works, which is formed on the end of the key. The slide when moved back or forward releases the bolt from the catch, and also moves it in either direction.

Claim.—A lock, when constructed and arranged substantially in the manner described.

No. 48,210.—JOHN L. RIPLEY, Fremouth, Ohio.—*Extension Ladder*.—June 13, 1865.—This invention consists in a combination of a series of ladders arranged in such a manner that they may be adjusted together and extended with the greatest facility, so as to form a long ladder, to be used against buildings, &c., and be also capable of being adjusted together so as to form an extensive step ladder, when the latter is required.

Claim.—The combination of the rollers *d* and *g*, plates *e* and *c*, hooks *f*, eyes *i*, pin *h*, with the ladders A B and C, when constructed and arranged as and for the purposes specified, constituting a combined step and extension ladder.

No. 48,211.—HERMAN SALOSHINSKY, New York, N. Y.—*Spring Balance*.—June 13, 1865.—The platform upon which the articles to be weighed are placed, is supported on the upper end of a vertical rod which passes down through the top of a box, and ends in a cross-bar passing horizontally from side to side of the box, but not attached to the sides of the box. This cross-bar is connected to the top of the box by means of spiral springs, so that whatever is placed upon the platform is really supported by these spiral springs. On one side of the vertical rod connecting the platform with the cross-bar is a rack in which works a small pinion. To this pinion is attached an index finger, which registers upon a dial the movements of the vertical rod caused by the weight of the article upon the platform.

Claim.—The combination of platform rod D, cross-bar B, springs S and S, rack *m*, pinion *n*, and dial handle *p*, when arranged and operating together in the manner and for the purpose substantially as set forth and described.

No. 48,212.—GELSTON SANFORD, New York, N. Y.—*Horse-power*.—June 13, 1865.—The frame and bearings of this horse-power, are so constructed that the bearings and position of the horizontal shaft may be changed so as to communicate power to machinery occupying different relative positions, without making any change in the position of the base of the horse-power itself. The bearing of the horizontal shaft is so arranged that it can be secured either on or under the floor of the room overhead, and thus form a bearing for the upright shaft.

Claim.—First, the construction, combination, and arrangement of the quadruple bearing *a*, and bearings *a' a2 a3*, substantially in the manner and for the purposes herein set forth and described.

Second, the centre-piece B, constructed substantially as herein described.

Third, the plate A provided with bearings *g* and *f f*, in combination with changeable wheels L and M, in the manner and for the purposes specified.

Fourth, the hanging shaft O, and universal joint P, in combination with the driving shaft of a horse-power, operating substantially as described.

No. 48,213.—ELLIOT SAVAGE and HENRY STRATTON, West Meriden, Conn.—*Hardening and Tempering Steel*.—June 13, 1865.—This invention consists in tempering steel by plunging it, after heating to a proper temperature, into a solution of gold, silver, or copper. For fine articles a silver solution is preferred, and is prepared as follows: the chloride of silver is dissolved in a solution of cyanide of potassium, or in aqua-ammonia, until it has a strength of ten degrees Baumé. A solution of copper is prepared by dissolving chloride of copper in water until a proper specific gravity is obtained.

Claim.—The use or employment in hardening steel or metallic solutions, in the manner and for the purpose substantially as set forth.

No. 48,214.—JOHN SCHMADEL, Newark, N. J., and JOHN A. LIEB, Essex, N. J.—*Roller for Trunk*.—June 13, 1865.—This invention consists in mounting the roller on a flexible plate with lugs, which can be spread or sprung open to admit the roller, if it is desirable, in such a manner that the roller can be either used as a plain bottom roller, or can be applied to the corner by securing one end of the plate to the bottom and turning its other end up over the edge, and securing it to the side of the trunk, as may be desirable.

Claim.—The combination of the flexible plate A with punched ears *a a* and the roller B, with solid journals *b b*, the whole being constructed and employed in the manner and for the purposes herein specified.

No. 48,215.—DENNING W. SEXTON, East Hampton, Conn.—*Casting Coffin Handles*.—June 13, 1865.—This invention consists in an A-shaped or triangular hollow mould or drag made of metal, and capable of being filled with water to prevent heating while being used. On each inclined side of this one-half of a mould is formed, the corresponding half being formed in its respective cope, hinged to the back of the mould, and the gate to both being formed at the apex by an aperture between the mould and the copes.

Claim.—The within described device, consisting of the triangular mould or drag 3 3, with the respective hinged copes, constructed substantially as and for the purpose herein described.

No. 48,216.—THOMAS SHAW, Philadelphia, Penn.—*Grinding Faucets and Valves*.—June 13, 1865.—This device consists of a vertical driving shaft, supported in a suitable frame, and carrying near its upper end two half wheels, one above the other, on opposite sides of the shafts, and the contiguous faces revolving in planes separated the distance apart of the small pinions or friction pulleys, being four in number, the shafts of which are at right angles to the main one and to each other, and in a horizontal plane midway between the planes of the two half wheels. On the outer ends of these shafts are the chucks, to which are attached the articles to be ground. The friction of the half wheels, in motion, when in contact with the friction pulleys, causes them to turn in a corresponding direction with said half wheels, and as one is below and the other above said pulleys, the motion of the latter will be alternately in opposite directions as they come in contact with one or the other of said half wheels.

Claim.—The employment of a series of mandrels rotating alternately in opposite directions, when constructed, arranged, and operated substantially as and for the purpose set forth.

No. 48,217.—WALTER SHRIVER, New York, N. Y.—*Copying Press*.—June 13, 1865.—In this invention the screw is connected to the platen by forming an annular groove around the screw step arbor, and after coating it with a paste made of plumbago, clay, or other proper material, and drying it, it is inserted into the sand mould, and the socket and platen cast around it in one solid piece, the said coating of plumbago forming a parting between the screw and the socket.

Claim.—The method above described for forming the connection between the screw and the platen, by casting the two together, as described, for the purpose set forth.

No. 48,218.—JOHN N. SNOWDON and HENRY WILKINS, Brownsville, Penn.—*Ejector for Steam Boiler Furnaces*.—June 13, 1865.—This invention has for its object to promote com-

bustion in furnaces of steam boilers and other furnaces, and it consists in an apparatus so constructed as to inject oil or water and air, by means of and along with a current of steam, into a furnace, and thereby promote the more perfect combustion of the gases and products of the fuel.

Claim.—The combination of the nozzle A, the nozzle B', and the nozzle C', placed concentrically one within the other, the nozzles B' C' being connected respectively with a steam boiler, and with an oil or other reservoir, substantially as above described.

No. 48,219.—H. M. STOKER, Watson, Ill.—*Submerged Pump.*—June 13, 1865.—In this invention a hollow piston rod carries a hollow piston, having a loose annular valve within it to alternately close the ports in the upper and lower disks, the periphery of the piston being flexible. The pump cylinder has valves at the top and bottom, and, being submerged, is lifted up and down by a pitman, while the piston and rod are stationary.

Claim.—First, in double-acting submerged pumps, the combination of the movable cylinder C, having inlet valves in both its heads D D', with the hollow piston rod and hollow piston, the inlet passages of said cylinder being governed by the same annular valve, substantially as described.

Second, making the hollow piston H with solid heads, perforated as shown, and with elastic sides, substantially as above described.

No. 48,220.—H. M. STOKER, Watson, Ill.—*Submerged Pump.*—June 13, 1865.—In this invention two pumping cylinders and a central discharge cylinder are formed together of potters' ware, having a valve-chest of metal united to them at the bottom, the tops of the pumping cylinders being open. The two pistons may be operated in any desired manner.

Claim.—In double-acting submerged pumps, with uncovered piston chambers, making the body or shell of the cylinder of potters' ware, moulded in one piece, combined with a valve chamber B of metal, constructed and arranged substantially as described.

No. 48,221.—JAMES GAMAGE TARR and AUGUSTUS HENRY WENSON, Gloucester, Mass.—*Paint for Ships' Bottoms.*—June 13, 1865.—This invention consists of a composition made by reducing an alloy of zinc, tin, iron, and quicksilver to powder, and adding to the mass twenty per cent. of white arsenic. This is mixed with a composition of forty gallons of wood tar, thirty gallons of coal naphtha, and three-fourths of a pound of oxide of iron.

Claim.—The composition, or a paint, in which metallic zinc forms the basis, and is alloyed or in contact with metals which dissolve less readily in sea water, substantially as set forth herein.

No. 48,222.—DANIEL K. ALBRIGHT, Philadelphia, Penn., and LEO H. DE LANGE, Burlington, N. J.—*Hat.*—June 13, 1865.—This invention consists in enlarging the body of the hat near the brim, so that an annular space may be formed within the enlargement for the purpose of ventilation.

Claim.—Enlarging a hat near the brim, so that an annular space may be formed within the enlargement, in the manner and for the purpose specified.

No. 48,223.—HOWARD TILDEN, Boston, Mass.—*Flour Sifter.*—June 13, 1865.—This invention consists in the use of rollers to roll against the screen, in combination with scrapers, to pass over the screen after the rollers. The flour or other material to be sifted having been placed in the hopper, upon the turning of a crank the flour is dropped upon the screen, and the rollers and scrapers then force it through the screen.

Claim.—As my improvement in sifters for flour, sauce, &c., the rollers, or their equivalents, for mashing the lumps, in combination with the scrapers, substantially as described.

No. 48,224.—PHILIP UMHOLTZ, Tremont, Penn.—*Coal Breaker.*—June 13, 1865.—This invention consists in providing the rollers of coal breakers with an occasional row of large teeth at proper intervals, so that the large lumps of coal, on which the ordinary teeth make no impression, may be broken.

Claim.—Making the toothed roller of the coal breaker with an occasional row of large teeth set at distant intervals, substantially as and for the purpose described.

No. 48,225.—FELIX VOGEL, Newburgh, N. Y.—*Horse Fastener.*—June 13, 1865.—This invention consists in a falling shutter, operated by a lifting and lowering apparatus, and furnished with a means for attaching animals, in the combination of sundry straps for attaching the horse in a vertical position, and of others with a roller, by means of which the animal may be suspended for treatment; finally in an apparatus for shoeing horses.

Claim.—First, the falling shutter, operated by any suitable lifting and lowering apparatus, and furnished with means for attaching animals thereto, substantially as and for the purpose described.

Second, the combination of the surcingle, the fore and aft straps, and the head straps, for attaching the animal securely in a vertical position, irrespective of the devices for prostrating the animal.

Third, the combination of the straps *b b* with the surcingle straps, or their equivalents, and the roller *H*, by means of which combined devices the animal may be suspended for treatment or discipline.

Fourth, the combination of the straps by which the body of the horse is secured, those pertaining to the hobbling of the feet, and the cross-bar and strap to which a foot is secured for shoeing, &c., forming in this connection a device for the compulsory acquiescence of the animal in the operation of shoeing or other treatment in which such position of the foot or limb is desirable.

No. 48,226.—J. D. WHELPLEY and JACOB J. STORER, Boston, Mass.—*Apparatus for Separating Metals from Ores*.—June 13, 1865.—This invention consists of a cylindrical case, within which is a revolving shaft provided with blades. The case is provided with a hopper and an air aperture at the top, and an air outlet and an outlet for the ore through the conductor at the bottom. The conductor communicates with a box, which is provided with an air aperture and door. This box communicates with another box by means of a pipe, the latter box being also provided with an air aperture and a door. A tube leads from this latter box to the centre of a spray wheel which is contained in a box, the bottom of which is covered with water, and the said box is provided with shelves in the upper part.

Claim.—First, the separating of metals from mixtures of earth and metal by the application of gravity in counter action to currents of air in an upright pulverizing mill, the air moving upward to carry off the finer dust of earthy matter, while the metal falls by its superior gravity, substantially as described.

Second, the tangential conductor *E* leading from the periphery of the mill, in combination with the pocket *B*, or its equivalent, substantially as and for the purpose described.

Third, the shorter pipe *l* within the larger and longer pipe *m*, when arranged in reference to the mill *A* and pocket *C*, or their equivalent, substantially as set forth and for the purpose described.

Fourth, the employment of a water tank and a draught and spray wheel, substantially as set forth and for the purpose described.

Fifth, the pipe *F* in combination with the pocket *B*, pipes *l m*, and pocket *C*, substantially as and for the purpose described.

Sixth, the windage post *n* in the pocket *B*, substantially as and for the purpose described.

Seventh, the windage post *n* in the pocket *C*, substantially as and for the purpose described.

Eighth, the air post *r* in combination with the mill *A*, tangential conductor *E*, pocket *B*, and pipe *F*, substantially as and for the purpose described.

Ninth, the valves *k* and *i* at the top and bottom of the mill to change the direction of the currents of air through the same, substantially as described.

Tenth, the shelves or partitions *t* arranged in the exit or chimney *D*, substantially as and for the purpose described.

No. 48,227.—H. H. WOLCOTT, Yonkers, N. Y.—*Cartridge Retractor for Breech-loading Fire-arms*.—June 13, 1865.—In this invention the movable breech-block of the arm, which is pivoted so as to swing downward by the depression of the trigger-guard lever, carries in it a small projecting spring pin which, engaging in a curved flange or rim of a sliding spring retractor, pulls out the same on being opened until the cartridge is entirely withdrawn, when the pin, escaping beyond the range of the rim, allows the retractor to spring back to its place. On closing the breech the spring pin slips over the engaging rim or flange of the retractor so as to be in position for repeating the withdrawal.

Claim.—The combination of the shell drawer *F*, tongue *g*, laterally projecting rim *i*, and pin *h*, all constructed and arranged substantially as and for the purpose set forth.

No. 48,228.—JOHN F. YATES, Mooresville, Ind.—*Wagon Lock*.—June 13, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—The combination of the tongue *K*, the tongue bolt *k*, the stop bolt *x*, the front rod *N*, the lever *M*, king bolt *h*, brace *O*, rear rod *P*, the rod bars *g* and *H*, with their connecting pulleys *a a* and slides *R R*, the hounds *D D*, the drop lock *i*, with the snake iron *h*, all arranged and operating substantially as described and for the purpose set forth.

No. 48,229.—E. M. WRIGHT, Wilmington, Ohio.—*Corn-planter*.—June 13, 1865.—In this machine the seed-slide is worked by hand with a curved grooved lever and cord. The roller is divided into partitions to contain sand for weighting it, and a straight bar is placed in front to guide in making the rows straight.

Claim.—The combination and arrangement of the spiral seed box *D*, reversible seed wheel *G*, conducting tube *h*, and pointed seed scatterer, substantially as and for the purposes herein specified.

Also, the double-curved lever *I* in combination with the connecting cords, or their equivalents, working around the peripheries of the curved arms thereof, substantially as and for the purpose specified.

Also, the guide rod *H*, arranged so as to be properly adjustable to the eyes of the attendant, substantially as and for the purpose herein set forth.

Also, the construction of the graduated roller M, substantially as and for the purpose herein specified.

No. 48,230.—WALTER YOUNG, Lansingburg, N. Y.—*Mode of Lubricating Car Wheels*.—June 13, 1865.—This invention consists in having the journal box, which is fitted centrally in a car wheel, encompassed by chambers or recesses, in which cotton waste or other proper absorbent material, saturated with oil or other lubricating substance, is placed in contact with the journal by means of slots or openings in the box; also, in an oil receptacle applied to the wheel, and arranged in such a manner as to keep the cotton waste properly lubricated, while at the same time dust is excluded from the oil receptacle and journal.

Claim.—The employment or use, in connection with a box D of a car wheel, of a series of holes or openings *b* in the hub C encompassing the box D, and the latter provided with slots or openings C, the holes or openings *b* being filled with cotton waste saturated with oil or other proper lubricating material, and all arranged substantially as and for the purpose herein set forth.

Also, in connection with the parts aforesaid, the oil receptacle I, applied to the outer end of the hub, substantially as and for the purpose herein specified.

No. 48,231.—D. M. YOUNGMAN, Fremont, Ohio.—*Drum Stove*.—June 13, 1865.—This invention consists of two cylindrical heating chambers joined together by several vertical tubes arranged in a circle. From the centre of the top of the lower chamber rises an elbow-shaped induction tube. The top of the upper chamber is made dome-shaped, from the apex of which rises the eduction pipe.

Claim.—The drum stove herein set forth as a new article of manufacture.

No. 48,232.—FREDERICK C. BOLENDER, Lima, Ohio, assignor to himself and WM. F. DOGGETT, Indianapolis, Ind.—*Broom Head*.—June 13, 1865.—This invention consists of a head or clamp for securing the broom corn, in which a screw with a nut and arms are arranged as a binder. A piece of sheet-metal of a funnel-form covers the broom, and is also secured to the handle by the screw.

Claim.—The arrangement of the screw stem A B C, binder E F G, sheath H I, and ferule J, or their equivalents, to form a metallic broom head, substantially as set forth.

No. 48,233.—S. K. AYRES, assignor to himself and B. A. WILDER, Delton, Wis.—*Grain Separator*.—June 13, 1865.—This invention consists in a combination of devices for giving motion to the shoe, the peculiarities of which are explained by the claim.

Claim.—First, the combination of the oval cam D, spring F, rod E, shaft H, arms I I', and rods J L, for the purpose of operating the screens or giving a shake motion to the same, as set forth.

Second, the hanging or suspending of the shoe N on the adjustable bar A by means of a hook arm P and vibrating or reciprocating bar K, as set forth.

No. 48,234.—A. G. DEXTER, San Francisco, Cal., assignor to himself and THOS. MACKELL, Palmyra, N. Y.—*Door-bell or Gong*.—June 13, 1865.—This invention consists of a bell of a gong-form placed on the inside of a door, and operated by a lever passing through to the outside of the door, and sounded by means of levers, springs, and a hammer.

Claim.—A gong for a door, the hammer of which is operated through the medium of a plate or handle at the outer side of the door, so arranged or connected with levers and the hammer shaft that the latter will be actuated and the gong sounded by pressing said plate or handle in a direction toward the door, substantially as herein set forth.

Also, the arrangement of the hammer shaft J, bent lever F, with yielding plate M attached, lever B, and plate or handle D, or its equivalent, with the springs H L, and gong I, substantially as and for the purpose set forth.

No. 48,235.—CYPRIEN FAURE, assignor to himself and HENRY J. YATES, New York, N. Y.—*Machine for Brushing Hats*.—June 13, 1865.—In this invention, upon an oblong table are two rows of circular blocks on which the hat bodies are to be brushed, a metal band around each block being adapted to rise and retain water when desired. A rod passing from end to end above the table has a horizontal reciprocating movement, which is varied laterally by a central descending pin, traversing an eccentric slot in the centre of the table. This rod has transverse arms, from the extremities of which descend brushes which traverse the several circular blocks described. A flexible tube descends from a tank through the body of each brush.

Claim.—First, the brushes F and reciprocating rod C, constructed and arranged substantially as herein described.

Second, the combination of a guide groove G and pin X, or their equivalents, with the reciprocating rod C and brushes F, substantially as and for the purpose set forth.

Third, the application of the joint F in combination with the rod C, brushes F, and blocks Z, substantially as and for the purpose described.

Fourth, the adjustable rings D in combination with the felting block Z, constructed and operating substantially as and for the purpose specified.

No. 48,236.—CHARLES B. HATFIELD, assignor to EUGENE H. RICHARDS, Boston, Mass.—*Buckle*.—June 13, 1865.—This invention consists in forming the device in two separate parts, one of which is attached to the strap; it being a square frame, with lips on its under side, which enables it to slide along on the strap, and secures it to the tongue; this tongue constitutes the other part, which is attached to the article itself, and has a flange on its side, gradually increasing in depth towards its end, over which the lips of the other part slide, and secure the two parts of the article together.

Claim.—A buckle for fastening shoes and other articles, constructed and applied substantially in the manner herein shown and described.

No. 48,237.—JOSEPH LOFVENDAHL, assignor to himself and JOHN BLOOMGRIST, Boston, Mass.—*Nutmeg Grater*.—June 13, 1865.—This invention consists in arranging a box with a hopper, having expanded sides adjusted by springs. Under the hopper is a revolving grater. The material to be grated is pressed into and through the hopper by a plunger, having a spiral spring around its stem for throwing it upward after it has been depressed.

Claim.—First, the hopper *a a*, in combination with the springs *C* or their equivalents, constructed substantially as herein shown and described.

Second, the plunger *b* in combination with the cover *D* and hopper *a a*, arranged substantially in the manner and for the purposes herein specified.

No. 48,238.—GORDON MCKAY, Boston Mass., assignor to JAMES PURINTON, Jr., Lynn, Mass.—*Channelled Sole*.—June 13, 1865.—This invention consists in making one or more channels in the sole of a boot or shoe by indentations, and a slight displacement of the material, the same being produced by a form or forms; the reverse or counterpart of the channel being forced into the sole by a blow or heavy pressure.

Claim.—A channel sole, in which the channel is formed by displacement of the material by pressure, substantially as set forth.

No. 48,239.—GEORGE W. RAY, assignor to RAY & TAYLOR, Springfield, Mass.—*Water-proof Collar and Cuff*.—June 13, 1865.—In this invention an ounce of gun cotton is dissolved in a mixture of one-half pound of sulphuric ether and one-half pound of alcohol. The solution is then poured on a glass plate and allowed to dry; a solution of gelatine in water is then poured over the plate, and the paper, thoroughly moistened, is then laid on the plate, and when dry it is removed. The paper retains the film of enamel, and is then ready to be manufactured into collars.

Claim.—A paper collar or cuff when enamelled with the composition and by the process herein described.

No. 48,240.—THOMAS SCOTT, assignor to THOMAS SCOTT, Sr., Carrollton, Ill.—*Stove*.—June 13, 1865.—In this invention the outside casing is of sheet metal, the lower part being lined with a plate of stout sheet metal, from the upper edge of which hangs a sufficient number of stirrups to hold a cast-iron lining for the sides and end of the stove.

Claim.—First, protecting the interior of sheet-iron or other thin stoves, with removable cast-iron linings, constructed and applied within the stove substantially as described.

Second, the arch *B* in combination with the lining *C*, substantially as above described.

No. 48,241.—DWIGHT L. SMITH, assignor to the WATERBURY BUCKLE COMPANY, Waterbury, Conn.—*Buckle*.—June 13, 1865.—This invention consists in making the buckle of two pieces of sheet metal, cut or swaged into shape; one piece forming the frame, leaving two internal projections for the hinges, and two others for rests, and the other forming the tongue and hook.

Claim.—As a new article of manufacture the combination of the hinges *h h*, with the ears or rests *c c*, on which the broad end *d* of the lever is supported, when the whole is constructed, arranged, and fitted for use substantially as herein described and set forth.

No. 48,242.—ANDREW TURNBULL, assignor to P. and F. CORBIN, New Britain, Conn.—*Door-bell*.—June 13, 1865.—This invention consists of devices so operated by a lever and springs that the hammer will strike the bell, when the outward and inward movement of the handle actuates the lever.

Claim.—The combination with hammer lever *m* of a device which in being moved by the outward and inward movement of the knob or handle shall actuate the lever *m* and its hammer, and thus cause the bell to be rung during each of said movements of the knob or handle, as herein described and represented.

No. 48,243.—WILLIAM BAKER, Sheffield, England.—*Manufacture of White Lead*.—June 13, 1865.—This invention consists in the use of salts of acetic acid, from which acetic acid may be liberated by means of sulphuric or hydrochloric acid, or the acid sulphates of the alkalies, instead of the acetic acid used in the ordinary process. The acetates which are preferred for this purpose are the acetates of lime, soda, and the soluble acetates of the alkalies and alkaline earths.

Claim.—The substitution for acetic acid, as now used in the Dutch method for the manufacture of white lead, of salts of acetic acid from which the acetic acid may be produced or liberated by the employment of either sulphuric acid or hydrochloric acid, or mixtures thereof, or by the employment of the acid sulphates of the alkalies.

No. 48,244.—FREDERICK E. HOFFMAN, Berlin, Prussia.—*Circular Brick-kiln.*—June 13, 1865.—This invention consists in the employment of a continuous arch divided into a number of sections, each provided with an opening to fill and empty it, and with apertures for introducing the fuel, in combination with a movable partition, with radiating flues and a smoke-stack; further, in the continuous smoke chamber, in combination with the flues, dampers, smoke stack, and sectional arch.

Claim.—The employment or use of a continuous arch, divided into a number of sections, each provided with an opening to fill and empty it, and with apertures for introducing the fuel, in combination with a movable partition, with radiating flues and smoke-stack, constructed and operating substantially as and for the purpose specified.

Also, the continuous smoke chamber, in combination with the flues, dampers, smoke-stack and sectional arch, constructed and operating substantially as and for the purpose specified.

No. 48,245.—GIDEON HUNTINGTON, Norwichville, Canada West.—*Machine for Upsetting Wagon Tires.*—June 13, 1865; antedated June 7, 1865.—This invention consists of a platform upon which are two heads, one being permanent, the other movable. These heads are each provided with two loops or bevelled mortises on each side, sufficiently far apart to allow the tire to be laid between them. Into these are fitted keys, the upper edges of which being rounded, turn in the upper part of the loop, while the lower edges, in contact with the tire, and standing inward, have the full width of the loop at the bottom in which to play as cams, when the two heads are forced together.

Claim.—First, the self-acting keys or wedges acting in the loops, or bevelled mortises, as above described.

Second, the combination of the keys and mortises with the various parts of this machine, and for the purposes herein set forth.

No. 48,246.—ANTOINE PERRIN, Paris, France.—*Knapsack.*—June 13, 1865.—This invention consists of a new article of dress, which may be used in combination with a bag. It is intended to be worn as a protection against the weather, and to sleep or sit upon. The absence of sleeves gives a perfect freedom to the arms, and admits of the dress being readily put on and taken off.

Claim.—First, the peculiar combination of a garment and bag, in the manner and for the purposes hereinbefore described.

Second, the peculiar construction of garment, combined or not with a sack or bag, as and for the purposes hereinbefore described.

No. 48,247.—JOHANN ZEH, Vienna, Austria.—*Grate for Steam Boiler Furnace.*—June 13, 1865.—This invention consists in the combination with transverse bars of supporting and connecting rods, with operating devices, consisting of cranks, &c., by means of which an oscillating movement is communicated to the bars, independently of the supporting rods, or in a modified form the whole grate may be oscillated bodily. The supply of coal from the hopper over the mouth of the furnace is regulated by a slide.

Claim.—First, the combination with the transverse grate bars *r*, of the rods *m* and *o*, and their operating devices, for the purpose of imparting to the grate bars an oscillating movement independent of their supporting rods.

Second, the combination of the coal hopper *a*, inclined furnace grate *b*, cinder conduit *c*, and ash-pit, constructed and operated as herein described.

Third, the combination with the transverse grate bars *r*, of the rods *m* and their operating devices, for the purpose of imparting to the entire grate, bodily, a backward and forward motion, as herein specified.

No. 48,248.—JOHN J. SIBLEY, New York, N. Y., assignor to BRUEN MANUFACTURING COMPANY, New York, N. Y.—*Sewing Machine.*—June 13, 1865.—This invention will be readily understood by reference to the claim and engraving.

Claim.—First, the attachment described, adjustable to a Wheeler & Wilson sewing machine, to make a stitch of three or more threads, substantially in the manner set forth.

Second, the combination of the attachment described, with the needle, rotating hook, bobbin, and other operative parts of a Wheeler & Wilson sewing machine, except the ring slide.

Third, the ring slide *j*, constructed and operating substantially as described.

Fourth, the combination of the needle *l*, bobbin *k*, thread carrier *d*, and ring slide *j*, constructed and operating together, substantially as described.

Fifth, the step *y*, constructed and operating substantially as set forth.

No. 48,249.—ETHAN ALLEN, Worcester, Mass.—*Constructing Gun-barrels.*—June 20, 1865.—This invention consists in splitting the rod which has been rolled out to form the barrel, and so arranging it that what was inside of the rod shall become the outside of the barrel, which gives more distinct and better defined figures upon the barrel.

Claim.—Splitting a twisted rod through the centre, and bringing what was the inside of the rod on the outside of the barrel, substantially as specified and for the purpose set forth.

No. 48,250.—T. F. ALLYN, Canandaigua, N. Y.—*Car Spring*.—June 20, 1865; antedated March 28, 1865.—This invention consists in the construction of a metallic car spring, with square or rectangular plates curved diagonally and fastened together at the corners, thus forming alternate pairs, which bear upon each other at the corners and diagonally through the centres, and by means of these transverse bearings or fulcra, the spring is made to vibrate and graduate to the required pressures upon it, and by the same means the fulcra or bearing points of the plates are changed alternately by being lengthened and shortened when the spring vibrates, and it is thus, to a great extent, protected against breaking.

Claim.—The construction of a metallic car spring with square or rectangular plates B, curved diagonally, and fastened together alternately at the corners with the rivets *d*, substantially as described in my specification, and for the purpose set forth.

No. 48,251.—JOHN J. AUSTIN, New York, N. Y.—*Artificial Leg*.—June 20, 1865.—The nature of this invention will be fully understood by reference to the claim and engraving.

Claim.—First, sinking the edge of the thigh socket to fit to the os-innominatum, substantially as and for the purpose set forth.

Second, the double stops of the knee joint, produced by the stud *c*, the edges *e f* of the slot *e'*, and the end *g h* of the thigh B, and leg C, substantially as and for the purpose described.

Third, the combination of the elastic segment *k* and spring *i* with the stud *c* and with the knee joint, substantially as and for the purpose specified.

Fourth, the two stops *n o* and abutment *p*, in combination with the spring *g* in the ankle joint, constructed and operated substantially as and for the purpose set forth.

No. 48,252.—ROBERT BAILEY, Cleveland, Ohio.—*Coal Stove*.—June 20, 1865.—The fuel is consumed in the rear part of the fire box, so that as the smoke and gases ascend from the front part of the mass of fuel, and come in contact with the heated air arising from the combustion of the rear part, and are, therefore, more perfectly consumed. That part not consumed, together with the heated air, is made to pass down a flue in the rear part of the stove around the pipes which admit outside air to the fire box thus heating it, and into a chamber at the base of the stove, whence it is conducted by two pipes, one on each side the stove, to a chamber in the top. Heat is thus radiated from a considerable amount of surface.

Claim.—First, so constructing the fire box that the fuel is consumed just in the rear of the same, when said chamber is arranged in relation to the ash-pit F', air chamber F, and damper L' and H', substantially as set forth.

Second, arranging the fire box E, in front of the stove, in combination with the hot-air chamber F, the draught pipe J, and diving flue *a*, as and for the purpose set forth.

No. 48,253.—JOHN BAUMEISTER, Detroit, Mich.—*Stove-pipe Water Heater*.—June 20, 1865.—This invention consists of a sheet metal water boiler, with movable lids, and a faucet for drawing off the water. A stove-pipe drum is made to embrace the boiler and support it in place, and impart heat by which the water is boiled.

Claim.—A stove-pipe water heater, above set forth, constructed substantially as and for the purpose above described.

No. 48,254.—HENRY W. BLEYER, Buffalo, N. Y.—*Regulator for the Wicks of Lanterns*.—June 20, 1865.—This invention consists in a rod, with an oblong slot fitted loosely on a pin with longitudinal play, in combination with a toothed wheel and shaft, so arranged in the bottom of the lantern lamp as conveniently to regulate the wick.

Claim.—The rod E, provided with an oblong slot *c*, and fitted on a pin *a*, or arranged in any suitable way so as to have a requisite degree of longitudinal play or adjustment, in combination with the toothed wheel D on shaft C, all arranged substantially as and for the purpose specified.

No. 48,255.—ERNST BREDT, New York, N. Y.—*Means for Manufacturing Baskets*.—June 20, 1865.—This invention consists in forming baskets by pressure between heated dies, from material that has been previously woven or interlaced in a flat form, thereby giving the basket form and shape very expeditiously.

Claim.—A basket formed by pressure between heated dies, of a sheet of material suitably prepared with sizing, stiffening, or moisture, substantially as specified.

No. 48,256.—CHARLES S. BROWN, New York, N. Y.—*Apparatus for Testing Milk*.—June 20, 1865.—This invention consists of a standard resting on a base, and having a top with apertures to hold the test tubes, which rest in basins in the base. The standard is provided with a graduated scale; and a movable scale is arranged to slide in a slot in the top and base.

Claim.—In combination with the test tubes, a permanent or movable scale to measure and compare the depth of cream or other matter in each tube with that in the other tubes, substantially as described.

No. 48,257.—CLARENCE E. BROWN, Florence, Mass.—*Calipers*.—June 20, 1867.—This invention consists in making a self-adjusting, self-registering caliper; the points of which project towards each other from the ends of its legs, and the line of their projection is in the arc of a circle drawn from the centre of the calipers, so that the wear of the points does not shorten the calipers. A scale for indicating the measurement is attached to the body of the instrument, and is made movable therein, so as to enable it to be adjusted to a new position as the points of the legs wear away.

Claim.—First, attaching a movable scale to a calipers, substantially as and for the purpose above described.

Second, also constructing a registering calipers, so as to be self-adjusting, by means of its index and a pin upon the movable scale, substantially as above described.

No. 48,258.—ANDREW BUCHANAN, Brooklyn, N. Y.—*Device for Boring and Excavating Coal*.—June 20, 1865; antedated June 15, 1865.—This invention consists in the use of a revolving longitudinally adjustable cutter bar, in combination with a truck to which a feed motion is imparted (by the same power which imparts motion to the cutter bar) in such a manner that, by the action of the cutters, inserted in said cutter bar, a narrow ditch of any required length and of suitable depth can be cut in an embankment of coal, limestone, &c., in a horizontal or inclined direction, and the labor of excavating coal or other material be considerably reduced. The cutters are arranged in sections which are secured to the bar in spiral lines, so that the material to be excavated has a chance to clear itself, and the action of the cutters will not produce an injurious strain on the cutter bar, or other parts of the apparatus.

Claim.—First, the longitudinally-adjustable revolving cutter bar D, in combination with the self-feeding truck A, constructed and operating substantially as set forth.

Second, the use of sectional cutters E, in combination with the revolving cutter bar D, and truck A, constructed and operating substantially as and for the purpose described.

No. 48,259.—S. B. BURRITT, New York, N. Y.—*Lathe Chuck*.—June 20, 1865.—In this chuck are two rings made with central openings to slide upon an extension of the hub, each having three inclined grooves cut in the said central openings; in these inclined openings are arranged three clamps with double inclines to correspond with these grooves, the clamps extending from one ring to the other; these rings have upon their exteriors, one a right and the other a left hand male thread, fit into the ends of a sleeve having corresponding female threads, so that by turning the sleeve one way or the other and drawing the rings to or from each other, causes the double inclined clamps to approach or recede from each other in the axial line of the chuck, so as to hold a drill of a large or small-sized shank.

Claim.—The combination of the radially movable clamps H H, having dovetail tongues of double reversed inclination on their outer edges, the rings F and G having right and left hand male screws upon their exteriors, and inclined grooves in their interiors, and the loose sleeve B, having right and left hand female screw threads in its interior, the whole arranged and applied in relation to each other and to the hub A, or body of the chuck, and operating substantially as herein specified.

No. 48,260.—ELIJAH R. CHAMBERLAIN, Sharonville, Ohio.—*Torpedo Ram*.—June 20, 1865; antedated June 10, 1865.—The principal feature of this invention is the foundation designed for strength and firmness, on which the ram or rod is protruded, in connection with the means by which the torpedo ram is actuated.

Claim.—First, the frame B B¹ B² b, constructed substantially as described, adapted to permit torpedoes to be expelled from the interior of the vessel below the water line, or to hold them at its mouth, and receive and effectually withstand the force which is applied to the torpedo on being driven into an enemy's vessel.

Second, in combination with the above, the piston G G', operated by the chains F F', or other suitable means, and employed to expel the torpedoes through the opening B³, or, in connection with the block H, to retain the torpedo in its operating position when the same is to be driven into an opposing body.

Third, the ropes C, and the hooks C¹, in combination with the pulleys C², and their shifting levers E E, the whole being arranged to operate substantially in the manner and for the purpose specified.

Fourth, in combination with the aforesaid B B' B'', the gate I, operating as herein described to close the opening B''', when said opening is not occupied by a torpedo or the expelling piston.

No. 48,261.—FREDERICK F. CORNELL, Jr., New York, N. Y.—*Baling Press*.—June 20, 1865.—The object of this invention is to provide a means for attaching the levers of a press to the travelling sides and follower in a strong and reliable manner; also to provide a means whereby the beater may be held firmly in position to serve as a head block to the press; also to provide a means for automatically holding the travelling sides, and consequently the follower, at any desired point during the operation of pressing.

Claim.—First, connecting the levers D to the sliding sides E, and follower B, by means

of the staples or eyes *b b*, and fulcrum pin *d*, and rods *e e*, or their equivalents, substantially as herein described.

Second, the pawls *H*, arranged so as to hold the beater in place, to serve as a head block for the press.

Third, the racks *I*, and slides *F*, in combination with the pawls *H*, as and for the purpose specified.

Fourth, the standards *F F*, and cross-beam *G*, in combination with the rod *k*, and pawls *H*, arranged to operate substantially as described.

Fifth, the detent rod *f'*, in combination with the projection *f*, and standards *F F*, substantially as and for the purpose hereinbefore described.

Sixth, the cam *J*, in combination with the travelling side *E*, and post *A*, substantially as and for the purpose herein specified.

No. 43,962.—JACOB B. CROWELL, Greencastle, Penn.—*Wheat Drill*.—June 20, 1865.—In this invention the middle gear wheel of the three that transmit motion from the traction wheel to the hopper is upon a wrist pin, placed at one side of the shaft. The eccentricity of this pin, and the rotation of the shaft, throws the seed apparatus out of gear.

Claim.—First, the use of the above-described eccentric pin for supporting the wheel *E*, and throwing the same out of gear and into gear, substantially as set forth.

Second, the above-described arrangement of the three gear wheels, *C E* and *K*, with the stationary hopper, substantially as described.

Third, the combination of the gear wheel *E*, with the eccentric pin and arm *O*, when operated simultaneously with the elevation or depression of the boxes, as described.

Fourth, a feed slide, when cast or made in two pieces or sections locked or coupled together and operated as one slide, substantially as described.

No. 43,963.—ERASTUS DOUGLASS, Lowell, Mass.—*Washing Machine*.—June 20, 1865.—This invention consists of a cross-piece to be inserted in the upper part of a common wash tub. One end of this cross-piece projects out from the side of the tub, and to this projecting end is hinged a beater. The clothes to be operated upon are laid upon the cross-piece after having been soaked, and the beater is then brought down upon them as many times as required.

Claim.—The combination of the cross-piece or block *B*, the tube *A*, and the beater *C*, as and for the purpose herein specified.

No. 43,964.—SIMON DUNN, Allegheny city, Penn.—*Shutter Hinge*.—June 20, 1865.—This device is provided with incline planes around the pinhole for dropping the shutter when swung out, and holding it open, and the improvement consists in arranging the inclined planes, upon both top and bottom of the female part of the hinge, so that it can be raised, and at once made a right or left hand hinge.

Claim.—Making on each end of the knuckle of the female part of the hinge two or more planes, corresponding to two or more around the pinhole of the male part of the hinge, substantially as herein described and for the purpose set forth.

No. 43,965.—A. DUBREUIL, Baltimore, Md.—*Apparatus for Distilling Petroleum*.—June 20, 1865.—This invention consists of a retort made of light boiler-iron, with cast-iron heads. A tubular boiler is inserted in the still near the bottom, passing entirely through the heads. A fireplace is situated at one end of the boiler, and a chimney at the other; the boiler is provided with a pressure gauge and injector. In the top of the still is a man-hole and pipe through which the vapors pass to the condenser.

Claim.—The use of boiling water inside the retort or still to vaporize the material known as petroleum or rock oil, substantially in the manner and for the purposes herein before shown and described.

No. 43,966.—EDWARD DENBAR, Buffalo, N. Y.—*Boot Heel*.—June 20, 1865.—This invention consists in constructing a metallic plate in the form of a boot or shoe heel, with an interior dovetail frame for holding an elastic heel-piece, and also having an inner flange or rim for a permanent attachment to a foundation leather heel.

Claim.—A metallic holding plate *A*, having an inner dovetail groove for receiving and holding the elastic tread piece *B*, so that the tread piece will be firmly held in the groove by its expansive force without other fastening, for the purpose and substantially as described.

No. 43,967.—JOHN S. FEE, Felicity, Ohio.—*Umbrella*.—June 20, 1865.—This invention consists in forming the web or covering of umbrellas of India-rubber.

Claim.—An umbrella whose web or covering is composed of a single piece of India-rubber, substantially as set forth.

No. 43,968.—L. D. GALE, Washington, D. C.—*Process for Preparing Coffee*.—June 20, 1865; antedated June 12, 1865.—This invention consists in extracting the soluble and vola-

tile parts of the coffee, which is done by putting the ground coffee into the boiler with water, which boiler is connected with condensers, and applying heat. The volatile parts of the coffee are condensed in the condenser; and the coffee remaining in the boiler is pressed, hot water being added, and the extract and volatile portions are then mixed with sugar and formed into solid cakes.

Claim.—Separating the aroma or volatile oil of coffee from the watery vapor, substantially in the manner and for the purpose herein set forth.

Also, the recombination of the aroma with the soluble non-volatile parts of the coffee preparatory to making the same into a solid cake, substantially in the manner and for the purpose set forth.

Also, a dense and solid cake coffee, that can be handled by itself like cakes of chocolate or sticks of candy without the aid and expense of boxes or cans, which are indispensable in all that class of preparations called coffee paste and coffee extract.

No. 48,269.—THOMAS A. GALT, Sterling, Ill.—*Seeding Machine and Cultivator.*—June 20, 1865.—The seed box has a slide carrying a slot in its bottom. This slide has another slide covering slots in it. The second slide having been adjusted by suitable device for that purpose so as to expose a greater or less portion of the slots in the main slide as may be desired to the main slide, a reciprocating motion is imparted by a device operated by one of the wheels of the carriage. Thus the seed, after passing through the slots in the main slide, is allowed to drop through the slots in the bottom of the seed box as those slots are alternately opened and shut by the motion of the main slide. The supply can in this way be regulated with nicety.

Claim.—The method of operating the slide D through the medium of the rack i, toothed segment j, and gearing n o, in combination with the sliding plate F, which is moved upon the slide D by means of the rack f and toothed segment g, the whole arranged as described and represented.

No. 48,270.—NELSON GATES, Middletown, Ohio.—*Head Rest for Railroad Car Seat.*—June 20, 1865.—This invention consists in the combination of an elastic cushion for the head, with a device by which the elastic rest or cushion is attached to the car seat at the back.

Claim.—First, the spring head rest constructed, arranged, and applied to use in the manner and for the purpose substantially as described.

Second, the spring head rest, constructed as described, in combination with the fastening by which it may be attached to the car, substantially as and for the purpose set forth.

No. 48,271.—EDWARD S. GILLIES, Albany, Wis.—*Cultivator.*—June 20, 1865.—This invention consists in fastening ploughs and harrows to a cultivator frame by pendent rods furnished with spiral springs to allow them to pass over obstacles. The front end of the harrows are fastened to a steel spring in front of the frame to bring them back into position.

Claim.—The attaching of harrows and ploughs, either or both, to the frame of a cultivator by means of pendent rods E provided with springs F, and connecting the heads of the harrows and ploughs to springs I attached to shafts J at the front part of frame A, in the manner substantially as and for the purpose set forth.

No. 48,272.—JOHN HABERMEHL, Wheeling, West Va.—*Chair.*—June 20, 1865.—This invention consists in hanging or attaching the seat portion of a chair to and upon its rear legs, so that, when desired, it can be tilted backwards and the front legs arranged in sockets in the under side of the seat so that they will not leave the floor when the chair is tilted.

Claim.—The arrangement of the seat of a chair, sofa, &c., herein described, the same consisting in hanging it by standards on its upper side to and upon its rear legs, in combination with so inserting the front legs within the seat that the seat can freely play up and down on the same and yet not be disengaged therefrom, substantially as and for the purposes specified.

No. 48,273.—ALBERT HALLOWELL, Lowell, Mass.—*Beer Faucet.*—June 20, 1865.—In this invention a screw inserted in the barrel has an external flange or face. It has also a superficial interior screw thread to receive the faucet. The portion projecting within the barrel is perforated to strain the outflowing liquid. A valve within is held to its seat by a spring in the socket. When the faucet is screwed in this socket it opens the valve, but the liquid cannot flow until the cock is rotated for the purpose in the usual manner.

Claim.—First, the faucet connection B as made with the two screws N and P, or their equivalents, provided with the valve and its seat, arranged substantially as specified.

Second, the said faucet connection B as made with the head o, combined with the screws n and p, and the valve and its seat, arranged as described.

Third, the said connection as made with the perforated guard or strainer r, the valve and seat and the screws, arranged as specified.

Fourth, the faucet constructed with the screw a and the projection c as arranged with the connection B, provided with a valve a ranged within it as specified.

Fifth, the combination of the connection B provided with a valve and made with screws n and p as described, with the faucet constructed with the screws a and the projection c, the whole being substantially as and for the purpose specified.

No. 48,274.—E. HAMBURGER, New York, N. Y.—*Ticket Box*.—June 20, 1865.—The tickets are made in two sections, one to be passed to the passenger and afterwards taken by the conductor, and the other to serve as a check. The tickets are enclosed in a box within which is such an arrangement of cutters that whenever a ticket is withdrawn from the box that portion which is intended to serve as a check is cut off and retained in the box. The tickets are also provided with a shoulder which serves to actuate the clapper of a bell whenever one of the tickets is withdrawn. The attention of the passenger is thereby called to the fact that the conductor has really taken the ticket from the box and not from any other place.

Claim.—The use of a box provided with suitable cutters, and with or without a bell, in combination with tickets formed substantially in the manner herein described, or in any other equivalent manner, so that by the act of withdrawing the ticket from the box a portion of said ticket is retained and serves as a check for the ticket, as herein set forth.

No. 48,275.—EDWARD HAMILTON, Chicago, Ill.—*Snap Hook*.—June 20, 1865.—This invention consists in providing the swivel with a barrel made to receive the shank of the hook. Between the barrel and shank there is a collar sliding up and down the barrel, and held in position by a spring placed within the latter. The ring of the hook is articulated, so that one part of it, moving on a pivot, forms an arm. To open the arm the collar is lifted up, and, by pressing said arm upon the collar, the latter is lifted up to resume its former place, and thus clasps the arm to the shank.

Claim.—First, the cylinder D, when attached to the eye or swivel of a snap hook, and fitted to receive a shank collar or slide and spring.

Second, the shoulder or stop *b*, in combination with the collar E.

Third, the collar E, when applied to a snap hook, having its inner end rest on a spring and its outer end arrested by a stop.

Fourth, the combination of the collar E, spring *a*, and stop *b*, with the hook A.

Fifth, the combination of the cylinder D, collar E, spring *a*, and stop *b*, with the hook A, arm B, and eye C.

Sixth, the combination and arrangement of the collar E, spring *a*, and the incline of the end of the arm B, whereby the hook is closed by simple pressure on the arm B: each of said parts and combinations being constructed and arranged substantially as and for the purposes set forth and specified.

No. 48,276.—THOMAS C. HARGRAVE and KENDAL W. KING, Boston, Mass.—*Mercurial Heater*.—June 20, 1865.—This invention consists of an endless pipe partially filled with mercury, which, by the application of heat, is caused to circulate through said tube to any desired part of the room or building, radiating heat sufficient to warm the same.

Claim.—First, the continuous or endless pipe B constructed and filled, or partially filled, with mercury, substantially as described and to the effect stated.

Second, the combination with the pipe B, containing mercury of the lamp D or other heating appliance, substantially as and to the effect set forth.

No. 48,277.—GEORGE HART, Atwater, Ohio.—*Churn*.—June 20, 1865.—This invention consists in pivoting to a standard and one end of the guide bar a lever: said bar having holes made through it at each end, through which straps pass around a pulley on the dasher shaft, which is put in motion by the lever.

Claim.—The guide H, straps *m m'* and lever L, in combination with the pulley F' and beaters P, when arranged and operating as and for the purpose set forth.

No. 48,278.—EDWARD F. HOLLOWAY, Knightstown, Ind.—*Churn*.—June 20, 1865.—This invention consists in arranging two disks in the bottom of a suitable vessel and operating them in such a manner as to effectually agitate the milk or cream, and to cause air to commingle with it so as to speedily separate the butter globules from the milk.

Claim.—The disks B and C, when constructed and arranged as shown, at the bottom of vessel A, and operating substantially in the manner described.

No. 48,279.—W. UPTON HOOVER, Macomb, Ill.—*Band Cutter for Threshing Machine*.—June 20, 1865.—In this invention a spout with a reversible platform can be fitted on at right angles to the threshing machine upon either side. The circular cutter in the centre of this feeding spout is rotated by a pulley and cord running over another pulley upon the end of a shaft operated from the threshing cylinder.

Claim.—First, the combination of the rotary cutter B and spout C, constructed and operating as and for the purpose set forth.

Second, the reversible platform E and hinge board D, in combination with spout C, arranged to operate as and for the purpose herein described.

Third, the combination and arrangement of shaft *b* provided with the wheels *d*, pulleys *f*, and wheels *c*, with the transverse shafts are provided with the wheels *d* and pulleys *h*, for the purpose of driving the cutter B, as set forth.

No. 48,280.—W. UPTON HOOVER, Macomb, Ill.—*Band Cutting Machine*.—June 20, 1865.—In this invention the axle running at right angles with the feed roller is bent and

carries a pitman. This pitman moves laterally a serrated cutting blade in guides parallel to and between the feed rollers. The feed rollers are adjusted by a rack.

Claim.—First, the reciprocating band cutter *a*, arranged and operating substantially as set forth.

Second, in combination with the cutter *a*, the feed rollers *C* and *C'*, constructed and operating substantially as shown and described.

Third, the vibrating shaker *E*, when used as shown, for the purpose of feeding the grain into the thresher.

Fourth, the combination and arrangement of shaft *F* provided with the crank *h*, gear wheels *l* *l'*, cam *p*, or its equivalent, and wheels *m* and *m'*, as and for the purpose set forth.

Fifth, the adjustable bearings *d* and *d'*, provided with the racks *g* and *g'*, in combination with the wheels *f*, for the purpose of adjusting the rollers *C* and *C'* as herein described.

No. 43,231.—B. HOLTZ and WILLIAM ENOCH, Springfield, Ohio.—*Cultivator*.—June 20, 1865.—In this invention the drag bars are connected to a single point under the draught pole. A lateral as well as a vertical movement is given to the plough by two single levers, the rear one being pivoted upon the axle and the front one upon the draught. The force of the front lever is all applied to the short arm of the rear one.

Claim.—First, connecting the drag bars *E E* to a single point on the main frame by the draught rods *G G*, substantially as described.

Second, in combination with the draught rods *G G*, the traveller rod *a*, substantially as described.

Third, imparting a lateral motion to the rear end of the plough beams by means of the two single levers or rods *O* and *K*, arranged and operating as described.

Fourth, pivoting the lever *K* upon the self-adjusting pivot *L* in the manner shown, for the purpose of permitting said lever to be moved both vertically and laterally, and thus performing the operation of moving the ploughs without the use of more than one lever, *K*, and with but a single pivot for said lever.

Fifth, connecting the drag bars in front by the stretcher *F*, provided with pivot screws and set screws, as described.

Sixth, the combination and arrangement of rods *G*, the drag bars *F*, posts *H*, foot rests *J*, levers *K* and *O*, ring *k*, and joint *L M*, as shown and described.

No. 48,282.—PETER H. JACKSON, New York, N. Y.—*Windlass*.—June 20, 1865.—This invention consists in the means of connecting and disconnecting the windlass head with and from the ratchet wheel in the use of a spiral friction mechanism, and in the introduction of sockets for handspikes for the purpose of changing the speed or power of the movements of the contiguous chain wheels.

Claim.—First, the bolt *i*, actuated by the cam or eccentric *3*, for connecting or disconnecting the chain wheel *h* from the wheel *f*, as specified.

Second, the strap *k*, blocks *t* and *d*, in combination with the cam *n*, substantially as specified.

Third, the wheel *f*, provided with handspike sockets *2*, in combination with the chain wheel *h* and the bolt *i*, or its equivalent, for connecting or disconnecting the wheels *f* and *h*, as set forth.

Fourth, the levers *q* and pawls *r* fitted as specified, in combination with the ratchet wheel *f* and chain wheel *h*, as set forth.

No. 48,283.—C. JILLSON, Worcester, Mass.—*Wire Pointing Machine*.—June 20, 1865.—In this device the end of the wire to be turned or pointed is supported by an eye or hub suspended from a slide which plays in a groove in the lower side of a guide bar extending longitudinally with the lathe from the head to a standard at the other end. The rest is kept in contact with the side of the cutter by means of a spring attached to a slide which bears the said rest or hub. The bed-plate, upon which the standard supporting the knife or cutter slides, is hinged at one end, and is capable of being set at any proper angle in a plane vertical and longitudinal with the axis of the wire, so that when the cutter is moved it will give to the point formed by it on the wire the angle required.

Claim.—First, the combination of the cutter stand *H I* with the hinged platform *G* and table *A*, substantially as and for the purposes described.

Second, the elastic band or spring *u*, in combination with the sliding block *Q*, and supporting eye *t*, substantially as and for the purposes specified.

Third, the combination of the hinged platform *G*, cutter stand *H I* and side pattern *R*, substantially as and for the purposes specified.

No. 48,284.—ALGERNON K. JOHNSTON, New York, N. Y.—*Mode of Roasting, Disintegrating, and Desulphurizing Ores of Gold and Silver, &c.*—June 20, 1865.—This invention consists in heating ores containing the precious metals, such as sulphurets, arsenurets, &c., and when heated, passing through the ore a current of steam or superheated steam, the object being to effect the complete desulphurizing and disintegrating of such ores in a short time, using the same principles of operation, viz., heat and moisture, as when such ores are disintegrated by the ordinary process of weathering.

Claim.—The treatment of sulphurets, arsenurets, and phosphides of iron, copper, nickel, or lead, containing any of the precious metals, with and by steam, with or without the presence of atmospheric air, for the purpose of freeing such ores from sulphur, arsenic, and phosphorus, and preparing the precious metal for amalgamation or other subsequent treatment.

No. 48,285.—JAMES J. JOHNSTON, Allegheny City, Penn.—*Apparatus for Distilling Oil.*—June 20, 1865.—This invention consists in exhausting air from the still, condenser, and receiving vessel, so that the distilling process may be carried on under a partial vacuum, in order that the distillation may be effected with less heat than in a plenum, and thereby a better quality of oil be obtained.

Claim.—First, distilling oil or other liquids by means of a still, condenser, and receiving vessel, from which air is exhausted, so that the distilling process is carried on under a partial vacuum, substantially as herein described and set forth.

Second, the arrangement of the vessel *a*, furnace *b*, condenser *k*, vessel *l*, and receiving vessel *m*, furnished with tube *x*, scale *g*, valves 7 and 8, and rack *n*, the whole being constructed, arranged, and operating substantially in the manner herein described and for the purposes set forth.

No. 48,286.—EDWARD H. JONES, West Albany, N. Y.—*Steam-furnace Grate.*—June 20, 1865.—In this invention an inclined grate composed of any convenient number of bars, with lozenge-shaped openings, and cast in one piece, and so arranged as to be operated in pairs or all at once, by levers. The bars are placed at right angles with the length of the grate; parallel to and between them are lozenge-shaped chambers; the air supplied to them from beneath flows through their perforated tops, which rise above the surface of the grate, and among the burning coals.

Claim.—First, a series of grates, when cast in the form herein described, and operated in sets of two or more.

Second, in combination with the action of the grate independently by means of the levers C C, and the arms F F, the use of the oxygen distributors D D, substantially as shown, for the purpose of producing more perfect combustion.

No. 48,287.—B. F. JOSLYN, Stonington, Conn.—*Revolving Fire-arm.*—June 20, 1865; antedated June 14, 1865.—This invention relates to the construction of the frame of revolvers, and the attachment of the barrel thereto, and consists in making the parallel jaws of the frame, which extend above and below the cylinder, to embrace the enlarged rear of the barrel, and to be locked thereto by dovetailed connections.

Claim.—The frame, with its two projections *a* and *a'*, and their dovetailed recesses, in combination with the enlargement *b* of the barrel and its dovetailed projections *x* and *x'*, the several parts being arranged and adapted to each other as set forth.

No. 48,288.—B. F. JOSLYN, Stonington, Conn.—*Breech-loading Fire-arm.*—June 20, 1865.—The breech-lock is pivoted beneath the barrel, and swings backward and downward through a mortise in the stock. The trigger guard lever is hinged or pivoted to the swinging breech-lock, and its head is so formed as to constitute a lock or brace against the recoil of the breech-block when in a closed position; and a spring pin holds the lever in such relation to the breech-block when open, that it allows the same to be brought home, before the bracing end of the lever enters its recess in the stock. A supplementary hammer-piece is attached to the swinging breech-block.

Claim.—First, the lever G, and the spring pin *n*, or its equivalent, in combination with the breech-piece D and its recess *g*, the whole being arranged and operating substantially as herein set forth.

Second, the supplementary hammer E, combined and arranged to move with the breech-piece D, and to operate on the cartridge substantially as described.

No. 48,289.—JOHN W. LANE, Newton, N. J.—*Wood Base-burning Stove.*—June 20, 1865.—This invention consists in the employment of a fire-chamber with one or more openings near its base extending from the bottom to, or nearly to, the top of the stove, in combination with one or more vertical flues, or hot-air chambers, in such a manner that wood or other fuel placed in said fire-chamber shall be burned from the bottom, and that portion of the fuel in the upper part of the chamber charred. The gases evolved during this process are condensed, and serve to increase the heat of the stove.

Claim.—First, the employment of the fire-box or chamber C containing the open and vertical grate F, in the rear and lower part of the partition wall or plate L and also containing the opening or space O in the front, and at or near the lower end of the wall or plate W in the manner and for the purpose substantially as set forth.

Second, the combination of the vertical grate F, with the openings or spaces O, at the bottom of the vertical partition plate V V, in the manner substantially as set forth.

Third, the damper Q, in combination with the intermediate flue or space H, and fire chamber C, in the manner and for the purpose substantially as set forth.

No. 48,290.—EDWIN B. LARCHAR, New York, N. Y.—*Intagliotype Plate*.—June 20, 1865; antedated April 5, 1865.—The object of this invention is to have plates prepared, on which drawings may be made of an oily ink. Over the surface of such drawings a liquid solution of the sulphate of copper is spread, and hardens where there is no oleaginous ink, and remains in a pliable state, where the ink has been deposited. A brush of suitable stiffness will now remove the soft parts, while the ground remains unaffected—thus an intaglio is produced. It is now coated entirely with the hardening solution, and is in condition to be stereotyped or electrotyped, by any of the usual processes. The plates may be used for embossing or printing in the usual manner.

Claim.—First, the metallic plate with the hardened coating of oxide upon it, made substantially in the manner described, as a new article of manufacture.

Second, the use of the oleaginous ink or pigment, in drawing a design on the surface of the oxide, so as to protect the parts drawn upon from being coated by the coating solution afterward applied.

No. 48,291.—CHARLES H. LAVIS, Philadelphia, Penn.—*Self-regulating Damper*.—June 20, 1865; antedated March 15, 1865.—This invention consists of a square drum of sheet-metal to be attached to a stove-pipe, which has in it a damper which vibrates on a rod passing through said drum, one end resting in a bearing, and the other passing entirely through said drum, and bent at any angle necessary. On the bent end of the rod a screw thread is cut, and a nut is made to screw up and down on this thread, and serve by its weight to keep the damper in any position required.

Claim.—The drum A, the damper B, the rod C, the screw D, and the balance E, constructed and operated with reference to each other, and for the purpose and in the manner as herein shown and described.

No. 48,292.—JOSEPH H. LEONARD, Wilmington, Ohio.—*Gate Latch*.—June 20, 1865.—This invention consists in arranging two latches and two catches to a gate opening either way. One shoulder of the notch into which the latch falls on one catch is made higher on one side, and one on the other catch higher on the other side, so as to prevent the gate swinging past the catches in shutting.

Claim.—The two latches B B', connected by a cord or chain C, and applied to the gate A, as shown in connection with the two notched plates F F' attached to the post F, and having with respect to each other their lower upper edges *f* at opposite sides of their notches *c*, substantially as and for the purpose herein set forth.

No. 48,293.—SEBEUS C. MAINE, Boston, Mass.—*Coal and Ash Sifter*.—June 20, 1865.—In this invention a cylindrical rotary sieve is provided on its inner side with a number of oblique-inclined flanges, or strips of metal, which take up the substance being sifted and throw it violently against the opposite side of the sieve.

Claim.—The flanges or strips *c*, in combination with the cylinder B, operating substantially as set forth for the purpose specified.

Also, the cylinder B, provided with flanges *c*, in combination with the box A, hopper G, and receptacle E, arranged and operating substantially as set forth.

No. 48,294.—ELISHA MATTESON, South Brooklyn, N. Y.—*Mechanical Movement*.—June 20, 1865.—This invention consists of a circular inclined plane mounted on a pivot. To this inclined plane motion is communicated from a vertical shaft passing through its upper side in such a manner that the rolling weight employed upon the inclined plane is constantly descending. The motion thus obtained can be transmitted to machinery of various descriptions.

Claim.—First, the employment of an inclined disk D and C', in conjunction with a rolling weight E, which is connected to a driving shaft in such a manner that a rotary motion will be communicated to this shaft by oscillating said disk, substantially as described.

Second, the application of arms *g g'* and a pitman J to the inclined disk D, substantially as described.

Third, the combination of the flanged-inclined disk D, roller E, shafts F G, and a contrivance applied to said disk for oscillating it, substantially as described.

Fourth, supporting the inclined disk D upon a gimbal-joint at its centre, and upon a base ring, or its equivalent, at or near its circumference, in combination with a rolling pendent weight E, substantially as described.

No. 48,295.—JOHN MAYER, Philadelphia, Penn.—*Hair Brush*.—June 20, 1865.—This invention consists in making the handle of the brush tubular, and in fitting within it a cylinder of pomade, so that the latter may be readily and sufficiently protruded for use, as occasion may require, at the uncovered end of the handle, by means of a concealed rack and pinion operated by the application of the thumb to a spur-wheel slightly projecting on the side of the handle.

Claim.—A hair brush having a tubular handle, provided with any suitable pomade, and constructed so as to operate substantially in the manner and for the purpose described.

No. 48,296.—THOMAS MCGIRR, Richmond, Ind., assignor to himself and NICHOLAS R. NIXON.—*Measuring Faucet*.—June 20, 1865.—This invention consists in an arrangement of devices designated in the claim, and will be understood from the engraving.

Claim.—The combination and arrangement of the float K, stem J, scale I, finger L, all substantially as shown and described.

No. 48,297.—M. MCGONIGLE, Allegheny City, Penn.—*Door Bolt*.—June 20, 1865.—This invention consists in the use of two cams for throwing back the bolt, to one of which a spindle and knob are attached from the outside, and to the other a spindle and knob from the inside, each of which performs its office independently of the other. The bolt is supported at the rear end by a hole made in the case, through which the end of the bolt extends, and so arranged that when it is desired to fasten the bolt shut a slide passes over the hole on the outside, where it is held by a thumb screw and preventing the bolt from sliding back.

Claim.—First, the use of two spindles and knobs, in combination with two cams and one spring bolt, constructed, arranged, and operating substantially as herein described and for the purpose set forth.

Second, the arrangement of the plate X in the end of the case A, in connection with the thumb screw 4, opening 3, and stem, as herein described and for the purpose set forth.

No. 48,298.—CHARLES R. MOFFETT, Philadelphia, Penn.—*Grubbing Machine*.—June 20, 1865.—In this machine a curved lever is so rotated upon its convex surface as to fasten the claws to the root, and with a sufficient force lift it from the ground.

Claim.—The lever A, with its curved end and prongs or teeth *e*, combined with the toothed plate E, as and for the purpose described.

No. 48,299.—JAMES MORRISON, JR., Troy, N. Y.—*Ash-pan Drawer and Lifter*.—June 20, 1865.—This invention consists of a handle with one end bent into a shape to fit into a dovetail projection constructed on the front plate of an ash-pan drawer. By means of a mortise in the same end it can be used to shake a grate. The other end is curved and perforated.

Claim.—First, the employment and combination of the lifting device Q with the said ash-pan or box P, or any equivalents therefor, in the manner and for the purposes substantially as herein described and set forth.

Second, the lifting device Q, constructed in the manner and for the purposes substantially as herein described and set forth.

No. 48,300.—E. D. MOYER, Philadelphia, Penn.—*Bottle Stopper*.—June 20, 1865.—This invention consists of a metallic cap filled with elastic material, and provided with a swinging frame, so formed that when the stopper is placed upon the bottle it can be readily pressed under its lip.

Claim.—The bottle stopper, described and shown, the same consisting of the cap A, the elastic water-proof filling *a'*, and the swinging spring frame B, the whole being constructed, arranged, and combined together so as to operate, when applied to the mouth and neck of a bottle, substantially as described, for the purposes specified.

No. 48,301.—GREGORY MULHAUPT, Buffalo, N. Y.—*Rock Drill*.—June 20, 1865.—This device consists in so supporting the drill stock in a vertically reciprocating gate—the upward movement of which is produced by a rack and pinion or similar means, and the downward motion by gravity—that while the motion of such gate is fixed and definite, the drill stock is so only in its upward movement, its downward movement being governed entirely by the drill striking the rock so that, as the hole being drilled increases in depth, the drill feeds itself, within certain limits, and strikes quick, hard blows.

Claim.—First, the combination of the drill stock B with a vertically reciprocating frame or cross-head C, the upward motion of which is produced by the action of the pinion E upon the rack F, or other equivalent means, and the downward motion thereof by gravity, in the manner and for the purposes substantially as described.

Second, the combination of the cam L, clutch K, pinion E, and rack F, arranged and operating as described to produce the reciprocating motion of cross-head C, for the purposes set forth.

Third, giving an intermittent rotary motion to the drill stock B by the upward motion of the cross-head acting on the ratchet wheel G', through the medium of the cam wedge J, rock shaft arms J' J3, and pawl G, in the manner substantially as described.

No. 48,302.—JOHN MURDOCK, South Carver, Mass.—*Portable Kettle Furnace*.—June 20, 1865.—This apparatus is made wholly of cast iron, and the kettle is made to fit into a recess directly over the fire, the whole being so constructed that the products of combustion are made to act more equally on the bottom and sides of said kettle, which is accomplished by a peculiar arrangement of horizontal partition plates forming flues.

Claim.—Combining with the fire-place, kettle, and surrounding cylinder the two rings termed the lower and upper rings to form the two series of flue spaces around the kettle, the lower ring having a flue space through it at one end of the fire-place, and the upper ring a like flue space above the opposite end of the fire-place, and apertures governed by a damper over the flue opening in the lower ring, substantially as and for the purpose specified.

Also, making the cylinder which surrounds the kettle in two parts, the upper part to receive and support the flanch of the kettle, and the lower part with an inward projecting flanch to form the upper ring, in combination with the ring on which the lower part of the cylinder rests, and which forms what is termed the lower ring, as and for the purpose specified.

No. 48,303.—FRANCIS G. MURRAY, Washington, D. C.—*Manufacture of Gunpowder*.—June 20, 1865.—This invention consists of a mixture of forty-five parts chlorate potash dissolved in twenty gallons of boiling water, and fifteen parts saltpetre is added; also, thirty parts of ground bark, the whole being boiled for twenty minutes, after which eight parts of pulverized charcoal and two parts of lampblack are added, and the whole heated until the water is expelled, when the composition is ready for use.

Claim.—The employment of the within described material, compounded as and for the purpose specified.

No. 48,304.—JOHN NANGLE, Mooresville, Ind.—*Weeding Hoe*.—June 20, 1865.—This invention consists in the attachment to the hoe of a handle, by means of a screw, and also the attachment of the blade to the shank in the same manner, so that it can be easily removed therefrom and any other shaped blade attached in its place to enable the operator to suit the tool to the work.

Claim.—The construction, arrangement, and combination of the different parts of the hoe substantially as described.

Also, the method herein described of fastening the hoe to the shank as set forth.

No. 48,305.—JESSE PALMER, Cleveland, Ohio.—*Knife Polisher*.—June 20, 1865.—This invention consists of an oblong box or trough, consisting of a horizontal bottom, provided with side ledges and a hinged cover, which is hinged to the said box at the end in such a manner that when the free end of the cover is depressed the hinged end will slightly bind upon the upper surface of the trough. The upper surface of the trough and the under surface of the cover are lined with leather or cloth, as a rubbing surface for the knife to be cleaned.

Claim.—A knife polisher, constructed and operating as herein described.

No. 48,306.—W. H. PEASE, Dayton, Ohio.—*Tobacco Dryer*.—June 20, 1865.—At either end of the dryer are rollers, over which endless belts are turned by gear wheels on the outside. Any number of these belts can be used, so placed one above the other that the tobacco will fall from the top shelf upon the next below, and so on. Heating pipes pass between the belt of one series of rollers and thence outside of the dryer to the next above.

Claim.—The arrangement of the endless belts D D, in connection with the tubes or pipes E, the whole being used and operating as and for the purpose specified.

No. 48,307.—J. HARDEN PLUMSTEAD, Lynn, Mass.—*Halter Clasp*.—June 20, 1865.—This invention consists in constructing a halter by a combination of straps, ring, clasps, and rivets, the latter only going through the leather strap and one side of the clasp; not being stiffly sewed or riveted to the ring, they yield readily to the motion of the animal's head.

Claim.—The ring A as constructed, in combination with the clasps B B, constructed, arranged, and operating as described and for the purposes set forth.

No. 48,308.—AMOS W. PRICE, Adrian, Mich.—*Mosquito Bar or Tent*.—June 20, 1865.—This invention consists of a frame somewhat similar to the frame of an umbrella, though folding differently, and covered with a gauze or netting to prevent the admission of flies or mosquitos.

Claim.—The combination and arrangement of the shaft *a*, the slide *c*, the braces *b*, the arms *e*, the joints *d*, the connecting plates *g*, the folding in the manner shown with the netting *f*, as and for the purpose specified.

No. 48,309.—FITCH RAYMOND and AUGUST MILLER, Cleveland, Ohio.—*Fence Gate*.—June 20, 1865.—This gate is provided with a semi-circular arm, one end of which is attached to the top of the gate near the hinged end thereof, and the other end is free. The arm passes around the post to which the gate is hung, and its free end is in the same vertical plane with the gate. When the gate is pushed back the free end of the arm is thrown forward beyond the vertical plane of the fence in which the gate is hung. In this plane is a weight suspended by a cord to the free end of the arm. When this free end is thrown out of the vertical plane of the fence the tendency of the weight is to draw it back again and thus close the gate.

Claim.—The arm F or J, in combination with the gate A, cord *f*, and weight *g*, when combined and operating substantially as and for the purpose set forth.

No. 48,310.—ELISHA ROBBINS, Worcester, Mass.—*Carriage*.—June 20, 1865.—The thills are applied to the carriage by means of a shaft provided with two hangers. The front end of the wagon rests upon a bearer, which rests upon another bearer, supported on the thills. When the horse is drawing the wagon up hill, the thills are raised, carrying up with them the two bearers and the front end of the wagon, and thus bringing the weight of the latter upon the horse's back through the medium of the lugs on the saddle. The horse is thus enabled to get a firmer foothold, owing to this increased weight brought upon his back.

Claim.—The application of the thills or their equivalent to the axle by hangers or a cranked

shaft, as described, and so as to bear against the wagon body, under circumstances and for the purpose substantially as described.

Also, the combination of the conical rollers F G, with their thills, their hangers and the carriage body, arranged and applied together substantially as and to operate as specified.

No. 48,311.—ALFRED ROBINSON, New York, N. Y.—*Mode of Preparing Roofing Material*.—June 20, 1865.—This invention consists in preparing roofing fabric by passing sheets of felt or other material between rollers, the asphalt in a plastic state being applied between the sheets as they pass between the rollers.

Claim.—The method of coating a sheet or sheets of felt or other material to form a roofing fabric with asphalt or other material in a soft or plastic state, applied directly to such fabric in the manner specified.

No. 48,312.—JOHN B. RIDER, Wapello, Ind.—*Machine for Cutting Stalks*.—June 20, 1865.—This machine consists of a roller armed with cutters. Extra wheels are used to transport the machine to and from the field. Sickle-shaped hooks attached to flat springs precede the roller for the purpose of adjusting the stalks in a longitudinal direction for the action of the cutters.

Claim.—The long journals B B, the extra wheels A A, the broad springs C C, with their sickle-shaped hooks, the adjustable cross-bar D and E, when these several parts are arranged and combined with the main roller, armed with cutters; the whole operating conjointly, as and for the purpose specified.

No. 48,313.—BLANEY E. SAMPSON, Boston, Mass.—*Connecting Thills to Carriages*.—June 20, 1865.—Arms placed closely against the shoulders of the axle journals project upward to a suitable height, and in them the thills are fastened by means of screw bolts, in such a manner as to turn freely therein in a vertical plane.

Claim.—The application of the thills to the arms or journals of an axle by means substantially as described, whereby they may be supported by and turn on such arms while in use.

No. 48,314.—GEORGE SAMPSON, Manchester, Me.—*Manufacture of Oilcloth*.—June 20, 1865.—This invention consists in filling up the interstices in the cloth with whiting, ochre, or earth, preparatory to painting on it, and in mixing such substances with the paint to be applied.

Claim.—A composition made of glue, gum, or vegetable sizing, thickened with clay, whiting, ochre, or other earths for filling or levelling up the surface of the cloth to prepare it for painting or printing.

Also, mixing clay largely with the oil paint for coating or painting cloths in the manufacture of painted floor cloths.

No. 48,315.—GILBERT L. SHELDON, Hartsville, Mass.—*Truck for Pulling Stones*.—June 20, 1865.—The frame which forms the bearings for the windlass is supported upon a truck upon two hind wheels, and one or more front wheels, in such a manner that when the team is detached from the draught pole it can be hitched to the drag chain without requiring any time for supporting or securing the truck.

Claim.—The combination of the secondary truck A' and wheel B', with the truck A, frame K, windlass I, sheave L, and chains M N, constructed and operating substantially as and for the purpose described.

No. 48,316.—THOMAS J. SLOANE, New York, N. Y.—*Machine for Cutting and Reducing Vegetables*.—June 20, 1865.—The object of this invention is to cut and reduce vegetable substances by a cutting or shearing operation, as set forth in the claim.

Claim.—The combination of the series of square or shear-edge cutters on the shaft with the series of square or shear-edged cutters in the case, arranged and operating substantially as herein described.

Also, sustaining the outer ends of the cutters on the shaft by the rings of the case, in combination with the sustaining of the inner ends of the cutters of the case by the rings on the shaft, substantially as and for the purpose described.

Also, connecting the cutters with the shaft and with the case, by having the cutters attached each separately by a dovetail or equivalent joint to a ring, and the rings to the shaft and case, substantially as described, to facilitate sharpening and other repairs.

No. 48,317.—ERASTUS W. SMITH, New York, N. Y.—*Pier for Bridges*.—June 20, 1865.—This invention is intended to be used in that system of construction in which tubes or hollow cylinders of iron formed in sections or otherwise are sunk through the water, and to a sufficient depth into the earth, and the contents excavated and removed through an air-lock. This general method of construction has been successfully practiced for a number of years. Excavation is carried on within the tube at the bottom of the water, under a pressure of air sufficient to keep out the water, and to allow work to be done under the same conditions as regards pressure as prevail in a diving bell at the same depth. The claim explains the improvement in the method of constructing the hollow piers.

Claim.—First, the employment of calcined plaster or equivalent expansive material in stopping the bottom of hollow piers or shells for submarine masonry, substantially in the manner and for the purpose herein set forth.

Second, stopping the bottom of such shells by grouting or flowing the calcined plaster or analogous semi-fluid material into interstices in previously laid stone, substantially in the manner and for the purpose herein set forth.

No. 48,318.—JOSEPH NOTTINGHAM SMITH, Jersey City, N. J.—*Measuring Faucets*.—June 20, 1865.—In this invention a valve plunger is moved forward in the measuring chamber by a handle turning on a pivot to expel the liquid to be drawn. The movement of the handle is limited by stops on an index plate, which indicates the amount of liquid drawn. When the plunger is drawn back, its valve is opened by the atmospheric pressure on the liquid in the containing vessel, and the liquid is thereby transmitted into the measuring chamber. The valve is closed by a spring sufficiently strong to prevent the pressure of liquid in the vessel from opening it. The liquid in the measuring chamber is retained by a spring valve closing the outlet.

Claim.—Introducing the liquid to be measured into the faucet behind a valved plunger, through which it is transmitted in the backward stroke thereof, and by which it is forced out from the faucet in the forward stroke, substantially as and for the purposes herein set forth.

Also, the outlet valve U, kept closed by a spring, in combination with the valve plunger of a measuring faucet, substantially as and for the purpose herein specified.

Also, actuating the plunger by a handle G or its equivalent, through the means of a gear wheel L, and two equal sized pinions M M, gearing respectively into the plunger racks N N, arranged and operating substantially as and for the purpose herein specified.

Also, the adjustable stop K on the handle G, and stationary pins or projections Y Y, in combination with a measuring faucet for gauging the amount of liquid drawn by rock movement of the handle.

Also, the registering dial H and index *h*, arranged in combination with the actuating handle, so as to indicate and register the whole amount of liquid drawn from the cock or vessel, substantially as herein specified.

Also, the combination and arrangement of the plunger in relation to the operation of its valve and packing, substantially as and for the purposes herein specified.

Also, in combination with a measuring and registering faucet, lining the body of the faucet with tin, brass, or other suitable soft metal or alloy, backed by a cement of hydraulic lime, plaster of Paris or equivalent substance, so that the lining may be removed and replaced when desired, substantially as herein specified.

No. 48,319.—FRANK M. STEARNS, Berea, Ohio.—*Mode of Packing Grindstones*.—June 20, 1865.—This invention consists in nesting grindstones in the form of a barrel by providing a rod of iron passing through the eyes of the stones, and securely fastened to end-boards or heads by nuts; also in having strips of wood fastened at intervals longitudinally around the outside of the nest, and protected by bands of hoop iron.

Claim.—The rods A and B, in combination with the end boards or heads C C, in the manner described, and for the purpose set forth.

No. 48,320.—JOHN D. STEWART, Baltimore, Md.—*Tobacco Pipe*.—June 20, 1865.—This invention consists in constructing the hinged cover of a tobacco pipe of a conical or hemispherical form, in the lower part of which, and just above the top of the pipe bowl, is fitted a disk with a perforation in its centre. The cover and disk thus form a chamber, in which is a spiral spring. Down through the cover and disk passes a straight piece of wire with a disk on its lower end, forming a presser for the contents of the pipe. The spiral spring in the cover chamber is attached to the handle of the presser, so as to retract it when forced down into the pipe.

Claim.—Constructing the hinged cover of a tobacco pipe of an inner disk *b* and a bulging outer portion *a*, when the said cover contains within the same a spring *d*, connected with a rod *g* of a follower or tobacco presser *c*, all arranged and operating substantially as herein set forth.

No. 48,321.—O. M. STILLMAN, Westerly, R. I.—*Steam Engine*.—June 20, 1865.—This invention consists of a superheater with its connections, and a jacket enclosing the entire cylinder in such a manner that superheated steam, before entering the cylinder, travels the entire circumference of the same, for the two fold purpose of reducing the temperature of the steam and increasing the temperature of the cylinder, with a view of preventing condensation in the same.

Claim.—First, the jacket E and cylinder G, constructed and arranged as described, in combination with the superheater C through which the steam passes on its way to the jacket, substantially as and for the purpose herein set forth.

Second, the within-described arrangement of the steam jacket E and cylinder G, whereby the steam is compelled to flow uniformly, or nearly so, over the cylindrical surface and through one or both heads of the cylinder, in the manner and for the purpose substantially as herein set forth.

Third, the within-described arrangement of the superheater C, the automatic regulator N and its connections, the steam jacket E, and the cylinder G, so as to operate together, in the manner and for the purpose substantially as herein set forth.

Fourth, the incombustible clothing K, the jacket E, cylinder G, and superheater C, arranged to operate together, substantially in the manner and for the purpose herein set forth.

No. 48,322.—WILLIAM TALLMAN, Manteno, Ill.—*Gate*.—June 20, 1865.—This gate slides upon two rollers, one of which is under the bottom rail and the other under the second rail from the bottom. This second roller is stepped in two posts, between which the gate passes. These two posts are not placed exactly opposite each other, but diagonally opposite, so that by lifting one end of the gate clear from the ground it may be swung round upon the secondary roller as a pivot, and be placed at right angles to its position when closed.

Claim.—The combination of the gate A, constructed as above set forth, and resting at one end on a roller, with posts B B' set in relation to each other as shown, and operating as described.

No. 48,323.—JAMES GAMAGE TARR and AUGUSTUS HENRY WONSON, Gloucester, Mass.—*Paint for the Bottoms of Ships*.—June 20, 1865.—This invention consists of a composition of wood coal tar, naphtha from coal or petroleum, oxide of copper, oxide of the alloys of copper, ochre or iron ore, and oxide of arsenic.

Claim.—An improved composition, formed essentially as set forth and for the purpose specified.

No. 48,324.—H. M. TEASDALE, Dansville, N. Y.—*Cultivator*.—June 20, 1865.—In this invention wings extend obliquely up from the front plough to the beams just above the rear plough. A removable plough with a continuation of the coulter upon it slides on with a groove and is secured by screws.

Claim.—First, the arrangement of the inclined wings E' E' with the double plough E and the beams D D, in the manner and for the purpose described.

Second, the construction of the point represented in Figs. 4 and 5, in combination with the parts E b d, substantially as and for the purpose herein described.

No. 48,325.—C. C. TEMPLE, Saco, Me.—*Cloth Registering Attachment for Looms*.—June 20, 1865.—This device, with its several dials, may register from one yard to thousands, and is designed also as a check against the felonious abstraction of cloth from the loom without detection.

Claim.—The registering mechanism herein described, consisting of the wheel b, provided with projections to seize the fabric, worm wheels d h and l, endless screws c k and g, and disks j f and n, substantially as and for the purposes herein set forth.

No. 48,326.—JAMES H. THOMPSON, Hoboken, N. J.—*Grain-huller*.—June 20, 1865.—This huller consists of three inverted frusta of cones, set one above another upon an upright shaft, spirally fluted upon their exterior surface, and of different sizes, the upper being the largest and the lower the smallest. The huller is enclosed in an inverted conical case. The lower periphery of each frustum is distant from the inner surface of the enclosing case only far enough to allow one grain to pass between, while the upper periphery is not so close to the case; consequently, when the space between the hullers and the case is full of corn, and the hullers are set in rotation, the hulls are removed by the pressure and attrition of the grains upon each other, whereby danger of crushing them is avoided.

Claim.—The combination of the inverted, fluted, conic frustums D, conical case B, and lateral projections or prominences c c c, all constructed and arranged and operating substantially as specified.

No. 48,327.—JUSTUS A. TRAUT, New Britain, Conn.—*Joint of Folding Rules*.—June 20, 1865.—In the centre piece of the rule is made a rectangular slit, in which is inserted a metallic spring for the purpose of producing rigidity, or, in other words, holding the rule with some degree of firmness to whatever degree it may be opened.

Claim.—First, the slit C in the centre piece a' of the joint a, for the purpose of receiving a device for producing tension or rigidity, substantially as and for the purpose described.

Second, the employment of a metal piece d, or its equivalent, placed in the slits of the joint a, substantially as and for the purpose described.

No. 48,328.—T. TROWBRIDGE, Danbury, Conn.—*Composition for Stiffening Hat Bodies*.—June 20, 1865.—This invention consists of a composition made by dissolving twenty-seven pounds of shellac acid and three pounds of sal soda in five gallons of hot water, and, after the shellac is dissolved, adding seven ounces of salt dissolved in one gallon of hot water.

Claim.—The within described composition, made of the ingredients specified, substantially as set forth.

No. 48,329.—JAMES R. WALLACE, Franklin, Ohio.—*Grain and Grass Seed Separator*.—June 20, 1865.—In this invention a series of sieves are hooked together, and rest at one end

upon the cross-bar of a frame, and at the other end rest upon a square shaft. This shaft by its rotation agitates the sieves. The shaft rests upon adjustable supports, and the device is to be used, without casing or fan, as a hand screen.

Claim.—The employment or use of a series of screws connected together as shown, and suspended within a suitable framing on a square shaft which is supported by adjustable bearings or blocks E E, all arranged to operate in the manner substantially as and for the purpose herein set forth.

No. 48,330.—HENRY A. WHITNEY, Brooklyn, N. Y.—*Device for Unloading or Storing Freight.*—June 20, 1855.—The ways on which the truck moves are adjustable, so as to change the inclination, and make the truck run in either direction. This is done by means of a windlass. A suspended platform is used to convey goods from the ground to the truck.

Claim.—First, the elevated ways A A, arranged in the manner shown, to admit of being adjusted in an inclined position for the movement of the car or truck B on the ways, for the purpose specified.

Second, in combination with the above, the suspended hoisting device G H J with the platform I attached.

No. 48,331.—JAMES P. WIGAL, Neago, Ill.—*Steam Pressure Gauge.*—June 20, 1865.—This invention consists in the peculiar construction of the coiled auger-shaped tube, and its combination with a plug, arm, segment, pinion, and index.

Claim.—The coiled auger-shaped tube B, in combination with the plug A, arm *d*, segment *f*, pinion *h*, and index *i*, constructed and operating substantially as and for the purpose set forth.

No. 48,332.—WARREN WRIGHT, Springfield, Ohio.—*Hominy Mills.*—June 20, 1865.—This mill is divided into a number of compartments (usually six) by a series of transverse diaphragms. A vertical shaft passes down through all the diaphragms, and is provided with ribbed blades. From one compartment to another are annular openings around the central shaft. The grain being poured into the upper compartment, fills it and then crowds the kernels down through the annular opening into the next lower compartment, and then into the next, and so on until the mill becomes full, when the tendency of the mass is, by a downward, spiral, helical motion, toward the place of discharge.

Claim.—First, in combination with diaphragms G, the series of screws H, formed so as to be cast in entire cylinders, having the longitudinal slits *h* from their lower to near their upper margins, substantially as set forth.

Second, the series of symmetrical, equal, annular, and two parted diaphragms G G' G2, capable of transposition and reversal, substantially as and for the purpose set forth.

Third, the provision of the lip *g'* or lips *g* and *g''*, at the interior margin of the annular diaphragms G G' G2, for the purpose explained.

Fourth, the enclosing case, composed of a series of entire cylindrical screens H H' H2 and marginally grooved annular diaphragms G G' G2, as represented.

Fifth, in the described combination with the series of diaphragms G G' G2, having equal central apertures, the floating suction heater L M, substantially as set forth.

Sixth, the arrangement of diaphragms G G' G2, having equal central apertures, in combination with the flaring and vertically adjustable suction beater L M, substantially as set forth.

No. 48,333.—ROBERT WYATT, Brooklyn, N. Y.—*Fire Escape.*—June 20, 1865.—This invention consists of a fire escape, to be attached to the exterior of a dwelling-house or other building, without defacing it or obstructing the sidewalk of a street, and to which, while it affords no facilities for burglars, access may be had from the several stories of a building, so that persons on the several floors may put it in a state for use without difficulty.

Claim.—First, the combination of the vertical slotted tube A A4, the bar *g*, and the hinged rounds *h h*, substantially as herein described, the whole forming a folding fire-escape ladder.

Second, the bar D, catch *f*, and cap C, in combination with each other and with the slotted tube A A' A4, bar *g*, and hinged rounds *h h*, substantially as and for the purpose herein specified.

No. 48,334.—THOMAS G. CROSBY, assignor to GEORGE H. STRONG and M. H. CROSBY, Buffalo, N. Y.—*Raising and Lowering Signal Lamps.*—June 20, 1865.—This invention consists in providing a pole or mast with two upright rods extending up along the sides thereof parallel with each other. Upon these rods a frame is made to move up and down by means of a rope and pulley. This frame contains a signal lamp, and is so constructed that the lamp may be easily put in or taken out.

Claim.—The rods or slides A B, or their equivalent, in combination with the rope or cord M, the pulley I, or its equivalent, and the frame J K, for holding the lamp, when constructed to operate as herein substantially set forth and described.

No. 48,335.—J. L. FOUNTAIN, assignor to himself and A. FOUNTAIN, New Milford, Ill.—*Harvesting Machine.*—June 20, 1865.—This invention relates to the peculiar arrangement

for raising and lowering the cutting apparatus, and to the manner of connecting therewith the reel band pulley, whereby said reel band is kept taut with the cutters at different elevations.

Claim.—First, the arrangement of the link *g*, arms *e'* and *f*, link *i* and *p*, in combination with the piece *E* of the mowing frame and guides *d d* and *b*, substantially as and for the purpose described.

Second, the rod *n* and lever *h'*, in combination with the lever *n'*, pulley *N*, and belt *l*, as and for the purpose set forth.

Third, the adjustable arm *J* and guides *J'*, in combination with the pulley lever *n'* and shoe, as and for the purposes described.

Fourth, the peculiar arrangement of the pulleys *G h'' g'* and *I*, in combination with the reel standard *F*, piece *F'*, when operating conjointly as and for the purpose set forth.

No. 48,336.—RUSSEL FRISBIE, assignor to IRA K. and ELMORE PENFIELD, Middletown, Conn.—*Tackle Hook*.—June 20, 1865.—This invention consists of many straps or enclosing devices extending from the shank to the point of the hook. The instrument is in the enclosed shank and the means of operating it. To enclose or free the cord or chain, the strap is in two parts hinged together by a spring bolt.

Claim.—A strap which swivels on the shank of a tackle hook, and is made in two parts that are hinged together, in combination with a spring bolt, constructed and operating substantially as and for the purpose set forth.

No. 48,337.—JOSHUA GRAY, Medford, Mass., assignor to himself, E. H. ELDRIDGE, Boston, Mass., and S. S. BUCKLIN, Providence, R. I.—*Cartridge Retractor for Breech-loading Fire-arms*.—June 20, 1865.—A sliding cartridge retractor is provided with a longitudinal slot through the bottom or horizontal stem, within which slot plays the heel of a tripping lever. On the breech-block being drawn backward longitudinally by an appropriate lever, it begins to engage the sliding retractor, and drawing with it until the limit of the slot strikes the tripping lever, and thus raising it, ejects the cartridge. The said tripping lever forms also a guide for the introduction of a new cartridge.

Claim.—First, the cartridge extractor *C*, provided with the slot *f*, in combination with the guide and expeller *B*, substantially as and for the purpose described.

Second, the sliding breech-pin *D*, extractor *C*, and guide and expeller *B*, when constructed, combined, and operating substantially as described.

No. 48,338.—THOMAS S. HUDSON and ANTHONY HARDY, assignors to THOMAS S. HUDSON, Cambridge, Mass.—*Hand Stamp*.—June 20, 1865.—This invention consists in combining with the devices used for printing the month and year, or the name or names of one or more persons, places, or things, a changeable mechanism or series of types by which the day of the month may also be printed at the same time with the other imprints. In the neck of the frame is made a chamber for holding the types for printing the months or years and months. To the plunger, by one or more clamp screws, is secured a chase capable of holding the types that do not require to be changed.

Claim.—First, the combination of the endless chain of types and its carrying mechanism with the plunger.

Second, the combination of the endless chain of types and its carrying mechanism with the plunger and the chase, the whole being arranged together as specified.

Third, the combination of the endless chain of types and its carrying mechanism with the chase, the plunger, and printing ribbon, arranged as specified.

Fourth, the combination of the type chamber *d*, in the neck *c* of the frame, with the endless chain of type, its carrying mechanism, the chase, and the plunger, arranged to operate as described.

Fifth, the combination of one or more elastic cushions or masses of vulcanized India-rubber *s s* with the frame and plunger of the press, such cushion or cushions being arranged on the bottom of the said frame, and for the purpose as explained.

Sixth, the combination of the catch wheel *o* and spring catch *p* with the endless type chain, its sprocket wheels, the chase, and the bed, arranged so as to co-operate as specified.

No. 48,339.—ANTONA KIEFFER, assignor to himself and JAMES KENNEDY, Buffalo, N. Y.—*Device for Releasing Screw Engines when Stopped on their Dead Centres*.—June 20, 1865.—On the crank-shaft is a prying-off wheel, as usual, by the side of which is a prying-off lever provided with a pawl for insertion into the teeth of the prying-off wheel. The upper end of the lever comes up into the engineer's room. A rod passes from the end of the pawl, also into the engineer's room, so that by stepping on the end of the rod he can force the pawl to engage with the teeth of the wheel, when, by pulling on the lever, he can start the shaft. The pawl is counterbalanced, so that when the pressure is taken off, the pawl will be removed from contact with the prying-off wheel.

Claim.—The counterbalanced pawl *D*, provided with a pawl rod *F*, in combination with the toothed wheel *B*, and prying-off lever *C*, for the purposes and substantially as described.

No. 48,340.—CHARLES H. JOHNSON, assignor to himself and EUGENE WOODMAN, Boston, Mass.—*Argand Gas Burner*.—June 20, 1865.—This invention consists in various com-

binations of numerous parts of a gas burner, which are designated in the claim and shown in the engraving.

Claim.—The arrangement and combination of the foraminous partition *e* with the tip *b*, its chamber *a*, and the conduits leading into and out of such chamber.

Also, the combination of the tip *b* with the groove *f*, in its upper surface or end, or with the said groove *f*, in its upper surface or end, and also with another groove *g*, arranged in its lower surface or end.

Also, the tip, as made with each of its jet holes countersunk at either or both of its extremities, and for the purpose specified.

Also, the tip, as made with a groove *f* in its upper surface or end, and with each of its jet holes countersunk at its upper end.

Also, the tip, as made with a groove *f* in its upper surface or end, and with each of its jet holes countersunk at both of its extremities.

No. 48,341.—WILHELM KLOENNE, assignor to himself and G. HUBNER, New York, N. Y.—*Bottle Stopper*.—June 20, 1865.—This invention consists of a plug of wood, to which is attached a rubber tube. Through the centre of the plug passes a rod, the lower end of which forms a conical valve. When the stopper is placed in a bottle containing liquid under pressure, the gas in the liquid forces the valve upward and presses the rubber tube against the neck of the bottle, making a tight joint.

Claim.—A bottle stopper, composed of a plug A, spring valve B, and elastic tube C, substantially as herein set forth.

No. 48,342.—JOSEPH H. LANING and VERON FLETCHER, Philadelphia, Penn., assignors to VERON FLETCHER.—*Sectional Folding Boats*.—June 20, 1865; antedated June 15, 1865.—This invention consists in constructing boats so that they may be folded away into a small compass. In each joint is a vulcanized rubber tube, combined with hinges and adjustable sections.

Claim.—The peculiar manner of constructing boats of movable and adjustable sections, so connected with hinges, part thereof affixed on the inside of the boat, and part thereof on the outside, so as to move in harmony with each other, whereby the boat can be opened and closed at will.

Also, the combination of hinges, vulcanized India-rubber tubing, and movable and adjustable sections, for the purpose as hereinbefore more fully set forth, and substantially as described in both clauses.

No. 48,343.—THOMAS J. LOVEGROVE, Philadelphia, Penn., assignor to himself and HENRY BALDWIN, jr.—*Machine for Boring Artesian Wells*.—June 20, 1865.—The object of this invention is to dispense with the derricks heretofore used in boring oil wells; to attain greater freedom of access to the mechanism; to raise and lower the drill automatically at any desired rate of speed, and thus to regulate the feed of the drill; to turn the drill automatically while working; and, finally, so to arrange the mechanism that all these movements can be effected and controlled by one person, and from one position, so as to avoid the necessity of running from place to place and stopping the work while adjusting some portion of the mechanism.

Claim.—First, vibrating the mechanism which supports, raises, lowers, feeds, and rotates the drill directly over the hole, so as to dispense with a derrick.

Second, rotating the drill automatically by mechanism actuated by the vibration of the parts which sustain it, substantially in the manner described.

Third, a mechanism which automatically and simultaneously vibrates, feeds, and rotates the drill.

Fourth, connecting one end of a walking beam or vibrating lever to the motor, and the other to the drill, by mechanism which gives the drill an intermittent axial rotation.

Fifth, combining with a walking beam or vibrating lever a mechanism actuated by the reciprocation of the beam intermittently to rotate the drill, and a mechanism similarly actuated for raising and lowering, and feeding the drill.

Sixth, combining with a vibrating mechanism which supports and rotates the drill, a mechanism independent of the vibrations of the beam, to raise or lower the drill.

Seventh, controlling the feed of the drill by the differential movement of the rotating and lowering mechanism.

Eighth, a drill-rope spool rotating both on a vertical and a horizontal axis, and having a vertical reciprocation.

Ninth, making the fulcrum of the walking beam the axis of motion, upon which the mechanism is supported for rotating the drill automatically, and raising and lowering it, substantially in the manner described, for the purposes set forth.

No. 48,344.—THOMAS J. LOVEGROVE, Philadelphia, Penn., assignor to himself and HENRY BALDWIN, jr.—*Steam Engine Governor*.—June 20, 1865.—This invention consists in arranging upon the top of the frame-work a revolving single chamber, to contain crude mercury and a float to rest upon the top of the mercury, for the purpose of controlling the

motion of the engine. Attached to the float is a rod that extends down through the hollow spindle upon which the gear wheel is placed, that gives motion to it, and to the lower end of this the lever which operates the throttle-valve is connected, in such a manner that when the engine is at rest the float in the chamber rests upon the mercury, and the valve is held in a closed position: but when the engine is in motion the mercury is dispersed in proportion to its speed, and the float settles down in the chamber, and the throttle is closed relatively, and the speed of the engine correspondingly reduced.

Claim.—First, the employment of the single closed chamber in a governor to contain crude mercury to control the engine, substantially as described.

Second, supporting a valve stem in a single closed chamber upon crude mercury, so that the valve shall close when the mercury is at rest in the chamber, and open when the mercury is diffused by centrifugal motion over the chamber and float, substantially in the manner described.

Third, the revolving closed chamber to contain mercury, combined with a float, to be operated by the mercury, substantially in the manner and for the purpose set forth.

Fourth, the combination of the sleeve E, the revolving chamber H, the float J, and the valve stem L, substantially in the manner and for the purposes set forth.

No. 43,345.—JOHN McCLOSKEY, assignor to himself and SAMUEL B. BALLOU, New York, N. Y.—*Sewing Machine*.—June 20, 1865.—By this invention the Wheeler & Wilson machine is capable of making a single threaded stitch, or a chain-stitch interlocked with a second or lower thread. To effect this a supplemental hook is used, either secured to the disk bobbin or to a separate concave disk fitting on one side of the ordinary disk bobbin; no other change being required.

Claim.—The hook A, constructed and applied to operate substantially as herein described, in combination with the rotating hook C, bobbin B, and needle, for the purpose herein set forth.

No. 43,346.—MILTON V. NOBLES, Rochester, N. Y., assignor to himself and JOHN C. NOBLES, Rushford, N. Y.—*Bit Stock*.—June 20, 1865.—This invention consists of a solid socket to receive the shank of the bit, over which is a split sleeve or ferrule pivoted, so as to open and let the bit-shank into the socket, when it is closed around the outside of the socket and over the end, embracing the bit tightly, being thus held by a ring slipped down on the outside of the sleeve.

Claim.—The combination of the uncut or solid socket with the split ferrule, ring and catch, by which the bit or other tool may be firmly held in the stock, and readily released therefrom, substantially as described.

No. 43,347.—JAMES SCANLAN, assignor to himself, S. J. STINE, and GEORGE ROSS, Lebanon, Penn.—*Paper-making Machine*.—June 20, 1865.—In this invention a roller prevents the water issuing from the perforated pipe, and from running back upon the pulp: and the third felt operating in conjunction with the first one, the pulp passing between them, supersedes the ordinary roll-cloth: and being constantly washed clean, and the water pressed out of it in its circuit, allows the water from the pulp to pass upwards through it. A third polishing roller smooths that side of the paper which has been in contact with the first felt.

Claim.—First, the couching roller A, with its lever attachment S S' R, in combination with the Fourdrinier wire cloth apron U, situated and operating in the manner and for the purpose specified.

Second, the third felt, in combination with the wash box L, its washers V, racks N, and rollers 1 2 3 4 5 6 7 8 9 and 10, arranged and operating substantially as set forth.

Third, the polishing roller I in the second press, in combination with the press-rollers G H.

Fourth, the combination of the Fourdrinier machine for making paper boards out of straw, sorghum, or other material, in combination with the third felt and felt-washer arrangement, as described.

No. 43,348.—JOHN SHIM, Leverington, Penn., assignor to himself, GEORGE S. HARWOOD, and GEORGE H. QUINCY.—*Machinery for Oiling Wool*.—June 20, 1865.—The claim sufficiently defines the nature of this invention.

Claim.—First, in wool-oiling machinery the combination of the bed a and grooved roller b, revolving inside of the tank, as and for the purpose described above.

Second, an endless cloth of wire, or a pressure roller covered with wire, mounted just above the feed cloth, to receive the oil after being discharged from the tank, and convey it to the wool on the feed cloth, as above described.

No. 43,349.—WILLIAM A. WRIGHT and JAMES MOLYNEUX, Bordentown, N. J., assignors to the BORDENTOWN MACHINE COMPANY.—*Saw Mill*.—June 20, 1865.—The object of this invention is to saw timber to any bevel or angle, or to a circle, and consists in providing a frame that can be rotated by means as described, so as to carry another frame, having a reciprocating saw, to any required angle from the perpendicular. It also consists in having the table upon which the timber is fed revolve, so as to move the stuff or stock to be cut in

a circular direction. Also, in providing a feed or carrying roller, which rises above the surface of the table, and is revolved by the action of an eccentric attached to the crank, which operates on a spring having two pawls working in ratchet wheels at the ends of the roller.

Claim.—First, the frame E, its teeth *a*, the worm *b*, saw frame G, pitman *f*, driving shaft H, crank *h*, the whole being arranged for joint action, and in respect to the stationary frame, as and for the purpose herein set forth.

Second, the movable table I, with its roller K, in combination with the movable frames E and G.

Third, the roller *k*, its ratchet wheel, the plate L, and pawls *m*, and wheel *h*, or its equivalent, the whole being arranged and operating substantially as and for the purpose herein set forth.

No. 48,350.—FRANCIS FEARON, London, Eng.—*Apparatus for Deadening Sound.*—June 20, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—The exclusive use of an apparatus for softening or deadening sound, by means of pressure on the tragus of each ear, substantially as herein described and illustrated by the drawing.

No. 48,351.—MARTYN J. ROBERTS, Pendarren House, Crickhowell, South Wales, Eng.—*Apparatus for Oiling Wool.*—June 20, 1865; patented in Belgium October 29, 1863.—This invention will be understood by reference to the claim and engraving.

Claim.—First, a reservoir in combination with revolving blades and a trough or gutter, the three being constructed and operated substantially as described.

Second, in combination with a perforated revolving disk or sprinkler, a tube or passage way leading to the disk, a gutter supplying liquid to the passage way, and revolving blades for raising liquid into the gutter, all these parts being and acting in combination as described.

Third, a revolving sprinkling disk in combination with a cover and a slotted pan, a tube, and a reservoir provided with a partition, as described, these parts being constructed and operating in combination, substantially as set forth.

Fourth, in combination, the following parts, when constructed and operating substantially as set forth, viz: 1st, a reservoir provided with a gutter and a partition; 2d, revolving blades; 3d, a revolving sprinkler supplied by the gutter; 4th, a roof and a slotted pan; and 5th, a tube extending from the pan to the reservoir.

No. 48,352.—ANTOINE JOSEPH SAX, Paris, France.—*Apparatus for Impregnating the Air of Rooms with Antiseptic Vapors.*—June 20, 1865.—This invention consists of a trough for holding the substance from which the vapors are to be generated. A lid, to which is attached blades, is supported by an adjustable frame in such a manner that it can be suspended at any desired height above the top of the trough to allow the vapors to escape. The frame also serves as a handle when the vessel is closed.

Claim.—An apparatus composed of the reservoir A and movable and adjustable impregnator B, substantially as herein described, for the purpose of impregnating the air of rooms, hospitals, and other buildings with the vapor of antiseptic substances, as herein described.

No. 48,353.—H. N. ARMSTRONG, Erie, Penn.—*Stop Washer for Nuts.*—June 27, 1865.—In this invention the washers are formed from a strip of metal of the proper size, into which holes are made of a size and distance apart to suit the bolts on which they are to be used. In the sides of this strip, near each hole, notches are cut, and over the lips thus formed the corners of the nut can be turned, and when sufficiently tight said lips are turned up against the nut to prevent it turning back and becoming loose.

Claim.—Cutting the edges of the fixed washer and turning up the corners thus formed to hold the nut from being forced back on its thread.

No. 48,354.—GEORGE ASMUS, Houghton, Mich.—*Device for Removing Lamp Chimneys.*—June 27, 1865.—This invention consists of a holder constructed of metal, with cork cushions, to remove the glass chimney from the lamp without burning the fingers or fracturing the glass.

Claim.—As an improved article of manufacture, a lamp chimney holder, made substantially as herein described.

No. 48,355.—CHRISTOPHER D. BAKER, Wheeling, West Va.—*Furnace for Boiling Iron.*—June 27, 1865.—This invention consists in the construction of the chill or iron bed, in a peculiar method of locating the chimney aperture relatively to the iron chamber, and in the structure of the exit flue. This invention is designed to insure the more economical working of the iron, both in respect to coal saved and in the actual effective influence on the iron itself.

Claim.—First, placing the iron chamber in the described position relatively to the exit flue, for the purpose described.

Second, shelving upwardly the margin of the floor of the chamber, in the manner and for the purpose set forth.

Third, shelving outwardly the chill or wall of the iron chamber, for the purpose described.

Fourth, making the throat or regulating point at the entrance of the neck, so as to limit the reverberation to the chamber itself.

Fifth, making the lower end of the stack flue inclined, and as such leading towards the flue which connects to the iron chamber, so as to favor the discharge of detritus collecting in the flues into the said chamber.

No. 48,356.—WILLIAM S. BARNES, Watertown, N. Y.—*Clasp for Holding Neckties and Shirt Collars together*.—June 27, 1865.—This invention consists of a piece of metal doubled, with a spring at the bend. When applied from beneath it clamps the cravat and collar together.

Claim.—As a new article of manufacture, a clasp for holding the necktie in place on the collar, substantially as described.

No. 48,357.—JOHN P. BEATTY, Norwalk, Conn.—*Hat*.—June 27, 1865.—This invention will be understood by reference to the claim.

Claim.—As a new article of manufacture, a hat composed chiefly of straw and provided with a supplementary brim of enamelled paper, made and applied as and for the purposes herein specified.

No. 48,358.—JOHN T. BEVER, Bethel, Ill.—*Cultivator*.—June 27, 1865.—In this invention a rectangular frame carrying plough standards moves freely upon a square frame underneath, and is attached to the latter frame by a clevis and guide furnished with notches, so that by depressing the handles in the rear the front of the frame rises upon this guide and is held in an elevated position.

Claim.—First, the lever handles I I containing uprights *d d*, with cross-bars X X, made in solid framing to vibrate upon pivot P, in combination with beam or tongue A, and clevis N.

Second, the arrangement of the elevating clevis N, clevis guide *o*, cleats or notches *r r*, and corresponding notches *s s*, as and for the purposes herein specified.

No. 48,359.—G. F. BIGELOW, Chicago, Ill.—*Paper Collar*.—June 27, 1865.—In this invention the band is formed of strong plain paper. The turn-down part is attached thereto by a piece of flexible material pasted on the outside of the band and collar. When the collar is turned down, the band and flexible piece are both concealed. The side of the collar exposed to view may be finished in any desired manner.

Claim.—A turn-down paper collar, made from two or more pieces, one or both or all of which are made of enamelled card board or any other material, substantially the same for the purpose, constructed and operating substantially as described.

No. 48,360.—F. BREWER, Collinsville, Ill.—*Device for Converting Motion*.—June 27, 1865.—This invention consists in a toothed segment gearing in a stationary toothed rack. To the centre of the segment is attached one end of a piston rod, which is moved to and fro horizontally in the ordinary manner by steam in a cylinder. To a projection on the segment opposite the teeth is attached one end of a pitman, the other end of which is connected with a wheel in such a manner that the reciprocating motion of the piston is converted into rotary motion.

Claim.—The employment or use of a toothed segment gearing into a stationary toothed rack, in combination with the piston rod of an engine or other equivalent part, and with the pitman shaft to which a rotary motion is to be imparted, all constructed and operating substantially as and for the purpose set forth.

No. 48,361.—O. H. BREWER, Shannon, Ill., and WILLIAM WIMER, Freeport, Ill.—*Apparatus for Tanning*.—June 27, 1865.—This invention consists of an ordinary tanning vat, to the top of which is secured an air-tight vessel provided with an aperture, through which the hides may be inserted. In the inside of this vessel is a rack for supporting the hides. The vessel communicates with the vat by means of pipes. An exhaust pump is attached to the pipe, by means of which the air may be withdrawn from the vessel, the pressure being regulated by a valve.

Claim.—The herein-described apparatus, consisting of the vat A, chamber B, pipes E G H, and valve F, when these several parts are combined, arranged, and operated as and for the purpose herein specified.

No. 48,362.—HARRISON T. BRIGGS, South Bend, Ind.—*Rotary Steam Engine*.—June 27, 1865.—This invention consists in the arrangement of the induction and eduction pipes, with reference to the sliding pistons and the adjustable abutment, so that the motion of the engine may be reversed by closing the cocks, or valves, in one set of the pipes and opening those in the other; and this may be done at any time without in any other respect affecting the operation of the engine.

Claim.—The arrangement of the ingress and egress pipes L M N O, with reference to the valves I K and the adjustable partition D and central wheel G, substantially as herein set forth.

No. 48,363.—ROBERT D. BROWN, Covington, Ind.—*Binding Attachment to Harvesters*.—June 27, 1865.—This invention consists in a vibrating cutting board; a cradle of hinged sections, in which the gavel is grasped; in the manner of attaching a spring to the hinged cradle to limit its size and open the cradle; an arrangement of gripping fingers, which hold one end of the band while the gripping jaws seize the other end and wrap it around the end held by the fingers, these parts receiving their appropriate intermittent motion by gearing; and in the tucking hand and holder which are advanced to the work, on arrival at which, the tucker is rotated, pushing the tuck under the band, while the latter is restrained by the holder.

Claim.—First, the cutting board I, operated as described, for cutting up that end of the sheaf.

Second, the cradle, constructed and operated as described—that is to say, consisting of the stationary part J and the double-hinged movable part J, which is raised by means of the cam K, and jointed slide L M N, substantially as described.

Third, the arrangement of the spring or springs j'' on the inside of the cradle, for the purpose of adjusting its capacity to varying sizes of gavels, when said spring is employed for opening the said cradle, substantially as described.

Fourth, the combination of the non-rotating gripping fingers P P and the rotating gripping jaws O O, whereby one end of the band is twisted around the other, in the manner described.

Fifth, the combination of the sliding mandrel t and head R with the rotary sleeve Q, furnished respectively with the toed gripping fingers P P and gripping jaws O O, which, by the protrusion or withdrawal of the mandrel, are caused to open and shut in the manner described.

Sixth, the method described of producing the intermittent revolution of the sleeve—that is to say, the combination of the wheel V, with its pin v, and the wheel Y, with its teeth y, and the sleeve pinion A, which secures one complete revolution of the sleeve s to a revolution of the wheel V, but periodically, and then at a speed commensurate with the delay due to its intermittent functions.

Seventh, the combination of the pivoted post a, carrying the pins d d, or analogous holding devices, with the pinion sleeve e b, carrying a tucking hand c, so that, after advancing to the point where the tuck is to be made, the said sleeve shall be rotated by a rack or other device, which is brought to engage therewith, and the hand caused to push the twist or knot under the band.

Eighth, pushing the knot under the band by means of a device, which is independent of the sheaf-holding and twisting devices, and which is advanced for that purpose, in connection with a holder, without rotating until it reaches the desired point, when it is caused to rotate to push the knot under the band, while the latter is restrained by the holder from lateral displacement.

No. 48,364.—EZRA CALDERWOOD, Portland, Me.—*Attaching Trace to Whiffletree*.—June 27, 1865.—The object of this invention is to obtain a means for attaching traces to whiffletrees, whereby the horse, in case of necessity, as, for instance, in running away, may be instantly disconnected, and many accidents, which now occur from that and similar causes, be avoided.

Claim.—The sliding bars B B, provided with the pendent lips e' e', to receive pins or rods a a at the ends of the whiffletree, in connection with the sliding slotted plate C, operated by a lever E, all being arranged and applied substantially in the manner as and for the purpose specified.

No. 48,365.—JAMES M. CALLER, Salem, Mass.—*Method of Treating Tan Bark*.—June 27, 1865.—This invention consists in grinding the bark, and then subjecting it to the action of steam, after which it is leached with hot water until the tannin is dissolved, and the extract thus obtained is evaporated to dryness, when it is ready for use.

Claim.—The process, hereinbefore described, of producing a solid extract from tan bark by steaming, leaching, and subsequent evaporation in vacuo.

No. 48,366.—R. W. CARPENTER, New York, N. Y.—*Tremolo Attachment*.—June 27, 1865.—This invention consists of a wing-fan, made to revolve by a spring and corded shaft.

Claim.—The application of means to the instrument by which the air may be agitated to produce a tremulous note, substantially as described.

No. 48,367.—ROBERT A. CHESEBROUGH, New York, N. Y.—*Process for Distilling Petroleum*.—June 27, 1865.—This invention consists in filtering the petroleum, after distillation, through a mixture of bone-dust and pulverized oyster shells. The mixture is supported in the filtering vessel by a layer of cotton cloth.

Claim.—The combination of bone-dust, pulverized oyster shells, and cotton cloth, for purifying, filtering, and deodorizing petroleum, naphtha, and heavy oil, as herein described.

No. 48,368.—EDWIN CHESTERMAN, Roxbury, Mass.—*Boot and Shoe*.—June 27, 1865.—This invention consists in a boot or shoe made of canvass, cloth, or other material, saturated with India-rubber, and vulcanized after having been formed over a last.

Claim.—A boot or shoe, made as herein described, as a new article of manufacture.

No. 48,369.—GEORGE F. CLEMONS, Springfield, Mass.—*Cloth-guide for Sewing Machine*.—June 27, 1865.—In this invention a pivoted spring piece serves, by its inclined position relatively to the straight guide, and by its pressure on the cloth, to insure the forcing of the edge of the cloth against that guide; and it is adjustable to any desired inclination. It may, with its attachments, be used either with or without the ordinary straight guide.

Claim.—The spring E, or its equivalent, when applied to a sewing machine, substantially in the manner and for the purpose described.

No. 48,370.—GEORGE COFFIN, Jamaica Plains, Mass.—*Anchor*.—June 27, 1865.—This invention is explained by the claim.

Claim.—First, the form of the anchor stock, herein described, consisting in making its end of a hook-shape, with inclined or rounding sides, and with flanged or inclined side edges, either when combined together in one and the same stock or when used separately, substantially as and for the purposes specified.

Second, making the end of the shank to which the stock of the anchor is secured in a forked shape, fastened to and within the stock by means of pins, or their equivalents, substantially as described and for the purpose specified.

Third, hanging the shackle ring, to which the anchor is hung, to and within the stock of the anchor, by means of a connecting band, arranged and operating as described and for the purpose set forth.

No. 48,371.—WILLIAM COUSINS, New York, N. Y.—*Arrow Projectile for Ordnance*.—June 27, 1865.—In this invention a projectile of ordinary form for cannon is provided with a long stem projecting from its point or front and extending beyond the muzzle of the gun, the said stem being armed at its forward end with a wide transverse barb or blade, which rests upon and is guided by two side arms, attached to the muzzle of the cannon by a band or ring.

Claim.—The combination of the elongated projectile D E F and guides B C, constructed and operating in the manner and for the purpose specified.

No. 48,372.—RICHARD COVERT, Brooklyn, N. Y.—*Artificial Lump Coal*.—June 27, 1865.—This composition consists of coal dust, gas, tar, or artificial asphaltum, and dead or heavy oil, mixed together and pressed into lumps.

Claim.—As a new article of manufacture, the artificial lump coal, consisting of coal dust, gas, tar, pitch, or artificial asphaltum, and dead or heavy oil, mixed by heat and stirring, and aggregated by pressure, as hereinbefore described.

No. 48,373.—R. P. COWLES, New Haven, Conn.—*Carriage Knob*.—June 27, 1865.—This invention consists in making a rose or bushing for carriage tacks, by first cutting out of thin metal, of the proper size, a disk, and then striking it up in dies, making a hole in the top and thrusting the common carriage tack into it.

Claim.—The herein-described knob, as a new article of manufacture.

No. 48,374.—F. W. COX, Brooklyn, N. Y.—*Pen and Pencil Case*.—June 27, 1865.—The object of this invention is to produce a pencil case which is capable of carrying a long lead, and to fetch the point in, and which is provided with a case to carry some reserve leads of the full length. When the pen is applied the reserve lead case is arranged by the same, and cannot be used for carrying leads.

Claim.—First, extending the longitudinally revolving revoking pencil tube *b* throughout the entire length of the case A, substantially as described, so that long leads can be inserted, and at the same time the tip can be fetched in.

Second, the circular groove *s* in the tube *b*, in combination with the pin *j*, substantially as herein set forth, so that sufficient hold for the said pin is obtained without the necessity of a cap over the tube *e*, and at the same time the pencil tube *b* is prevented from moving in a longitudinal direction.

Third, the collar *o*, applied in combination with the tube *f* and shell *h*, substantially as and for the purpose specified.

Fourth, the reserve lead chamber *p*, extending partially or wholly around the tube *b*, and from end to end of the shell *h*, as shown and described.

No. 48,375.—JOHN DANNER, Canton, Ohio.—*Washing Machine*.—June 27, 1865.—This invention consists in making washing machine rolls by covering a shaft or core piece with India-rubber rings, of cylindrical or other cross sectional areas or forms, so as to make a good rubbing surface.

Claim.—A roll or cylinder for washing machines, the perimeter of which is covered with India-rubber rings, so as to make a washing or rubbing surface, substantially as herein described and represented.

No. 48,376.—ALFRED DAWES, Waltham, Mass.—*Saw*.—June 27, 1865.—This invention consists in attaching a saw blade to its frame in such a manner that it can be turned in any direction desired, and tightened or loosened at pleasure.

Claim.—Attaching a saw blade to and within its frame by means of the screw shafts *f* and *g*, handles *l l*, and thumb nuts *n*, or their equivalents, arranged and operating together substantially as herein described and for the purposes specified.

No. 48,377.—AUSTIN G. DAY, Seymour, Conn.—*Bungs for Barrels and other Vessels.*—June 27, 1865.—This invention consists of a bung fitted with a tube containing a valve, which is pressed against its seat by means of a spring, an aperture being made in the centre of the bung. This bung is intended for barrels and other vessels for holding petroleum and other volatile liquids.

Claim.—Providing, in the bung or stopper, or other part of a cask or other vessel for the transportation or storage of petroleum or other liquids in which vapors or gases are naturally generated, a valve which operates automatically, substantially as and for the purpose herein described.

No. 48,378.—NEHEMIAH DODGE, New York, N. Y.—*Deep Well Pump.*—June 27, 1865.—In this invention, a tube is made in sections, the lowest of which sections passes into that above it by a slip joint, being so shaped at the bottom as to admit the influx of liquids, and carrying a valve at the top, formed of a section of a sphere made concave on the under side, and being hinged by a pin passing through the periphery of the lowest section of the pipe, and confined to its place by the section next above, within which it is held.

Claim.—First, the slip joint of the lower part of the barrel, in combination with a hollow piston rod, made in the manner and for the purposes herein described.

Second, the making of the contact part of the valve and valve seat of the section of a sphere, in combination with the cylindrical concave of the under surface of said valve, substantially in the manner and for the purpose set forth.

Third, in combination with said valve, a hinge pin, substantially in the manner and for the purpose set forth, so that the bearing of the pin against the cylindrical concave of the pump shall hold it firmly in its place.

No. 48,379.—H. W. DOPP, Buffalo, N. Y.—*Hydro-Carbon Burner for Cooking and Heating.*—June 27, 1865.—In this invention, the oil is drawn up into a retort and vaporized, and thence led by a needle point, controlled by a suitable device, to a commingling tube into which air is admitted through an aperture, and hence passing up is burned on a perforated plate surrounding the retort. Vessels for cooking can be placed over the flame; and a convenient number of commingling tubes may lead to a like number of burners. A stopping box secures by a tight joint and connects the retort to a reservoir which holds water, to collect and absorb the residuum of the oil after vaporization and combustion; the water is drawn off by a faucet when desired, and a safety valve is attached to the water reservoir.

Claim.—First, the needle point *A'*, in combination with spindle *A2*, perforated plate *C*, crank pin, sliding block and slot, substantially as shown and described.

Second, the commingling tube *C*, in combination with perforated plate *C*, arranged and operating substantially in the manner described.

Third, the mode of connecting the retort *B* with reservoir *E*, for the purpose described.

Fourth, the application of reservoir *E*, for the collection of the residue of hydro-carbon liquids.

Fifth, the use of water, or other liquid of suitable specific gravity, for the purpose described, but only in connection with hydro-carbon stoves for cooking and heating purposes.

Sixth, the safety valve *l*, for the purpose set forth.

Seventh, the draw-off faucet *g2*, in combination with reservoir *E*, for the purpose herein set forth.

Eighth, supplying vapor to two or more aero-vapor burners by a generating apparatus.

Ninth, the retort *B*, and feed tube *F*, when constructed as and for the purpose set forth.

Tenth, the use of a pipe or tube in connection with a chimney or other apertures for the removal of noxious gases obtained from hydro-carbon liquid, the product of combustion, as described and set forth.

No. 48,380.—H. W. DOPP, Buffalo, N. Y.—*Sad-Iron Heater.*—June 27, 1865.—In this invention the gas escaping from a tube commingles with air, and flows into a chamber in the sad iron, and is burned at the perforation in this chamber and inside the sad iron; air being communicated thereto through a slot in the top plate.

Claim.—The aero-gas burner *B* and *B'1*, as constructed and for the purpose described.

Also, the regulating screw *A1*, in combination with commingling tube *B1*, substantially as and for the purpose described.

Also, the slot, or its equivalent, in the upper part of said iron, for the purpose set forth.

No. 48,381.—JAMES DOWD, Boston, Mass.—*Wagon.*—June 27, 1865.—One of the rocker plates is provided with a pivot which enters a socket in the other rocker plate. The transom bolt passes down through this pivot; around the pivot in the lower rocker plate is formed an annular channel for the reception of a lubricant. The wagon body is supported upon semi-elliptic springs fastened at their centres to each axle. One end of each spring is jointed to the wagon body in the usual manner; the other end is attached to a bar which slides to any desired extent in ways fastened to the bottom of the wagon.

Claim.—The combination of the oil-holding channel *f*, with the tubular pivot *d*, and step *e*, applied to the rocker plates, and the transom bolt, as specified.

Also, the combination of the slider *L*, with the spring and wagon body or truck, in manner and so as to operate substantially as described.

Also, the combination and arrangement of the auxiliary or tie bars *c c*, with the truck *F*, and the springs *H H*, and their sliders *I I*, applied thereto substantially as explained.

No. 48,382.—SPENCER B. DRIGGS, New York, N. Y.—*Mode of Reclaiming Marsh and Swamp.*—June 27, 1865.—This invention consists in forming a continuous wall of iron plates, with water-tight joints, sufficiently high to shut out the tide at ordinary flood. Also, in making a ditch within said wall, deeper than the bottom of the iron plates, to take up the ooze or leach through the ground under the plates.

Claim.—The construction of a wall impervious to water, for the reclamation of swamp or marsh lands on the shores or banks of the sea, bays, lakes, rivers, creeks, or other waters, by the insertion into the ground, at a suitable distance from the margin of the shore or bank, of a series of iron plates, with water-tight joints, extending to a suitable height above the surface of the ground, to shut out the ordinary tidal or other flood, substantially as herein specified.

No. 48,383.—GEORGE DUNHAM, Unionville, Conn.—*Nut Machine.*—June 27, 1865.—This invention consists in a combination of several devices for making nuts, and will be understood by reference to the claim and engraving.

Claim.—First, the sliding plate *o*, operated by the plate *d*, with its inclined edges, for gauging the width of the bar just before the blank is cut therefrom, substantially as described.

Second, the combination of the conical shaped recess *Q*, with the spring or yielding table *P*, substantially as and for the purpose described.

Third, the employment of the lifting holders *S S'*, substantially in the manner and for the purpose described.

Fourth, the clearer bar *N*, for holding, clearing, and carrying the nut from one point to another, substantially as described.

Fifth, forming a screw upon the upper end of the punch *k*, in combination with the threaded socket *i*, substantially as described.

No. 48,384.—ROBERT DUNLAP, New York, N. Y.—*Hat.*—June 27, 1865.—This invention will be understood by reference to the claim.

Claim.—As a new article of manufacture, a head covering with its sides made of two thicknesses of woven or knitted material, formed upon a block and cemented together with gutta percha or India-rubber by the aid of wet heat, as herein specified.

No. 48,385.—GEORGE DURYEE, New York, N. Y.—*Manufacture of Printers' Ink.*—June 27, 1865.—This ink is composed of one hundred pounds of the dark-colored residuum resulting from the distillation of petroleum, to which is added twenty-five pounds of the waste sulphuric acid which has been used in deodorizing petroleum. This compound is agitated until it becomes thick, tenacious, and nearly black. Water is then added to wash out the acid, and if necessary chloride of lime to neutralize and destroy any unpleasant odor. The resulting substance is called petroline wax, which is substituted for linseed or other oils in the manufacture of printers' ink.

Claim.—First, the improved ink prepared of the materials and in the manner substantially as herein set forth and described.

Second, as a basis for the manufacture of various kinds of printers' ink the material derived from the residuum of petroleum, and herein designated as petroline wax the same to be used substantially as set forth.

No. 48,386.—JOSEPH ENDERS, Louisville, Ky.—*Carriage Top.*—June 27, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—First, the pillars *E*, and open rings *F*, or their equivalents, formed by the rear ends of the rail *B*, in combination with braces *I*, lazy back *D* and top *C*, constructed and operating substantially as and for the purpose set forth.

Second, the hooks *d*, and catches *e*, in combination with the rail *B*, and straps *J*, secured to the seat *A*, substantially as and for the purpose specified.

No. 48,387.—VALENTINE FELKNER, Cannel, Me.—*Plough.*—June 27, 1865.—This invention consists in connecting any common plough with an ordinary wheel in a peculiar manner, whereby the plough is held and guided in the furrow; also, in a peculiar device for governing the depth of the furrow, and in a combination of two or more ploughs in gangs, held and governed by these devices.

Claim.—Elbow *C*, upright *D*, and level elbow *b*, combined and arranged to operate substantially as and for the purpose set forth.

Also, rod *G*, lever *H*, truck *g* and adjustable collar *j*, when arranged and combined to operate substantially as described, whereby the depth of the furrow is not only controlled, but the direction of movement of the truck *g* always corresponds to the line of draught.

Also, the arrangement of the plough holder, as constructed of parts C D B and *b*, attached to plough A, with plough governor G H *g* and *j*, operating as described and for the purposes set forth.

Also, the combination of two ploughs in one gang, when combined and arranged to operate substantially as and for the purposes specified.

No. 48,388.—W. A. FISHER, Lower Merion, Penn.—*Boring Artesian Wells*.—June 27, 1865.—This invention consists of a drill composed of three detachable sections; a central one, the lower end of which is reduced to a straight cutting edge; and two side ones, presenting sharp curved edges, bevelled on their inner sides. Also, of a device for giving an upward driving motion to the upper end of the drill stock, to disengage the drill when it becomes wedged fast in the well.

Claim.—First, the drill B, composed of two or more detachable sections, each having a cutting edge, and the whole being arranged and secured together by the within described devices, or their equivalents, substantially as and for the purposes specified.

Second, a drill, with a central straight-cutting edge *x*, and a curved cutting edge *y*, at each side of the same, arranged in respect to each other as described.

Third, the tube D, combined with the casing A, drill B, and its valve, substantially as and for the purpose specified.

Fourth, the case A, its cross-piece F, and drill B, in combination with the sliding rod F, and its plate *h*, all being arranged and operating substantially as and for the purpose described.

No. 48,389.—SAMUEL WARD FRANCIS, New York, N. Y.—*Postage and Revenue Stamp*.—June 27, 1865.—The nature of this invention is defined by the claim.

Claim.—Incorporating with or applying on to stamps, either before or partially before and partially after being used, ingredients such as will chemically combine to produce a dark color or stain under the action of moisture, substantially as and for the purpose set forth.

No. 48,390.—WILLIAM and JOHN GROVES, Providence, R. I.—*Puddling Furnaces*.—June 27, 1865.—This invention consists in the use of two fire chambers, arranged on opposite sides of the body of the furnace, with a flue directly over the same midway between the two fires.

Claim.—The employment or use of fire chambers on opposite sides of the body of the furnace, substantially as specified.

No. 48,391.—FREDERICK HAINSWORTH, Chicago, Ill.—*Apparatus for Carburetting Air*.—June 27, 1865.—This invention consists of a carburetter communicating with a reservoir by means of a tube, and also with a blower by means of a tube. The pipe connecting the reservoir is provided with a stop-cock, which is provided with apertures, by means of which the flow of naphtha may be regulated. The inside of the carburetter is provided with a series of semicircular partitions, made of fibrous material.

Claim.—First, the combination and arrangement of the regulating cock M, provided with a diagonal series of perforations *c*, with the dial and pointer, as and for the purposes herein specified and shown.

Second, the peculiar arrangement of the vertical porous partitions B, with the ducts *b*, leading from the pipe C, operating as specified and described.

Third, in combination with the carburetter A, the employment of the fan H, and regulating cock M, with the dial and pointer, arranged and operating as described.

No. 48,392.—CALEB C. HAND, Cincinnati, Ohio.—*Broom Head*.—June 27, 1865.—This invention consists in the combination of the parts of a metallic broom head, referred to in the claim and shown in the engraving.

Claim.—The parts A B E F G H J and K, in the described combination, for the purpose set forth.

No. 48,393.—CHARLES THOMPSON HARVEY, New York, N. Y.—*Sleeping Car*.—June 27, 1865.—This invention consists in the construction of sleeping cars, so that the berths are supported by adjustable standards, entering into fixed sockets above and below; the upper one being of sufficient length to receive the berths and retain them in position, out of the way of occupants of the seats; said berths resting on springs, around or within the adjustable supports; also in the mode of ventilating the berths, and providing curtains to screen the occupants from observation.

Claim.—First, the adjustable standards D, whether solid or hollow, either surrounded by, or, if hollow, enclosing within, spiral or other form of springs, combined with the berth of a sleeping car, in the manner and for the purpose herein set forth.

Second, the combination of the air tube G, tube *h*, flexible tubes H, and air valves I, when used in connection with the berth of a sleeping car, for the purpose of ventilation, in the manner and for the purposes herein described.

Third, suspending and nesting the berths upon the upper sockets, or upon the parts which constitute the upper portions of the standard of the berths when the berths are out of use, substantially as described.

Fourth, supporting the berths upon adjustable elastic bearings, when in use as shown at D, in Fig. 2, substantially as described.

Fifth, preventing and controlling violent oscillations and noise from the movements of the berths on their standards and sockets by means of elastic diaphragms or rings, when combined with the bottom of the berth, substantially as described.

Sixth, applying elastic curtains to adjacent berths, so that the same will yield and conform to the motion of the supporting springs thereof, so as to isolate the berths from the common passage way and from each other, substantially as described.

No. 48,394.—MATTHEW HASTINGS, Philadelphia, Penn.—*Gold Beating Machine*.—June 27, 1865.—This invention consists in an upright frame, supporting a driving shaft in the same manner as in many other drop hammers. On this shaft is mounted a cam or wheel, having nearly one-half of its periphery cut away. In a rocking frame, pivoted to the back of the main frame, in rear of and operated by a pinion on the driving shaft, is another shaft having a similar wheel, the two full peripheries of which, when in motion, clamp the vertical rod or handle of the hammer between them, and raise it until their revolution presents the shorter radius of the cut-away portion, and then releasing their hold on the handle, and allowing the hammer to descend.

Claim.—First, the employment for beating gold of a vertically guided hammer which is raised and permitted to fall with uniform face by the mechanism herein described, or the equivalent to the same.

Second, the shaft K, with its arms L, the rock frame H, and cam *f'*, the whole being arranged for joint action on the rod F, substantially as and for the purpose herein set forth.

No. 48,395.—JONATHAN HATCH, South Windham, Conn.—*Machine for Cutting Paper into Sheets*.—June 27, 1865.—In this invention an intermitting movement of the feed roll is attained, and the paper from the roll is cut between the movements.

Claim.—The crank L, slotted lever E, slide D, band C, clutch A3, pulley A4, lever H, and cam F, in combination with each other, and with the feed rolls of a paper-cutting machine, substantially as and for the purpose herein specified.

No. 48,396.—THOMAS HAWKS, Rochester, N. Y.—*Manufacture of Malt Sirup*.—June 27, 1865.—The malt, prepared from barley in the ordinary manner, is ground and placed in a mash tun with a perforated false bottom, and water at a temperature of 175° to 180° is admitted and allowed to rise through the perforated bottom. Corn meal is then added, and thoroughly mixed by stirring, after which the whole is allowed to stand; the liquor is then drawn off, and water at 200° added, and allowed to remain for two hours. This may be repeated as often as necessary; the liquor is then purified and evaporated in a vacuum to the proper consistency.

Claim.—The method and process of producing a sirup of sugar from malt and meal of Indian corn, substantially as herein described.

Also, as a new product a sirup of sugar produced from malt and the meal of Indian corn without any separation of the fecula thereof, substantially as set forth.

No. 48,397.—SAMUEL HEATON, Kingston, Iowa.—*Sorghum Evaporator*.—June 27, 1865.—This invention consists of a furnace, over which is placed an evaporating pan: the pan is supported by arms attached to a cross-bar, resting upon two bars: these latter bars are supported by upright posts: one end of each bar rests in a notch in the upright posts, and may be raised and supported by hooks; the object being to move the pan on or off the fire as required.

Claim.—First, the levers E E, constructed in the manner and for the purposes specified, substantially as set forth.

Second, the cross-bar D, constructed in the manner and for the purposes specified, substantially as described.

Third, the swinging hooks *g g*, constructed in the manner and for the purposes specified, substantially as described.

Fourth, in combination with an evaporator, the levers E E, the cross-bars D, and the hooks *g g*, constructed and operated substantially as and for the purposes herein specified.

No. 48,398.—LUDWIG HELD, Harlem, N. Y.—*Composition for Lining Barrels*.—June 27, 1865.—This invention consists of a composition of clay, silicic acid, potash, sulphate of soda, coal or carbon, and carbonate of lime.

Claim.—First, the within described composition, when the same is applied in combination with carbonate of lime, substantially as and for the purpose set forth.

Second, the within described composition, when applied in combination with carbonate of lime and graphite brown spar, copperas, or other material containing iron, particularly as a lining for barrels or other vessels.

No. 48,399.—ROBERT HEMINGRAY, Cincinnati, Ohio.—*Fruit Jar*.—June 27, 1865.—This invention consists in forming upon the neck of a jar two shoulders on opposite sides, the

object of which is to afford support for a clamp passing over the cover of the jar, and down under the shoulders. The direction of the shoulders around the neck is spiral, so that in rotating the clamp, it is compressed upon the rim. The shoulders run out so as to leave openings upon the neck for the adjustment of the clamp.

Claim.—The peculiar form of the neck of the jar from the spiral shoulders gradually contracting to the top, as herein shown and described.

No. 48,400.—GIBBONS G. HICKMAN, Downingtown, Penn.—*Railroad Frog*.—June 27, 1865.—This invention consists in so constructing and applying the movable part of a railroad frog, that it is made capable of returning to its normal position by the force of gravitation, after it has been moved by the car-wheels; and locked or retained in its closed or normal position by the weight of the wheels, when the latter are running thereon.

Claim.—The rail B, applied and secured in such a manner as to be caused to assume its normal position by the influence of gravity after it has been moved by the wheels of a passing train, and also adapted to be retained in position by the pressure of the wheels when the latter are running upon it, substantially as herein described and represented.

No. 48,401.—BENJAMIN S. HILL, New York, N. Y.—*Pump*.—June 27, 1865.—This pump consists of three cylinders arranged concentrically, the second enlarging into a hollow piston at its lower end, the third and innermost constituting a hollow piston-rod, and being rigidly attached to a diaphragm a little above the piston. Above this diaphragm, between the hollow rod and second cylinder, is a perfectly closed air space; below the diaphragm are openings in the second cylinder through which the access of water received from below passes, to fill the space between the outer and second cylinder, as the piston descends, and again to pass upward through the hollow rod as the cylinder ascends, the only valves being one at the bottom of the pump-barrel, and one on the under disk of the piston.

Claim.—First, the cylinder having openings *ff*, combined with the piston P, and arranged in relation to the discharge pipe H, substantially as and for the purpose herein specified.

Second, combining the discharge-pipe H with the piston by means of the cap G of the cylinder C, and the pipe F, the latter pipe serving also as a means of securing the cap G tightly to the cylinder C, and of forming an air-tight chamber *e* within the said cylinder, all substantially as herein specified.

Third, the combination and arrangement of the piston P, cylinder C, chamber E, and discharge-pipe H, substantially as herein specified.

No. 48,402.—W. R. HILL, Detroit, Mich.—*Washing Machine*.—June 27, 1865.—This invention consists in securing to the bottom and centre of an ordinary washtub a stud, into which a centre post is secured by a screw, the lower disk or rubber being placed between the stud and post, and kept in place by a shoulder, the lower disk having perforations through it, and cleats so that it does not come in contact with the bottom of the tub.

Claim.—First, the lower disk, fastened and constructed as described, and acting as a wash-board and a filter.

Second, the combination of the central part, stepped into the stud as described, and having the two shoulders which act respectively upon the washboard disk and the rubber disk, to maintain them in their relative position.

No. 48,403.—EDWARD F. HOLLOWAY, Kingston, Ind.—*Straw Cutter*.—June 27, 1865.—In this invention the fly-wheel that carries the knife has its shaft provided with a coiled spring, to keep the knife pressed closely to the mouth of the box.

Claim.—The combination and arrangement of the knife F, shaft C, coiled spring S, collar I, metal front B, box A, fly-wheel G, and guard P, substantially as shown and described.

No. 48,404.—BENJAMIN HOWARD, New York, N. Y.—*Ambulance*.—June 27, 1865.—This invention consists in placing within the body of an ordinary ambulance, a slight distance above the floor, a wooden frame somewhat less in width than the ambulance, and which is provided with a number of transverse removable seats, and with a series of rollers, parallel to the seats and flush with the upper surface of the frame. Upon these rollers can be slid, when desired, two litters, which, when in position, lie side by side, and cover the seats. The frame is provided with four stanchions which rest upon counterpoise springs upon the floor of the vehicle; counterpoise springs are also interposed between the sides of the frame and vehicle, and by this means it is claimed all vertical and lateral motion is taken up. Underneath the vehicle is a compartment in which the litters are placed when not in use.

Claim.—The combination of transverse seats and sliding litters or beds resting on a frame placed within the body of the vehicle, supported and balanced by counterpoise springs within the body of the vehicle. This, together with the compartment for the beds beneath the main floor of the body of the vehicle, in which the litters or beds may be placed for convenience, when not in use, as in the manner described above.

No. 48,405.—A. C. HOWELL, Vienna, N. J.—*Beverage*.—June 27, 1865.—This invention consists of a composition of bicarbonate of soda, water, white sugar, the white of four eggs,

a table-spoonful of wheat flour, and any flavoring that may be desired. When the composition is to be used a small quantity of tartaric acid is dissolved in water, in a suitable vessel, and one or two table-spoonfuls of the composition added, and the vessel filled up with cold water.

Claim.—The drink composed of the materials, and prepared in the manner substantially as herein described.

No. 48,406.—DUANE HULL, Newburg, N. Y.—*Extracting Turpentine and other Products from Resinous Wood.*—June 27, 1865.—This invention consists in effecting the distillation of wood at a pressure less than that of the atmosphere. The wood is placed in a retort or still, and heat is applied; the air is then withdrawn from the retort by means of an air-pump, or other suitable device.

Claim.—The distillation of pine or other resinous wood, for the purpose of obtaining spirits of turpentine or other products, under reduced pressure, or pressure less than the atmosphere, substantially as herein set forth and described.

No. 48,407.—NATHANIEL JENKINS, Boston, Mass.—*Self-closing Cock.*—June 27, 1865.—In this invention the valve opens downward against a spring which has sufficient power to close the valve against the pressure of a step screw thread on the follower within the cap. The valve seat is in a line with the centre of the horizontal induction pipe, and the fluid passes upward when the valve is depressed, and thence ascends through the nozzle. The follower is in sections, the lower section having the valve attached to it and entering the main or upper section which is hollow to receive it, and being suspended and centred by means of a flexible diaphragm.

Claim.—First, the screw-follower H, in combination with the valve of a self-closing faucet, substantially as set forth and for the purpose described.

Second, the combination of the swivel P, screw-follower H, valve K, and spring O, substantially as and for the purpose described.

No. 48,408.—ROYAL E. HOUSE, Binghamton, N. Y.—*Electro-phonetic Telegraph.*—June 27, 1865; patented in England July 21, 1864.—This invention consists in using as a register a magnetic needle, the deflections in which produce sounds by striking against rods connected to a bell; these sounds are intensified by a sound-condenser surrounding the bell. It also consists in certain peculiarities in the suspension of the needle by which its torsion is regulated; in certain improvements in the construction of magnetic helices; in the arrangement of an adjuster in connection with the main line, by which the amount of electricity passing through the helix is regulated; and in a decrease in the size of the helices towards the centre of the line proportionate to their distances from its ends.

Claim.—First, in combination, a magnetized needle or helix, and an adjustable torsion suspension apparatus existing both above and below the needle, the combination being substantially such as is described.

Second, the combination with a magnetized needle suspended by torsion wire or thread limiters for limiting its motion, and which give sounds when struck by the needle, the combination being substantially such as described, and in combination with these, a gong or bell, substantially as specified.

Third, in combination with a torsion suspended magnetized needle, a knife edge applied to the needle, and acting substantially as set forth, and also, in combination with a magnetized needle, a knife edge and limiters, arranged with reference to the needle, substantially as described.

Fourth, a suspension torsion apparatus, consisting of wires or threads attached to collars or rings, as described, in combination with a magnetized needle supported in the collars, substantially as described, and also a magnetized needle in combination with a torsion suspension apparatus, both ends of which can be adjusted as set forth; and also a magnetized needle, in combination with a torsion suspension apparatus, both ends of which can be adjusted at once by reason of being geared together, both these combinations being substantially as set forth; and also, in combination with a magnetized needle, an adjustable torsion suspension apparatus extending both above and below the needle, and having one thread or wire attached to a weight, substantially as described, so as to compensate for the varying length of the wire.

Fifth, a magnetized needle, in combination with limiters, and a gong or bell, and concentrating cone, and in combination with these an outer cone, all these parts being substantially as set forth; and also a sounding apparatus consisting of a bell and a truncated concentrated cone, arranged with reference to each other as described, and, in combination with such an apparatus, an outer concentrating cone, arranged with reference to a ball and interior cone, as described.

Sixth, sections of a helix, composed of members connected to and insulated from each other, substantially as set forth.

Seventh, a helix made up of sections of varying diameter, insulated from each other as described.

Eighth, a helix made up of sections connected to and insulated from each other as set forth.

Ninth, a helix made up of sections composed of members when both the members and the sections are connected to and insulated from each other, substantially as set forth.

Tenth, a helix made of decreasing area to the ends, as described, and also a divided helix or helix made in two parts, so that one part may readily be moved away from the other, and also a divided helix, in combination with a divided case, all substantially as specified.

Eleventh, apparatus substantially such as is described, for registering the power or force of reaction, in combination with a telegraph line and a signalizer, whereby the locality of excessive leakage may be determined as described.

Twelfth, a helix making part of a signalizer, in combination with branch lines and ends of a main line, capable of being advanced toward and drawn away from each other, the combination being as described.

Thirteenth, a helix making part of a signalizer, in combination with branch lines and ends of a main line, capable of being operated as described, and with tubes containing liquid, as described, whereby varying amounts of currents of electricity may be caused to pass through a helix, substantially in the manner and for the purposes specified.

Fourteenth, in combination a helix making part of a signalizer, branch lines or conducting wire, an electric adjuster located between the points where the branch wires are connected to the main wire, and a key or circuit breaker also located between the points where the branch wires are connected to the main line, and operating when open to send the whole current through the helix.

Fifteenth, a helix making part of a signalizer and united to a main line by branch lines or wires, substantially as described, in combination with an electric adjuster in connection with or making part of a main line, and located between the points where the branch lines are connected with the main line, as described, whereby the relative proportions of electricity passing through the adjuster and the helix may be governed and regulated as described.

Sixteenth, a helix of a signalizer, in combination with a line, by means of a tube and adjustable severed wire, as described, when the wire is provided with a register or index as set forth, whereby the condition of a helix or of the batteries that work the line may be tested in the manner specified.

Seventeenth, an apparatus substantially such as is described, whereby the apparatus for adjusting torsion, and the apparatus for adjusting the relative position of the ends of a main line, may be put in operation at the same time, substantially as set forth.

Eighteenth, in combination with a line, a series of helices differing in size at each station thereof, and proportioned each to the other in proportion to the length of line between each helix and the most distant extremity thereof, the combination being substantially as set forth.

Nineteenth, the new telegraphic signalizer herein described, composed of a helix, a torsion, suspended magnetized needle, limiters, and a bell and concentrating apparatus, all substantially such as hereinbefore specified.

Twentieth, in combination with a helix making part of a signalizer, and connected to a line by branch wires, a key or commutator, located in the line and capable of breaking the current through both the main line and the branch wires, the combination being substantially such as described.

And finally, in combination with an ordinary protector, such as is described, applied to the ordinary wire of a line, a protector, such as is specified, applied to a fine wire inserted in and making part of the main line, for the purposes specified.

No. 48,409.—H. K. JONES, Kensington, Conn.—*Lathe for Turning Tool Handles*.—June 27, 1865.—This invention consists in placing the blanks into an adjustable V-shaped crotch, where they are held until two revolving heads, with centres and revolving driving dogs, come to the point, where one of them is driven forward by coming in contact with a revolving cam which centres the blank at one end and forces it on to the revolving driving dog, the crotch travelling with the heads until the blank is securely held by a spring and pawl on a rack on the centre, when it is released and falls back to receive the next blank. The revolving heads carry the blanks forward to a series of stationary knives which give shape to the handle.

Claim.—First, the spindle *f* provided with spurs, and arranged in a revolving head *b e*, and operating, in combination with the longitudinally sliding centres *k*, in the revolving drum *E*, substantially as and for the purpose set forth.

Second, giving to the spur centres *a* sun and planet motion by means substantially such as herein described, for the purpose set forth.

Third, giving to the centres *k* an automatic reciprocating motion by means of a spring and cam or other equivalent means, substantially as and for the purpose specified.

Fourth, the pins *t* and hook *s* applied in combination with the trough *F* and centres *k*, substantially in the manner and for the purpose described.

Fifth, the use of stationary cutters *G I* in combination with the centres *f k*, arranged in revolving heads, substantially as and for the purpose set forth.

No. 48,410.—J. O. JONES, Boston, Mass.—*Carpet Fastener*.—June 27, 1865.—This invention consists in the application to the floor of an eccentric or curved plate and its supporting frame, by means of which a carpet may be securely attached to the floor, while at the same time it may be easily and expeditiously removed.

Claim.—The application and arrangement of the above-described apparatus, substantially in manner and to operate as before described.

No. 48,411.—ANTHONY KIPP, Brooklyn, N. Y.—*Tea Kettle*.—June 27, 1865.—This invention consists in making the lower part of tea kettles, including the spout, of copper, and the rest of tin.

Claim.—The tea kettle above described, the lower half of the kettle, including the spout, being made of copper, and the upper part above the spout and line C being made of tin, as a new article of manufacture.

No. 48,412.—ALBERT KOMP, New York, N. Y.—*Hot Frame*.—June 27, 1865.—This invention is fully described by the claim.

Claim.—A hot frame, composed of a series of arched stays B, radiating from a common centre and fastened to a ring A, substantially as set forth.

No. 48,413.—ERNST J. KRAUSE, Lancaster, Penn.—*Process for Making Beer*.—June 27, 1865.—This invention consists in treating the malt in a mash tun with water at 178° for one hour, and then adding to it a second quantity of water at 180° in half the proportion of the first quantity. The whole is then allowed to stand for one hour and a half, after which a portion of the liquor in the tun is drawn off, and water, at 182°, added: a proper quantity of hops is then added, and the whole is boiled for one hour, after which it is treated in the ordinary manner.

Claim.—The mode of manipulating or process for making bottom fermenting beer, as herein set forth and distinctly specified.

No. 48,414.—ISAAC J. LANCASTER, Vancouver, W. T.—*Hoisting and Lowering Apparatus*.—June 27, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—The employment, in connection with a ratchet wheel and windlass, of pawls D D', springs G G', a retainer H, and lever E, the whole being arranged and operating substantially in the manner and for the purpose set forth.

No. 48,415.—JOSEPH H. LITTLEFIELD, Cambridge, Mass.—*Breeching Hook*.—June 27, 1865.—This invention consists of an inclined standard attached to the shaft as a support for the breeching when under strain: a hook running over and beyond the standard and resting upon the shaft at any required distance in front of the standard, which hook is pivoted at its rear end so as to be capable of an upward motion in order to allow the breeching to be slipped under it, and is also provided with a spiral spring at its rear end, whose function it is to keep the end of the hook in contact with the shaft. In the hook just at the end of the standard is a recess, into which fits an upward-projecting tongue on the end of the standard, in order that, when the hook is raised up, there may be no opening by which the breeching might slip between the hook and standard.

Claim.—The hook A with its swell D and slot I, the standard B, with its tongue or continuation C and the spring F, all constructed, arranged, and combined substantially as described and for the purposes set forth.

No. 48,416.—JOSEPH H. LITTLEFIELD, Cambridge, Mass.—*Whiffletree*.—June 27, 1865.—This whiffletree is intended to be a safety device, by means of which the horse, when beyond control, may be released from the carriage. This object is to be effected by making the hooks in the ends of the whiffletree rotatory, and securing them in such a manner that they may be released and then pulled round by the rags far enough to allow the rags to slip off. The releasing is effected by means of a cord running from the hooks in the ends of the tree longitudinally through the tree, coming out at its centre and passing within reach of the driver.

Claim.—The combination of the ferrule B, having its guard d and socket k, the hook C, having its lever f, spindle j, and pin p, the spring D and the cord and chain F and E, or their equivalent, all arranged substantially as described and for the purposes set forth.

No. 48,417.—THOMAS H. LOWERRE, New York, N. Y.—*Apparatus for Attaching Mourning Badge to Hat*.—June 27, 1865.—In this invention a series of pins pass through the hat from within, and through the prepared edges of the badge or weed, which is then sewed on by ordinary means. These pins are held in an iron frame inside the hat, which is held to one side thereof by an adjustable arm which abuts against the opposite side of the hat.

Claim.—The implement herein described for securing bombazine to hats.

No. 48,418.—J. W. MALOT, Boston, Mass.—*Valve Gear of Steam Engine*.—June 27, 1865; antedated June 9, 1865.—This invention consists in the use of an auxiliary engine so arranged that the piston rod thereof is attached to the lower extremity of the link which controls the motion of the valve of the principal engine. The governor, which is driven in the usual way, is attached directly to the valve stem of the auxiliary engine, by which means any change of speed causes its valve to be opened and the piston to be raised in the cylinder, and thus the link is carried up, and the amount of steam admitted to the main cylinder is diminished, when, as a consequence, the balls of the governor fall, and the steam is shut off from the small cylinder and the link falls, and the necessary amount of steam is again admitted to the principal engine.

Claim.—Actuating the link that forms the communication between the eccentric rod and sliding-valve rod by means of an auxiliary steam cylinder and piston when supplied with steam by the movement of the regulator rod, as set forth.

No. 48,419.—HENRY MARTIN, Springfield, Mass.—*Brick Machine.*—June 27, 1865.—This invention consists chiefly in a mechanism so constructed that the plunger can be regulated according to the thickness of the bricks to be made. The press boxes are provided with a slide, through which stones, &c., can be discharged from the press box. A pusher, serving to bring the moulds under the grate, is operated by a hand lever secured to a rock-shaft; by the action of a crank a shaft is put in motion, and by means of a crank-pin on two slotted levers, the motion of the central shaft is transmitted to the gate and plunger.

Claim.—First, the slotted levers *i2 i2* and cog wheel *i t*, or their equivalents, in combination with the gate *f*, plunger *d*, mixing-box A and press-box C, constructed and operating substantially as and for the purpose set forth.

Second, the adjustable tapering slide *i4*, in combination with the lever *i2*, pins *i3*, or its equivalent, and plungers *d*, constructed and operating substantially as and for the purpose described.

Third, the rising and falling slide or gate *m*, in combination with the press-box C, constructed and operating substantially as and for the purpose specified.

Fourth, the pusher E, arms *f*, and rock-shaft *e*, in combination with the roller platform D and with the mould constructed and operating substantially as and for the purpose set forth.

No. 48,420.—MAURICE H. MATSINGER, Philadelphia, Penn.—*Bracket.*—June 27, 1865.—This bracket is formed from a bar or plate of metal, on one end of which is a socket, the axis of which is of the width of the plate, and the portion of which contiguous thereto is turned upwards edgewise, so that the axis of said socket is parallel with and above the edge of the main body of the plate. The inner end of this plate is twisted one-fourth round, and bent out of line sufficiently to give the staff a proper inclination, and is secured to the sill of the window by means of screws passing through it. A short distance from this inner end is attached another socket, the axis of which is in line with the outer one, and which sustains the inner end of the staff.

Claim.—The plate A with its sockets *c* and *c'*, the whole being constructed and adapted for the reception of a rod or staff, substantially as described.

No. 48,421.—JOHN MATTHEWS, jr., New York, N. Y.—*Faucet.*—June 27, 1865.—In this invention within the tube is a flexible lining which is compressed by a spring stopper at one point; pressing down this spring permits the flow of the liquid.

Claim.—First, in combination with a flexible lining tube C applied within the passage of a cock or faucet, a stopper, the operation of which is so controlled by a spring as to compress and close the said tube C automatically, substantially as herein specified.

Second, the combination of the flexible lining tube C, stopper D *d d e*, fixed diaphragm *a*, spring E and cap F, the whole applied in relation to each other and to a cock or faucet, to operate substantially as herein specified.

No. 48,422.—JOHN MATTHEWS, jr., New York, N. Y.—*Instrument for Opening Bottles.*—June 27, 1865.—This invention consists of a metallic cap, to which are attached clips which pass over the neck of the bottle and fasten in the recess around the neck. The cap has a tube of hard rubber, or similar material, of such size as to fit loosely in the neck of the bottle attached to it. A packing ring is attached to the instrument to prevent the liquid from escaping between the neck of the bottle and the metallic cap.

Claim.—First, an instrument for opening and holding open the inwardly closing stopper of a bottle, consisting of an internally operating device for pressing back the stopper from its seat, and an attached externally operating means of holding the said internally operating device in position to keep the stopper open, substantially as and for the purpose herein specified.

Second, the combination of the collar A, tube or hollow hub C, elastic packing ring D, and spring clasps or clips B B, substantially as and for the purpose herein specified.

No. 48,423.—EDWARD MAYNARD, Washington, D. C.—*Breech-loading Fire-arm.*—June 27, 1865.—This invention consists in the combination of a retaining spring with the plunger, in the hinged block of a breech-loading fire-arm, when the said spring is contained in a hole extending from the under side of the breech block to the aperture in which the plungers work.

Claim.—The combination of the retaining spring S, with the plunger B, in the hinged block of a breech-loading musket or other fire-arm, when the said spring is contained in a hole extending from the under side of the breech block to the aperture in which the plungers work, substantially in the manner and for the purpose herein set forth.

No. 48,424.—JOSIAH F. MELCHER, Bloomington, Ill.—*Washing Machine.*—June 27, 1865.—This invention relates to a means used to cause a flow of water toward the plunger, during the act of forcing it up to its work, so that the water will be thrown upon and through the clothes during the act of pressing them against the washboard.

Claim.—First, forcing a stream of water through or upon the articles to be washed, simultaneously with the operation of the plunger, and in a contrary direction to the movement of the plunger, by means substantially as described.

Second, the valves *b h*, and chamber *D*, in combination with a perforated washboard *C*, and a plunger *G*, substantially as described.

Third, the combination of a reciprocating plunger *G*, a water passage *D*, and a perforated washboard *C*, substantially as described.

No. 48,425.—JAMES MILLER, St. Louis, Mo.—*Grate.*—June 27, 1865.—In this invention the bars in the back of the fire pot are hollow, and communicate with chambers at either side of the grate: from these chambers and in adjacent flues pipes conduct the heat to upper chambers.

Claim.—The combination and arrangement of the horizontal tubular or hollow grate bars *b h*, with the lateral chambers *A A*, substantially in the manner and for the purpose herein set forth.

No. 48,426.—ALEXANDER NADOW, Springfield, Mass.—*Automatic Stop Motion for Steam Engines.*—June 27, 1865.—This invention consists in placing on and combining with the fly-wheel a sliding bar placed in a socket, with a spring acting upon it in such a way that in the event of any considerable increase in the motion of the wheel, the centrifugal force will cause this bar to protrude so far from its socket as to come in contact with the arm of a lever placed near it, and which in turn acts upon a sliding rod to the opposite end of which is a dog, which engages with the ratchet wheel placed upon the valve spindle, and which keeps the valve open while the engine is running at its proper rate of speed. On the same valve spindle, and outside of the ratchet wheel, is another wheel over which a cord or belt passes, which has a weight attached to it so that as the dog is disengaged from the ratchet wheel the weight falls, and by the action of the cord closes the valve, and thus prevents injurious increase of speed in the engine.

Claim.—The rod *d*, in combination with the fly wheel *A*, and suitable mechanism for closing the valve, substantially as described.

No. 48,427.—C. A. NEUHAUS, New York, N. Y.—*Bungs for Barrels.*—June 27, 1865.—This invention consists of a plug, provided with a valve which is pressed against its seat by means of a spiral spring. A lever set in a mortise is provided with a knuckle which rests on the head attached to a rod, and by depressing the end of the lever the valve may be opened.

Claim.—A bung provided with a tubular plug *c*, spring valve *d*, and lever *B*, substantially as and for the purpose set forth.

No. 48,428.—G. H. OBER, Newburg, Ohio.—*Wood Turning Lathes.*—June 27, 1865.—The object of this invention is to turn irregular forms, and it consists of a vibrating frame, with gear arranged in the frame to give the motion to the pattern, and the stock, with a sliding carriage, operated by a worm wheel and rack.

Claim.—First, the rack *L*, stop *r*, and shaft *E*, in combination with the lever *r*, catch *j*, screw *g*, and adjustable carriage *G* or *H*, substantially as and for the purpose set forth.

Second, the special arrangement of the spring *I*, clutch *c*, and shifter *T*, in combination with the shaft *E*, and adjustable carriages *G* or *H*, as herein described, for the purposes set forth.

No. 48,429.—JOHN H. O'NEIL, Pittsburg, Pa.—*Ash Sifter.*—June 27, 1865.—In this invention a sifter is made from a single piece of wire cloth, bent up on three sides to a pan shape, and fastened to a piece of stout wire which forms the rim: it is provided with feet, and a handle made of strong wire, and is intended to be placed in the ash pit of stoves.

Claim.—As an improved article of manufacture, the ash sifter constructed with its entire side and bottom of wire cloth, and provided with feet *b b b*, and handle *c*, all as herein described, and for the purposes set forth.

No. 48,430.—F. S. PEASE, Buffalo, N. Y.—*Three Way Cock.*—June 27, 1865.—In this invention the plug has a single transverse channel: when the direction of this is vertical the flow is direct through the delivery pipe, but when oblique or horizontal the flow is into an auxiliary tube, which curves upward and then enters the delivery pipe.

Claim.—The rotary valve *K*, with the through port *M*, rotating in a casing provided with parts which connect on one side with the chamber of condensed air *A*, with the vacuum chamber *A*, and with the exhaust opening *E*, and on the other side with corresponding opposite ports, which connect with the well pipe *I*, all substantially as and for the purpose described.

No. 48,431.—JOHN PEACE, Camden, N. J.—*Gas Fitter's Clamp.*—June 27, 1865.—This invention consists in two clips or supplementary jaws, each of which passes over one of the jaws of an ordinary vise. The contiguous faces of these clips are each furnished with a block of iron pivoted thereto in the centre, and of such a thickness that two semi-circular

transverse grooves, crossing each other at right angles, can be made in the faces of each. These grooves are of different sizes, and form the openings in which the different sized pipes or tubes are held while being cut.

Claim.—As an improved article of manufacture, a gas fitter's clamp, made substantially as herein shown and described.

No. 48,432.—WARDEN P. PENN, JACOB GEISS, and JACOB BROSINS, Belleville, Ind.—*Grain Drill.*—June 27, 1865.—This drill is provided with a reciprocating agitator, of peculiar form, for the purpose of insuring a free flow of seed from the hopper. One of the regulating slides at the bottom of the seed box is connected with an oscillating bar, and the teeth through which the seed are dropped are also attached to the same bar in such a manner that by a single movement of a lever the flow of seed from the hopper can be entirely cut off, and at the same time the teeth elevated clear from the ground. A pendant, and if necessary an adjustable support to the frame of the machine is added for the purpose of supporting a man behind the hopper to attend to the machine.

Claim.—First, the arrangement consisting of the slide C, fixed plates *d*, with check pieces *c2*, and movable plates *d1 b2*, in combination with the hopper, all constructed and arranged in the manner and for the purpose described.

Second, the construction of the agitating slide with doubled bevelled projections *e' e'* and clearing pins *e2*, in combination with the divisions *a a*, vibrating hangers D3; and seed-distributing devices shown, substantially as and for the purposes set forth.

Third, the long cut-off plate *d2* arranged with the plates *d d'* and slide C, and connected with the drill teeth by means of the pivoted vibrating bar E and chains *g*, and operated by a handle E, all in the manner and for the purpose described.

Fourth, the slotted hinge braces *h* applied to the drill tooth G and its bar H, in the manner and for the purpose described.

Fifth, the pendent stand board J, arranged substantially as described, upon a seed drill, for the purpose set forth.

No. 48,433.—W. B. PORTER, Farmer City, Mo.—*Seed Drill.*—June 27, 1865.—This invention consists in the employment of rollers in front and rear of the machine, the front rollers being placed between furrow openers for the purpose of crushing the clods of earth that arise from the openers. The roller in the rear has for its object, being bevelled off at its edges, the pressing of the seed in the ground after it is delivered from the seed box down through the openers.

Claim.—The combination with the furrow openers G and wheels H, provided with bevelled edges, of the rollers D, substantially as and for the purposes herein described.

No. 48,434.—THOMAS H. POWERS, Milwaukee, Wis.—*Broom Head.*—June 27, 1865.—This invention consists in forming the open end of the conical socket which holds the broom corn with a flange-shaped edge, whereby a closer joint is made with the broom inserted: also in the use of a D-shaped nut having its edges notched, for the purpose of giving it a more firm hold of the broom.

Claim.—Forming the edge of the conical or other suitable socket plate, in and by which the upper portion of the broom corn is held, of a flange shape, substantially as herein described and for the purpose specified.

Also, the D-shaped nut having its edges serrated or toothed, and arranged substantially as set forth and for the purpose specified.

No. 48,435.—ELIJAH FREEMAN PRENTISS and ROBERT ADAM ROBERTSON, Philadelphia, Penn.—*Apparatus for Distilling Petroleum.*—June 27, 1865.—This invention relates to improvements upon the patent granted to the same parties the 8th day of March, 1864, and consists in doing away with the danger of damage to the condenser by expansion and contraction thereof: in giving a free boiling space above the surface of the oil in the condenser: in making the auxiliary head a part of the column, thus dispensing with collecting pipes and lessening the surface liable to cause condensation: in making the condenser square instead of round, and having the inlet and outlet pipes on the same side, thus allowing the condensers to be conveniently ranged on a straight line; also in feeding the condensers with oil in such a manner that it is distributed equally over all the parts: in obtaining an enlarged air chamber and an increased surface for steam heating by a better disposition of the vapor pipes, without increasing the size of the columns.

Claim.—First, the employment of the bent vapor, steam, and air pipes *a b* and *c*, arranged constructed, and operating substantially as shown and described.

Second, constructing the column so as to have a space I unobstructed with pipes for the free boiling of the oil, substantially as shown and described.

Third, constructing the column so that the head K shall form a part thereof, the same being arranged, constructed, and operating in the manner and for the purpose substantially as shown and described.

Fourth, the slotted pipe or trough L in combination with the column, whereby the cooler oil is fed in and distributed equally over the pipes, arranged and constructed substantially as shown and described.

No. 48,436.—ELIJAH FREEMAN PRENTISS and ROBERT ADAM ROBERTSON, Philadelphia, Penn.—*Apparatus for Distilling and Rectifying Whiskey*.—June 27, 1865.—This invention (which is designed as an improvement on the patent of the same inventor dated March 1, 1864) consists in providing an additional chamber, with a thermometer, to be kept at a lower temperature than chamber 2 of the former patent. The weak spirit from the chamber is made to pass into boxes, while the spirit from chambers 2 and 3 falls upon the top of these boxes.

Claim.—First, the employment of chamber A, constructed substantially as described, and having a separate regulator, so that the said chamber can be maintained at any desired temperature lower than that of chamber 2, for the purpose of more effectually dehydrating the alcohol.

Second, the employment of boxes R1 R2, &c., attached to the upper shelves in chamber 4, in the manner and for the purpose substantially as described.

Third, the trough *e'* in combination with the pipe *e* and chamber A, arranged, constructed, and operating substantially as described.

No. 48,437.—PETER J. PERETZ, Milwaukee, Wis.—*Melodeon*.—June 27, 1865.—On one side of the instrument a shaft is placed provided with two levers capable of being operated by the knee of the player. These levers operate the shutters that close two sets of reeds in such manner as to open the same when required. These levers are so arranged that a short motion of one lever will open one shutter, and that a longer motion of the other lever will open the other shutter. The opening of the first shutter increases the volume of sound, and the opening of the second shutter produces two notes, one of which is an octave higher than the other.

Claim.—First, the arrangement of closing and operating the reeds at F and H by means of shutters J and G, and operated by arms *d* and *h* fast to a shaft K, when arranged and operating in the manner substantially as described.

Second, operating the shaft K by means of a lever *f*, acted upon by the said knee of the player in such a manner as to open either one set of reeds or both sets, as may be desired, substantially as set forth.

No. 48,438.—JOHN RAMDOHR, Virginia City, Nevada.—*Process for Refining Metal*.—June 27, 1865.—This invention consists in treating bullion broken into small pieces with sulphuric or muriatic acid, then washing it with water, after which the pieces are heated in a reverberating furnace to a red heat, the pieces being exposed to the influence of the atmosphere while being heated. The pieces are then taken out of the furnace and while hot again subjected to the action of the acids, then washed and heated as before; this process is repeated until the bullion is perfectly refined.

Claim.—The within-described process of refining the amalgam of gold and silver, commonly known as crude bullion, said process consisting of three subsequent manipulations, substantially such as set forth.

No. 48,439.—HENRY REDLICH, Chicago, Ill.—*Artificial Fuel*.—June 27, 1865.—This invention consists of coal dust, four parts; cow dung, three parts; and blood, one part.

Claim.—The within described combination of the ingredients above specified and mixed together, substantially in the manner and about in the proportion set forth.

No. 48,440.—JOHN REICHENBACH, Pittsburg, Penn.—*Substitute for Artificial Hands*.—June 27, 1865.—This invention consists of a pair of pincers attached to a case to be worn over the stump of the natural arm and operated by means of a cord attached to the arm above the elbow in such a manner that by extending the arm the pincers are opened, and by flexing the arm again the pincers are closed. On the top of the upper pincers is arranged a hook for convenience in lifting articles.

Claim.—The use of a pair of pincers, constructed substantially as described, attached to a case to be worn over the stump of the arm which has lost the natural hand, and operated by means of a cord attached to the arm above the elbow, as a substitute for an artificial hand.

Also, the combination of the pincers and hook, constructed substantially as described, for the purposes hereinbefore set forth.

No. 48,441.—WILLIAM RICE, Concord, Ill.—*Wheat Drill*.—June 27, 1865.—In this invention separate frames are pivoted within a stationary main frame. Each of the inner frames are pivoted at its front end and carries an opening runner and roller. These frames, when elevated singly, raise both the runner, roller, and seed tube.

Claim.—The combination of the frame A, pivoted frames E E, wheels B G, and furrow cutters H, all constructed and arranged to operate as specified.

No. 48,442.—M. A. RICHARDSON, Sherman, N. Y.—*Washing Machine*.—June 27, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—First, the adjustable apron I I in combination with the elastic spring K and the wooden springs G G, constructed and operated in the manner and for the purposes specified, substantially as set forth.

Second, in combination with a washing machine constructed with two adjustable aprons, which are connected by an elastic spring and a series of rollers resting upon wooden springs, as represented, the clothes box M, constructed and operated in the manner and for the purposes specified, substantially as set forth.

No. 48,443.—E. S. RITCHIE, Brooklyn, N. Y.—*Binnacle*.—June 27, 1865.—This invention consists of an arrangement of prisms by which light is so directed from a lamp in the upper part of a binnacle through two lenticular prisms so disposed with reference to the lamp and the mariner's compass beneath it that through one of the prisms a soft and mild light illuminates the whole card of the compass, while through the other the rays are so deflected as to fall in a brilliant pencil upon that portion of it from which the magnetic course is to be read. Either one or two shutters or screens may be so fitted to the interior of the lamp case that by means of a lever and working slide, with a knob extending through a slot to the exterior of the case, the light may be shut off from either one or both lenses at will.

Claim.—The combination of one or two lenticular prisms, or the equivalent or equivalents thereof, with a binnacle and its lamp, substantially in the manner and for the purpose of illuminating the compass, or part of the same and a part of the compass box, as specified.

Also, the binnacle lamp as made with a recess in its side to cause it to rest on the bottom of the lamp chamber and fit around the prism case, as specified.

Also, the combination as well as the arrangement of the prism case D and the light-discharging passage or mouth E, with the binnacle chamber and the lamp chamber, as specified.

Also, the combination of the movable shutter or screen O and its operative mechanism with the lamp, the lenticular prism, and its case, and the lamp and binnacle chambers, arranged substantially as described.

No. 48,444.—ANDREW J. RITTER, Rahway, N. J.—*Carriage Spring*.—June 27, 1865.—This invention consists in the use of double side spars placed upon the axles, and provided with longitudinal braces of leather or rubber belting. The lower spars connect the axles and form the carriage part in such manner as to do away with steel springs, perch irons, body irons, &c.

Claim.—The double side spars A a A a, or their equivalent, in combination with the thorough-braces K K, cross bars I L, axle c', and axle bars F F, for the purpose herein set forth and specified.

No. 48,445.—CYRUS ROBERTS.—Three Rivers, Mich.—*Cultivator*.—June 27, 1865.—This invention consists in hinging the plough beams to the frame, and connecting them by means of stay rods to flaps, likewise pivoted to the frame, whereby the ploughs are lifted from the ground by the action of the stay rods. In connection therewith the driver's seat is mounted on radial bars, and connected with the plough in such a manner that the seat moves back and forth as the ploughs are lowered or raised, whereby the machine is counter-balanced, whether the ploughs are in or out of the ground. It also consists in the combination of the driver's seat with the ploughs by means of an adjustable connection, whereby the machine can be balanced with drivers of different weights.

Claim.—First, the combination of the plough beams with the flaps and stay rods, substantially in the manner described, for the purpose set forth.

Second, the combination of the frame, the movable driver's seat, and the ploughs, substantially as and for the purpose described.

Third, the combination of the adjustable driver's seat and hand lever with the adjustable link rod s, as and for the purpose described.

Fourth, the combination of the frame, the driver's seat, and the ploughs with the rear flap and stay rods, substantially as described, whereby the driver can exert his whole weight in raising the ploughs, as set forth.

Fifth, the combination of the frame and driver's seat with the shifting ploughs and elbow levers, when arranged and operating as described.

Sixth, the combination of the plough beam and stay rod with the hinged socket and wooden pin, when arranged and operating as described, for the purpose set forth.

No. 48,446.—JOSEPH ROGERS, Nashua, N. H.—*Water Door for Furnaces*.—June 27, 1865.—This invention consists of an iron shell cast around pipes, so that a constant stream of water can be made to flow through them.

Claim.—As an improved article of manufacture a door for furnaces, provided with internal tubes to form a water-passage through them, substantially as and for the purpose herein set forth.

No. 48,447.—JOHN ROSS, Philadelphia, Penn.—*Jack for holding Shoes*.—June 27, 1865.—This invention consists in a device whereby the jack can be rotated so as to present any portion of the edge of the sole towards the workman, and whereby the shoe, without unclamping, may be turned in any position for the purpose of sewing the sole, the whole being effected by means of the combination of the pin, rack and pawl, sliding block and pad, of a swivel, plate, and base, and finally of a swivel joint and rotating bearing.

Claim.—First, the combination of the pin, rack and pawl, and sliding block and pad, arranged substantially as set forth and described.

Second, the combination of the swivel G, plate M, and base L, arranged and used substantially as drawn and described.

Third, the combination of the swivel G, joint J, and rotating bearing K, when arranged substantially as set forth and described.

No. 48,448.—JOHN ROSS, Philadelphia, Penn.—*Heel Shave*.—June 27, 1865.—This invention consists in applying an adjustable blade sliding toward and from the guard of the device.

Claim.—The adjustable blade combined with the adjustable guard of heel-shaving tools, when constructed and operating substantially in the manner hereinbefore set forth and specified.

No. 48,449.—J. F. SANBORN, Hardwick, Vt.—*Churn*.—June 27, 1865.—In this invention the concave bottom of the churn is furnished with ribs arranged in V-shape, all inclining towards the centre of the churn. The dasher blades are also ribbed.

Claim.—First, the arrangement of revolving staves or beaters which are adapted for producing butter from cream, and then working the butter in conjunction with the obliquely ribbed concave, substantially as described.

Second, the combination of the long and short beaters or staves *d d* and *e e*, which are grooved and ribbed, with the oblique ribs *b b*, and plane portions of the churn bottom, substantially in the manner and for the purpose described.

Third, the arrangement of the ribs *b b* upon the surface of the concave bottom of the churn box, so that these ribs all incline toward the centre of the bottom of the box and toward one end thereof, substantially as described.

No. 48,450.—HUGH and JAMES SANGSTER, Buffalo, N. Y.—*Kerosene Oil Burner*.—June 27, 1865.—This invention consists of a spring at the base of the burner, so made that the burner may be connected to the collar by pressing it down and turning it partly round.

Claim.—First, constructing the spring E so that it connects the burner to the collar B by pressing it down into said collar, and turning it around until it springs over either corner J or J into the notch K, thus bringing the spring under the lower edge of the collar.

Second, in so constructing the lower part A of the collar B that when the burner is turned so that the spring passes the corner J it is forced into the case A, and allows the burner to be drawn out easily.

No. 48,451.—GEORGE W. SARGENT and PLUMER H. CHESLEY, Chelsea, Mass.—*Meat-chopping Machine*.—June 27, 1865.—This invention consists in the peculiar construction of the arms on which the knives are placed, and the means of operating them by a crank in connection with a rotating tub.

Claim.—The arrangement of the crank shaft *a*, the application of the chambers *m* on the knife rods *b*, the diagonal position of the knives, and the operation of the ratchet, in the manner and for the purpose as described.

No. 48,452.—JAMES B. SARGENT and FRANCIS W. TOWNE, Fitchburg, Mass.—*Steam Cock*.—June 27, 1865.—The object of this invention is to so arrange the parts composing a steam cock that the valve shall be certain to set tight irrespective of wear, and that leakage around the stem shall be prevented during a great length of time.

Claim.—An improved steam cock, made as described, viz., not only with the lifting screws, arranged with or applied to the stem of the valve and the cap B, as set forth, but with the valve stem provided with a key socket *k* to receive the key head *h*, as specified.

Also, the combination and arrangement of the wooden annuli *r s* and the flange *g* with the stem C, the chambered cap B, and its screw cap nut E.

Also, the combination of the auxiliary guide *g* and the socketed projection *h* with the case A, the valve *f*, and its lifting screws and key C, arranged with respect to it as described.

No. 48,453.—CHARLES SENTELL, Waterloo, N. Y.—*Mode of Renouncing the Surface of Printers' Rolls*.—June 27, 1865.—This invention consists in removing the hardened surface of printers' rolls, and recasting the same, by placing them in a mould and turning the melted material around them.

Claim.—Removing the hardened surface of printers' rolls, and recasting the same, by placing them in the mould C and turning the melted material around them, substantially as herein set forth.

No. 48,454.—S. L. SIMPSON, New York, N. Y.—*Ruler*.—June 27, 1865.—This invention consists in the employment of two or more spring stops applied to a strip of sheet metal which is secured to the upper surface of a ruler. Holes are bored through the ruler in such manner that by pressing on the ends of the strip of sheet metal the stops are depressed through the holes upon the paper or other surface on which the ruler is to be used, and an accidental slipping of the ruler prevented.

Claim.—The spring stop *d*, applied in combination with a ruler *A'*, substantially as and for the purpose set forth.

No. 48,455.—GEORGE L. SMITH, Brooklyn, N. Y.—*Grate for Steam-boiler Furnaces.*—June 27, 1865.—This invention consists of a grate divided into sections by longitudinal and transverse sections, and arranged so that each section will rest upon disconnected supports or trusses of an inverted V-shape and transverse beams.

Claim.—First, a grate surface formed of a series of sections upon which the fuel is placed in combination with a series of disconnected supports or trusses and traverse bearers, substantially in the manner and for the purposes herein set forth.

Second, a grate divided into sections by longitudinal and traverse divisions in combination with a series of disconnected supports or trusses and traverse bearers and a grated surface, substantially as and for the purposes described.

Third, the combination of disconnected supports or trusses with taper upper edges, traverse bearers, and a grated surface, substantially as and for the purposes set forth.

Fourth, trusses or supports for a grated surface made free from the grated surface and from the transverse bearers, substantially as and for the purposes set forth.

Fifth, so arranging the sections and the trusses or supports of a sectional grate that each section will be supported and balanced, substantially in the manner described.

No. 48,456.—DANIEL E. SOMES, Washington, D. C.—*Cooling Air in Buildings and Chambers.*—June 27, 1865.—This invention consists in constructing chambers and tanks beneath the surface of the earth, or under water in rivers, bays, &c, so that warm air shall be excluded, but means provided for ventilating with cool air. They are to be used for salting and curing meat, storing provisions, spirits, oils, or other substances requiring a low temperature for preservation.

Claim.—First, constructing submarine buildings, tanks, or chambers, substantially as described and for the purposes set forth.

Second, ventilating submarine buildings, tanks, or chambers, substantially as described and for the purposes set forth.

Third, cooling air by means and for the purposes herein set forth.

Fourth, cooling tanks and their contents in the manner herein specified.

Fifth, constructing and ventilating buildings, chambers, or tanks below the surface of the earth, for the purpose and in the manner herein set forth.

No. 48,457.—DANIEL E. SOMES, Washington, D. C.—*Cooling and Ventilating Ships and other Vessels.*—June 27, 1865.—This invention consists in the use of tubes of a bell shape, arranged in rows or groups, as may be most convenient, and running from the upper deck to near the bottom of the vessel. On one side of the ship the larger ends of the tubes are uppermost, and on the opposite side the smaller ends are uppermost. By this arrangement it is claimed a constant current of air is maintained through the bottom of the ship.

Claim.—First, constructing canal boats and other vessels with tubes or air ducts extending below the deck, and in a diagonal position with it.

Second, air ducts made in a funnel form, and used substantially as described.

Third, using water pipes or channels, substantially as and for the purpose set forth.

Fourth, using water pipes and air tubes in combination, substantially as set forth and described.

Fifth, increasing water pipes and conducting off water from condensed air, substantially as set forth.

No. 48,458.—LE ROY S. STARRETT, Newburyport, Mass.—*Washing Machine.*—June 27, 1865.—This invention consists in a means for operating the plunger, whereby an up and down, and also a rotary, motion is communicated to the same; and the invention also consists in the employment of a yielding perforated partition plate in the suds-box, whereby the cleansing or washing operation is greatly facilitated.

Claim.—The washing machine herein described, consisting of the suds-box *P*, false bottom *Q*, springs *R*, plunger *O*, adjustable rod *M*, walking beam *H*, crank *F*, pitman *I*, tubes *J* *K*, pawl *N*, ratchet wheel *L*, all arranged to operate as specified.

No. 48,459.—HENRY B. STOCKWELL, Brooklyn, N. Y.—*Fulminate Gas Lighter.*—June 27, 1865; antedated June 17, 1865.—This invention consists of a socket containing vertical passages; one of which passages extends through the socket, and is tapped so that it can be attached to an ordinary gas pipe; the other passage extends only partly through the socket, terminating in a transverse passage, in which a plug is inserted. A plunger and spiral spring are secured in the passage, extending only part way through the socket, the plunger operating as a hammer, by means of which the fulminate is ignited. Below the transverse passage there is a branch tube to contain the fulminate, which is made in the form of a stick; in the lower end of this tube is a plug, to which is attached a spiral spring, which keeps the fulminate constantly pressed against the plug.

Claim.—First, so applying a fulminate and a hammer or its equivalent, in combination with each other and with a gas burner, as to produce the ignition of the gas issuing from the burner

by the action of the hammer, or its equivalent on the fulminate, substantially as herein described.

Second, so combining the stop-cock which admits the supply of gas to the burner with the hammer or its equivalent, as to produce the action of the latter by the act of opening the former to turn on the gas, substantially as herein set forth.

Third, the hollow plunger or hammer D, rod *g*, and cam *t*, combined with each other and with the stop-cock and burner, and operated substantially as herein specified.

Fourth, one or more cavities, *ll*, in the plug of the stop cock operating in relating to a passage *f* containing the fulminate, and a passage *e* containing the plunger or hammer D, substantially as and for the purpose herein described.

No. 48,460.—HENRY B. STOCKWELL, Brooklyn, N. Y.—*Fulminating Compound*.—June 27, 1865; antedated June 17, 1865.—This invention consists of fulminating mercury four parts, saltpetre three parts, black sulphuret of antimony two parts, and French chalk one part.

Claim.—The fulminate compound, composed of materials herein specified, in about the proportions herein set forth.

No. 48,461.—JAMES STRATTON, Brooklyn, N. Y.—*Street Lamp*.—June 27, 1865.—This invention consists in a combination of two reflectors, having vitreous corrugated surfaces, with a street lamp.

Claim.—The two reflectors B D, with vitreous corrugated surfaces, in combination with the street lamp A C E, all constructed, arranged, and operating as and for the purposes specified.

No. 48,462.—JOHN S. P. TAYLOR, Oxford, Ohio.—*Carbine Socket*.—June 27, 1865.—This invention consists of a socket formed by winding India-rubber cloth around a proper form, the socket being made larger at the ends than in the middle. The socket is bound over at the edges, and covered with a coating of India-rubber, and the strap and buckle attached by means of rivets.

Claim.—A carbine socket formed of alternate layers of cloth and India-rubber, or their equivalents, substantially as described and to the effect set forth, as a new article of manufacture.

No. 48,463.—WILLIAM TOSHACH, New York, N. Y.—*Spring Catch for Window Sash*.—June 27, 1865.—This invention consists in making a knob of two parts, one fastened to the bottom of the sash, the other hinged to the first on the top of it, and having an arm projecting into the frame of the sash, and connecting with an angular lever, which lever in turn is connected by a wire to a spring actuated stop. The operation is such that when the double knob is grasped by the thumb and fingers to raise or lower the sash, the two parts of the knob being forced together, draw the stop and allow the sash to be raised or lowered.

Claim.—The arrangement in or upon a window sash, in combination therewith and with the arms *c* and *d* of an angular lever, A of a spring-actuated window catch B, and a hinged lever and window knob *a b*, as described, in such a manner as that pressure exerted upon the knob to raise the sash will also disengage the fastenings, all substantially in the manner herein set forth.

No. 48,464.—L. D. WALRAD, Sycamore, Ill.—*Device for Preventing Snow Drifts on Railroad Tracks*.—June 27, 1865.—The object of this invention is to obtain a means for preventing snow from drifting and accumulating on railroads, when the latter are by the sides of hills, or have an elevation at one side of them.

Claim.—The employment or use of inclined planes, placed at the side of and in a relative position with the track, to operate in the manner substantially as and for the purpose set forth.

Second, the manner substantially as shown and described, of constructing the inclined planes so that they may be adjustable, as and for the purposes specified.

No. 48,465.—ZACHARIAH WALSH, Newark, N. J.—*Machine for Putting Head Filling on Trunk Nails*.—June 27, 1865.—This invention consists of a machine for putting the pieces of pasteboard on trunk and similar nails, and which form the principal portion of the filling for the enlarged heads of said nails. It does not admit of a brief description.

Claim.—First, the employment or use of a rotating wheel A', provided with recesses to receive a series of dies *j'*, in which the pasteboards D and plates C are deposited in connection with a punch G'', and a nail-driving mechanism for pressing or passing the nails through the pasteboards and plates, substantially as and for the purpose herein set forth.

Second, the rotating notched wheel L'', encompassed partially by the strap S'', in connection with the jaws *y'' y'''*, for the purpose of presenting the nails properly to the punch G'' and the pasteboards and plates in the dies *j'*, substantially as described.

Third, the parallel bars *p'' p''*, in combination with the hopper H'', wheel L'', and spouts J'' K'', for the purpose of presenting the nails to the wheel L'', substantially as set forth.

Fourth, the perforated tubes F N to receive the sheet-metal plates C, arranged in the machine substantially as shown, so as to be movable, and placed alternately in positions for being filled and discharged, as herein described.

Fifth, the employment or use of an air pump W, in connection with a lifter X, arranged as shown, or in any equivalent way, for the purpose of taking the plates C from the tube N or N', and depositing them in the dies j', of the wheel A, as set forth.

Sixth, the spring n at the upper end of the tubes N N', in connection with the pressure lever L' and the slide M', or its equivalent, arranged substantially as shown, for the purpose of liberating the upper plate in said tubes, and admitting of the discharge of the same at the proper time, substantially as described.

Seventh, the rod S, fitted in the tube N or N', and operated upon by the weight V, in combination with the spring n, pressure lever I, and the slide M', or its equivalent, for the purpose specified.

Eighth, the catch X', arranged with the rod V' of the lever U', substantially as shown, in combination with the pivoted plate e'', provided with the arm or bar g'', connected with the catch X' by the links h'', for the purpose of constituting a means for the several stop mechanisms herein described, to act upon the lever U' and clutch I, as set forth.

Ninth, the rods E'' F'' passing through the arm g, and provided with the collars and springs, as shown and arranged, with the pivoted plate e'' and the arm g'' of slide Z, to operate or act upon the latter so as to stop the machine when necessary, as herein described.

Tenth, the rod E''' passing through the pivoted plate e'', and provided with the collar h''', in connection with the lever D''' and rod C''', connected with the arm f'', all arranged substantially as shown, to form a stop mechanism for the nail-discharging device, as set forth.

Eleventh, the lever R'', with pendent pivoted bar Q'', provided with the shoulders d'', in connection with the projection e''' on the slide Z, the lever R being placed relatively with the plate e'', and all arranged as shown, to serve as a stop mechanism for the wheel L', as described.

Twelfth, the lever X'' connected with the lever or bar Z'' by the link Y''', in connection with the spring C''' and the cam A''' on the shaft G, all arranged as shown, for discharging the nails from the wheel A'.

Thirteenth, the bent or curved bar Y, spring e', and the arm g' of slide Z, for operating the lever X, or moving it from over the tube N or N' to a proper position over the wheel A', and back again over the tube N or N' for the purpose specified.

Fourteenth, the plunger rod r and spring o, in connection with the lateral projection p, an arm g' for ejecting the plates C from the cylinder q for the lifter, as set forth.

Fifteenth, the rod T attached to the arm or operate or plate k of the rod S, and provided with an upper bevelled end t, in combination with the fixed plate t' and catch X', all arranged substantially as shown, to form a stop mechanism in connection with the discharging of the plates C from the tube N or N', substantially as described.

No. 48,466.—HERVEY WATERS, Northbridge, Mass.—*Guide for Roller*.—June 27, 1865.—This guide is composed of a horizontal plate upon which the bar is to rest when being presented to the rolls, and two side cheeks hinged to projections on said plate, in such manner as to accommodate themselves to the inequalities in width of a tapering bar or to bars of different widths, and thus maintain a uniform direction of movement of the bar until the rolls shall have drawn it forward off the guide.

Claim.—A self-adjusting roller guide, constructed to operate substantially as set forth.

No. 48,467.—WALTER S. WELLS, New York, N. Y., and S. B. WELLS, Middleburg, N. Y.—*Mode of Driving Machinery*.—June 27, 1865.—This invention consists in the employment, in combination with a motive spring or its equivalent, and a suitable system of gearing, of a governor and adjustable friction device for regulating and controlling the speed at which the driving mechanism shall run, and thus driving the machine to which the power is to be applied at any given uniform speed.

Claim.—The employment, in combination with a motive spring and the system of gearing, a governor and friction controlling and regulating device, substantially as and for the purposes hereinbefore set forth.

No. 48,468.—P. WERUM, Berlin, Ohio.—*Stave Machine*.—June 27, 1865.—This invention consists of a curved base on a reciprocating carriage, having the curvature of the stave, and upon it the stave is clamped and brought in contact with two saws that work in adjustable frames, so that both sides of the staves are cut to the exact bevel and shape desired.

Claim.—The sliding frame B, the adjustable saw frames C C E E, the adjustable rest G and arch L, the catch J, fingers g g and curved lever n, when these several parts are arranged, so as to operate as and for the purpose set forth.

No. 48,469.—ISAIAH M. WEST, Wilmington, Ohio.—*Churn*.—June 27, 1865.—In this invention the lever is fastened to the dasher rod by means of a notched pin and slot in the lever, held by a spring so as to be quickly detached. The dasher is formed of a small perforated box with a rim around it.

Claim.—The combination pin D in the lever slot *e* and dasher rod *c*, with the spring catch *f*, for the purposes herein specified.

Also, the construction of the dasher C, with the vertical perforated sides *h h*, close rim *g*, and close swing lids G G, substantially as and for the purposes herein set forth.

No. 48,470.—WILLIAM WHARTON, Jr., Philadelphia, Penn.—*Railroad Switch*.—June 27, 1865.—This invention consists in the arrangement of rails and a movable switch, for the purpose of transferring cars from the main track to the turn-out without injuring the main rail, by reason of the contact of the flanges of the wheels when passing over it, the switch rail being so elevated that the wheel passes freely over the main track rail.

Claim.—The combination of the permanent rails A A' of the main track, the permanent rails B and B' of the turn-out, and the rails D and D', comprising the movable switch, and forming continuations of the permanent rails of the said turn-out, when the rail D is so inclined that it will raise the wheels on one side of a car above the permanent rail A of the main track prior to the wheels being guided laterally by the tapering rail D', or its equivalent, all substantially as set forth.

No. 48,471.—EDWIN WHITEFIELD, Buffalo, N. Y.—*Printing Fluid*.—June 27, 1865.—This invention consists of a composition as follows: One pound of nitric acid is mixed with two ounces sulphuric acid, quarter of a pound of logwood, and quarter of a pound of Chinese blue. Iron filings are then added, and the whole is mixed with a strong decoction of logwood.

Claim.—A printing fluid composed and manufactured of the ingredients and applied substantially as herein described.

No. 48,472.—GEO. W. WICKS, Brooklyn, N. Y.—*Roller Die*.—June 27, 1865.—This invention consists in communicating motion to the rolls through the medium of a particular arrangement of worm gearing, in order to cause the dies to meet each other with greater exactitude than is possible with gearing such as is ordinarily used.

Claim.—The combination of the rolls with an adjustable worm shaft, arranged substantially as specified and for the purposes set forth.

No. 48,473.—ANDREW WINTERBURN, Albany, N. Y.—*Guard Finger for Reaping Machines*.—June 27, 1865.—This invention consists in constructing the guard finger with a cavity underneath the slot, through which the cutter is to play, and casting white iron into said cavity and against a chill plate placed over the same, thus producing a chill-hardened surface upon that part of the finger which is liable to be worn by the action of the cutter upon it.

Claim.—Constructing the guard finger or knife guard A with the chambers or cavity B, and casting hard metal in said cavity or chambers, substantially in the manner and for the purpose described.

No. 48,474.—L. H. WOOD, Marlboro', Mass.—*Machine for Punching Leather*.—June 27, 1865.—This machine consists mainly of a punch and die or anvil, the former working vertically, and a presser foot, arranged in such manner that, immediately after a hole has been punched, the presser foot is raised up so as to release the bar or other article which is being punched, and a lateral translatory movement is given to the punch, by which (the punch being still within the hole just made by it,) the bar will be carried along over the anvil the distance required for another hole to be made, then the presser foot again descends and clamps the bar, the punch is elevated, and by means of springs forced back to its original position, and then descends again to punch another hole. The lateral movement of the punch, and consequently the distance which shall separate one hole from another, is regulated by set-screws.

Claim.—First, giving a simultaneous lateral motion to the punch carrier B and bed E, substantially as set forth and for the purpose described.

Second, holding the work by means of the presser L, during the lateral translatory movement of the punch, substantially as described.

Third, rendering the punch adjustable, so as to punch holes any required distance apart, substantially as described.

No. 48,475.—LINUS YALE, Jr., Shelburne Falls, Mass.—*Locks*.—June 27, 1865.—This invention consists of a mortise lock, the case of which has on each side a screw-tapped hole, into either one of which is screwed a cylinder containing a series of pin tumblers, which are operated by a thin flat key. Screwing the cylinder into one or the other of the two holes in the case adapts the lock to either a right or left hand door, and it is adapted to doors of different thicknesses by screwing the cylinder to a greater or less distance into the lock case.

Claim.—First, the contrivance substantially as described for holding a bolt in place.

Second, the combination of a lock case, containing a bolt with a cylindrical chamber containing tumblers, all constructed and arranged with reference to each other, substantially as described, whereby the lock may be made right or left hand, or fitted to either thick or thin doors, the combination being substantially as set forth.

Third, the combination of a cylinder containing tumblers, and having a screw cut thereon, with a lock case having a nut attached to or making part thereof, and a screw pin, or its equivalent, arranged as described, whereby the former may be attached to the case so as to fit doors of different thicknesses, and secured in position by a device, which is so arranged as to be acted upon through the bolt hole.

Fourth, notched pin tumblers, in combination with a keyhole slit narrower than the diameter of the pins, and also notched, containing recesses, in combination with a keyhole slit narrower than their diameter, the combinations being substantially such as described, and operating substantially as set forth.

Fifth, in combination with a cylinder containing a keyhole and pin tumbler, a wing or lazy arm, constructed and operating as specified.

No. 48,476.—LINUS YALE, JR., Shelburne Falls, Mass.—*Reversing the Motion of Screw Taps*.—June 27, 1865.—This invention will be understood by reference to the claim.

Claim.—The combination of two recessed pulleys with two corresponding disks to clutch therewith, and a line spindle, to which the latter are attached, arranged substantially as described, so that the spindle can be clutched to either pulley and made to rotate in accordance with the motions thereof by a force employed to push or to pull said spindle longitudinally in either direction, substantially as described.

No. 48,477.—F. W. BACON, assignor to the NEW YORK DESICCATING COMPANY, New York, N. Y.—*Vegetable Washer*.—June 27, 1865.—This invention consists in a rotating cylindrical cage, containing a spirally-formed grate, extending the length of the central shaft, and from the shaft to the circumference of the cage, for the purpose of producing a movement of the vegetables from one end to the other of the cage as it rotates in a tank of water. The principal novelty in the machine consists in its having a hollow central shaft extending through the cage, and perforated at short intervals, for the purpose of throwing among the vegetables, in numerous streams, clean water, received through a pipe entering one end of the shaft.

Claim.—The hollow perforated shaft B, receiving water at one end and delivering it in numerous jets or streams from its perforations, in combination with the revolving cylindrical cage and the spiral grate or grates, or their equivalents, arranged between the said shafts and the circumference of the cage, substantially as herein described.

No. 48,478.—HORACE BOARDMAN, assignor to himself and KELBY, DE MILL & Co., New York, N. Y.—*Manufacture of Wrought Iron from the Ore*.—June 27, 1865.—This invention consists of a furnace provided with two hearths, the balling hearth being separated from the grate by means or a bridge wall. At one end of the furnace, directly over the other hearth, is a reducing furnace, which is enclosed on three sides by gas chambers, which communicate with the reverberating furnace. In the upper part of the reducing furnace is a steam jet pipe, by means of which the draught may be increased, and a door is provided for introducing ore and fuel. A series of tuyeres passes through the outer wall of the gas chamber, and terminates in the said chamber directly opposite the apertures which lead to the fire chamber. When the furnace is in operation the blast of air through these tuyeres carries the heated products of combustion from the furnace out of the gas chamber and into the fire.

Claim.—First, the reducing fire F, combined with the gas chamber G and its tuyeres, substantially as described, for the purpose set forth.

Second, the combination and arrangement of the said reducing fire with a reverberatory furnace and balling hearth, in the manner described, so that the escaped combustible gasses from the said furnace or hearth can be used, when ignited by blasts of atmospheric air, for deoxidising and smelting the ore in the said reducing fire, as herein set forth.

Third, subjecting the ore in a reducing fire, while mixed or in contact with carbonaceous fuel, to the action of the escaping gases from the fire on the grate A, the gases being ignited by the introduction of atmospheric air, substantially as herein described.

No. 48,479.—LEVERETT BRADLEY, Jersey City, N. J., assignor to MARSHALL LEFFERTS, New York, N. Y.—*Machine for Perforating Paper for Telegraphs*.—June 27, 1865.—This invention consists of a punch provided with a reciprocating motion, so connected to the roller by a ratchet and cog wheel that the motion of the punch revolves it.

Claim.—First, the punch c, actuated by the lever h, and regulated in its movements by the adjustment of the nuts Q Q and shackle, substantially as specified.

Second, a reciprocating punch, in combination with a pair of rollers for drawing the paper along, and with a ratchet movement, actuated by the reciprocation of the punch, substantially as specified.

Third, a spacing lever or levers, combined with a pair of rollers for drawing the paper along and with a device for perforating the paper, substantially as and for the purposes specified.

No. 48,480.—SMITH W. BULLOCK, Elizabeth, N. J., assignor to THE BULLOCK ORE-DRESSING MACHINE COMPANY.—*Amalgamating Pan*.—June 27, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—First, the arrangement of the shafts of the plate E, and of the roller D, in a vertical position, or nearly so, in connection with the pan B, for the purposes set forth.

Second, the application of the springs to the boxes I I, for the purposes described.

Third, the application of gear or blank wheels, or of band pulleys, to the shafts C F and G, and to the pan B, for the purposes herein set forth.

Fourth, the application of an elastic coating or jacket to the roller D, in combination with an amalgamated plate of copper or other metal, for the purposes herein set forth, each of the several features being arranged substantially as and for the purposes described.

No. 48,481.—JOHN W. COLBURN, assignor to himself and O. F. CASE, New Haven, Conn.—*Water-proof Soles*.—June 27, 1865.—The object of this invention is to overcome a difficulty in the construction of combined rubber and leather soles for boots and shoes—the rubber to take the wear and resist moisture, and the leather for uniting the sole to the upper.

Claim.—A sole composed of an interior of rubber and a margin of sole leather, cemented together by a vertical butt joint, and of uniform thickness, or nearly so, without an insole, and made substantially as herein described.

No. 48,482.—EDWARD A. COOPER, assignor to himself and J. M. JOHNSTON, Buffalo, N. Y.—*Snap Hook*.—June 27, 1865.—This invention relates to the manner of constructing and fastening the spring which operates the moving lip of the snap. The spring is made tapering, and is driven into and held by a corresponding mortise made through the main bar of the loop, a lug being formed to lap over the mortise after the spring is driven in to prevent it from receding from its place.

Claim.—The tapering spring *d*, fitting and working in a corresponding groove in the thumb piece E, and passing through and secured by the mortise C and lug C', substantially as described.

No. 48,483.—ALEXANDER H. EVERETT, assignor to AMERICAN CAR WHEEL AND RAILWAY CHAIR MANUFACTURING COMPANY, New York, N. Y.—*Manufacture of Iron*.—June 27, 1865.—This invention consists in the use of cryolite in the manufacture of iron. The cast iron is melted in an ordinary cupola furnace, and to every one hundred pounds of iron from three to five pounds of cryolite is added, and then it is treated in the ordinary manner.

Claim.—First, the employment of cryolite, or its component elements, in the melting of cast iron, for the purpose of refining and strengthening the same.

Second, the employment of cryolite, or its component elements, in the melting of cast iron and wrought iron mixed, thereby producing a metal of great strength and fineness.

Third, the use of cryolite as a purifying agent in the melting of iron.

No. 48,484.—HENRY B. FAIRMAN, assignor to the METROPOLITAN COLLAR COMPANY, New York, N. Y.—*Button Hole*.—June 27, 1865.—In this invention a button-hole, having a narrow recess at the upper side in the middle of its length, is made to rest down upon the shank of the button, and thus hold it to a central position and prevent strain upon the edges of the slit, and also, by the lateral position of the shank, to permit the button readily to dip into the slit in the act of unbuttoning.

Claim.—The construction of a button-hole with a recess *b'*, at or near the middle of the length of one side, substantially as and for the purpose herein specified.

No. 48,485.—JOHN GRIFFITHS, Litchwich, England, assignor to himself and Z. S. DURFEE, Pittsburg, Penn.—*Apparatus for Puddling Iron*.—June 27, 1865.—This invention consists of a device for giving motion to the rabble of a puddling furnace. A circular bed plate is firmly attached to the furnace, the said bed plate having a groove upon its upper surface in which balls are placed. A rotary circular plate rests on these balls, the said plate being provided with a standard which serves as a support for the gearing, by which motion is given to the rabble.

Claim.—First, attaching the jib *q*, which carries the hanger *r* (through the intervention of which motion is communicated from the crank *x* to the rabble or stirring tool *v* in puddling and other operations) to a base or plate *d*, which is movable automatically in a horizontal plane substantially as and for the purposes hereinbefore described.

Second, giving a reciprocating lateral motion in an arc of a circle to the jib *q*, and consequently to the hanger *r*, through the partial rotation of the movable plate *d*, produced by means of the curved endless rack 8 and the pointed shaft 5, having on its end a pinion working in said rack, and which carries with it the forked lever 11, substantially as hereinbefore shown.

Third, controlling the movement of the hanger and rabble by means of a bow 2, proportioned in shape and dimensions to the character and extent of the furnace bottom in which the rabble is to work.

Fourth, providing the free end of the hanger *r* to which the rabble is attached with a double fork, or the rabble with double pins, at suitable distance apart to compensate for the irregular enlargement of the furnace bottom.

Fifth, placing the axis, around which all the movements of the apparatus are made, so far back of the line of the working hole as to produce a leverage in the action of the rabble, at certain stages of the operations, in order to clean the jambs of the furnace.

Sixth, also communicating the peculiar stirring motion to a stirring tool or rabble, in puddling or other operations, by loosely attaching the free end of the tool to a hanging rod, to the point of suspension of which a reciprocating motion is given from side to side, while a simultaneous but more rapid motion is given to the hanging rod or tool holder to and fro, in the direction of the tool, by means of the combination of devices for that purpose, constructed and arranged substantially as hereinbefore described.

No. 48,486.—GEORGE R. HAY, assignor to himself and J. R. and E. SEELEY, Edgarton, Ohio.—*Stave Machine*.—June 27, 1865.—This invention consists in hanging the saw upon and between friction rollers set in a true circle, so that the saw is put in motion and driven by one of said rollers. These rollers are set in adjustable brackets, so as to be adjusted to the circle outside as well as inside of the saw, and it further consists of a reciprocating carriage having a gauge and dog which are worked by a cam lever to dog the stock.

Claim.—The arrangement of the adjustable brackets H H' with the adjusting screws, rollers F F', and saw D, operating as and for the purpose set forth.

Also, the carriage P, gauge L, cam lever p', dogs r r, and springs c', when arranged and operating as and for the purpose described.

No. 48,487.—HORATIO F. HICKS, assignor to HICKS BROTHERS, Grand View, Ind.—*Baling Press*.—June 27, 1865.—The feed door is automatically opened and closed by a revolving cam, and the packer is elevated and depressed by the same means, and thus operated by a force independent of its gravity. The irregular bulging contour of ordinary pressed bales is avoided, and at the same time the durability of the press increased by providing the baling doors with struts at their mid lengths, which struts support bridge rods whose rear ends become members of the hinges, whose stationary portions are secured to and extend entirely athwart one side of the trunk, and become at their other ends the corresponding members of the hinge of the other bale door.

Claim.—First, the revolving cage or cam, operating to automatically open and close the feed door, and to elevate and depress the packer by a force independent of its gravity, substantially as set forth.

Second, the arrangement of nut D, sill E, transom C, collars F, rings H H', and rollers G, for the support and easy operation of the press as set forth.

Third, the provision of the parts 11, 22, 33, 44, 55, 66, or their equivalents, for the purpose explained.

No. 48,488.—GEORGE J. HILL, Buffalo, N. Y., assignor to himself and H. G. LEISENRING, Philadelphia, Penn.—*Numbering and Paging Machine*.—June 27, 1865.—A cross-head is arranged to slide in vertical guides formed in the side frames. In the longitudinal opening in the cross-head are fitted the stems of a number of hangers, each of which carries a numbering wheel, and each wheel has a number of projecting types for imprinting the numerals. The desired movement is imparted to the numbering wheels by rods, one of which is arranged to slide vertically in a bracket attached to each hanger. These rods have bent lower ends which are made to engage with the teeth of a ratchet wheel adjacent to the numbering wheels, and thus impart the desired motion to the latter.

Claim.—First, the reciprocating cross-head H and its system of numbering wheels in combination with the endless apron I, the whole being arranged for joint action, as set forth for the purpose specified.

Second, the bars V and V' adapted to inclined openings in the standards or guide pieces T and T', and supported by a spring or springs, all substantially as set forth and for the purposes specified.

Third, the hanger 8 with its numbering wheels and the spring 10, or their equivalents, for rendering the said numbering wheels self-accommodating to the thickness of the book, the pages of which have to be numbered.

No. 48,489.—L. D. HOIT, Medford, Mass., and ROBERT MURRAY, Boston, Mass., assignors to JAMES W. TUFTS, Medford, Mass.—*Draught Cock for Soda Water*.—June 27, 1865.—This invention consists of a cock with two outlets so arranged that the first outlet may be opened by means of a valve, and the other outlet by giving a partial rotation to the cock itself; the latter opens into a conical tube which terminates within the conical deflector opening into the gas chamber.

Claim.—First, the deflector G, constructed and arranged substantially as set forth, in combination with the chamber E or its equivalent, for the purposes described.

Second, the combination of the cone F with the cone G and nozzle E, substantially as and for the purpose described.

Third, providing the cock C with two channels a and b, and so arranging the same that the one may be opened and shut by means of the valve L, and the other by giving a partial rotation to the cock itself, substantially as and for the purpose described.

No. 48,490.—T. C. LUTHER, assignor to himself and AMERICAN FLASK AND CAP COMPANY, Waterbury, Conn.—*Machine for making Paper Boxes*.—June 27, 1865.—Circular boxes with

this machine are manufactured by winding the paper upon a cylinder and compressing it during the winding process by means of an auxiliary roller, the end of the paper being pasted to prevent its unwinding. After the paper tube is thus formed a series of circular cutters is pressed against it, dividing it into pieces of a length equal to the space between the cutters.

Claim.—The cutters *H* in combination with the rollers *B C*, arranged to operate in the manner substantially as and for the purpose specified.

No. 48,491.—NATHAN R. RAMSEY, assignor to DANIEL POMROY, Orange, Mass.—*Damper.*—June 27, 1865.—An annular space across which concavo-convex slots arranged alternately on upper and lower sides so that between the edges of the upper and lower slots are apertures through which the products of combustion pass when the damper is in a horizontal position.

Claim.—The above-described improved heat regulator or damper, or combination and arrangement of the ring *a* and the two series of concavo-convex bars *b b b d d*, with openings between them, as set forth.

No. 48,492.—W. J. RAND, Brooklyn, N. Y., assignor to the NEW YORK DESICCATING COMPANY, New York.—*Desiccating Kiln.*—June 27, 1865.—In this invention two or more drying chambers are arranged one above the other, and having double or hollow floors, the upper one being perforated and the lower closed, and between the two are coils of steam pipes. In the lower part of the apparatus is a steam coil to which external air is admitted or forced, and whence hot air is conveyed by artificial flues at the sides or corners of the kiln into the drying chambers; its admission here may be controlled by registers. In the centre is an upright ventilating shaft extending from the lowest desiccating chamber up through the roof, through slotted openings and in this shaft the moisture from each chamber may flow off. On the outside of the kiln is an upright feeding trunk with apertures into each chamber; in each aperture is a door hinged at the bottom, so that when thrown back an inclined plane is formed, down which the substance to be dried will slide.

Claim.—First, a kiln for desiccating purposes, constructed with two or more desiccating chambers *C C'*, one above another, having double or hollow floors *a c* heated by steam pipes *d*, with an air heating or distributing chamber below, from which heated air enters the desiccating chambers by flues *h h* at the sides or corners thereof, and with a central ventilating shaft communicating with the several chambers for the escape of the moisture, the whole combined or ranged and operating substantially as herein specified.

Second, in combination with a kiln having several desiccating floors or chambers arranged one above another one feeding trunk *F* common to all the chambers, communicating with them by apertures fitted with doors *m m* hinged at the bottom, and so constructed that when thrown back from the said apertures they close the feeding trunk below, and form inclined planes, down which the substances slide into the desiccating chambers, substantially as herein specified.

No. 48,493.—JAMES SANGSTER, assignor to himself, ROCKWELL, BAKER & HILL, and E. B. SANGSTER, Buffalo, N. Y.—*Printing Press.*—June 27, 1865.—This invention consists of a movable revolving bed with flat surfaces and ink rolls suspended between two springs with a cylindrical impression roller.

Claim.—First, a revolving cylinder having a number of plain surfaces upon its periphery or circumference for the purpose of recessing the paper or card-board to be printed, and resisting the pressure of the type when brought down against it, when said cylinder is so constructed as to move and present its plain surfaces one at a time at the proper angle to receive an impression.

Second, the springs *U'* and *U2* between which the inking roller *S* is suspended, for the purposes specified.

Third, in combination with the revolving cylinder or roller *B*, three or more slats such as are shown at *F3 F3* and *F3*, for the purpose of holding the card-board or paper in place while being carried under the belts *B3* and *B4*, and in the position to be printed, when found necessary to feed or lay the cards or tickets in by hand.

Fourth, in combination with numbering wheels, revolving roller in cylinder upon the periphery or circumference of which the tickets or cards are numbered.

No. 48,494.—WILLIAM MONT STORM, Harlem, N. Y., assignor to himself and CHARLES J. FERGUSON, New York, N. Y.—*Railroad Spike.*—June 27, 1865.—The object of this invention is to produce a spike that, when driven into the sleeper and brought to its seat, shall be so fastened therein that the movement of the cars over the rails will not in the least degree loosen it.

Claim.—As an improved article of manufacture a railroad spike, made substantially as herein described.

No. 48,495.—FRANCIS TAGGART, LEWIS S. CHICHESTER, and CLARK W. MILLS, assignors to GEORGE H. NICHOLS, Brooklyn, N. Y.—*Grain Elevator.*—June 27, 1865; antedated June 12, 1865.—This invention consists of an elevator applied between two floats, and in a deck or house covering the space between said floats, and into which space a vessel loaded

with grain may be floated so as to be entirely under cover. At the same time the elevator is made much more steady in consequence of its base being broader and space is furnished in the deck or house for the reception of grain. The same deck or house can be used for drying, cleaning, and cooling, or grinding the grain.

Claim.—First, a floating elevator for grain, formed with a deck extending across a space left for the reception of a canal boat or barge between two floats, and provided with an elevator or elevators working through such deck for the removal of grain from the said canal boat or barge, substantially as specified.

Second, the spout *k* sliding in the trunk *l*, in combination with the elevator *d* fitted to be raised or lowered, as and for the purposes specified.

No. 48,496.—EDWARD WASSALL, assignor to himself and ARCHIBALD MCFARLAND, Pittsburg, Penn.—*Rolling Apparatus.*—June 27, 1865.—This invention consists in placing the grooved roll in the middle and the flanged rolls above and below the same, for the purpose as indicated in the claim.

Claim.—First, the use, in a series of three high rolls, of one grooved roll and two flanged or tongued rolls, the grooved roll being placed between the other two rolls, substantially as and for the purpose hereinbefore described.

Second, the use of L-shaped guides in combination with the grooved roll in the middle of a series of three high rolls, for the purpose of giving the iron a bearing from the points to the heel of the guide as it passes from between the rolls as well as clearing it from the groove, substantially as hereinbefore described.

No. 48,497.—WILLIAM WILSON, Jr., assignor to himself and CHARLES GREEN, Wilmington, Del.—*Metallic Hoop for Barrels, Casks, &c.*—June 27, 1865.—This invention consists in crimping the hoop transversely or diagonally, and thus giving to it an elasticity which allows it to accommodate its shape to the bilge, and prevents its becoming loose by the shrinking of the cask.

Claim.—A corrugated or crimped metallic hoop for casks, barrels, kegs, &c., substantially as herein shown and described.

No. 48,498.—E. P. WOOD, Lowell, Mass., and A. E. BLOOD, Lynn, Mass., assignors to WOOD, SHERWOOD & CO., Lowell, Mass.—*Bench Hooks and Clamps.*—June 27, 1865.—This invention consists of two parallel bars of wood loosely attached together by means of an iron plate pivoted to one bar that has a dog to it, and the other bar so that it can slide on the plate and be stopped at the desired point by means of a pin which slides in a slot, on one side of which are teeth, into the recesses of which the pin enters and allows the bar to slide so that this bar is brought in close contact with the stuff and securely clamps it.

Claim.—First, the jaws A B, in combination with the hook E and connecting bar C, substantially as and for the purposes set forth and described.

Second, in combination with the jaws A B and hook E, making the apparatus adjustable for thick or thin material by means of the rack D and pin C, or equivalents therefor, substantially as and for the purposes set forth and described.

No. 48,499.—HENRY WURTZ, assignor to WURTZ AMALGAMATING COMPANY, New York, N. Y.—*Extracting Gold and other Precious Metals from their Ores, &c.*—June 27, 1865.—This invention consists in adding to quicksilver to be used in the amalgamation of gold, silver, &c., of a small quantity of an amalgam of mercury and sodium, or of mercury, or other equivalent metal, as potassium; by this addition the mercury more readily attacks the precious metals. Mercury treated in this way will also form a mercurial film or coating on iron or steel, so as to form amalgamated surfaces, to take the place of the usual copper plates. The mercury so treated is less liable to flow.

Claim.—First, the combination with quicksilver, when used for the extraction by amalgamation of metals from their ores or their mixtures with other materials, of metallic sodium or metallic potassium, or any other highly electro-positive metal equivalent in its action thereto, as above set forth.

Second, in those amalgamations in which amalgamated plates of copper or other metal are used, the substitution for the plates of copper or other metal, of iron coated with quicksilver combined with sodium or other highly electro-positive metal, as above set forth.

Third, the coating of iron, steel, or other metallic surfaces between or under which ores or other materials are crushed, with quicksilver combined with sodium or other highly electro-positive metal, as above set forth.

Fourth, the prevention of the granulation or flowing of quicksilver when used in any method of amalgamating ores or other materials by addition thereto of sodium or other highly electro-positive metal, as above set forth.

No. 48,500.—THEODORE L. OEST, Berlin, Prussia, assignor to HENRY MAURER and ADAM WEBER, New York, N. Y.—*Enamel.*—June 27, 1865.—This enamel, consisting of chemical pure clay, chalk, feldspar, flint, barytes, white glass, and silicate of soda, in the described proportions, is claimed to be particularly applicable to clay gas retorts, in which,

by its use, the separation of carbon and graphite is easily effected without requiring the re-burning of the retort, and the retort receives at the same time a solidity rendering unnecessary the exhausting operation.

Claim.—An enamel powder composed of the different parts mentioned, and in proportions substantially as specified and set forth.

No. 48,501.—JOHN CREA, Alleghany City, Penn.—*Heating Stoves.*—June 27, 1865.—This invention is set forth in the claim.

Claim.—First, the use of an air-chamber placed at the top of a close stove and having an imperforate top or cover and a perforated bottom, when such bottom is so curved, substantially as hereinbefore described, so as to form a circular recess for the detention of the gas and smoke.

Second, so arranging the perforated air-chamber, constructed substantially as hereinbefore described, that its top and sides, or the top alone, shall be parallel, or nearly so, with the top or cover of the stove, and at such a distance therefrom as to leave a narrow passage for the flame.

No. 48,502.—S. F. AMES, Stamford, Conn.—*Converting Rotary into Reciprocating Motion.*—July 4, 1865.—The object of this invention is to overcome the dead points in ordinary crank movements, which is effected by means of a rock shaft, in connection with an inclined plane wheel, fly-wheel, and anti-friction rollers.

Claim.—The combination and arrangement of rock shaft A, the inclined plane wheel B, the fly-wheel C, shaft D, and anti-friction rollers *a a*, constructed, arranged, and operating as and for the purpose herein described and set forth.

No. 48,503.—TRUMAN G. BAILEY, Wassiac, N. Y.—*Buckle.*—July 4, 1865.—This invention consists of two jaws, the outer faces of which are bevelled or wedge-shape, together with a tongue or spur which extends across the space between the jaws when in use, and stands in a corresponding hole in the opposite jaw, arranged relatively to a loop or strap and to a strap of malleable cast iron, and a slender steel spring.

Claim.—The jaws C D, with their inclined faces C' D', and tongue or spur G, arranged relatively to the enclosing strap B', and parts B E and F, or their equivalents, substantially in the manner and for the purpose herein set forth.

No. 48,504.—WILLIAM BAILEY, Troy, N. Y.—*Hydrant.*—July 4, 1865.—In this invention a detachable valve chamber is screwed to an ascending water pipe, at the base of the hydrant. The screw valve rod is in line with this pipe, the conical valve being seated at the bottom of the chamber; the flow of water is from the side of this chamber, whence it ascends through a pipe to the place of delivery. The descent of the valve to its lower water seat opens a waste port at the top of the valve chamber.

Claim.—The detachable valve chamber E, with its discharge pipe M, inlet valve-seat and screw opened inlet valve A, in combination with the fixed supply pipe O, united to the said valve chamber by male and female screws N, and arranged in the hydrant box Z, Fig. 4, substantially as herein described.

Also, the valves A and B, and screw C, all fast together, in combination with the stationary screw-nut D, valve chamber E, inlet passage F, discharge pipe M, waste opening I, and valve seats G and J, as herein described.

No. 48,505.—GEORGE BANISTER, Hartford, Vt.—*Socket for Hoe, Chisel, &c.*—July 4, 1865.—A short stout socket or hollow shank is formed on the steel or blade part of the chisel, and then inserted in one end of a cylindrical ferrule or socket, and the two are welded together.

Claim.—The method of forming the shank or stem on the part to which the socket is to be attached, and of uniting it to a sheet-metal band or ferrule, so as to form an additional layer of metal to give the socket an increased thickness and strength near the bottom or smaller part thereof, substantially as herein shown and described.

No. 48,506.—R. B. BAYARD, Philadelphia, Penn.—*Artificial Fuel.*—July 4, 1865.—This invention consists of a composition of petroleum, saw dust, coal dust, and resin, plaster or cement. The composition is placed in suitable moulds and subjected to pressure, so as to form it into blocks.

Claim.—The combination of petroleum or rock oil with vegetable fibre and coal dust in about the proportions herein specified.

No. 48,507.—O. T. BEDELL, New York, N. Y.—*Egg-holder and Packer.*—July 4, 1865.—This invention consists of a plate of India-rubber or other suitable material, having a series of pockets, each of which is capable of holding an egg.

Claim.—An egg-holder and packer produced from a disk or plate A, provided with or without a central hole *a*, and with a series of pockets B, each capable of holding an egg, substantially as herein set forth.

No. 48,508.—JOHN W. BOUGHTON, Appleton, Wis.—*Top for Mucilage Bottle*.—July 4, 1865.—This invention consists of a metallic cylinder, to which is hinged a top having a slot, so that it can be closed over the brush. The top is fastened, when the bottle is closed, by means of a screw and nut. The brush handle passes through a rubber pad, which rests in the mouth of the bottle.

Claim.—The combination of the compressible pad around the brush handle with the pressure cap, substantially as described and for the purposes set forth.

No. 48,509.—HENRY BOTEMLY, Camden, N. J.—*Lubricating Material for Wool*.—July 4, 1865.—This invention consists in using the secretion extracted from the wool for lubricating, preparatory to its carding and spinning.

Claim.—The use, for lubricating wool, preparatory to carding or spinning the same, of the secretion extracted from the wool.

No. 48,510.—THOMAS BRACHER, New York, N. Y.—*Covering for the Head*.—July 4, 1865.—In this invention a hat or cap of wire cloth is coated with a water-repelling gum or composition; and the exterior covering of cloth being laid upon this, is united thereto by heat and pressure.

Claim.—As a new and improved article of manufacture, a covering for the head, made of open weave wire cloth, combined by adhesion with the material to form the outer surface of the hat, bonnet, &c., substantially as described and for the purposes specified.

No. 48,511.—E. F. BRADFORD and L. L. BARBER, Boston, Mass.—*Sewing Machine*.—July 4, 1865.—This machine is designed for sewing leather, &c., with waxed thread, a single thread being used—a barbed needle from below and an awl working from above; and as neither of these instruments is used for feeding, the needle cannot fail to enter the perforation made by the awl.

Claim.—First, the thread feed in combination with a hook or barb needle, either with or without an awl, substantially as described.

Second, the employment of the feed finger B in combination with a hook needle and awl, substantially as and for the purpose described.

Third, arranging the end of the feed finger B so as to slide and act upon the double-thread or loop within a slot or hole in the sewing plate, and with its upper surface, either just below or flush with the surface of the plate, substantially as and for the purpose described.

Fourth, the combination and arrangement of the finger B with the hook needle F and automatically rising presser foot D, substantially as and for the purpose described.

No. 48,512.—JAMES BREWER, Albany, N. Y.—*Sulky Plough*.—July 4, 1865.—In this invention the rounded end of the plough beam adjusts vertically in the space between two hangers in front of the frame. The rear end of the plough beam moves vertically between two hangers, on which it is pivoted, to turn laterally at its upper end. This hanger is held against the plough beam by a spiral spring, but when the mouldboard of the plough strikes an obstacle, it turns, and the yielding hanger and rounded front end of beam allow it to turn sufficiently to pass an obstacle.

Claim.—First, making one of the standards E E, with the plough beam in its proper position, yielding to a certain degree, for the purpose of permitting the plough to pass obstructions which are in its line, and which are too hard to cut, substantially as and for the purpose specified.

Second, the combination with the plough beam of the rigid standard F, yielding standard E, screw bolt *a*, and spring *p*, substantially as and for the purposes specified.

Third, hanging the plough beam of a sulky plough between two standards in such a manner that the operation of the plough is not affected by the passage of the supporting wheel over rough or uneven ground, as and for the purposes specified.

Fourth, the combination with the plough and its beam G, herein described, of the laterally adjustable caster wheel H, when fastened to the rear of the plough beam, substantially as and for the purposes specified.

Fifth, connecting the hound in the furrow side to the pole by means of a hinge *s*, for the purpose of making it and the furrow wheel adaptable, as and for the purposes specified.

Sixth, the combination with the foot lever L and plough beam G, when capable of rotation within the standards I, of the friction rolls *q*, as and for the purposes specified.

Seventh, in combination with the plough beam G and tongue P the adjustable breast yoke Q, for the purpose of cutting more or less land, as herein described.

No. 48,513.—EDWIN BROWN, Leominster, Mass.—*Breeching Hook for Vehicles*.—July 4, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—First, the construction of a breeching hook by combining with a fixed standard a rigid hook swinging upon said standard, as described, so that the breeching strap shall be released by the displacement of the hook, substantially as herein described.

Second, in combination with a fixed standard and movable hook a spring actuating the hook, and located in relation to the hook and standard, as described.

No. 48,514.—D. P. BUTLER, Boston, Mass.—*Dumb Bells*.—July 4, 1865.—This invention makes dumb bells capable of graduation in weight by constructing them of a series of shells, one over the other, which may be removed or added at pleasure.

Claim.—The series of movable shells, held together and to the spindle or handle by a halved joint on each set of shells, and a screw *g*, passing through the centre of each shell and into the spindle, substantially as set forth.

Also, the sectional handle *b*, made in two parts, fitting upon and detachable from a central spindle *a*.

Also, the employment of the rings *k* interposed between the handle and shells for increasing the length of the handle, substantially as set forth.

No. 48,515.—MALCOLM CAMPBELL and JOB H. COLE, Philadelphia, Penn.—*Machine for Boring Wells*.—July 4, 1865.—This invention consists in corrugating the drill stock and lifting cams, where they come in contact with others, so as to render the lift of the drill more certain and efficient.

Claim.—Corrugating or otherwise indenting the contact surfaces of the lifting cam and drill stock, so that the lifting will be positive and without liability to slip, substantially as described.

Also, hanging the lifting cam shafts in adjustable and self-yielding boxes or bearings, as and for the purpose described.

Also, in combination with the drill stock and its lifting cams, the counterpoise *P* for aiding in raising the drill, when, from its extreme length, it becomes very heavy, and to equalize the force with which it falls, substantially as described.

No. 48,516.—CHARLES F. CHAMBERS, Hutsonville, Ill.—*Machine for Making Sheet-metal Pans*.—July 4, 1865.—This invention is designed as an improvement on a machine patented to the same inventor November 29, 1864, and consists in the employment of two rollers on the same line, instead of one, the inner ends of said rollers being considerably lower than the outer ones, the bending of the sheet by this means being commenced at the middle, and proceeding towards and finishing at each end. Also, in adjusting the blocks or forms relatively to each other to or from the rollers, and in the attachment of the gauge the slide or gate instead of to the table.

Claim.—First, the angling rollers *E E'*, or their equivalents, placed at any suitable inclination, to press the sheet-metal from the centre outward, as described and set forth.

Second, the set screws *m m'* and *c*, or their equivalents, for throwing the operating forms out of line with the remaining one, substantially as described.

Third, in this composition, the gauge *O*, when attached to the gate *D*, for the purpose of regulating the depth of the pans, in the manner set forth.

No. 48,517.—JAMES CHAMBERS, Boston, Mass.—*Pipe Coupling*.—July 4, 1865.—In this invention the coupling is formed of two semi-cylindrical bands of metal which embrace the extremities of the two pipes, and meet each other on opposite sides of the same. The ends of the bands which meet each other are provided with an outwardly projecting dove-tailed rib, and the two sections of the band are tightened upon the pipe by two sliding metal blocks, called keys, which, having each a dove-tailed and slightly wedge-shaped recess, embrace the two ribs, and, being driven up, draw the flanges or ribs together. A recess is formed on the inner surface of the ring to admit of packing.

Claim.—A pipe coupling, composed of two or more sections of a cylinder, having their contiguous edges provided with cleats or tenons *h h*, and fastened by keys *F F*, provided with dovetail wedge-shaped mortises *m*, or their equivalents, substantially as set forth and for the purpose described.

No. 48,518.—JOHN CHILCOTT, Brooklyn, N. Y.—*Cast-iron Steam Generator*.—July 4, 1865; antedated June 21, 1865.—This invention consists in providing, in a steam generator, a system of cast-iron arch-sided polygonal water and steam tubes, so arranged as to form flues for the passage of the products of combustion, which pass through to the rear and return again to the front before being allowed to pass off to the atmosphere.

Claim.—A steam generator, composed of tiers of arch-sided polygonal cast-iron water and steam tubes, arranged substantially as herein described, to form flues between the tiers.

No. 48,519.—D. M. COCHRAN and A. GEAR, Richmond, Ind.—*Machine for Stacking Straw*.—July 4, 1865.—In this invention a folding stacker is fastened by a tubular journal at its lower end to the winnow. Near the middle it rests on a horizontal rod, extending from two nearly vertical beams of the machine. This rod is vertically adjustable, and when the stacker is lowered below the sides of the separator, their wind boards fall with it, and fill the space between the separator and stacker. There is upon the upper end of the stacker an adjustable deflector to guide the straw to its position.

Claim.—First, the combination of a folding straw stacker, which is constructed of sections, with the hanging posts or beam *B*, and rod *j*, when these are used for confining and supporting the stacker in transportation or in operation, substantially as herein described.

Second, the combination of the guard or side boards *e'*, of the section *D*, with an adjustable stacker, and the box *A* of a threshing machine, substantially as described.

Third, a hinged or pivoted deflector H, applied at the discharging end of the stacker, substantially as described.

Fourth, the hinged apron H', in combination with a device or devices, for protecting the straw from the wind at its point of discharge from the stacker, substantially as described.

Fifth, a folding sectional stacker, which is susceptible of being elevated or depressed without leaving wind openings at the side of the lowest section, and which is arranged and combined with the rear end of a threshing machine in such manner that it can be folded beneath the same, substantially as described.

No. 48,520.—D. C. COLBY, New York, N. Y.—*Flour Sifter*.—July 4, 1865.—This invention consists of a shaft placed horizontally in a suitable hopper, having curved rubbers upon the shaft, a screen above it, and a concave sieve below; the hopper or box is hung by a rod to a frame, so that it can be tilted over to empty the refuse from the sieve.

Claim.—First, the use of the shaft B, provided with one or more rows of the strips *g g* and *h*, in combination with the box A, and the sieve I, and with or without the screen *m*, substantially as described and for the purposes set forth.

Second, the combination and arrangement of the box A, the standards D D, the rod *k*, and the strips E and F, as and for the purposes set forth.

No. 48,521.—S. J. CONE, Middletown, Conn.—*Chuck for Lathe*.—July 4, 1865.—In this invention a female screw, which is formed by a thread being cut in a cylindrical flange projecting from the face plate, has made to fit into it a thread ring, divided transversely into two parts. The internal surface of this ring is bevelled to fit a circular dovetailed tenon formed on the end of the wooden chuck, upon, and surrounding which said ring is placed; the whole is then screwed into the face plate.

Claim.—The use of the V-shaped split ring D, applied in combination with the head A, and chuck B, in the manner and for the purpose substantially as set forth.

No. 48,522.—D. M. COOK, Mansfield, Ohio.—*Apparatus for Boiling and Evaporating Saccharine Liquids*.—July 4, 1865.—This invention consists in forming an evaporating pan with the bottom in cells or corrugations. Cross ledges with underflow spaces are so arranged that the scum will flow over the top of the ledge, towards the cold end of the pan, while the juice flows through the openings towards the finishing pan. A removable cover is placed on the pan, and two or more pans may be arranged, one above the other, so that the steam from the lower pans will heat the upper pan. A false bottom may be placed on the outside of the corrugated bottom, so that the cells will form tubes or flues.

Claim.—First, the construction of cellular or tubular boilers, substantially in the manner and for the purposes described.

Second, the combination of one or more perforated or imperforated ledges, with cellular or tubular boilers, substantially as and for the purposes described.

Third, constructing a tubular or cellular boiler with finishing cells or chambers, substantially as described.

Fourth, the combination of two or more cellular or tubular boilers, arranged substantially as and for the purposes described.

Fifth, the combination of a lid or cover with a cellular or tubular boiler, substantially as described.

Sixth, the construction of a cellular boiler with a bottom plate C, or its equivalent, substantially as described.

No. 48,523.—WALDO P. CRAIG, Milton, Ky.—*Baling Presses*.—July 4, 1865.—Two slabs with grooved external faces hold the hay to be pressed between them in a tumbling box, the trunnions of which run in slots in the side of the press frame. Doors on the sides of the tumbling box allow clamps to be placed in the grooves of the slabs, to clamp the bale and hold it when sufficiently pressed. The tumbling box can be placed in a vertical position to be filled, and in a horizontal one to apply the pressure.

Claim.—First, the tumbling box H, substantially as described and set forth.

Second, the arrangement of tumbling box or trunk H, trunnions *h*, slots *e*, and abutment E', substantially as set forth.

Third, the combination of the U-formed clamp irons M M', tie bars N N', and grooved clamp boards or slabs K K', when constructed and employed as specified.

No. 48,524.—AMOS CRANDALL, Great Bend, Penn.—*Well Drill*.—July 4, 1865.—The object of this invention is to provide an instrument for drilling artesian wells, which will drill and run the well and pump out the sand at the same operation. It also consists of a chisel drill, over which is placed a reamer; above these on the drill shaft are fastened cups or buckets with their mouths upwards, into which the sand settles, until they are full, when the whole may be removed from the well, and the buckets emptied.

Claim.—The combination and arrangement of the drill D, reamer R, shaft S, and buckets B B B, constructed and operating substantially as and for the purpose set forth.

No. 45,325.—**MOSES G. CRANE**, Boston, Mass.—*Egg Beater*.—July 4, 1865.—With the rotary shaft of an egg beater two pinions and a sectional gear wheel are combined for the purpose of rotating the beater rapidly in opposite directions alternately.

Claim.—The combination of the rotary spindles A, the series of curved wires or arms a a and c, the pinions B and B', and the sectional gear C, the same being arranged so as to operate together, substantially as described.

No. 45,326.—**JOHN W. CURRIER**, Holbrook, Mass.—*Sanding Iron*.—July 4, 1865.—A separate block to be heated is placed within a case forming a double air space around the block on all sides, except the bottom. The block is easily taken out, quickly heated, and, on removal of the air space around it, retains its heat for a long time. The surface of the bottom of the case is thus continually smooth, clean, and hot.

Claim.—The combination of the block A with the parts B C and G in a flat or smoothing iron for the purpose of holding the block A, and forming a double air space around it, substantially as described.

No. 45,327.—**DARUS DAVISON**, New York, N. Y., assignor to **OLIVER DAVISON**, Lansingburg, N. Y.—*Cigar*.—July 4, 1865.—This invention consists in forming a wrapper by winding two pieces of leaf in different directions around a forming core. The wrapper is then filed and perforated at both ends.

Claim.—First, forming the wrappers or cases of cigars of two or more distinct pieces wound spirally around the spindle towards the cone-shaped end thereof, in opposite directions, one upon the other, and formed and finished at the cone-shaped end, substantially in the manner and for the purposes before described.

Second, combined as a whole, the making, forming, and finishing cigars, substantially as herein described.

No. 45,328.—**FRANK DEAN**, Beloit, Wis.—*Corn Planter*.—July 4, 1865.—In this machine the seed gate or cut-off is operated by a cord and ring in combination with an elastic rubber band.

Claim.—The slide A, in combination with the roller F, cone E, and ring H, arranged and operating substantially as described.

No. 45,329.—**B. DEMOREE** and **WABRY FOREYER**, Cleveland, Ohio.—*Sawm Engine*.—July 4, 1865.—This invention consists in two valves, valve rods, and levers by which they are operated, and a peculiarly formed cam by which they are moved, the object being to move the valves with varying rates of speed through different portions of their stroke.

Claim.—First, the valves C D, when arranged and operating in connection with four ports, in the manner and for the purpose described.

Second, the arrangement of the cam L, and levers E K, in combination with the valves and valve rods, substantially as and for the purpose set forth.

No. 45,330.—**ANDREW DUNNISON**, Paterson, N. J.—*Truss Bridge*.—July 4, 1865.—This invention consists in the construction of a bridge, adapted for military purposes, to be made of such timber and trees as may be readily found in the vicinity where the bridge is needed.

Claim.—First, securing the end-pieces to the legs of a truss, to be used for bridges, &c., by means of one or more wedge-shaped pieces driven into the same from the under side thereof, substantially as herein described.

Second, the adjustable feet for the truss legs arranged upon the same, substantially as herein described and for the purposes specified.

No. 45,331.—**EDWARD JAMES DUNSTON**, New York, N. Y.—*Screw-Sub for Fastening Railroad Chairs*.—July 4, 1865.—This invention consists in forming the screw thread on bolts by forging or swinging in proper dies, beginning at the point of the screw, which is turned slowly, as the work of swinging progresses, towards the neck or head.

Claim.—The bolt with the screw part thereof formed substantially as described, as a new article of manufacture.

No. 45,332.—**JOHN A. JACKSON**, Scranton, Penn.—*Coal Breaker*.—July 4, 1865.—In this invention the rollers revolve in opposite directions towards each other, and their faces are made of rings bearing teeth, separated from each other by flaps without teeth, the several teeth on the one roller revolving with and moving in the respective spaces between the teeth of the other.

Claim.—The construction of rings bearing teeth separated from each other by rings without teeth, as above described and for the purposes herein pointed out.

No. 45,333.—**GUSTAVE DEVEREAUX**, New York, N. Y.—*Hand-washing Device for Garment Persons*.—July 4, 1865.—In this invention a sponge or other flexible material is attached to the concave side of a reticulated plate, which plate slides into the grooves of a suitable frame screwed to the washboard. This sponge may be soaped and moistened, and the hand and arm passed over it, when it may be removed, with its back plate, to wash the face, neck, &c.

Claim.—First, a rubbing or washing surface composed of a sponge or other suitable porous substance fixed to a frame with an open or perforated bottom, substantially as and for the purpose above described.

Second, in combination, the perforated plate for holding a sponge or other flexible material with a bed plate, upon which it may be fitted by sliding in grooves or otherwise, substantially as described.

No. 48,534.—JOHN DANGLISH, M. D., Reading, England, assignor to STEUBEN T. BACON, of Boston, Mass.—*Machine for the Manufacture of Aerated Bread.*—July 4, 1865.—The escape of gas from dough in the manufacture of aerated bread is lessened by surrounding the dough, during its passage from the mixer to the baking pan, with any suitable aeriform body under a pressure exceeding the ordinary atmospheric pressure.

Claim.—The process or method of operation, substantially as described.

No. 48,535.—JACOB DOBBINS, Litchfield, Mich.—*Hoop Cutting and Bending.*—July 4, 1865.—In this machine are a series of feed rollers, upon which the stock is fed to the revolving circular knives, the axis of one being horizontal, and that of the other inclined, so as to cut one side of the hoop and bevelling. As the hoops are cut they are guided to and between rollers that crimp them to the proper shape for use.

Claim.—The rotating knives G K and guides M M', in combination with the rollers H N, for bending the hoops as they are cut, all substantially as and for the purpose set forth.

No. 48,536.—WILLIAM C. DODGE, Washington, D. C.—*Metallic Cartridge Case.*—July 4, 1865.—This invention consists in coating a copper or other ductile metallic cartridge case with tin to prevent its oxidation.

Claim.—A cartridge case for small-arms composed of ductile metal, and coated or plated internally, or both internally and externally, with tin or other suitable metal or alloy of metals, substantially as and for the purpose herein set forth.

No. 48,537.—J. P. DORMAN, Galesburg, Ill.—*Clothes Dryer.*—July 4, 1865.—This invention consists of a series of bars arranged parallel and at right angles to one another, with a sufficient distance between each of them to allow the placing of wet or damp clothing on each bar, and retaining the article there without pins; also in securing another set of bars that are in parallel form only to the post or standard, and are detachable at pleasure.

Claim.—First, a series of bars, *a* and *a'*, arranged parallel and at right angles to one another, constituting two or more arms B B, substantially in the manner and for the purpose herein described.

Second, arms B B, upright plate D, bracelet-plates *d d*, and hinged plate *b*, so constructed and arranged as to be readily detached from the post when desired, substantially in the manner and for the purpose described.

No. 48,538.—JOHN W. EASBY, Washington, D. C.—*Machine for Bending Metal Plates.*—July 4, 1865.—This invention consists of a series of bars lying near to each other, side by side, and supported separately by two adjustable screws, one under each end, which pass up through a strong base plate, and are provided with two nuts to bear respectively against the upper and lower surfaces of said plate; and to each of the two outer bars of the series there is attached a clamping bar, which, by means of screws, is made to clamp the plate of metal at both ends down upon the bars.

Claim.—The combination of the patterns E E, adjustable bars C C C, running transversely of the said patterns, the clamps D D, and bed-plate A, all constructed, arranged, and operating in the manner and for the purposes specified.

No. 48,539.—TEMPERANCE P. EDSON, Cambridge, Ill.—*Self-inflator for Raising Sunken Vessels, &c.*—July 4, 1865.—This invention consists of a box; the top and bottom may be made of wood and the sides of some flexible material; it is expanded by springs placed inside. There is an opening into the interior sufficiently large to allow it to fill with air as it is forced open by the springs. An India-rubber tube is applied to the hole corresponding in length to the depth of water into which it is plunged. It is placed in the water in a collapsed state, and when inflated will cause the vessel or article to which it is attached to rise to the surface. The number of inflators used must depend upon the weight to be raised.

Claim.—The herein described inflator when constructed, applied, and operating as and for the purpose set forth.

No. 48,540.—ALFRED EDWARDS, Chicago, Ill.—*Heat Radiator.*—July 4, 1865.—Inside a stove-pipe drum is a smaller cylinder, and in the top and bottom of the drum and by the side of the stove-pipe are tubes opening at one end into the room, and at the other into the cylinder.

Claim.—The combination of the heating chamber D provided with inlet and outlet tubes *b c*, with the cylinder B and circular plate C, arranged and operating as and for the purposes shown and specified.

No. 48,541.—HORACE FENTON, Cleveland, Ohio.—*Propelling Wheel for River and Canal Boats*.—July 4, 1865.—This invention relates to that class of wheels which act on the ground or bottom of canals in shoal water, and it consists in the gearing arrangements, arms, and friction rollers, by which the wheel is free to rise and fall, and thus adapt itself to the changes of the depth of the water.

Claim.—The adjustable wheel A, arms E, and slots *g*, in combination with gearings C D and friction rollers when arranged and operating conjointly, substantially as and for the purpose set forth.

No. 48,542.—JAMES H. FLAGG, Perkinsville, Vt.—*Corner or Joint for Soapstone Stoves*.—July 4, 1865.—This invention consists of corner pieces for holding the soapstone sides and lining plates together, cast in one piece, and readily put together or taken apart when desired.

Claim.—The corner piece of stoves for holding the sides of the stove and its linings together, cast in one and the same piece, substantially as herein described.

No. 48,543.—EDWARD A. FLOYD, Macomb, Ill.—*Escape Valve for Pumps*.—July 4, 1865.—In order to permit the water to flow out below the freezing line, an exterior slide valve is so arranged as to be held to its seat by a spring, and to be opened by the elevation of a rod, which may be lashed at its upper end, and the escape port thus kept open.

Claim.—The slide D, constructed as shown and described, operated by the stem F and spring *u*, as and for the purpose herein set forth.

No. 48,544.—J. W. FOARD, San Francisco, Cal.—*Shoemakers' Float*.—July 4, 1865.—This invention consists in constructing the float so that the cutters are separated from the float and held therein by means of a clamping screw; and further, in making the cutters with double faces.

Claim.—First, constructing shoemakers' floats so that the cutters are separate from the stock, and are held therein by means of a clamping screw, substantially as above described.

Second, making the cutters C with double faces, substantially as described.

No. 48,545.—H. G. FOLGER, Wadsworth, Ohio.—*Clothes Wringer*.—July 4, 1865.—This invention consists of a combination of devices for clamping the machine to the tub and the other operative parts, as indicated in the claim.

Claim.—The above described arrangement of the adjustable clamps G, levers L, pawls *h*, arm B, end-pieces A, bearings *b*, springs I, and brace D, for the purposes set forth.

No. 48,546.—A. K. FOSTER, Hallettsville, Texas.—*Saw Gummer*.—July 4, 1865.—This invention consists in the arrangement of an adjustable bar which carries a slide, on a stud in which the saw is pivoted, and an arrangement of levers for working said slide up to an adjustable gauge, and for turning the saw so as to present the teeth in succession to the grinding surface.

Claim.—The grindstone D, with the adjustable bar F, sliding bar H, and with the levers J K, and clamp or jaw L, or their equivalents, all arranged in connection with the saw M, to operate substantially in the manner as and for the purpose herein set forth.

No. 48,547.—ANDREW FULTON, Pittsburg, Penn.—*Piston Packing*.—July 4, 1865.—This invention consists in arranging upon a suitably constructed piston, uncut hard and soft metal rings, alternately; the rings being made of wedge form, and placed between the flanges of the piston head in such a manner that, upon screwing the nut upon the end of the rod, the movable flange is forced against the rings, and in consequence of their form the soft ones are extended so as to form a tight joint with the interior of the cylinder.

Claim.—The construction of the packing of a piston so as to operate as herein described, by arranging uncut hard and soft metal rings *b c b c*, of the wedge form, described upon a hub A, and between heads B D, one of which is adjustable lengthwise of the rod C, the said soft and hard metal rings being disposed in the order substantially as described, all for the purpose set forth.

No. 48,548.—FRANKLIN GLEASON, Philadelphia, Penn.—*Expanding Drill*.—July 4, 1865.—This invention consists in making a longitudinal slot in the end of the drill shank, and boring the shank from the bottom of said slot, and introducing into it a plate having a shank extending into the said bored hole; upon this shank is a screw nut, arranged so as to draw the plate into or out of the slot in the drill shank. Upon the outer end of the plate, on each side, are inclined grooves in which work pins attached to the expanding cutters, so that by drawing in or shoving out the said plate, the cutters are expanded or otherwise as desired, in a lateral direction in relation to the drill shank.

Claim.—The plate C, provided with the oblique grooves *d*, at opposite sides, fitted within the stock A, and adjusted by means of the nut F, on the screw of the shank *b*, or an equivalent means, in connection with the cutters D D, fitted in the cylindrical part B of the stock, and connected to the plate C by pins *g*, fitting in grooves *d*, substantially as and for the purpose set forth.

No. 48,549.—WILLIAM GOLDING, New Orleans, La.—*Steam Engine*.—July 4, 1865.—This invention consists in the application of a radius arm, in combination with a connecting rod, cross-head, and link, connecting said cross-head with the trunk of a trunk engine, for the purpose of making available the radius bar, in preventing the strain upon the sides of the trunk, and enabling the constructor to use a much smaller trunk than usual, thus considerably increasing the effective diameter of the cylinder, without really altering its dimensions.

Claim.—The radius arm G, applied in combination with the connecting rod b, cross-head a, link F, and trunk E, substantially in the manner and for the purpose herein shown and described.

No. 48,550.—EBENEZER GORDON, Cedar Rapids, Iowa.—*Washing Machine*.—July 4, 1865.—A semicircular frame in the body of the machine supports a number of rollers; a semicircular rubber, whose convex surface corresponds with the concave form of the frame, oscillates over the frame, and is provided with cross-bars, the exterior faces of which are rounded off. At the upper ends of the frame, above the uppermost roller, are blocks with corrugated surfaces which may serve as washboards when the rubber is removed.

Claim.—First, the combination of the supporting frame I, the rollers R, the semicircles F, the rubbing bars G, provided with exterior surfaces, the cross-bar E, the journals c c, and slots a a, arranged as and for the purposes specified.

Second, the combination and arrangement of the box A B, the removable supporting frame I, the rollers R, corrugated blocks D, rubber E G, and handle H, operating as and for the purposes specified.

No. 48,551.—WILLIAM GOLTRY, La Grange, Iowa.—*Field Marker for Planting*.—July 4, 1865.—This invention consists of a series of marking runners, with a fixed bar, and an operating handle or lever, for the purpose of controlling and changing with facility their direction.

Claim.—The combination of two or more runners or markers A A with each other, and with the connecting bars B and C, by means of pivot pin c c', substantially in the manner and for the purpose herein set forth.

Also, in combination with the pivoted markers A A, and connecting levers B C, the lever D, pivoted to the bar B, and operating substantially as herein described.

No. 48,552.—STUART GWYNN, New York, N. Y.—*Coating for Oil Vessels*.—July 4, 1865.—A coating consisting of a solution of dextrine, with or without admixture of glucose, or glycerine, is applied to the vessel, and the drying accelerated by artificial heat.

Claim.—The new article of manufacture constituting a tight oil vessel, lined or coated internally as described.

No. 48,553.—WILLIAM SMITH HALL, Quincy, Mass.—*Railway Car*.—July 4, 1865.—The object of this invention is to facilitate the starting of street cars, by means of a mechanism that is under the control of the driver, and operating upon the wheels of the car.

Claim.—The employment of the ratchet mechanism, when operated to start the car, by a chain winding upon a crank shaft or pulley, substantially as set forth.

Also, the method of disengaging the pawl from the ratchet, substantially as shown.

Also, combining with the starting apparatus a brake mechanism, operated by foot, substantially as shown and described.

No. 58,554.—CHARLES W. HARRIS, Philadelphia, Penn.—*Box, Ship, or Mast Scraper*.—July 4, 1865.—This invention consists in making the box or mast scraper of a concave form, having three casting edges, and of simple construction.

Claim.—Constructing a box scraper of the form substantially as described.

No. 48,555.—WILLIAM H. HART, New Britain, Conn.—*Door Bolt*.—July 4, 1865.—This invention consists in stamping out the barrel from sheet metal in one piece, having projections that pass through corresponding openings in the plate, and riveting them fast thereto, the barrel being rolled up to the proper shape after being stamped.

Claim.—Making the barrel of a door or shutter bolt of one piece of sheet metal, punched, formed and secured to the plate d, substantially as described.

No. 48,556.—G. H. HENKLE, Middletown, Ohio.—*Graduated Faucet Measure*.—July 4, 1865.—A cylindrical measuring vessel is so connected with a faucet that when it is in a horizontal position the liquid flows in a direct course from the cask into it, and when raised to a perpendicular position the liquid descends into the vessel in which it is to be drawn. The quantity is determined by the position of a packed piston within the measuring cylinder, as indicated by a solid rod connected with one side of said piston, a tubular piston rod on the upper side of the horizontal cylinder serving also to indicate when the graduated measure is full.

Claim.—First, the frame D E B, in combination with the measure A, arranged and operating in the manner and for the purpose substantially as described.

Second, the faucet constructed in the manner described, in combination with the measure A, to operate in the manner and for the purpose described.

No. 48,557.—R. HOFFHEINS, Dover, Penn.—*Combined Rake and Reel Attachment to Harvesters*.—July 4, 1865.—The object of this invention is to obtain a rake and reel combined in such a manner that the motion of each is independent of the other, and that the former can be stopped and started at will by the attendant. This is secured by hinging the rake to a cogged wheel and ring, both of which are fitted loosely about the tubular support of the shaft, which carries or drives the reel, and the former of which is actuated by a clutch gear wheel under the control of the driver. The whole apparatus is driven directly from the main axle by a tumbling shaft, and is mounted upon a hinged cutting apparatus, which is supported by a curved hinged frame.

Claim.—First, constructing a combined rake and reel, so that the rake is independent in its revolutions of the reel, upon a support which is mounted upon the hinged cutting apparatus of harvesting machines, substantially as herein described.

Second, the construction of the support H, for the combined rake and reel, substantially as described.

Third, securing the required motions for the rake by connecting it to a revolving ring or yoke or coupling, and to a revolving wheel J, which are arranged in different planes, and applied to a central shaft or axial support, substantially as described.

Fourth, the manner substantially as described of connecting the rake to its driving wheel J by means of a spring bar, or its equivalent, for the purpose set forth.

Fifth, the arrangement of the four gear wheels *J q p p'* with the combined but independently revolving rake and reel, substantially as herein described.

Sixth, in a rake and reel combined, the rake revolving, independently of the reel, around the axis of the shaft which carries or drives the reel; providing for stopping and starting the rake without disturbing the reel, and without stopping the machine or harvester, substantially in the manner herein described.

Seventh, the combination of the driver's seat of the harvester, independently revolving rake, independently revolving reel, and stopping and starting contrivance of the rake, substantially in the manner and for the purpose described.

Eighth, the combination of the extensible and flexible or jointed shaft S, independent rake, and independent reel, substantially in the manner and for the purpose described.

Ninth, connecting a rake, which turns around the shaft L, to opposite sides of a revolving device *k*, which serves as a hinge, on two sides of the shaft L, for the rake to play up and down upon, and also as a coupling, which permits the rake to revolve independently of the reel, substantially as herein described.

Tenth, the combination of an independently revolving rake, an independently revolving reel, sliding clutch wheel *q*, or its equivalent, and the hinging or coupling device *k'*, or its equivalent, substantially as and for the purpose herein described.

Eleventh, a rake which revolves or turns independently of the reel around the shaft L, which drives or carries the reel during its entire circuit, substantially as and for the purpose described.

Twelfth, the arrangement, with an independently revolving rake and an independently revolving reel, of a contrivance for stopping and starting the rake without stopping the reel, substantially as described.

Thirteenth, constructing a combined rake and reel in such manner that the rake and reel have independent motions of one another, although the rake moves around the shaft which carries or drives the reel, substantially as described.

Fourteenth, an independent revolving reel, mounted upon a hinged cutting apparatus of a harvester, in combination with a revolving rake, substantially as described.

Fifteenth, the arrangement in a harvester of the independent reel, independent rake, hinged cutting apparatus, and stopping and starting apparatus, substantially as described.

Sixteenth, an independent reel and an independent rake combined, both moving in a similar direction, but in different paths, about a common axis or shaft, substantially as herein described.

Seventeenth, the combination of an independent revolving rake, which is sustained at only one end, with an independent revolving reel or gatherer, which is also sustained at only one end, in such manner that the rake always maintains a position below the reel, substantially as described.

Eighteenth, the combination with a harvesting machine constructed with two driving wheels, a jointed cutting apparatus, an independently revolving rake, and an independently revolving reel—the reel and rake being mounted on the cutting apparatus—of an adjusting contrivance, which is so arranged that the driver, while riding on the machine, can adjust the cutting apparatus and the rake and reel without stopping the machine, substantially as described.

Nineteenth, the combination of a hinged curved frame, hinged cutting apparatus, independent revolving rake, and independent revolving reel, substantially as described.

Twentieth, the arrangement of the independently revolving rake and independently revolving reel upon a jointed cutting apparatus at a point forward of the axle *a*, and to one side of the drive wheel A1, substantially as and for the purpose described.

Twenty-first, the arrangement, in a two-wheel harvesting machine, of a hinged supporting frame C, a jointed cutting apparatus, a revolving reel or gatherer, and a rake, with attach-

ments or connections by which the attendant of the machine, while riding thereon, can control its motions, substantially as herein described.

Twenty-second, combining a rake and reel or gatherer in such manner that the former revolves around the axis of the latter, and also independently of it, and can be stopped and started at the will of the operator while he is riding upon the machine, substantially as described.

No. 48,558.—ABRAHAM HUFFER and NATHANIEL SEHNER, Hagerstown, Md.—*Padlock*.—July 4, 1865.—In this lock the bolt which locks the hasp is itself locked by an auxiliary bolt, besides being otherwise fastened by a fixed stub, which catches in a notch in its side, the bolt being raised up for that purpose by a spring. The main key serves simply to operate the auxiliary bolt, the first or principal bolt being operated by an arm projecting from the shaft, which carries on its outer end the key hole cover.

Claim.—First, a padlock provided with two bolts, one being employed to bolt the hasp, while the other fastens the first bolt, all constructed and arranged substantially in the manner and for the purposes set forth.

Second, the use of the notch, *b* in combination with the staple S and spring C and D, substantially in the manner and for the purposes set forth.

Third, the use of the hasp, or its equivalent, for moving the bolt laterally into the range of the key, substantially as specified.

No. 48,559.—DAVID H. KAUFMAN, Kokoma, Ind.—*Apparatus for Separating Grease from Slush*.—July 4, 1865.—This invention consists of a tank for receiving the slush from the rendering tank. The said tank is provided with an adjustable gate, bearing against the rubber packing in front of the spring; the gate is adjusted by means of the crank, pinion, and rack. In front of the gate is an inclined grate, beneath which is an inclined board. The slush, flowing upon the grate from the tank, passes through the grate, any solid pieces of fat being retained thereby. The slush flows from the inclined board into a compartment of the tank below. The water passes into the compartment through the aperture, and the grease collects on the surface of the water in the compartment.

Claim.—The combined apparatus shown and described, consisting of the upper vat, with its adjusting gate, the grated incline, and the divided vat I L, with their communicating opening.

Also, the vat, with its respective chambers I L, communicating at or near the bottom so as to act as a separator by allowing the lower or watery fluid to pass out of the chamber, which retains the grease.

No. 48,560.—JOHN C. JEWELL, Boston, Mass.—*Forging Machine*.—July 4, 1865.—This invention will be understood by reference to the claim and engravings.

Claim.—First, the stop K, when arranged in connection with the hammers G, to operate in the manner substantially as and for the purpose herein set forth.

Second, the knife or cutter R, when arranged so as to be operated from the shaft T, substantially as described.

Third, the ratchet Y', provided with the bevelled projections *n*, and used in connection with the pin *a*, on the hub *p* of arbor C, in combination with the sliding bar Y, provided with the button *u* and fork X', the pawl *v*, the bar W, connected with shaft T, and the cam X on arbor C, all arranged substantially as shown for the purpose specified.

Fourth, the horizontal movable or turning bed A', with sliding trough B' attached, operated from the rock shaft O, through the medium of the obliquely slotted plate *i'*, rod D', arranged substantially as and for the purpose set forth.

Fifth, the manner of operating the trough B' for feeding the rod to the hammers, to wit: by means of the rack C' attached to the slide *b'*, the pinion *d* gearing into rack *c'*, and the ratchet *e'*, into which a pawl *f'*, attached to lever C', catches, the lever C' being actuated from the rock shaft O, and all arranged substantially as described.

No. 48,561.—JOHN KEANE, New York, N. Y.—*Laundry Water Heater*.—July 4, 1865.—This invention consists of a wooden tub or tank, in which the water to be boiled is placed. The tank has connected with it, by means of double tubes, a closed metallic boiler in the shape of an "oblate spheroid." This boiler is placed over a hole in the top of the stove, and when the water begins to boil a circulation of the water takes place through the tubes above mentioned, and by these means all the water is passed through the boiler, and thus heated.

Claim.—First, in water-heating apparatus, connecting the branch pipes E F, which lead to the tub B, with the pipes G and L, which convey the water to the fire by means of a horizontal pipe D, which is divided by a diaphragm, as shown, and in whose ends the pipes G and L are capable of turning, substantially as and for the purpose above described.

Second, the combination with boiler H and the circulating pipes G and L of a plate K, whereby the boiler can be used with a cooking stove or range, substantially as above described.

Third, combining the water-heating apparatus above described with a tub or other vessel B for laundry or culinary uses, substantially as above described.

No. 48,562.—CLEMENT H. KELLOGG, Elyria, Ohio.—*Hand Corn Planter*.—July 4, 1865.—In this machine a seed slide, by compressing the sides of the planter, carries the seed from the seed box to a seed distributor, composed of a block perforated with several holes, converging and uniting in one upon the upper side; after passing this seeding block, the seed passes through several inserters into the ground.

Claim.—The seed distributor A having apertures *c c c* converging from opposite directions, upward and diagonally to one common point of intersection, and thence upward perpendicularly to the upper surface of the block, in combination with sliding stop D and seeding slide B, the whole being arranged in the manner substantially as described, and for the purpose of inserting the seed in two or more places in the soil.

No. 48,563.—WM. H. KING, Philadelphia, Penn.—*Oscillating Engine*.—July 4, 1865.—This invention consists in the arrangement of the channels through the trunnion and the steam chest relatively to the trunnion and cylinder, and the construction and arrangement of the valve gear.

Claim.—First, the arrangement of the channel S S' and T through the trunnion H, substantially in the manner described and shown.

Second, arranging the steam chest relatively to the trunnion H and cylinder A, substantially as set forth.

Third, the construction and arrangement of the valve gear hereinbefore described, in combination with the steam chest, substantially as herein set forth.

No. 48,564.—CHARLES KORFF, New York, N. Y.—*Artificial Fuel*.—July 4, 1865.—This invention consists of one ton of coal dust, one gallon of blood, and one gallon of water, pressed into moulds and dried.

Claim.—The production of artificial coal out of mineral coal dust by combining the same with animal blood and water, substantially in the manner and for the purpose above described.

No. 48,565.—FREDERICK KOTH, New York, N. Y.—*Piano Forte Action*.—July 4, 1865.—This invention consists in the arrangement of a second jack on the key lever acting upon the hammer butt to hold the hammer near the spring, thus allowing the usual jack to pass readily at the least motion of the key under the hammer butt, and produce a repetition of blows by a very slight rise of the end of the key.

Claim.—The arrangement of the jack G, lever H, spring S, and stop *n* attached to the key A in combination with the adjustable stop N, and operating on the hammer butt in the manner and for the purpose substantially as described.

No. 48,566.—CASPER KROGH, Kroghville, Wis.—*Seeding Machine*.—July 4, 1865.—In this machine the distributing board underneath the hopper is adjustable on side pieces running in slots.

Claim.—The arrangement of the adjustable corrugated apron H beneath the hopper of a grain drill, substantially as and for the purposes herein shown and specified.

No. 48,567.—H. A. LAMB, Portland, Me.—*Medicine for the Cure of Erysipelas*.—July 4, 1865.—This invention consists of a composition of lard, sulphate of iron, and oil of bergamot.

Claim.—The compound of ingredients mixed in the proportions and for the purpose described.

No. 48,568.—GUSTAVE LAUTENSCHLAGER, New York, N. Y.—*Paper File*.—July 4, 1865.—This invention consists in the application to a central stem or axis of a series of looped wires, in combination with a folding frame in such a manner that each wire is capable of receiving and holding its own paper, and all the wires swivel on the central stem, so that they will fold one over the other when the frame is closed. The papers are placed one above the other in a convenient position for the reader. Each paper can be conveniently removed without disturbing the others, and furthermore, the papers are not injured or torn by passing needles through them or by points or other devices generally employed in paper files of the ordinary construction.

Claim.—The application of a series of folding wires *b* to a common rod A in combination with a suitable frame B, constructed and operating substantially as and for the purpose set forth.

No. 48,569.—B. S. LAWSON, New York, N. Y.—*Buckle*.—July 4, 1865.—This invention consists in placing the journals of the tongue in openings in the frame of the buckle so that the journals can be shifted from their bearings, and in so constructing the buckle that its tongue can be loosened from the strap by lifting the rear end of the buckle.

Claim.—First, in buckles for fastening skates and for other uses, placing the journals of the tongue in openings in the frame of the buckle of such form as that said journals can be shifted from their bearings, substantially as described.

Second, so constructing a buckle as that its tongue can be loosened from the strap by lifting the hinder end of the buckle, substantially as described.

No. 48,570.—DAVID LIPPY, Mansfield, Ohio.—*Fruit Dryer*.—July 4, 1865.—The furnace extends the whole length of the lower part of the dryer, but is of less width, leaving a space on either side. A little above the furnace, and equal to the area of its top, is a horizontal plate: a little above this is another of much greater area, but leaving spaces at either side; along its centre are apertures and registers. In the upper part of the dryer are series of drawers with slotted bottoms; between the sides and walls of the dryer, and in the middle between the drawers, are spaces with registers; in the ceiling are apertures and registers, and in the gable or roof, perforations.

Claim.—First, a series of drawers F provided with slatted bottoms *c* and dampers C, and arranged with dampers H at their sides, substantially as and for the purpose specified.

Second, the furnace B having two plates C D above it, one of which D is provided with a register E, all being arranged in connection with the drawers and dampers, to operate as and for the purpose set forth.

Third, the ventilators I applied to the building A, and used in connection with the furnace drawers and dampers, substantially as and for the purpose set forth.

Fourth, the combination of the furnace drawers, dampers, and ventilators, all arranged within a building, to operate in the manner substantially as and for the purpose described.

No. 48,571.—HARVEY LOCKE, Boston, Mass.—*Flour Sifter*.—July 4, 1865.—This invention consists in arranging the wings or curved bars attached to the radial arms of a horizontal shaft to scrape the concave surface of the sieve to force the flour through the meshes.

Claim.—The improved sifting apparatus, having its wings or scrapers G G constructed and applied to the arms *b b b b* and so as to operate with the sieve, in the manner as set forth.

No. 48,572.—S. C. MAINE, Boston, Mass.—*Flour Sifter*.—July 4, 1865.—This invention consists of a sifting cylinder composed of independent sections placed one within the other, and operated by a shaft, so that as the shaft is turned, they are brought together, forming an entire cylinder. There is also a cover operated by the shaft to prevent the dust arising from the sieve.

Claim.—A sifter cylinder, composed of independent sections or parts, placed one within the other, and operating substantially as and for the purpose set forth.

Also, in combination with the above, the cover E, operating substantially as set forth and for the purpose described.

No. 48,573.—SYLVESTER MARSH, Chicago, Ill.—*Grain Dryer*.—July 4, 1865.—The claim, with the engraving, fully explains this invention.

Claim.—First, the general construction and arrangement of the grain-drying apparatus, substantially as herein described; that is to say, forming the grain receivers or chambers of a cylindrico-conical form, in combination with central induct and eduction pipes, arranged circumferentially in the manner and for the purpose set forth.

Second, in combination with cylindro-conical grain receivers or chambers, forming the underside of covering plates, to equally distribute the grain and insure its uniform discharge through the pipes.

Third, the arrangement of the central column or radiator or smoke-stack, in combination with concentric drying chambers and enclosures, operating substantially in the manner and for the purpose set forth.

Fourth, the combination of the discharge pipes or openings, with hinged valve traps, arranged for operation in the manner and for the purpose set forth.

Fifth, the method herein described of regulating the temperature of the ascending currents by means of a blast of air down upon the furnace, substantially in the manner and for the purpose set forth.

No. 48,574.—ANGUS McDONALD, Mattawan, Mich.—*Endless Chain Propeller*.—July 4, 1865.—This invention consists in the employment of endless chains of buckets, peculiarly constructed, and arranged to work over the ends of arms attached to rotating shafts, whereby a very durable propeller is obtained, especially for boats of light draught.

Claim.—First, as an improvement in propellers the combination of the twisted wire links D E, buckets F, and thimbles G, as and for the purposes specified.

Second, the connecting of the links D E of said chains together by means of the eyes *e*, protected by metal strips *d*, and the metal bars composed of the parts *f g*, as set forth.

Third, the arms B provided with chains H at their ends, having projections *h*, in connection with the thimble G, in the links E of the chains, substantially as and for the purpose specified.

No. 48,575.—H. S. MEAD, Gloversville, N. Y.—*Culticator*.—July 4, 1865.—In this invention two rotating shafts, armed with teeth, are fastened obliquely to the line of draught in metallic hangers. The shafts are rotated by a band passing over a pulley made fast to the draught axle.

Claim.—The oblique rotating toothed shaft F, fitted at the lower ends of pendants attached to the frame A of the machine, and arranged to operate in the manner substantially as and for the purpose herein set forth.

No. 48,576.—S. P. MECAY, Kilborn, Ohio.—*Washing Machine*.—July 4, 1865.—This invention consists in the employment of a spring, in combination with a head provided with an arm, which is connected with the spring and a lever, whereby the clothes are washed.

Claim.—The spring H connected to the slides G, in which the ends of the shaft F are fitted, in combination with the link E and arm D of the head C, all being arranged substantially as shown, with a lever J, or its equivalent, for operating the head, for the purpose set forth.

No. 48,577.—TRUMAN MERRIAM and JAMES CUSHING, Waterloo Village, Wis.—*Rotary Engine*.—July 4, 1865.—This invention consists in the arrangement of the cylinder and pistons upon a revolving shaft or drum, and of the parts which are adapted to circular apertures in a stationary steam chest. It also consists in the combination of semicircular disks, and the trucks placed upon the crossheads, by which the pistons of the cylinder are guided, and which cause the engine as a whole to rotate. The steam chest is so arranged upon or around the axis of the engine that it can be rotated to a certain extent, and then the motion of the engine be reversed.

Claim.—First, the arrangement of the cylinders and pistons upon a revolving drum on a shaft, in combination with a face-plate and ports, and adapted to circular apertures in a stationary steam chest, so that a constant pressure of active steam may be alternately applied to the piston, thereby increasing the leverage and speed, as herein set forth and described.

Second, the two semicircles, in combination with friction trucks on a cross head, by which, in connection with the movement of a common piston, rotary motion and power are obtained, as herein set forth and described.

Third, the steam chest, with an oscillating joint, in such a peculiar arrangement and adaptation to a face-plate as will admit steam to cylinders and permit the chest to revolve one quarter, and thereby reverse the motion of the engine, as herein set forth and described.

No. 48,578.—SAMUEL J. MILLER, ALBERT B. BARNETT and WILLIAM H. STUDY.—*Economy, Ind.—Apparatus for Liming Hides*.—July 4, 1865.—This invention consists of a shaft, having its bearing in a sliding frame, which can be raised or lowered by means of racks. To the shafts are attached circular disks, to which are attached hooks, and to the latter the hides are suspended. The disk is made in two parts, so that it can be removed from the shaft when necessary. These disks are so arranged that they can be secured at any place upon the shaft, so that hides of any size may be attached to them.

Claim.—First, the employment of rotating hide racks in the process of liming hides, substantially as described.

Second, applying hide racks to a shaft in such manner that they can be adjusted and set at different distances apart to adapt them to hides of varying sizes, substantially as described.

Third, the use of rotating hide racks, in conjunction with a supporting frame, which is susceptible of being elevated or depressed, substantially as described.

Fourth, a liming vat, which is constructed with a concave bottom and provided with hide racks, substantially as described.

No. 48,579.—WILLIAM MILLER, Cincinnati, Ohio.—*Hoisting Machine*.—July 4, 1865.—A platform, provided with rollers at its bottom, rests upon a large worm wheel which meshes equally into two vertical worm racks or segmental screws. Motion is imparted to the worm wheel by a small gear wheel gearing with a toothed rack on the lower surface of the worm wheel.

Claim.—First, an elevator platform having a single worm wheel F, which meshes within two or more opposite worm racks B B, substantially as set forth.

Second, an elevator platform supported by rollers G, or their equivalents, on a single worm wheel F resting in worm racks B B, substantially as set forth.

No. 48,580.—THOMAS MOORE, Bloomington, Ill.—*Process for Making Sugar*.—July 4, 1865.—This invention consists in mixing with the cane juice white oak bark, and heating gradually to 200° F. The heat is then shut off and the juice allowed to stand for ten minutes, and the scum removed; the juice is then treated with a weak lye of wood ashes, allowed to stand for ten minutes and strained through flannel, after which it is evaporated and crystallized.

Claim.—The within described process of treating saccharine juices and sirups of the sorgho and imphee canes, by first treating the juice with a tannate made of white oak bark, or other equivalent, while cold, and raising it to a certain point by a gradual heat, for the purpose of rendering insoluble, in order to remove certain glutinous or starchy matters contained therein, then mixing with it a weak ley for further defecation, then boiling to the point of crystallization, substantially in the manner set forth.

Also, distinctly the use of a liquor made of oak bark, or other equivalent material, in connection with a ley of wood ashes, or other equivalent, as an effectual agent for the defecation of sorgho and imphee juices and sirups, substantially as and for the purposes specified.

No. 48,581.—JASON C. OSGOOD, Troy, N. Y.—*Excavator*.—July 4, 1865.—This invention is designed as an improvement on the "Carmichael and Osgood Excavator," used for removing obstructions from harbors, rivers, &c. It will be understood by reference to the claim and engraving.

Claim.—The combination of the toothed chain friction wheel C with the friction wheel F, the belt chain and toothed wheel B, and toothed sheave wheel A, for the purposes as herein set forth.

No. 43,582.—CHARLES H. PARKER and GRINDLY BURNHAM, Waltham, Mass.—*Dust Pan and Brush.*—July 4, 1865.—This invention consists in the combination of a dust pan and brush, the latter being inserted in the handle of the former, which is made hollow and sufficiently large to receive it.

Claim.—A dust pan and brush combined, substantially in the manner herein shown and described.

No. 43,583.—DAVID PARKHURST, Gloucester, Mass.—*Paint for Ships' Bottoms.*—July 4, 1865.—This invention consists of a composition of tar oil, vegetable tar, oxide of iron, and arsenical oxide of copper.

Claim.—The compositions prepared substantially as hereinbefore set forth and for the purpose specified.

No. 43,584.—GEORGE T. PARRY and WILLIAM S. WARNER, Philadelphia, Penn.—*Apparatus for Heating Oil Wells by Electricity.*—July 4, 1865.—Two copper rings, one above the other and connected by platina wires, are placed within a closed chamber around the bottom of the tube. Electricity being conducted to the upper ring, the same passes slowly to the lower ring, as the platina wires are inferior in their conducting power, and thus become red hot, communicating their heat to the tube and oil. The electricity passes off into the ground.

Claim.—First, employing the heating power of electricity for the purpose of liquefying and accelerating the flow of oil from oil wells, substantially as described.

Second, enclosing the circuit interrupter or electrical heater within a tight chamber, substantially as herein described.

No. 43,585.—JOHN M. PERKINS and MARK W. HOUSE, Cleveland, Ohio.—*Oil Can.*—July 4, 1865.—This invention consists in substituting a series of tubes, made of corrugated metal plates, for wire-gauze, as a safety screen to prevent the flame from communicating with the contents of the oil cans through the spout.

Claim.—Forming passages with corrugated metal plate or plates, substantially as described and for the purpose set forth.

No. 43,586.—WILLIAM R. PHELPS, New York, N. Y.—*Head-Rest for Railroad Car Seats.*—July 4, 1865.—A cushion is attached to a frame sliding in another light frame, the upper end of which latter is curved so as to clamp the back of the seat. The first frame may be slid up or down to suit the traveller, who in reclining holds the frame firmly against the back of the seat.

Claim.—The improved head-rest herein described, to be attached to car seats, &c., the same consisting of a movable and adjustable head-rest frame, in combination with a frame susceptible of being attached to or removed from the seat at pleasure, arranged and operating together substantially as specified.

No. 43,587.—JOHN EDWARD PHILIPS, Philadelphia, Penn.—*Broom or Brush Head.*—July 4, 1865.—The broom or brush head is made by aggregating and confining numerous strands of fibrous or other suitable material, so as to make a mass or body whose unconfining ends make the wearing surface of the article.

Claim.—The metal frame A, as shown in Fig. 2, whether moulded and cast in one piece of metal or stamped and pressed in one piece of sheet metal, having bars, on two or more of which the loops c c are formed to receive the handle and thereby clamp the filling, as and for the purposes described.

Also, the spring metal confiner D, or its equivalent, made as described, and to be placed on the filling below the frame, as and for the purpose described.

No. 43,588.—LOUIS POH, Buffalo, N. Y.—*Beer Faucet.*—July 4, 1865.—The claim and engraving fully explain this invention.

Claim.—The combination of the key C, plunger C', plunger barrel E, and discharge nozzle B, when arranged and operating in the manner and for the purposes described.

No. 43,589.—JOSEPH POLLAK, Chicago, Ill.—*Machine for Printing Checks.*—July 4, 1865.—Two or more metal wheels, on the circumference of which numerals are raised, are placed side by side on different axes, which slide one within another. An inking roller passes over the wheels automatically every time a check holder is passed in to press a check against the wheels, which latter are adjustable and are held in place by springs.

Claim.—The device for printing numbers on checks, as herein described, which can be constructed so that it may be attached to scales, or otherwise, where such printing is required.

No. 48,590.—O. M. POND, Independence, Iowa.—*Seeding Machine and Cultivator Combined*.—July 4, 1865.—In this invention the drag bars are so arranged upon two parallel bars that either can be elevated separately, and by raising the middle one all are raised. The tongue has a pivot joint, and by fastening it at different angles with a pin the depth of the furrow is regulated.

Claim.—First, the arrangement of described devices for jointing the tongue and reach together, and securing said joint in place as may be required in raising and lowering said tongue and reach, in combination with the cultivator apparatus, in the manner and for the purposes set forth.

Second, the beams of the cultivator teeth to the rod J, as described, in combination with the bar K, when the said bar is attached as set forth, and operating as and for the purpose herein specified.

No. 48,591.—NATHANIEL POTTER, East Hamburg, N. Y.—*Machine for Scraping Roads and Clearing Gutters*.—July 4, 1865.—Scrapers are pivoted to each side of the frame so that they may be used, according to the position given to them, either to smooth the road or scrape the gutters, or, in combination with adjustable shovels on the forward part of the frame, to fill ruts in roads.

Claim.—The manner of constructing the scrapers, as described, so that they may be used either for clearing gutters at the sides of roads, or for smoothing roads and filling ruts, in combination with the cutters attached to the centre piece, and other portions of the machine necessary for the purpose specified.

No. 48,592.—FITCH RAYMOND and AUGUST MILLER, Cleveland, Ohio.—*Hood for Cook Stoves*.—July 4, 1865.—A hood, covering the top of the cooking stove, is made to slide on the stove-pipe. When down upon the stove the heat may be passed through this hood by shutting a damper in the stove-pipe. The hood then serves as a bake oven, and carries off all the steam and odors from the cooking.

Claim.—First, hinging the sections A and B together in the manner described, when used in their relation to the stove E, stove-pipe C, tubes *d d'*, and valve *e*, as and for the purpose set forth.

Second, the adjustable cap A, troughs D, and rods H, in combination with the valve *e* and opening *d*, as and for the purpose set forth.

No. 48,593.—CHARLES G. SARGENT, Graniteville, Mass.—*Fan Blower*.—July 4, 1865.—In this invention the frame in which the wheel revolves consists of a shallow cylinder with a conical extension, into which extension the air is drawn by a series of revolving blades inclined to the axis of the shaft on which they are placed, and narrowing to suit the conical form of the case; the rear part of said case forming a bearing for the shaft has a series of stationary arms, to act as cut-offs and directors to the blast of air.

Claim.—In combination with a fan-case substantially such as described, a series of fan wings or blades, inclining outward and backward, and revolving in said case, in the manner and for the purpose substantially as described.

Also, in combination with the inclined wings or blades of a revolving fan, substantially such as herein described, the stationary inclined arms or vanes in the fan-case, for the purpose substantially as described.

No. 48,594.—ERHARD SCHLENKER, Buffalo, N. Y.—*Bolt Cutter*.—July 4, 1865.—In this device the circular cutter holder or hub is supported and partly enclosed by a thick ring with inwardly projecting flanges at the edges. The inner surface of this ring is divided into three sections, each of equal eccentricity to the hub, and against which the outer ends of the cutters abut, and the improvement consists in their adjustment to or from the centre by rotating the hub in the proper direction by means of a handle attached thereto, the extent of whose motion is controlled by an adjustable stop formed by a set screw passing through an arm projecting from the standard on which the tool is supported.

Claim.—A bolt cutter, with the die carrying disk D and handle C attached, when all are combined, arranged, and operated as and for the purposes specified.

No. 48,595.—THERON SHERRY, Newark, N. J.—*Basket*.—July 4, 1865.—This invention consists in forming the basket in parts, and so joining those parts, that when not in use they can be folded together convenient for carriage or storage.

Claim.—Folding baskets, constructed in the manner and for the purpose herein set forth.

No. 48,596.—HAMILTON E. SMITH, Cincinnati, Ohio.—*Washing Machine*.—July 4, 1865.—This invention consists in the combination of the cover, which is flexible, and capable of being used as a hand washboard; also in the method of constructing the perforated rotary dasher.

Claim.—First, the combined cover and washboard G, constructed and applied as herein specified.

Second, the combination of the heads B B, slots C, ribs D, rods E, and water passages *b c c'* arranged and operating as set forth.

No. 48,597.—BASIL SPENCER, Lewisburg, Penn.—*Straw Cutter*.—July 4, 1865.—This invention consists in an arrangement of devices for feeding hay to the machine, and will be understood by reference to the claim and engraving.

Claim.—The arrangement and combination of the bars F with their pitman K, crank shafts I and J, as connected with the rake head L, and feeding rollers M, and arm V, and operating lever W, when arranged and combined as herein described and for the purposes set forth.

No. 48,598.—O. W. STOWE, Plantsville, Conn.—*Sausage Filler*.—July 4, 1865.—This invention consists in the case being in the form of a portion of a sphere and a cone, and a rotary slotted disk, in or through which the piston works, the disk rotating in an oblique plane in the hopper, all so arranged as to force the meat into the skins.

Claim.—The case A, composed of a section of a hollow sphere *a*, or of the suitable form, and a cone *b*, in connection with a slotted disk D placed obliquely on the shaft B, and a piston C, all arranged to operate in the manner substantially as and for the purpose herein set forth.

No. 48,599.—SAMUEL SWARTZ, Buffalo, N. Y.—*Packing for Artesian Wells*.—July 4, 1865.—In this invention the packing around the pump consists of a duplex cylinder of leather or other elastic material, to be dilated by a series of wedges from below, having their attachments in a metal ring, each wedge having a spiral spring between a shoulder on said wedge and the ring below. Two rods secured in the ring below pass up through a similar ring above the packing, where a chain or cord attached to them passes around pulleys on ears ascending from the upper ring, which chains or cords, as well as the rods, pass to a lifting apparatus at the top of the well. When the packing is at rest in the well, the superincumbent water dilates it by pressing it upon the wedges; when the chain or cord is drawn towards the surface, the first effect is to withdraw the packing from the wedges, and thus permit its collapse, and the second, to elevate the whole apparatus out of the well.

Claim.—First, the spring packing and wedges, when constructed and arranged substantially as herein set forth.

Second, the wedges, in combination with the spiral springs and lower ring, for the purpose set forth.

Third, the chain or its equivalent connected with the rod and pulley, as arranged with an adjustable packing, substantially as shown and described.

No. 48,600.—J. B. SWEETLAND, Pontiac, Mich.—*Horse-power*.—July 4, 1865.—On the under side of the horizontal master-wheel of this machine are pins, provided with small friction rollers which work in between spiral threads upon a horizontal shaft, thus giving a rotary motion to the shaft.

Claim.—The arrangement of the triangular frame A, the metallic bed plate E and F, the master-wheel C, and the shaft D, the several parts being constructed and used together as and for the purpose herein specified.

No. 48,601.—OWEN W. TAFT, New York, N. Y.—*Skates*.—July 4, 1865.—This invention consists in a heating attachment, and making the foot plate detachable, and will be understood by reference to claim and engraving.

Claim.—First, the application to a skate of a heating attachment, substantially such as herein described, or any equivalent thereof, for the purposes set forth.

Second, making the foot plate detachable, substantially as and for the purpose specified.

Third, the hook catches *d* and forked stud *f*, in combination with the foot plate C, heater E, studs *e*, and spring *g*, constructed and operating substantially as and for the purpose set forth.

No. 48,602.—JAMES R. TEMPEST, Philadelphia, Penn.—*Device for Fastening Lock Key*.—July 4, 1865.—This invention consists in attaching permanently to the shank of the key a circular plate and small ratchet wheel, and to the lock case a spring pawl, all of which operate as follows: the key being inserted the circular plate covers the key-hole, and thus prevents picking instruments being thrust through from the outside, while the pawl engages with the ratchet, and when the bolt is projected the key is prevented from being turned from the outside.

Claim.—The disk *c*, in combination with the ratchet teeth *c2* on the key C, and the spring pawl D on the face of the lock case A B, the said parts being constructed and arranged to operate together substantially as and for the purpose described.

No. 48,603.—JULIUS TOMLINSON, Newburg, Wis.—*Grain Separator*.—July 4, 1865.—In this machine the hinged pendants and standards of the screen are secured to the frame by means of slots and screws, in order to adjust the inclination. The screen is composed of a series formed with lower bevelled edges, and a spout passing over a central portion that carries the grain from each single screen independently of the others. The inclined feed spout has openings of different sizes, to promote the equal distribution of the grain. A combination of levers with an eccentric is also used.

Claim.—First, securing the pendants C C and standards D D of the screen frame B to the framing A, by means of screws *a* passing through oblong vertical slots *b* in the pendants and standards and into the framing, to admit of the varying of the inclination of the screen frame, substantially as shown and described.

Second, the screens E formed with bevelled lower edges provided with a flange or lip *d*, and with spouts E, and arranged or disposed within the frame B, and with a blast spout G, to operate in the manner substantially as and for the purpose set forth.

Third, the inclined feed spout N, provided with a bottom *j* having perforations of different sizes, substantially as and for the purpose set forth.

Fourth, the introduction of a lever either straight or bent between the eccentric and the sieve frame, the straight lever to have a movable fulcrum, and the bent lever to be operated by a movable eccentric, substantially as and for the purpose set forth.

No. 45,604.—PHILIP UMHOLTZ, Tremont, Penn.—*Rotary Pump*.—July 4, 1865.—In this invention a vibrating valve on the periphery of a cylinder rotates within a casing; the water entering from a supply pipe is drawn from the annular space surrounding the cylinder into the interior of it, and is thence discharged from an orifice in the side of the casing.

Claim.—The combination of the casing A and its plate B and pin K with the rotary cylinder C, vibrating valve G G', spring L, and stopper J, substantially as described and represented.

No. 45,605.—SALMON J. WADSWORTH, Buffalo, N. Y.—*Drilling Artesian Wells*.—July 4, 1865.—This invention consists of a device attached to the centre of a drop or trip wheel, whereby most of the twist given to the rope at each revolution of the wheel is absorbed, and only a portion imparted to the rope, to cause an even and gradual rotation to the drill.

Claim.—The swivel C with its rod *c*, in combination with the wheel A, cam B, and rope *x*, in the manner and for the purpose described.

No. 45,606.—ELI G. WARNER, Union Township, Ohio.—*Grain Rake*.—July 4, 1865.—The object of this invention is to provide a rake by which the grain can be readily gathered and brought to a convenient position for binding.

Claim.—The construction of the rake with feet and long teeth, braced to the handle in such a manner as to form a platform on which the grain will lie, raised out of the stubble ready for the hands of the binder, as above described.

No. 45,607.—GEORGE I. WASHBURN, Worcester, Mass.—*Thermal Motor*.—July 4, 1865.—In this invention the expansion and contraction of a bar of metal, under the influence of natural heat, are gathered up by means of springs and levers, so that the power can be used for propelling machinery, clock-work, and similar purposes.

Claim.—First, the utilizing the expansive and contractile force derived from variations of temperature, in tubes or bars of metal, so as to produce a regularly recurrent or continuous motion, the said force being applied through the intervention of a mainspring, or resulting from the regularly recurrent artificial application of heat to said bar or tube.

Second, utilizing the expansive force resulting from the increase of temperature of a confined body of air, to compress a spring from which a regularly recurring or continuous motion is obtained.

Third, utilizing the expansive force resulting from the artificially produced increase of temperature of a confined body of air, which is subjected to the variations of temperature without the accession of fresh air, excepting sufficient to supply the waste.

Fourth, the double forked-shaped bars M M' K, or their equivalent, embracing a central bar N, of a different expansive power, to which they are mutually attached at or near their extremities, by which the expansive power of a single rod may be almost doubled within a given length, and by which, according to the relative expansibility of the tongs and the embraced portion, it may be made to contract or expand longitudinally by increase of temperature.

Fifth, the levers B B', multiplying wheels or pulleys A a A', &c., and expansible rod D, the whole being arranged to operate in the manner and for the purpose herein set forth.

Sixth, a series of multiplying levers G I, operating in connection with the levers B B, and expansible rods E E', in any manner substantially as described.

Seventh, the connecting wires or cords C C, &c., H J, formed of metal or other material, and employed in combination with the multiplying wheels and levers, substantially as and for the purposes explained.

No. 45,608.—GEORGE I. WASHBURN, Worcester, Mass.—*Wire Straightening Machine*.—July 4, 1865.—In this apparatus a double-elbowed shaft, supported horizontally in suitable framework, carries within the elbow a reel supported by and turning upon a short journal which projects from and at a right angle to the central horizontal portion of said elbow. The wire, first wound upon the reel, is thence passed through an orifice made through and coincident with the axis of one of the journals of the elbowed shaft, and thence to a series of small rollers suitably arranged for straightening the wire as they draw it gradually from the

reel. In practice, the elbowed shaft is made to revolve with considerable velocity, and as the reel is carried around with it, the torsion thus produced keeps the wire perpetually turning over, and thus offering successively every portion of its surface to the proper action of the straightening rolls.

Claim.—First, causing the wire to rotate upon its own axis, as it passes between the straightening points, in any manner substantially as set forth.

Second, as an improvement in machines for straightening wire, the combination of the reel C, yoke D, and wheels L L' L2 L3, arranged and operating substantially as and for the purposes set forth.

No. 48,609.—R. G. WELLS, Plummer, Penn.—*Drill.*—July 4, 1865.—This invention consists of a rock drill for boring through all kinds of strata in succession, whether they are hard or soft.

Claim.—Forming the drill with the diagonal edge *b*, and diagonally opposite straight corners *a a*, and alternate bevelled corners *c c*, substantially as and for the purposes herein specified.

No. 48,610.—PEREGRINE WHITE, Dixmont Centre, Me.—*Buckle.*—July 4, 1865.—This invention consists in an eccentric roller, provided with one or more spurs, a frame or loop, and a cross-bar. One of the straps is attached to the bar, the other to the roller and a bar underneath. In pulling the strap in an opposite direction the roller turns and binds the strap between it and the bar beneath, and in so doing holds the strap firmly.

Claim.—The improved buckle, consisting of the eccentric roller C, one or more spurs *b*, a frame or loop A, and a cross-bar B, arranged and combined substantially in manner and so as to operate as specified.

No. 48,611.—JAMES A. WOODBURY, Boston, Mass.—*Slide Valve.*—July 4, 1865.—This invention consists in making the valves of vertical ports, when two series are used independent of each other, and with a space between them, so that they may freely expand between the vertical walls of the ports without sticking between them; across the top of the valves is placed a flat bar, covered with a cap made fast to each valve, but divided in the centre, as the valves are, so as to compel a uniformly parallel movement of the valves, and at the same time provide for the required expansion.

Claim.—First, constructing the valves D D independently of each other, and with a space between them, so that they may be free to expand or contract between the vertical parallel port walls C C, substantially as and for the purpose described.

Second, connecting the valves D D, by means of the bar G, or its equivalent, substantially as and for the purpose described.

No. 48,612.—THOMAS H. WORRALL, Lawrence, Mass.—*Self-centring Chuck or Holder.*—July 4, 1865.—This invention is designed as an improvement on a chuck patented March 7, 1865, to the present inventor, and consists in passing the outer end of the wedge-shaped jaws through radial slots in the face of the cap, which is operated longitudinally to or from the stock by a thimble, screw-threaded on its outer and inner surface; the inner being of a greater pitch, and gearing, in a thread of corresponding size, on the shank of a spindle, while the outer thread, of less pitch, plays in one formed on the interior of the inner end of the cap. The motion of the nut or thimble one way or the other gives a corresponding movement to the cap, which carries the jaws back or forth in their inclined ways, and consequently moving their faces to or from each other.

Claim.—First, the projections *d'*, or their equivalents, extending from the ends of the jaws *c*, and operating in combination with cross pieces *f*, or their equivalents, and with the cap C, substantially as and for the purpose herein set forth.

Second, the adjustable tips *g*, in combination with the jaws *c*, cap C, and mandrel A, constructed and operating substantially as and for the purpose described.

Third, the differential screws *d c*, applied in combination with the thimble D, cap C, jaws *c*, and mandrel A, substantially as and for the purposes specified.

No. 48,613.—GILMAN F. WRIGHT, Graniteville, Mass.—*Water Wheel.*—July 4, 1865.—This invention consists in the water entering the flume or scroll, passing through horizontal, centrally inclined chutes to the bucket, whence it is discharged at the base. A gate, encircling the wheel, is elevated and depressed by a pinion and ratchet arrangement, and the volume of water applied is thus regulated.

Claim.—In combination with a scroll water-way D, the ring gate or curb C, the stationary guide B', and the wheel B, the whole being constructed, arranged, and operated in the manner and for the purpose substantially as herein described and represented.

No. 48,614.—F. D. BALLOU, Abington, Mass., assignor to ALFRED B. ELY, Boston, Mass.—*Boot and Shoe.*—July 4, 1865.—This invention consists of a boot or shoe, in which the vamp is fastened by an independent seam, or some other mode of union, to the upper, and then the sole is sewed to the vamp by a sewing machine, which places all the stitches on the outside

of the upper, thus producing in effect a Scotch bottom shoe by machinery; and this the inventor claims as a new article of manufacture.

Claim.—The new article of manufacture, constituting a boot or shoe, substantially in the manner described.

No. 43,615.—JACOB BEYER, assignor to himself and JOHN E. SMITH, Buffalo, N. Y.—*Mode of Extracting Drills from Wells.*—July 4, 1865.—This invention consists of a pair of gripping tongs operated by secondary levers in such a manner as to firmly grasp the broken drill and withdraw the same by a direct upward draught. Also, in constructing the tongs with exterior wedge surfaces above and below the hinge, on which are fitted rings operated by a cord reaching to the top of the well, by which the tongs are opened or closed at pleasure.

Claim.—First, operating the gripping tongs A A by the reversing or secondary levers C C and rope D, in the manner and for the purposes described.

Second, the combination of the upper ring E and operating cord F with the tapering gripping tongs, for the purposes and substantially as described.

Third, the combination of the lower ring E' with the tapering gripping tongs and stop bar G, operating as and for the purposes described.

No. 43,616.—MOSES and JOHN W. CHANDLER, East Corinth, Me., assignor to themselves and ANTHONY and WILSON R. WOODARD, Bangor, Me.—*Cultivator and Potato Digger Combined.*—July 4, 1865.—This invention consists in the employment of two adjustable blades or cultivators in connection with a screen and shares, so arranged as to leave an open space in the centre to admit of the passage of obstructions therefrom.

Claim.—First, the oblique blades or cultivators E E in combination with the shares G G and screens F F, all arranged to operate substantially as and for the purposes set forth.

Second, the shares G G and screens F F, arranged with a space *k* between them to admit of the passage or escape of obstructions from the shares and screens, as set forth.

No. 43,617.—WILLIAM C. CLARK, Portland, Me., assignor to himself, W. D. RICHARDS, Lynn, Mass., and WILLIAM H. SKINNER, Lexington, Mass.—*Car Coupling.*—July 4, 1865.—This invention will be understood by reference to the claim and engravings.

Claim.—The combination of the arm *d* and its socket *h* with the link pin C and the bunter bar, the whole being arranged so as to operate substantially as specified.

Also, the above-described arrangement or application of the spring latch with the socket *h*—that is, so as to operate with the head of the arm *d*, in manner and under circumstances substantially as specified.

No. 43,618.—GEORGE CUSTER, assignor to himself and CHARLES TOLL and JOHN PAXTON, Monroe, Mich.—*Horseshoe.*—July 4, 1865.—This invention consists in serrating or roughening the enlarged parts of the nail hole, so as to hold the head of the nail more tightly when driven in, and also making a shoulder between the roughened part and the nail hole proper.

Claim.—Corrugating or otherwise roughening the countersink or crease at and around the nail hole, so that when the head of the nail is driven against them there shall be a more perfect contact of metal between them, substantially as and for the purpose described.

Also, forming a shoulder between the inclined sides of the countersink or crease in a horseshoe and the nail hole, as and for the purpose substantially as described.

No. 43,619.—P. K. DEDERICK, assignor to L. and P. K. DEDERICK, Albany, N. Y.—*Beater Press.*—July 4, 1865.—This invention consists in an arrangement of the parts whereby the operation of beating and compressing substances for baling may be performed with greater facility than usual. It refers to that class in which levers are employed for operating the follower.

Claim.—First, the employment and use in a beater press of toggle levers with the lower ends of the fulcrum levers permanently located on a plane even with or above the top of the bale, when said levers are connected by the rod H H and bars I I, the whole being so constructed as not to interfere with the relieving of the bale endwise when pressed.

Second, the frames O forming a direct and substantial connection between the fulcrum bars *b'* and the beater as head block, and the suspended plates N attached to the frame O, in the manner and for the purpose described.

Third, the fastenings for the doors composed of the rollers S, connected to the frame of the press by means of links V, and provided with the eccentrics T T and handles U, substantially as set forth.

Fourth, the relieving plates X X arranged with the bars Z, shafts Z', having eccentrics A' on them, and connected with the follower bars G, to operate in the manner substantially as and for the purpose set forth.

Fifth, the follower suspended by the bars G G to the upper ends of the toggle levers J J, in combination with the beater C, used as a fixed head while the bale is being pressed.

No. 43,620.—WILLIAM EDSON, assignor to SHEDD & EDSON, Boston, Mass.—*Hydrometer.*—July 4, 1864.—This invention consists of a diagram of lines so drawn and combined

with a scale of figures as to indicate the relative humidity of the air, the dew point, and the absolute amount of moisture when pointed out by an index whose position is regulated by adjustment to the height of the mercury in wet and dry bulb thermometers.

Claim.—First, the combination of indices in such a manner that when one is placed at the height of the mercury in a dry bulb thermometer, and another at the height of the mercury in a wet bulb thermometer, a third point will indicate on a scale the proportion of moisture in the atmosphere, substantially as and for the purpose set forth.

Second, a diagram of lines so combined with a scale of figures, and so constructed or drawn as to indicate the relative humidity of the air, the dew-point, and the absolute amount of moisture, either or all, when pointed out by an index whose position is regulated by adjustment to the height of the mercury in wet and dry bulb thermometers, substantially as and for the purpose set forth.

No. 48,621.—LOYAL C. FIELD, assignor to himself, JOSEPH P. FROST, and W. S. BELL-OWS, Galesburg, Ill.—*Beating Device for Baling Presses.*—July 4, 1865.—Two sides of the box are hinged at the bottom, and close automatically before the beater falls, after which they again open, thus allowing the substance to be beaten to lie at each operation on a solid bottom, the quantity previously beaten being removed after the opening of the sides or doors.

Claim.—Closing the doors automatically just previous to the liberation and fall of the beater, and opening them after its fall by means of the horse power, by mechanism substantially as herein described and for the purposes specified.

Also, the connecting of the doors J J to pulleys M on a shaft N, by means of chains, ropes, or cards L, the lever P connected to a pulley O on shaft N by a chain, cord, or strap Q, when said parts are used in connection with a rising and falling beater B, and a horse power or other motor, all arranged to operate substantially as and for the purpose set forth.

No. 48,622.—JOSHUA GRAY, Medford, Mass., assignor to himself and E. H. ELDRIDGE, Boston, Mass.; W. G. LANGDON, Malden, Mass., and S. S. BUCKLIN, Providence, R. I.—*Magazine Fire-arm.*—July 4, 1865.—A side-opening is provided in the outer tube of the magazine for the introduction of cartridges, so that the inner tube, containing the spring and follower, may never have to be removed.

Claim.—First, so shaping the opening L in the magazine that it will be impossible to insert a cartridge wrong end front, substantially as described.

Second, the slot or stop j and a pin or stop i, or their equivalents, to prevent the inner tube D from ever coming out of the magazine C, substantially as described.

No. 48,623.—J. WILSON HODGES, assignor to himself and P. DE MURGUIONDS, Baltimore, Md.—*Horseshoe.*—July 4, 1865.—This invention consists in making a groove in the under side of an ordinary horseshoe, in which is secured a removable roughing bar provided with calks. A blank bar may be placed in the groove when the roughing bar is removed.

Claim.—First, the attachable and removable roughing bar C provided with calks and secured in the groove of the shoe by means substantially as described.

Second, the blank bar E adapted to occupy the groove B in the absence of the roughing bar, and secured in a similar manner within the groove.

No. 48,624.—HORACE HOLT, Brooklyn, N. Y., assignor to WILLIAM W. SECOR, of New York, N. Y.—*Hand Stamp.*—July 4, 1865.—Two cavities are made in the stamp head, each containing a reel. One reel contains all the inked ribbon, which is led under the head over the type and is rolled up on the other reel. This head is secured to its stem by two screws, one catching in a nick in one side of the plate and the other in a segmental slot on the opposite side.

Claim.—First, the type-carrying head F, constructed with cavities d d for the reception of the ink ribbon, and attached to its stem D by a circular groove and set screw, or equivalent device, to admit of turning it on its axis, all substantially as herein shown and described, and for the purposes specified.

Second, the nick j, segmental slot j, and spring k in the type plate G, to operate in combination with the screws or studs i i in the head F, substantially as and for the purpose set forth.

No. 48,625.—CHARLES B. HUTCHINSON, assignor to himself and J. H. WOODRUFF, Auburn, N. Y.—*Process for Lining Oil Barrels.*—July 4, 1865.—This invention consists in heating the inside of the barrel, by means of hot air forced into it by a pump, and treating the barrel while warm with an oil-proof composition, and forcing it into the pores of the wood by the pressure of the hot air. A pump may be used, communicating with the annular space around the furnace. The annular space is connected with a vessel by means of a tube, the vessel being provided with a tube which is connected with the barrel when the apparatus is in operation.

Claim.—The within described process for applying solutions to the interior of casks, barrels, &c., to render them tight, so as to avoid the loss of their contents by leakage and evaporation, to wit, by heating and drying the interior of the cask or barrel, and opening the pores of wood by hot air, forced into the same through the medium of a pump, or its equivalent.

lent, and then applying the solution to the interior warm surface of the cask or barrel and forcing it into the open pores, cracks, and crevices by hot air under pressure, substantially as set forth.

No. 43,626.—H. D. JENNINGS, Non. N. Y., assignor to BERNARD LAVERY, Waterford, N. Y.—*Curling Iron*.—July 4, 1865.—In this invention the curling iron is heated by an interior iron which is removed when the outer iron is applied to the hair.

Claim.—A curling iron constructed and made in two parts, consisting of a shell and core, each having a separate handle, substantially as and for the purpose herein described.

No. 43,627.—JOHN LACEY, assignor to CONRAD FURST and DAVID BRADLEY, Chicago, Ill.—*Cultivator*.—July 4, 1865.—In this machine the square cultivator frame moves freely over the axle upon bevelled rollers. Two movable arms are pivoted to the axle near the wheels at one end, and at the other to the front ends of the cultivator frame. The seat rests upon a long lever firmly fastened by an upright to the axle, and its front end to the draught pole. The driver's feet move the whole frame laterally.

Claim.—First, connecting the movable parts of a mounted cultivator with the wheels and axle by the horizontal swinging bars or rods I, substantially as shown and described.

Second, pivoting the seat lever K to the axle by means of the post M, or its equivalent, and to the movable parts of a cultivator, so as to adjust the weight of such movable parts and cause the reaction of the force applied to move them to operate in the same direction as the direct force, all being substantially arranged and constructed as and for the purposes set forth and specified.

No. 43,628.—F. M. LOVE, assignor to himself and SAMUEL C. LOVE, Waldron, Ind.—*Evaporator*.—July 4, 1865.—This invention consists of a furnace provided with pans, partitions being placed between the bottoms of the pans and the bottom of the furnace. The valves are so arranged that the heat can be thrown directly under the pans, or can be made to pass through the space between the partitions and the bottom of the furnace. Under the bottom of the pan is a valve, sliding in a groove in such a manner that it can be removed when desired.

Claim.—The combination of the furnace A with the valves *c c c c* and *c*, the graduations with plates B B B B and *f*, the boxes C C1 C2 C3 and D, the partitions *d d d*, and doors *k*, and the pipes O O O O: all or as many of each of the above-mentioned boxes, plates, valves, cranks, or pipes and graduations as may be desired, arranged and operating substantially as and for the purpose shown and described.

No. 43,629.—ROBERT J. ROBESON, assignor to himself and JARED W. MILLS, Chicago, Ill.—*Horse Rake*.—July 4, 1865.—This invention consists in the employment of an adjustable fulcrum bar, hinged to the axle, with a metallic plate attached to its rear end, said plates being provided with slots, in which a pin, passing through the lever by which the rake is raised, plays back and forth.

Claim.—First, the employment of the hinged or adjustable fulcrum F, provided with the slot *f*, arranged and operating substantially as and for the purposes herein specified and shown.

Second, the combination of the lever E, provided with the rod or rest *e* and the hinged arm or fulcrum F, provided with the slot *f*, as and for the purposes specified.

Third, the combination of the rake D, the levers E, and arms M, the lever *l n*, and hinged fulcrum F, all arranged and operating substantially as and for the purpose specified and shown.

No. 43,630.—NATHANIEL SEHNER, assignor to himself and ABRAHAM HUFFER, Hagerstown, Md.—*Hinge*.—July 4, 1865.—That part of the hinge which forms the eye to receive the pintle is extended considerably beyond the eye and terminates in a wide, flat surface, and upon the other part of the hinge are riveted strong steel springs, which bear against this extension, the latter having three angles outside, which operate to hold the shutter either open, half open, or shut, as desired.

Claim.—Fastening or locking a hinge or butt by means of a spring or springs and an eccentric, constructed and operated substantially in the manner and for the purpose set forth.

No. 43,631.—JOB SHATTUCK, Brookline, N. H., assignor to himself and JOHN S. PROCTOR, Mason, N. H.—*Pantry*.—July 4, 1865.—This invention consists in the combination of a sink with a closet for dishes and kitchen stores, a closet for a barrel of flour, several drawers, a moulding and an ironing board, when combined and ready for use, and rendered portable or removable from place to place.

Claim.—A movable pantry, constructed substantially as and for the purpose above described and stated.

No. 43,632.—CORNELIUS ST. JOHN, Boston, Mass., assignor to O. M. SOUTHWICK, Woonsocket, R. I.—*Lamp Shade*.—July 4, 1865.—This invention consists in the combina-

tion of a pyramidal lamp shade and a series of reflectors hinged thereto. The shade is lined with mica, to resist heat and reflect light.

Claim.—The combination of the pyramidal lamp shade A and the series of reflectors C C and c arranged and applied to it, substantially as and so as to operate as specified.

Also, the pyramidal shade, as made with the heat resisting and reflecting lining and the adjustable reflectors, arranged substantially as specified.

No. 48,633.—EDWARD H. TRACEY, assignor to the EAGLE AUGER AND SKATE MANUFACTURING COMPANY, Meriden, Conn.—*Die for Making Augers.*—July 4, 1865.—This invention consists in so constructing the dies that the two cutting bits and two lips of a double-bitted auger may be formed simultaneously and at one operation.

Claim.—The construction of the respective parts of the die which perform the operation set forth substantially in the manner described.

No. 48,634.—DANIEL T. WILSON, Harrisburg, Penn., assignor to himself and REUBEN HOFFHEINS, Dover, Penn.—*Substitute for Rosin.*—July 4, 1865.—This invention consists of coal tar boiled down to the consistency of rosin, for which it may be used as a substitute in soldering, casting, &c.

Claim.—The use of coal tar, prepared substantially as described, as a substitute for rosin, for the purposes set forth.

No. 48,635.—CHARLES BOSCHAN, JOSEF BINDTNER, and WILLIAM CAFFON, Vienna, Austria.—*Lamp.*—July 4, 1865.—This invention consists in making the exterior of the lamp in sections, and with a removable oil can or cans, to be taken out so as to be filled and replaced, and placing the wick tube on the external section. The oil cup is attached by a screw from the under and inner side thereof, to the outer and upper section.

Claim.—First, making the exterior of the lamps in sections, M M', so that they may be taken apart for the purpose of removing or replacing the oil cup or reservoir, which is separable from the said exterior of the lamp, substantially as described.

Second, in combination with the sectional exterior of the lamp, M M', and a removable and replaceable cup or oil reservoir, the placing of the wick tube and cap or burner on the external section, and attaching the oil cup, with the wick tube projecting therein, by a screw from the under and inner side thereof, to the said outer and upper section, substantially as described.

No. 48,636.—ALEXANDER HAMAR, Hungary, Austria, assignor to JOHN C. FREMONT, New York, N. Y.—*Preserving Wood from Decay, &c.*—July 4, 1865.—This invention consists in making a solution of sulphate of iron, in the proportion of one pound to one hundred pounds of water, and then forcing the solution through the pores of the wood, until the liquid issues from the other end of the same strength that it enters.

Claim.—Preserving wood from decay, insects, and other destructive agents, by means of a solution prepared substantially as herein described, and applied in the manner herein set forth.

No. 48,637.—HORATIO H. ABBE, Chatham, Conn.—*Door Bell or Gong.*—July 11, 1865.—This invention consists in the employment of a slide formed with a zigzag groove, which operates the hammer, giving it several motions or strokes on the bell by one pull of the slide to which the bell-pull is attached.

Claim.—The use of a sliding groove, or its equivalent, in combination with the clapper E, and the spring b, for the purposes specified.

No. 48,638.—CHARLES S. ADAMS, Hillsdale, Mich.—*Foot Rest.*—July 11, 1865.—This invention consists in forming an ottoman or foot rest, the top of which is in three parts, the centre part being adjustable and forced up by a spring, and held in any desirable position by spring catches. The main or lower part of the box can be used as a receptacle for slippers, boot-jack, &c.

Claim.—First, the combination of the section C, and slides a, with the spring catches d, or their equivalents, constructed and arranged so that the section C, or foot rest, may be raised or lowered to the desired height, substantially as herein shown and described.

Second, the combination of the section C, spring E, and spring catches d, arranged and employed in the manner and for the objects herein specified.

No. 48,639.—CYRUS W. BALDWIN, Boston, Mass.—*Hot-air Engine.*—July 11, 1865.—This invention consists in a combination and arrangement of devices for the purpose of supplying the operating ends of each cylinder with heated air and gaseous products of combustion for two or more furnaces. Also, in the arrangement of passages for the purpose of preventing any flame or solid substance from entering the cylinders. The air induction passage is so arranged that the valves are prevented from becoming heated to an injurious extent, and the air induction passages are so arranged that the impelling medium is made to enter the cylinder directly under the centre of the piston.

Claim.—First, in a hot-air engine the arrangement, substantially as described, by which

a single cylinder is supplied on one side only of its piston from two or more furnaces, which are separate from each other as to the means for the reception in each of fuel and air, but which discharge their gaseous products of combustion into said cylinder as stated, through a common valve chamber.

Second, providing at the top of the fire box of a hot-air engine a passage around the same for conducting the gaseous products of combustion to the cylinder, so as to cut off therefrom and from the valve chamber actual flame, and cause the deposit of solid matter, substantially as specified.

Third, the arrangement for supplying the air for the support of combustion, and to be heated to fill the cylinder by passing the whole of it into the fire box above the fuel, instead of passing the whole or a portion of it through the fuel, as previously practiced.

Fourth, incasing the valve chest, and passing the cold air from the force pump on its way to the fire box into said casing and around, and for the purpose of cooling the chest, substantially as specified.

Fifth, the arrangement of the lower part of the cylinder without any metallic inner boundary, and of fire brick or other suitable non-conductor, supported by a metallic casing, substantially as specified.

No. 48,640.—MILTON BALL, Canton, Ohio.—*Railroad Switch*.—July 11, 1865.—This invention consists in enclosing the switch stand in such a manner that the tender cannot leave his position until the switch is properly arranged; the lever operating the switch being connected by rods to a door or doors, so as to close them, and the person cannot leave the place when the switch is not adjusted.

Claim.—First, so constructing a railroad switch that when the operator opens it he will be unable to leave it without closing it again, substantially as described.

Second, surrounding a railroad switch with an enclosure having one or more entrances, which stand open while the switch is closed, but which are closed in the act of opening the switch, substantially as described.

No. 48,641.—MILTON BARNARD, Unionville, Penn.—*Sheep Rack*.—July 11, 1865.—In this device a pyramidal partition extends upward and beyond the ends of two pivoted sides, in order to form two separate hoppers and troughs.

Claim.—The pyramidal partition B, extending upward beyond and between the ends of the pivoted sides *b b*, for the purpose of forming two separate hoppers and troughs, substantially as herein described.

No. 48,642.—HENRY BARTON, Baltimore, Md.—*Compound Explosive Shell*.—July 11, 1865.—The shell belongs to that class containing or consisting of a number of independent segmental shells. Within an elongated or cylindrical shell are arranged a series of closely fitting segmental shells, leaving a central tubular space for the exploding or separating charge. From this central charge, fire is communicated to each of the contained shells by means of a fuse from each, connecting with the central chamber.

Claim.—The construction and arrangement of the independent chambers J, within an external shell A, so as to form a central chamber or magazine K, communicating with each fuse pipe L, as herein described and for the purposes set forth.

No. 48,643.—WILLIAM BATCHELDER, Newburyport, Mass.—*Truss for Bridges*.—July 11, 1865.—This invention consists of a truss bridge formed of a series of wires attached to metallic plates, placed diagonally and vertically, in order to produce the greater strength.

Claim.—The truss made substantially as described—that is to say, of the rods *a a b b c c c c d d d d e e e e f f f f g g h h r r t t t t*, the hangers *o p p q*, and the connections *A A A A C C D E F F* and *G*, arranged and applied together in manner as specified and represented.

Also, in combination therewith, the series of rings *c*, or their equivalents, applied at the intersections or crossings of the rods.

Also, the combination of two of the said trusses and two series of parallel rods *u u*, diagonal rods *i k*, and bent rods *l*, arranged with the said trusses as specified.

No. 48,644.—GEORGE BEARD, Salineville, Ohio.—*Measure for the Human Body*.—July 11, 1865.—Extensible bands and rods are arranged to be applied to the lengths and circumference of the different parts of the body, scales being arranged at each part to indicate the exact measures.

Claim.—An extensible measure for the human body, applied thereto and operated substantially as herein described.

No. 48,645.—B. H. BENER and M. H. BURGESS, Erie, Penn.—*Medicated Candy*.—July 11, 1865.—This candy is made by combining sugar with a decoction formed by boiling together equal quantities of Iceland moss, slippery elm, horehound, and water.

Claim.—A medical compound, made as herein described.

No. 48,646.—JOHN S. BODGE, Bath, N. Y.—*Feed-regulating Mechanism for Hoppers*.—July 11, 1865.—In this device a slide working in a slot at the lower opening in the hopper is raised and lowered by a rotating knob and band, placed within reach of the operator, for

the purpose of feeding grain and other substances to the machine in greater or less quantities.

Claim.—A hopper provided with a sliding slide *b*, and operating as herein shown, for the purpose of being raised and lowered to regulate the feed or the discharge of the contents of the hopper from the same, as set forth.

No. 48,647.—JOHN BOLEY, Baldwinsville, N. Y.—*Pump*.—July 11, 1865.—A case provided with an increasing spiral discharge passage has a piston formed with curved wings. Beneath the central part of the piston the wings descend slightly enlarging, to a level with the lower extremity of a flange of the bottom shell, and close up against this flange is a central bar upon which the revolving piston is stepped.

Claim.—The concave extension wings *D'*, the flange *C**, the bar *E*, securing the step to the flange, the whole arranged and operating substantially as and for the purposes herein set forth.

No. 48,648.—A. F. H. BRAUN, San Francisco, Cal.—*Damper for Violins*.—July 11, 1865.—This device is attached to the tail-board of violins, so as to be pressed by the chin of the performer and produce a softening and modulation of tone when required.

Claim.—The combination and arrangement of the springs *D K* with the sordine *C*, as operated by the spring or lever *I*, and button *E*, substantially as described, and for the purpose set forth.

No. 48,649.—JOSEPH BROCKWAY, Cambria, N. Y.—*Straw Cutter*.—July 11, 1865.—This invention consists in attaching the cutting knife to the lower end of a pendulum frame so that the swing of the pendulum will bring the edge of the knife to cut the straw obliquely as it passes the throat of the cutting box.

Claim.—Attaching the knife to the lower part of a pendulum or swinging frame, for the purpose as herein set forth.

No. 48,650.—CHAS. BROMBACHER, New York, N. Y.—*Shears for Cutting Paper*.—July 11, 1865.—This device consists of a stationary shear combined with a moving cutter and a clamping bar which is actuated by springs so as to hold the material to the bed while it is being cut. Between the moving shear and the spring clamping bar is a mechanism so arranged that the upward movement of the shear will release the spring clamping bar. The clamping bar is formed with a bevelled edge next to the shears.

Claim.—First, the combination of a stationary shear, a moving cutter and clamping bar actuated by springs to hold the material to the bed while being cut, as and for the purposes specified.

Second, the combination of a stationary shear, a moving cutter, a spring clamping bar, and mechanism, substantially as specified, between the moving shear and the spring clamping bar, whereby the upward movement of the shear releases the spring clamping bar, substantially as set forth.

Third, forming the clamping bar with a bevelled edge next to the shears, for the purposes specified.

Fourth, the sustaining slide rod *t*, fitted substantially as specified, in combination with the spring clamping bar, for the purposes set forth.

Fifth, the movable sustainer *v* in combination with an adjustable gauge *e*, for the purposes specified.

No. 48,651.—JOHN BROOKS and CHAS. F. SYLVESTER, North Bridgewater, Mass.—*Counter Machine*.—July 11, 1865.—This invention consists in the combination of two edge cutters, and a main cutter, and a mechanism for feeding the strips of leather, and in the combination of a rotary platform with its elevating and turning mechanism and a movable supporter.

Claim.—The combination and arrangement of the edge cutters *y y'*, the main cutter or knife *D*, and mechanism for feeding the strip of leather to such cutters, the same being in order that such strip may not only be separated into counters, but each counter be reduced or trimmed on its opposite longer or curved edges, substantially as specified.

Also, the combination of the rotary platform *C* and its elevating and turning mechanisms with the stationary foot *B*, the tilting knife *D*, its stationary abutment *m*, and movable supporter *P*, the whole being arranged and the knife provided with springs, substantially as described.

No. 48,652.—OLIVER L. BROWN, Manitowoc, Wis.—*Governor Valve*.—July 11, 1865.—This invention consists of a valve which is provided with a series of cavities and works in an annular seat which is surrounded by a steam chamber with cavities corresponding in number and position to the cavities in the valve, in such manner that by turning the valve in its seat said cavities can be made to register partially or wholly with the apertures in the seat, and more or less steam passes through the valve.

Claim.—The combination of the projecting valve stems *d d'*, arms *F*, screws *l l'*, conical valve *D*, formed with trapezoidal openings *i*, annular seat *H*, with rectangular openings *h*, steam chamber *B*, inlet *a*, and outlet *b*, all arranged to operate as specified.

No. 43,653.—JOHN BUNDY, Irondequoit, N. Y.—*Coupling for Carriages*.—July 11, 1865.—This coupling consists of a small circular plate to be fastened to the upper surface of the forward axle at the centre, and of a larger circular plate to be fastened to the bolster or spring-block immediately over the smaller plate, and of an arm extending through a longitudinal box along the back of the larger plate connecting in the rear with the reach from the hind axle.

Claim.—The combination of the coupling with the reach from the rear axle by means of an arm or rod extending through the upper circular plate in such form that the plate revolves around it, substantially as above set forth.

No. 43,654.—ROBERT BURNS, New York, N. Y.—*Corn Planter*.—July 11, 1865.—In this machine the upper section of the seed tube has a perpendicular grating through which move forks that act as cut-offs. These forks and also the seed slides are operated by a small gear-wheel inside the tractor wheel. A small frame suspended by elastic pendants is drawn along with the machine. The frame has two cross-bars carrying an adjustable opener and coverer.

Claim.—The tubes F provided with vertical rods or a grating at their outer or rear sides, in connection with the adjustable seed retainers or holders G, arranged to operate substantially as and for the purpose set forth.

Also, the plates I, in combination with the seed retainers or holders G, all arranged to operate conjointly, substantially as described.

Also, the wheel N provided with teeth *ghrrt* on one side, and arranged as shown, so as to be readily thrown in and out of gear with the wheel R, in combination with the levers M O X, for operating the plates I, seed retainers or holders G, and knockers Y Y, for the purposes set forth.

Also, the frames U suspended by the pendants *m*, in combination with the furrow openers T and adjustable coverers, consisting of the flaring plates *n*, and plate *o*, arranged to operate in the manner and for the objects specified.

No. 43,655.—ROBERT BURNS, New York, N. Y.—*Seeding Machine*.—July 11, 1865.—In this machine the perforated reciprocating slides are provided with pendent tubes that have removable plates placed within them and in connection with adjustable pivoted seed delivery tubes placed underneath.

Claim.—The perforated reciprocating slides D provided with pendent tubes E, and having removable plates D placed within them, in connection with the adjustable or pivoted tubes F, substantially as and for the purpose herein set forth.

No. 43,656.—SAMUEL S. CHENEY, Hillsboro', Ohio.—*Car Coupling*.—July 11, 1865.—The object of this invention is to provide an automatic means of attachment of the coupling links which connect the respective draw-heads of two cars, so that by the collision the unconnected end of the link shall act upon the piston which sustains the coupling pin, and thrusting it back shall allow the pin to drop into its lower position in which engages the coupling link; the point of novelty consists in the devices for controlling the motions of the said piston.

Claim.—The method of controlling the motions of the piston in the draw-head by the shoulder in the rear of the head B, and the pin F, which traverses the slot G, the whole arranged substantially as described and represented.

No. 43,657.—WM. and LEWIS CLAYTON, West Philadelphia, Penn.—*Cider Mill*.—July 11, 1865.—This invention consists in the arrangement of knives and scrapers for cutting the apple into thin slices or pieces, in connection with a flexible flap for cleaning the knives as they revolve, whereby the cider mill is rendered very effective and expeditious in operation.

Claim.—First, the combination of the cylinder *g*, sectional pieces *f*, adjustable metallic slips *h*, with sharpened edges and flexible flap *d*, in a cider mill, as and for the purposes herein set forth.

Second, the flexible flap *d*, arranged as and for the purposes described.

No. 43,658.—ISAAC H. COLLAR, Poughkeepsie, N. Y.—*Harvesting Machine*.—July 11, 1865.—The crank wrist or sleeve is furnished with an auxiliary sleeve or box placed exteriorly and at right angles to the main sleeve for the connecting pin of the pitman to pass through, the end of the pitman connected therewith embracing the wrist. The object of this construction is to prevent the twisting or straining of the parts in conforming the cutting apparatus to the uneven surface of the ground.

Claim.—The application of the sleeve D *m* with the crank shaft A, pitman C, and sickle B to harvesting machines, substantially as and for the purpose herein described.

No. 43,659.—JOHN CONDELL, Morristown, N. Y.—*Artificial Arm*.—July 11, 1865.—The nature of this invention will be understood from the claim.

Claim.—First, the appendage Fig. 4, which is adapted to maintain its place by means of its auxiliary attachment, so as to afford two definite and practically rigid points D' D'', to which the flexor and extensor straps or cords are to be attached, so as to produce those motions by the forward and backward movement of the stump.

Second, the cord *a c e* or its equivalent, with or without the intervening lever *d*, and attached substantially as described, by which the forward motion of the metacarpus is obtained.

Third, attaching the flexor and extensor cords or straps to points on the front and rear of the shoulder joint, so as to be brought into action by the forward and rearward motions of the stump.

Fourth, the combination of the flexor and extensor straps with the rocking frame *L* or its equivalent, which connects by link or otherwise with the fore-arm.

Fifth, the flexor spring *L* attached to the socket and to the rocking frame *L*, or its equivalent.

Sixth, the combination of the spring *N* with the arm *P* on the axial bolt, and the rocking frame *L*.

Seventh, the spring *Z* with its tendons *Y F* or their equivalent, and extending from a point in the fore-arm to a point back of the centre of vibration of the metacarpus, substantially as described.

Eighth, articulating the metacarpus to the end of the fore-arm by a pivoted point or points, so as to be moved in either direction by appropriate springs or cords, which are attached to the metacarpus at points on opposite sides of the axis of vibration.

Ninth, constructing the fore-arm as described, with a sleeve portion *V*, which is capable of rotation, so as to change the presentation of the hand.

Tenth, operating the fingers or thumb by the motion, however induced, of the metacarpus.

Eleventh, pivoting the frame piece *m* of the fingers to a point on the metacarpus and the rods, which, under the motion of the metacarpus, primarily induce the deflection of the fingers to a point on the fore-arm.

Twelfth, pivoting the second joint of the frame pan *q* to a point on the frame piece *m* and the rod, which gives the additional deflection due to the second joint to a point attached to or connected with the metacarpus.

Thirteenth, giving the additional deflection due to the terminal section or first joint of each finger by a rod attached to it, and to a point on the frame piece *m*.

Fourteenth, governing the motion of the thumb by a rod attached to the end of the fore-arm, which, under the vibration of the metacarpus, influences the frame piece *x*, and gives the deflection due to the second joint of the thumb.

Fifteenth, giving the deflection due to the first joint of the thumb by means of the rod *y* which performs that office, as the frame piece *x* is vibrated by the rod *Z*, when the metacarpus is moved

No. 48,660.—JOHN CONDELL, Morristown, N. Y.—*Artificial Leg*.—July 11, 1865.—The nature of this invention will be understood from the claim.

Claim.—First, the adjustable pad *B* or plate within the socket, for the purpose of adapting the capacity of the socket to the stump, substantially as set forth.

Second, the bridge piece *K*, which is supported on the frame *G* and upon the bolt *F*, and affording the superior point of attachment for the extensor spring *I i' i''*, substantially as described.

Third, the hamstrings *N N*, arranged substantially as described and attached to the posterior portions of the thigh and leg to act as checks to the forward motion of the leg, in combination with the arrangement for adjusting their tension.

Fourth, the extension spring, consisting of the muscular or spring portion *I*, the tendon *i'* and the bifurcated tendon *i''*, the insertion of the upper tendon being at the bridge piece *K*, which bears up the knee belt, and the lower insertion being in the toe piece, substantially as described.

Fifth, the construction of the ankle joint, consisting of the socket in the foot, and the ball *P* attached by its neck and the iron frame *Q Q'* to the leg, and having a stud upon it, fitting its appropriate recess in the socket in the foot, so as to prevent vibration in a horizontal plane, while leaving the joint free for motion in vertical planes, as described.

Sixth, the elastic straps *a b*, proportioned as to length and strength, substantially as and for the purpose described.

Seventh, the yoke, Fig. 4, which derives its rigidity and freedom from tendency to displacement from its ultimate point of auxiliary attachment, from whence the straps proceed over the shoulders, so as not alone to bring the weight upon the framework of the body, but also to enable the shoulders by their motion to influence the motion of the artificial limb.

No. 48,661.—MATTHEW F. CONNETT, Evansville, Ind.—*Wood-bending Machine*.—July 11, 1865.—The object of this invention is to bend wood into proper shape for plough handles, and it consists in the combination of a series of rollers set in a frame, and arranged in a circular form, a former being so hung that it vibrates centrally with the rollers, and is adjusted to work nearer to or farther from the rollers, and a sliding lever by which the former is adjusted on the wood.

Claim.—The combination of the uprights *b*, carrying rollers *a*, the curved formers *J*, and the sliding blocks *e f*, arranged and operated substantially as described, for the purpose set forth.

No. 42,602.—F. B. CONVERSE, New York, N. Y.—*Instrument for Ripping Sutures in Cloth*.—July 11, 1865.—This invention relates to a convenient implement, by means of which seams or sewing in cloth or other materials can be readily and with ease ripped, with no danger of cutting the material; it is applicable both to machine and hand sewing.

Claim.—The implement for ripping seams herein shown, constructed substantially as above described.

No. 42,663.—B. T. CURRIER, Boston, Mass.—*Carpenter's Gauge*.—July 11, 1865.—This invention consists in the use of revolving rollers, provided with flanges and edges, and attached to the gauge stock, and adjusted by screws as are the marking points in common gauges, and are used instead of marking points.

Claim.—Ranging the adjustable stand I, which carries the marking wheel L to traverse in the slot G of the gauge bar B, substantially as described.

No. 42,664.—G. W. DOTY, E. A. and W. F. STEIN, Ravenna, Ohio.—*Photographer's Decanter*.—July 11, 1865.—This invention consists of a decanter provided at its lower end with a faucet with which is connected a tube. The tube is provided at its other end with a cork through which it passes, and is of such length that the cork may be placed in the neck of the decanter. The tube and the cork are connected in this manner, both to prevent the loss of the latter and to conveniently dispose of the former when not in use.

Claim.—The above-described decanter, when provided with the stop-cock tube and cork, substantially in the manner and for the purposes set forth.

No. 42,665.—CHARLES L. DRIESSLEIN, Chicago, Ill.—*Hay Fork*.—July 11, 1865.—This invention consists in a supplementary fork, hinged to the handle or elsewhere, and operated by a rope for holding the load in place; also in overpoising the supplementary fork by attaching balls or equivalents to the ends of its tines, and also in the employment in combination with the above devices of upright arms upon the rigid fork, for the purpose of preventing it from entering the hay or grain too far.

Claim.—In combination with an ordinary rigid fork and its handle, a hinged and swinging fork or shield D, actuated by a cord or rope, substantially as and for the purpose described and represented.

Also, weighing or overpoising the tines or arms of the swinging fork by means of the ball E, or their equivalents, to cause it to fall with more readiness and quickness, as and for the purpose described.

Also, in combination with the permanent and swinging forks, the arms G for preventing the fork from entering the material to be moved by it too far, and thus interfering with the free and unencumbered action of the swinging fork, substantially as herein described.

No. 42,666.—WORDEN EDMISTER and STEPHEN JOHNSON, Mount Vernon, Ohio.—*Churn*.—July 11, 1865.—In this churn the dasher is of the shape of the inverted hand with extended fingers, and is perforated in several places. It is adjusted vertically upon an upright revolving shaft.

Claim.—The dasher C, composed of two parts, constructed as shown, connected together and applied to the shaft D, so as to admit of being adjusted higher and lower thereon, substantially as and for the purpose specified.

No. 42,667.—JAMES ESLER, Brooklyn, N. Y.—*Coupling for Shafts of Boring Tools*.—July 11, 1865.—In this coupling a threaded tenon on the end of one section or rod screws into a threaded socket in the end of the other rod, and the two are prevented from becoming unscrewed by a hollow sleeve which surrounds the rods at the joint, having an inwardly turned flange at one end, which hooks against a shoulder on one rod, and a flat spring key which passes diagonally through the sleeve and against the flat surface of the other rod.

Claim.—Preventing the lower section of the boring rod A from turning away or being disconnected from the rod C by means of the sleeve E and the key H, the said key passing through an aperture in said sleeve by and past one of the squares formed on said section A, as and for the purpose set forth.

No. 42,668.—HORATIO FAIRBANKS, Boston, Mass.—*Flour Sifter*.—July 11, 1865.—This invention consists of a box or hopper provided with a sieve and containing a revolving shaft having a series of angular projections, by means of which the flour is agitated and caused to pass rapidly through the sieve.

Claim.—The revolving shaft C, carrying a series of angular projections, in combination with a box or hopper A, and sieve B, substantially as and for the purpose set forth.

Also, in combination with the above, attaching a rubber strip to one or both sides of the sieve B, substantially as and for the purpose described.

No. 42,669.—H. W. FARLEY, Hannibal, Ohio.—*Excavator*.—July 11, 1865.—This invention consists of an excavator for removing earth from the sides of railroads that may have been washed down near or upon the track. The device is carried upon a car. The scoops

project below it and are operated by means of a windlass and lifting apparatus, so that the scoops can be raised and discharged when desired, the power of the locomotive operating the scoops.

Claim.—First, the shaft G, with its scoops H, in combination with the block and tackle devices for raising, substantially in the manner and for the purpose described.

Second, the partially rotating scoops, operated by a lever or levers on the shafts, to adjust their position or discharge their load.

Third, the combination of the crank W and its connecting gearing with the rope S, and counterbalance weight T, for raising the shaft G, and its scoops.

No. 48,670.—G. W. FITTS, South Hampton, N. H.—*Corn Sheller*.—July 11, 1865.—This invention consists in devices which constitute the discharging throat and by means of which the cobs and grain are separated and the grain subjected to the action of a blast to separate the chaff.

Claim.—The arrangement of the discharging throat G, and its back board or part X, with the curved chute F, and the wheel C, to operate as specified.

No. 48,671.—CHRISTIAN FOSTENSEN, HANS IVERSON, and CHARLES J. SKOW, Racine, Wis.—*Camp Bedstead*.—July 11, 1865.—This invention consists in a combination of devices whereby bedsteads when not in use can be neatly folded up into a compact shape and thus be convenient for transportation or storage.

Claim.—First, the combination and arrangement of the sacking *a*, side-bars *b b*, short end pieces *c* and *d*, bars *f* and *g*, rod *l*, plates *n n*, arms *p* and *q*, plates *t t*, bars *y*, and legs *u u*, substantially as described.

Second, attaching the two ends of the mattress or sacking used for the bedstead to and within a swinging frame of its side-bars, arranged and operating substantially in the manner and for the purposes specified.

No. 48,672.—C. F. FREDERICI, New York, N. Y.—*Apparatus for Distilling*.—July 11, 1865.—This invention consists of a series of hollow drums connected together by means of oblique pipes and secured to a shaft, one end of which is hollow and stationary, and connects with a branch pipe. The whole is surrounded by a jacket by means of which the apparatus may be heated.

Claim.—A distilling apparatus, composed of a series of hollow drums (two or more) connected by oblique pipes, and provided with gudgeons on which it revolves, substantially as and for the purpose set forth.

Also, the combination of the pipe E, and hollow gudgeon *a'*, with the drums C, with or without oblique pipes D, constructed and operating substantially as and for the purpose described.

No. 48,673.—JOSEPH P. GALLAGHER, St. Louis, Mo.—*Cocks*.—July 11, 1865.—This invention consists of a subsidiary tube leading from the main chamber of a faucet, into the valve chamber above the valve. Out of the valve chamber leads a similar tube, not into the main chamber, however. When the valve closes the waste water passes by means of the tube before mentioned up into the valve chamber, and thence by means of the egress tube is conducted away, thus preventing freezing. When the valve rises the waste passage is closed.

Claim.—First, the tube F, arranged relatively with the body A of the cock or faucet and the chamber or barrel D, and the valve B, in connection with the tube C, disk G, and escape spout H, substantially as and for the purpose specified.

Second, the groove *b* in the periphery of disk G, when used in connection with the parts specified in the first claim, for the purpose of affording an annular chamber around the disk G as described.

No. 48,674.—AMMI M. GEORGE, Nashua, N. H.—*Pipe Couplings*.—July 11, 1865.—This invention consists in an arrangement of two or more button bolts, in combination with the two parts of a hose coupling. The arrangement is such that by turning the bolts so as to bring the button heads in one position, the two parts of the coupling are put together or taken apart at pleasure, and by simply turning the heads to other positions while the two parts of the coupling are in contact they are bound together and firmly held.

Claim.—The combinations of the projections, heads, or buttons *b b* of the bolts B B, and the inclined surface K K *l l*, K K *l l*, with the two parts of the coupling, substantially as and for the purpose set forth.

No. 48,675.—SAMUEL GLADDING, Providence, R. I.—*Chain-holder*.—July 11, 1865.—This chain-holder is the common claw with fingers made winged so as to close for grasping the chain and to open for freeing it. The fingers are kept close to the chain by a pin or catch on one end of a claw. By the use of a wedge the catch is held down and by knocking out the wedge the catch is freed and the fingers open to permit the chain to pass.

Claim.—First, the movable fingers *a a* in combination with the catch *b* and the mortises *c c* constructed substantially as set forth.

Second, the combination of the fingers *a a* mortises *c c* with the catch *b* provided with the pins *i* in connection with the wedge *h*, constructed and arranged substantially in the manner described and for the purpose set forth.

No. 48,676.—PORTER J. GLADWIN, Boston, Mass.—*Tool for Lifting Stove-covers, &c.*—July 11, 1865.—This device is composed of two parts, one pivoted in a slot near the end of the other, so that when the tool is in position, this part falling by its gravity opens the notched jaws at the end furthest from the hand. When in use the fingers can easily control the handles and thus cause the jaws to open or close; the other end is formed so that it may be used as a tack drawer, &c.

Claim.—The within described tool consisting essentially of the handle *A*, with its stationary jaw *B*, and slot *b*, in combination with the movable jaw *C*, and its arm *c'*, the whole arranged and operating as and for the purpose set forth.

No. 48,677.—NATHANIEL GRANT and GEORGE DOWNS, Providence, R. I.—*Band for Head Dresses.*—July 11, 1865.—This band presenting its concavity to the back of the head has a hole at each end through which a rod passes in a line corresponding to the cord of a bow. At each end of this rod is a ball or other enlargement. These parts are made of hoops or horns reduced to a plastic condition by well-known means and formed in heated moulds.

Claim.—The improved band for ornamental head dresses made of the material herein described, as a new article of manufacture.

No. 48,678.—C. B. GUY, Lybrand, Iowa.—*Combined Lamp and Stove.*—July 11, 1865.—This device consists of a combination of a lamp and stove, so that the smoke may be carried off by the stove-pipe.

Claim.—A lamp combined with a stove and register in the manner substantially as herein shown and described, so that the smoke and odor emitted from the lamp may be carried off by the stove-pipe, and the rays of light admitted into the apartment or shut off from the same when desired, substantially as set forth.

No. 48,679.—A. HAMMOND, Jacksonville, Ill.—*Gang Plough.*—July 11, 1865.—In this machine the tongue is bolted upon the front of a small platform that is itself held by a shaft passing through both beams of the plough in front of the axle. The platform with the tongue turns vertically upon the shaft and is kept at any desired angle by a vertical rack and pawl. The rear end of the tongue moves laterally upon a rack at the rear of the platform; thus the tongue is adjusted both laterally and vertically.

Claim.—First, the segment rack *L*, pawl *M*, and foot lever *O*, all arranged and applied to the plank or timber *D*, and beam *A*, substantially as and for the purpose specified.

Second, the button *P*, when applied to the plank or timber *D*, and used in connection with the rack *L*, pawl *M*, and foot lever *O*, for the purpose set forth.

No. 48,680.—J. H. HARRIS, Newark, N. J.—*Machine for Granulating Tobacco.*—July 11, 1865.—This invention consists in a machine for granulating or dividing the leaves of tobacco into minute divisions for smoking in pipes, wherein a corrugated beater roller is made to revolve within a vibrating vessel, whose sides are composed of wire-cloth on a mesh of like character, so that the tobacco is broken up and delivered in small pieces through the meshes of the wire-cloth into a box below.

Claim.—The combination in a machine for granulating tobacco of the vibrating vessel *D* having open sides with a corrugated roller revolving therein, substantially as described.

No. 48,681.—E. H. HAWLEY, Signal Corps, army of Potomac.—*Cryptographic Alphabet.*—July 11, 1865.—The object of this invention is to so construct a cryptographic alphabet that the different letter tablets may be variously adjusted with relation to each other as dictated by a new key word, and the signification of the different key letters so changed thereby that even an expert who thoroughly understands the system and apparatus, cannot decipher a despatch without first possessing the key word which dictates the arrangement of the tablets.

Claim.—A cryptographic alphabet arranged substantially in the manner and for the purpose specified.

No. 48,682.—FRANCIS D. HAYWARD, Malden, Mass., and PASCAL STONE, Charlestown, Mass.—*Boot Heel.*—July 11, 1865.—This invention consists in an elastic dovetailed connection so that the tread part may be either revolved or adjusted relatively to the heel part.

Claim.—The improved heel or parts *A B*, as made with the dovetail connection, elastic as described, or with the circular or polygonal elastic dovetail connection as explained, the whole being so that the tread part *B* may be either revolved or adjusted relatively to the part *A*, substantially as and for the purpose specified.

No. 48,683.—JOHN HEINLEIN, Galena, Ill.—*Washing Machine.*—July 11, 1865.—This invention consists of a swinging pressure roller frame, in connection with an elastic wash-board and combination with an air chamber.

Claim.—First, the air chamber E, arranged relatively with the wash-board C, to operate in connection therewith, substantially as and for the purpose specified.

Second, the combination of the swinging rollers e, wash-board C, and air chamber E, all arranged and combined to operate in the manner as and for the purpose set forth.

No. 48,684.—SAMUEL HEFLEBOWER, Alexandria, Va.—*Flour Bolt.*—July 11, 1865.—This invention consists of a radial prolongation of the wings of a fan at the tail end of a bolt to create a current of air. It also consists in inserting a metal plate at the bottom of a non-revolving bolt reel to receive the falling meal and prevent injury to the bolt-cloth.

Claim.—Making a radial prolongation e to the wings of the fan at the tail end of the horizontal or nearly horizontal bolt, the said radial extension of the wing or wings beyond the main portion of the fan being adapted to cause a current of air to be drawn through the bolt in the manner and for the purpose described.

Also, the plate N, Fig. 3, in combination with the scoop-shaped dippers.

No. 48,685.—ANTON HEHNIGER, New Haven Conn.—*Dirk Knives.*—July 11, 1865.—This invention consists in enlarging the shoulder of the small blade upon the inner side, so that when shut it will come in contact with a small bent projection upon the inner side of the spring of the large or dirk blade, and being pressed inward by the thumb it will pass the said spring so as to release the dirk blade from the catch at the end of the spring and allow it to be shut.

Claim.—The combination of two blades, B and C, with the spring g, when the parts are constructed, arranged, and fitted for use, substantially as herein described.

No. 48,686.—H. Z. HOPKINS, San Francisco, Cal.—*Metallic Packing Boxes.*—July 11, 1865.—This invention consists of a conical box or follower, a sectional or split lining, and a cap, so constructed that the lining can be made to embrace the rod more or less closely by tightening the nuts which hold the follower in position; and it is prevented from closing too tightly upon the rail by the zig which passes into an aperture in the lining provided for the purpose. The key is held in its position by a nut placed upon a stud secured to the cylinder head, and which passes through a portion of the wedge, which is at a right angle to the main portion thereof. By tightening the nut on this belt the wedge is thrust into the lining, and the position of the same is regulated with reference to the rod.

Claim.—The tapering split or sectional lining C, with expanding wedge D, in combination with the box A and follower or cap B, constructed and operating substantially as and for the purpose described.

No. 48,687.—J. M. HOWE, Portland, Oregon.—*Machine for Making Wagon Wheels.*—July 11, 1865.—This invention relates to a machine which saws and bores the felloes, tenons the spokes at both ends, sawing them to the required length, and planing the felloes simultaneously at three sides; and it consists in forming the tenons on the spoke, driving the spokes into the hub, which is centred on the ring table, formed by a slide and ring, so that by turning the ring the spokes are in turn presented to a circular saw, which cuts them to the required length. The tenons on the outer end of the spokes are made by a hollow auger on the shaft in the place of the saw, and the felloes bored by a bit placed on the shaft. The felloes are then driven on the spokes and presented to planers that, as the ring carrying the wheel is revolved, planes the sides and the outer circle of the wheel at the same time.

Claim.—The annular slide G, with the ring H attached, and the latter provided with the arms f and the slides g, in connection with the shafts C C' and D, provided with cutters C and C', all arranged substantially as and for the purpose herein set forth.

No. 48,688.—K. T. HURLBERT, Lyons, N. Y.—*Carriage Top.*—July 11, 1865.—This invention consists in placing the socket on the seat of the carriage and the joints in the bows, so that the top can be folded in a very small space and put under the seat.

Claim.—The combination of the pivoted socket D, guide a, and plate C, so arranged as to allow the carriage top to be easily applied or removed, and to be turned half way back, substantially as described.

Also, the construction of the top, consisting of the jointed bows E E' E'', single toggle levers G G, and suitable covering A, the whole so arranged as to be compactly folded up, substantially as herein set forth.

Also, the arrangement of the pivoted socket D and guide a of the seat, and the bows E E', toggle levers G G, and covering A of the top, substantially in the manner and for the purpose herein specified.

No. 48,689.—W. W. HUSE, Brooklyn, N. Y.—*Process of Curing Tobacco.*—July 11, 1865.—An air-tight room is so arranged that by means of steam pipes it may be heated to any required temperature. One half of the steam pipes are pierced with holes so that steam may be let into the room. The tobacco is placed in this room, and the temperature is raised to 150° Fahrenheit, and maintained for about forty-eight hours; the tobacco is then taken out, dried, and heated in the ordinary manner.

Claim.—The process, substantially as herein described, of curing tobacco, which process consists in subjecting it to the action of artificial heat and steam to induce the required fermentation until nicotine is evolved, and then stopping the further progress of fermentation by opening the packages and thoroughly drying every part, substantially as described.

No. 45,690.—JOHN S. JONES, Covington, Ind.—*Binding Attachment to Reaping Machines.*—July 11, 1865.—This invention consists in certain devices that bind and drop on the ground the sheaf by twisting the band under a rod, tucking it, holding the sheaf and band firmly until the latter is tucked, and removing the sheaf by the devices that tuck the band.

Claim.—First, the combination of the rack *a*, pinion *b*, wheel *C*, bevel pinion *d*, curved wings *G*, spring *A*, hand *N*, fork *T*, and triangle *g*, for the purposes set forth.

Second, the rod *I*, or its equivalent, in combination with twisting devices *J* and *K*, for the purpose described.

Third, the arrangement of the sheaf bed *F* and its wings *G*, in combination with the elevator *X*, that lifts them, the device *Y* that operates that elevator, the rods *m* that lay over the sheaf bed, holding the straw down while the wings press it.

No. 45,691.—HORACE M. KEITH, Commerce, Michigan.—*Pump.*—July 11, 1865.—The induction tube is within a pump stock, to which the main cylinder is clamped. A cut-off is set transversely within this stock. Below this cut-off a port and valve permit the flow into the cylinder, and above the cut-off a port and valve permit the flow back to the stock and upward. The pump brake is pivoted at the top of the stock. Water forced up around the piston through a packing of slot overflows into a side cylinder, into which dips an arm with a bucket at its extremity, said arm springing from and moving with the piston rod. Thus the water, overflowing with the descent of the piston, is poured back with its ascent.

Claim.—The reservoir *B*, the valves *m* and *n*, the cut-off *S*, the swipe pole *I*, and the bucket *F*, and the cylinder *C*, the whole constructed, arranged, and operating as and for the purpose substantially as herein set forth.

No. 45,692.—EDWIN KENDALL, New Lebanon, N. Y.—*Piston Packing.*—July 11, 1865.—This invention consists of a coiled spring, which is placed between the flanges of the piston head in such a manner as to be capable of expanding for the purpose of producing a tight joint between itself and the sides of the cylinder.

Claim.—A packing for pistons, consisting of a coiled spring *C*, secured between the heads *B B*, and adapted to operate substantially as herein described.

No. 45,693.—E. D. KINNEY and CALER WRIGHT, Philadelphia, Penn.—*Construction of Glass Cases.*—July 11, 1865.—This invention consists of a case constructed of plates of glass, six in number, arranged in the form of a parallelepipedon, the plates being connected by angle irons or other metallic strips, and intended to form a transparent covering for photographic albums.

Claim.—The within-described case composed of the plates of glass arranged in respect to each other, held by the angular slips of the frame, and supported by the bent pieces *a*, all substantially as described.

No. 45,694.—J. KINDLEBERGER, Springfield, Ohio.—*Water Wheel.*—July 11, 1865.—The object of this invention consists in a combination of devices whereby to open and close the gates to increase or diminish the ingress of water, and to protect the mechanism from injury by drift or other foreign substances. Its novelty consists in a cap through which the shaft of a pinion passes, and the combination and arrangement of the buckets, bent arms, levers, screws, springs, and segment pins, for operating the gates.

Claim.—First, the springs, applied to the opening and closing mechanism of the gates, where a plurality of gates are used for a single wheel, so that any one of said gates, in case of being prevented from closing, will not prevent the closing of the others, as herein set forth.

Second, the arrangement of the bent arms *C* and levers *D* with the set screws *a*, springs *g*, plate *E*, the pendent pins *h*, the segment *G*, and pinion *H*, for operating the gates *B*, as set forth.

Third, the arrangement of the buckets *I* of serpentine form, substantially as described.

Fourth, the cap *I* through which the shaft *j* of the pinion *H* passes, and which covers and protects the parts for opening and closing the gates, as herein set forth.

No. 45,695.—JOHN KNICKERBOCKER, Hartford, Conn.—*Damper.*—July 11, 1865.—At any desirable point in the stove-pipe are placed two radiating plates, joined together at their lower ends, extending lengthwise of the pipe. By means of connecting rods and joints these plates are connected with a circular damper placed above them. The entire apparatus is hung on a pivot rod, which projects outside the pipe, and by means of which the draught is regulated.

Claim.—As a new improved article of manufacture, viz., the combination of the plates *b* with the damper *c* and adjusting rod *g*, with their connections, substantially as and for the purpose described.

No. 43,696.—J. H. LA BOYTEAUX and C. A. ASHTON, Jacksonville, Ill.—*Gang Plough*.—July 11, 1865.—In this machine an upright, upon which the wheel is fixed, slides vertically upon the end of the axle, thus raising and lowering the plough axle. This upright is adjusted by a hand lever and chain running over pulleys in the upright, and also in the guide in which the upright moves. A short hand lever, running through a slotted bar, hinged in the rear of the seat, by means of a chain and pulleys on the draught pole, elevates the plough beams.

Claim.—First, the adjusting of the axle A, and consequently of the plough beams and ploughs, by means of the lever *j* connected with the axle through the medium of the chain G, arranged substantially as described, for the purpose of adjusting the ploughs to suit the surface of the ground over which they work.

Second, the pivoted plough beams N M, in connection with the bar S, lever T, and chain N*, all arranged to operate in the manner substantially as and for the purpose set forth.

No. 43,697.—EDWIN B. LARCHER, New York, N. Y.—*Method of Preparing Flour and Meal for Transportation*.—July 11, 1865; antedated June 28, 1865.—This invention consists in pressing the flour or meal into cakes by means of hydraulic pressure. These cakes are protected from atmospheric influence by a coating of paste, starch, or varnish.

Claim.—The preparation of flour or meal for its preservation by compressing the same, as and for the purposes specified.

No. 43,698.—JOHN LEE, Massillon, Ohio.—*Self-acting Gate*.—July 11, 1865.—This invention consists in pivoting the upper horizontal balance rail of a gate to a sliding bearing, so that the pivot of the upper rail shall be beyond the pivot of the lower rail, and shall approach the lower pivot as the gate approaches a vertical position. By this means the gate is enabled to be so easily balanced that a light operating weight only is required; and also to be constructed with vertical pickets, whereby the appearance of the gate is preserved uniform with that of the fence.

Claim.—First, sliding block E and pivot *d*, or their equivalent, constructed and operating as set forth.

Second, hinging the weight H to the top of the upper rail in the manner described, or its equivalent.

Third, operating the latch bar G by means of the picket F' and slots Y, or their equivalents, as set forth.

Fourth, the cast-iron piece P, or its equivalent, operating as described.

Fifth, the combination and arrangement of shafts L and N and lever Q, or their equivalents, operating as described.

No. 43,699.—MICHAEL LOUGHRAN, assignor to himself and JAMES B. LOUGHRAN, Pittsburg, Penn.—*Method of Forming Blank Clips for Singletrees*.—July 11, 1865.—This invention consists in rolling out a bar of iron of suitable size into a thin band or strip, with a longitudinal bead or rib on each side, either in the middle or near the edge, and afterwards passing the said strip through another set of rolls, whereby alternate portions of the bead on one side are made level or even with the surface of the main band or strip.

Claim.—As a new article of manufacture, bars of iron having a raised brad running longitudinally on one or both sides, whether said brads are in the centre of the bar or near one edge, and with flattened spaces on one or both sides at regular intervals along the body of the bar, made by depressing the brads in certain places, without regard to the shape of the brads, so as to form clips and clevises, in the manner herein shown.

No. 43,700.—THOMAS MASON, Boston, Mass.—*Vegetable Slicer*.—July 11, 1865.—This invention consists in combining with one cutter stock, carrying any desirable number of knives, a series of hoppers or conductors, each of which is so arranged with respect to the common cutter stock as to present the vegetable so that it shall be cut into slices of even thickness.

Claim.—The combination of the series of conductors *b* with the single rotary cutter stock *d*, arranged to operate together substantially as set forth.

No. 43,701.—JOHN M. MAY, Janesville, Wis., and E. B. GODFREY, Oshkosh, Wis.—*Portable Fence*.—July 11, 1865; antedated June 23, 1865.—This invention consists in making a portable and stationary fence with a support that dispenses wholly with nails or spikes, the picket or piece that pins the panels or lengths of the fence together being at the same time a kind of key that binds the parts of the fence and its supports firmly together. By removing the picket key the panels of the fence and their supporting pieces fall apart, and the fence may be readily removed. The picket or piece that pins together the panels of the fence also serves as a pivot to form a kind of hinge or joint to allow the fence to be made in a curved or circular form, or in a straight line, without altering the manner of constructing the fence or its supports. The picket or piece that holds the panel of the fence together is so formed that when the joints of the fence become loose from the shrinking of the wood of which the fence is made they are made tight and firm by turning the picket in a horizontal direction, by which movement it acts as a key or wedge.

Claim.—First, picket C, or its equivalent, when used in constructing a fence, substantially as and for the purpose described.

Second, braces F F, or their equivalent, when made substantially as described and used in combination with picket C, or its equivalent, and base B, substantially as and for the purposes described.

Third, a hinge or joint, when formed by means of picket C, or its equivalent, and the perforated ends of rails, and supported by base B and braces F F, substantially as and for the purpose described.

No. 48,702.—W. MCARTHUR, Philadelphia, Penn.—*Feather Renovator*.—July 11, 1865.—This invention consists of a cylinder divided into two parts, and provided with a shaft carrying long and short arms. The lower part of the cylinder is enclosed in a tight box, which is provided with pipes. The lower part of the cylinder has a steam chest attached to it, and communicates with said chest through an opening covered with wire gauze. The chest is provided with pipes, and the cylinder with the steam pipes and escape pipes. The upper portion of the cylinder may be raised, and the wire gauze frame inserted to prevent the feathers from being thrown out.

Claim.—First, the casing B, its shaft C, and arms *b* and *b'*, in combination with the case A and the pipes *f* and *g*, or their equivalents, the whole being arranged and operating substantially as and for the purpose described.

Second, the combination of the casing B, chamber *d*, and perforated or gauze plate *e*.

Third, the frames D and E with their gauze or perforated plates adapted to the two halves of the casing B, substantially as and for the purpose herein set forth.

Fourth, the long and short tapering arms *b* and *b'*, arranged on the shaft C, as set forth.

Fifth, the combination of the steam-tight box A and its pipes *f* and *g*, or their equivalents, with the casing B.

No. 48,703.—JAMES McCUREM, Lorain, Grove, Ohio.—*Carpenters' Gauges*.—July 11, 1865.—This invention consists of a loose head and spring applied to and connected with an adjustable head on a gauge bar, so that, by the action of the loose head and spring, the marking points will be guarded in the use of the gauge.

Claim.—The employment or use of the loose head D and spring E, or its equivalent, in combination with the bar B and adjustable heads A C, constructed and operating in the manner and for the purpose substantially as herein shown and described.

No. 48,704.—THOMAS W. McDILL, Perry, Ill.—*Cornstalk Cutter*.—July 11, 1865.—This invention consists of a suitable frame provided with a draught pole and a shaft having trilateral heads upon it, to which knives are attached at the angles or corners.

Claim.—The knives E attached to triangular heads U' kept on a shaft C, which is placed within a suitable frame A, and all arranged to operate in the manner substantially as and for the purpose set forth.

No. 48,705.—T. N. MORSE, Grosse Pointe, Mich.—*Wood Press*.—July 11, 1865.—The object of this invention is to put up *boards* of wood in square or nearly square form, so as to be easily handled and be capable of being packed for storage or transportation, in less space than is now required.

Claim.—First, a machine for binding *boards* of wood, constructed and operated as shown, having bands C, which are attached to and detached from the woodless by means of a bar W and groove Y, substantially as and for the purposes above set forth.

Second, the combination of the side levers *a*, transverse levers C', and grooves *d* and *d'*, all constructed, arranged, and employed substantially as and for the purposes set forth.

No. 48,706.—J. F. BRICHARD, Milwaukee, Wis.—*Apparatus for Carburetting Air*.—July 11, 1865.—This invention consists of a metallic case provided with inlet tubes. Inside of this cylinder a series of metallic tubes, surrounded by fibrous tubes, are arranged, the fibrous tubes being attached to the upper and lower heads, and the metallic tubes to the upper head only. The apparatus is provided with a try cock.

Claim.—First, the vertical tubes *b* for exposing the fluid of the hydro-carbon to the current of air, substantially as herein recited.

Second, the arrangement of the vertical metal tubes *c*, or their equivalents, in relation to the tubes *b*, as herein described.

No. 48,707.—AARON CARYER, Little Falls, N. Y.—*Pump*.—July 11, 1865.—This invention consists of a double-action pump, the piston having two ball valves, the upper one of which relieves the lower of superincumbent water in the hollow piston rod. A ball valve at the bottom of the cylinder admits water to the lower piston valve. A series of small ball valves arranged in a circle around this, admit water around the pump cylinder, and within an outer cylinder to a point of ingress above the play of the piston, this outer tube being held to the inner at the bottom of an inverted cap. The section of tube next above descends between the lower pin until its inner and outer shoulders rest upon them, when a surround-

ing thimble screws down upon the outer lower cylinder and confines all in place. On the inside of this short section of tube there is an annular groove to receive and retain a spring collar surrounding the bottom piston rod, which collar drops into place as soon as it descends to this position, and can only be displaced by extending the play of the piston so as to bring its upper end against the lower part of said collar, when the piston may be withdrawn from the well to be again instantly replaced at will.

Claim.—First, the piston constructed substantially as described; that is to say, with a supplementary upper valve restraining the downward pressure of the contents of the piston rod or pump tube upon the lower valve of the piston, substantially as described and represented.

Second, so fitting the piston rod of a double-action pump to the working cylinder thereof as that it can be detached and withdrawn thereout and replaced thereon at pleasure, automatically, by increasing the length of the stroke substantially as described.

Third, separating the cylinder of a pump from the pump tube above by a removable inner collar, within which the piston top works, and which is capable of being detached so as to allow the piston to be withdrawn and replaced again after the piston is replaced, by means substantially as described.

Fourth, connecting the valve-box I, forming the lower part of the working cylinder, to the outer cylinder A3 by means of the screw *p*, constructed and applied substantially as above described.

No. 48,703.—J. C. DEAN, Chicago, Ill.—*Dental Hammers.*—July 11, 1865.—This dental hammer is so constructed that the stock or handle for holding the plugging point is also adapted for receiving the hammer which is used for giving the required blow to said point, a spiral spring being located between the hammer and the head of the handle, in order to force the former forward when released against the plugging instrument. The releasing device is arranged to be situated at any desired point along the handle, so as to enable the spring to act with greater or less force upon the hammer, as may be required.

Claim.—First, the combination of the hammer D with the device for holding dentists' plugging points, substantially as described.

Second, providing for regulating the force of the blow of a hammer when the latter is applied to the holder of a plugging point, by means substantially as described.

Third, the combination of a tool-holder C, spring-hammer D, and the device or devices for actuating said hammer, substantially as described.

No. 48,709.—CHARLES W. EMORY, Dorchester, Mass.—*Pipe Coupling.*—July 11, 1865.—This invention consists in forming a thimble tapering towards the end, and provided externally with large rounded screw threads, upon which the elastic tube is forced, and a tapering cap similarly threaded internally, which is screwed upon said thimble and over the distended tubes, the latter lying between the thimble and the cap, being thus forced to conform to the inequalities of the threaded portions, is firmly and tightly held.

Claim.—The combination of the thimble *a* with the screw-cap *c*, constructed and operating as herein described.

No. 48,710.—ADDISON C. FLETCHER, New York, N. Y.—*Condenser.*—July 11, 1865.—This invention consists in the arrangement of a fan with reference to the radiators into which the exhaust steam from the engine is conveyed by suitable pipes. The exhaust fan is placed upon top of the case which surrounds the radiator, so that the air entering the spaces in the case between the radiator shall rise vertically through such apertures, and thus act in concert.

Claim.—The arrangement of the fan G, or its equivalent, and the inlet openings *a a* of the air-box B, substantially as herein described, in relation to the upright steam radiators A A of an apparatus for condensing steam and heating air, whereby there is produced over the surfaces of the said radiators an artificial upward circulation, in which the natural upward circulation is taken advantage of, substantially as herein set forth.

No. 48,711.—ALEXANDER FRIES, Cincinnati, Ohio.—*Distillation of Alcohol, &c.*—July 11, 1865.—This invention consists of a still heated by steam pipes, and connected with a U-shaped tube by means of a goose neck. The said tube is connected with a receiver by means of a goose neck, and the receiver is connected to an ordinary condensing apparatus by a goose neck. The vapor first passes from the still into the U-shaped tube, where the heavy portions are condensed and allowed to flow back into the still. The vapor then passes into the receiver, where condensation again takes place, the liquid being returned to the U-shaped tube by means of a pipe. The lighter vapors are finally condensed in the condensing room.

Claim.—The mode substantially as set forth of distilling purified spirits direct from the mash.

No. 48,712.—E. G. NILES, Cincinnati, Ohio.—*Cooking Range.*—July 11, 1865.—A water chamber is cast with the top plate at its rear part, and directly back of the upper part of the fire chamber. A supplemental fire grate is fitted in the top plate, directly over the fire chamber. The flues are so arranged that the products of combustion can be made to circu-

late around and under the ovens when desired, by which means air may be heated for warming apartments other than that in which the range is placed.

Claim.—First, the supplemental fire-grate E fitted in the top plate of the range directly over the fire-chamber B, arranged substantially as described.

Second, the water-chamber G cast with the top-plate D, and placed in relation with the fire-chamber B and supplemental grate E, substantially as described.

Third, the arrangement of the flues *b c* provided with partitions *d*, substantially as and for the purpose specified.

No. 48,713.—GEORGE NIMMO, Jersey City, N. J.—*Drying and Preparing Crucibles.*—July 11, 1865.—This invention consists in placing the crucibles on carriages at the cool end of a flue, and gradually forwarding them towards the fire, where they are prepared and ejected.

Claim.—First, drying and preparing crucibles by gradually moving them from the cool part of a flue toward the fire, either inside or outside said flue, on a carriage, or shifted by hand.

Second, the construction of a flue, in combination with carriages, as described, and for the purpose specified.

No. 48,714.—CHARLES NOBLE, New York, N. Y.—*Manufacture of Gas.*—July 11, 1865.—This invention consists in preparing gas from coal dust or waste coal, the coal dust being mixed with starch and formed into lumps, so that the heat may penetrate the mass in the retort evenly and uniformly.

Claim.—The employment or use in the manufacture of gas, of lumps produced from coal dust or waste coal, substantially in the manner and for the purpose set forth.

No. 48,715.—OTIS OLDS, Aurora, N. Y.—*Wheel for the Propulsion of Vessels in Shoa! Water.*—July 11, 1865.—This invention consists in the combination of the ground wheel with its supporting frame and hand wheel, which operates upon the ground wheel so that a purchase may be obtained to lift upon the bow of the boat.

Claim.—The combination of the traction or ground wheel H with the compound frame A B (including the hand wheel I and lifting ropes and pulleys) so that a purchase may be obtained to lift upon the bow of the boat, substantially as described.

No. 48,716.—JOSEPH C. PAINE, Dubuque, Iowa.—*Stove-pipe Drum.*—July 11, 1865.—Inside the drum and surrounding the inner cylinder is a cone-shaped chamber, its closed apex being near the bottom, and its closed base near the top. Pipes convey cold air into this chamber at a point near its apex, and through pipes in its base the heated air escapes. Between this and the outer casing is another chamber, so that by closing a damper in the top of the inner pipe the circulation flows through this chamber to the exit pipe, being directed in its passage to and from the outer casing by deflectors on the outside of the cone-shaped chamber, and one inside of the outer casing.

Claim.—The combination of cone A2, within the drum, with the hot air-chamber B' B'', the tubes or pipes D' D'' and E' E'', the double deflectors G' G'', and the double damper F1 F2, for the purpose and in the manner set forth.

No. 48,717.—STEPHEN A. POTTER, Philadelphia, Penn.—*Pen Distributor.*—July 11, 1865.—This invention consists of a case with drawers, having partitions to divide the pens, and spring catches to hold them when closed.

Claim.—The peculiar construction and combination of a case of drawers, so arranged with partitions H H, divisions A A, catches C C, or their equivalents, for the purpose and in the manner substantially as shown and described.

No. 48,718.—S. SAFFORD PUTNAM, Dorchester, Mass.—*Washing Machine.*—July 11, 1865.—This invention consists of a vessel provided with a series of buckets so arranged and inclined upon its sides that the series of buckets on one side shall incline upwards, while the series on the opposite side shall incline downwards, and the series on the bottom shall incline from right to left, while that on the top shall incline in an opposite direction, so as to form buckets for dipping up and throwing water over the clothes, and at the same time to turn and rub them.

Claim.—A receptacle, having a series of buckets so arranged and inclined upon its sides as that the series on one side shall incline upward, while the series on the opposite shall incline downward, and the series on the bottom incline from right to left, while the series on the top shall incline from left to right, so as to form buckets for dipping up and throwing the water over the clothes, as well as to turn and rub them, as herein set forth.

No. 48,719.—WILLIAM J. RAND, Brooklyn, N. Y.—*Preparation of Desiccated Vegetable Extracts.*—July 11, 1865.—This invention consists of a digester, surrounded by a steam jacket, and connected to the receiver by means of a pipe which is provided with strainers. A vacuum pan is connected with the receiver by means of a pipe. The material to be operated upon is placed in the digester and subjected to the action of boiling water, under a

pressure greater than that of the atmosphere. The material is then forced through a pipe into the receiver, the solid matter being retained by the strainers. When the strained product has all passed into the receiver, a vacuum is produced in the pan and the extract is allowed to flow into said pan. The extract, after being sufficiently concentrated in the pan, is removed and desiccated by any known process.

Claim.—As an improvement in the process of obtaining desiccated or highly concentrated juices or soluble extracts of animal or vegetable substances, first obtaining the juices or soluble extracts of such substances by heating or boiling them under a pressure greater than that of the atmosphere, and afterward straining and concentrating the juices or extracts so obtained by evaporation in vacuo, substantially as herein described, whereby to obtain in the concentrated or desiccated product all the soluble or reducible matters contained in the substances.

Also, forcing the juices, extracts or reducible substances obtained by the digestion of animal substances through strainers, by means of the pressure of steam in the digester, substantially as herein specified.

Also, the steam pipe H. and its cock *a*, and the stop valve or cock G, applied in relation to each other and to the digester and receiver, and in combination with the pipe C, substantially as and for the purpose herein specified.

Also, the combination of the digester A, pipe C, one or more strainers E, receiver D, and vacuum pan I, the whole arranged and operating substantially as and for the purpose herein specified.

No. 48,720.—FRANKLIN RANSOM, Buffalo, N. Y.—*Pump*.—July 11, 1865.—This invention consists of a double-action pump, operated by a solid piston in a vertical cylinder. In the ascent of the piston water enters below, having ascended through a vertical pipe to a line nearly parallel with the top of the pump cylinder, and thence through a trough on this line to the cylinder, and thence down nearly to the bottom of the cylinder, where it enters. In the descent of the piston, water enters near the top of the cylinder, through a trough parallel with the above-mentioned trough. Beneath the ends of these troughs, remote from the cylinder and piston, water is received alternately from a single pipe, and above is discharged alternately into a single chamber.

Claim.—The arrangement of the inlet valves I I', and the divided chamber C, having two compartments of greater capacity than the displacement of the piston, in combination with each other and with the cylinder of the pump, substantially as and for the purpose herein specified.

No. 48,721.—JOSEPH REGESTER, Baltimore, Md.—*Cock*.—July 11, 1865.—A hat-shaped cap of India-rubber has its brim clamped by a screw cap. In the bottom of this cap rests a rigid valve. The screw plug descends upon this valve and forces it to its seat.

Claim.—First, the elastic capsule as arranged with the valve stem of a stop cock, substantially as described.

Second, seating the lower end of a valve stem loosely upon a valve *d*, having its support upon a soft packing, substantially as described.

No. 48,722.—E. Y. ROBBINS, Cincinnati, Ohio.—*Ventilating Apparatus*.—July 11, 1865.—The chamber around the furnace communicates by a direct flue with a hollow space under a metallic or tiled floor, and circulating through this, passes by another flue back to the chamber. Outside this is another chamber, supplied with external air, and communicating by flues with registers in the apartment which has the tiled or metallic floor space.

Claim.—First, the arrangement for warming the floor or portions of the floor, by causing the hot air from the furnace to circulate through a hot air-chamber C, and return to the bottom of the furnace through the return pipe or flue D, substantially as set forth.

Second, the construction of the outer fresh air or warm air channel *x*, Fig. 1, entirely separate and distinct from the inner or hot air channel *y*, the air in the latter, heated by contact with the hot surface of the iron, being excluded from the room, and only used for carrying heat to the hot air-chamber beneath the floor or in the wall, while the air from the former, *x*, being warmed entirely by contact with the outer surface of the brick or earthen wall or casing *a*, is conducted into the room for respiration.

No. 48,723.—BENJAMIN ROBINSON, East Gloucester, Mass.—*Apparatus for Curing and Drying Fish*.—July 11, 1865.—This invention consists in combining with a flake frame, upon which the fish are laid, screens on slatted frames, so constructed and arranged that the fish may be wholly protected from the weather, and more or less screened from the rays of the sun, as circumstances may require.

Claim.—The combination with a fish flake of a screening frame, arranged to operate substantially as and for the purpose set forth.

No. 48,724.—TIMOTHY ROSE, Cortlandville, N. Y.—*Water Wheel*.—July 11, 1865.—This wheel is adapted to operate in a vertical as well as in a horizontal position. It is formed of a central drum, to the sides of which angular or zigzag floats or buckets are attached transversely. At the top and bottom these floats assume a gentle curve, and terminate in a

horizontal line, where they are bounded by a rim which confines and gives direction to the flow. The course of the wheel may be reversed by turning it end for end in its position.

Claim.—The central angular floats or brackets *b b*, in connection and combination with the reversed end brackets *e e*, as above set forth, and working in the manner herein described.

No. 48,725.—HENRY ROTHFELDER, New York, N. Y.—*Watches.*—July 11, 1865.—This invention consists in forcing loosely on the arbor of the spring barrel a lever upon which is fixed a spring pawl, which gears and holds the teeth of a toothed wheel upon the winding arbor. By giving to the lever an oscillating motion, the spring is wound up. If desired, the winding lever can be attached to the shank which slides in a mortise on the periphery of the case. The minute wheel is turned by means of a key fitted to the square end of its shaft.

Claim.—First, the combination of the winding lever with the ratchet wheel and spring barrel, in the manner specified.

Second, the shank, fitted to slide in a mortise through the periphery of the case, in combination with the winding lever, spring barrel and ratchet, as set forth.

Third, the arm or crank *z*, affixed to the square for the minute hand, by which to set the watch, as specified.

No. 48,726.—HENRY ROTHFELDER, New York, N. Y.—*Chronometer Escapement.*—July 11, 1865.—This invention consists in the employment of a locking lever provided with a jointed spring arm, which is acted upon by the pallet or change pin of the balance wheel which moves the lever and disengaging detent, thus allowing the escape wheel to move and at the same time give an impulse to the balance by acting upon its notched roller or pallet.

Claim.—The arm *J* jointed to the lever *F* and provided with a spring, as set forth, in combination with the change pin *D*, detent *E*, and escapement, as specified.

No. 48,727.—LOUIS SAARBACK, Philadelphia, Penn.—*Pocket-books.*—July 11, 1865.—This invention consists of an elastic metallic band to be clasped around a pocket-book, having bent ends, one of which fits into the other in order to produce the clasp, and two rings, one on each side, against one of which a finger bears when the band is to be unclasped, and against the other a thumb, so that by a slight pressure one bent end of the band is caused to escape from the other.

Claim.—The elastic metal band or strip *B*, combined with and arranged in respect to a pocket-book or portmonnaie in the manner described, and having bent ends adapted to each other, as and for the purpose set forth.

No. 48,728.—JOHN SEARLE, San Francisco, California.—*Process of Imparting Age to Wines.*—July 11, 1865: antedated June 15, 1865.—This invention consists in placing the wines in casks or tanks, through which a steam-pipe is passed and subjecting it to the action of heat. The temperature is regulated by means of stop-cocks attached to the pipes.

Claim.—The introducing the heat by steam or otherwise to the wine itself by means of metallic pipes or chambers passing through the casks or vessels, substantially as set forth.

No. 48,729.—CHRISTIAN SHARPS, Philadelphia, Penn.—*Projectile for Rifled Fire-arms.*—July 11, 1865.—The projectile belongs to the class, provided with webs or fins, designed to enter the rifle grooves of the barrel, and the peculiarity consists in causing the body of the ball to taper from its base toward its point, while the projecting webs or fins bounded externally by a cylindrical or parallel surface have their edges inclined to each other so as to run out in a point about midway of the length of the tapering projectiles.

Claim.—The within described projectiles, having a body tapering from the rear toward the front end, in combination with the wedge-formed projections *a*, the whole being constructed and adapted to the bore of the barrel and to the case *B*, substantially as and for the purpose herein set forth.

No. 48,730.—THOMAS SHAW, Philadelphia, Penn.—*Low-water Signal.*—July 11, 1865.—This invention consists in combining with the whistle and a chamber for the reception of the same a composition of animal or vegetable substance sufficiently hard to resist the water pressure of the boiler, but which will melt at a temperature of from 160° to 200° Fahrenheit, so that, in the event of the water falling below the end of the pipe to which it is attached, the steam will melt the composition and the whistle will be sounded, and thus call the attention of the person in charge to the condition of the boiler.

Claim.—The described apparatus in combination with described animal or vegetable substance when used for the purpose set forth.

No. 48,731.—JOHN SILVERS, Lambertsville, N. J.—*Flax-pulling Machine.*—July 11, 1865.—In this machine the flax is drawn in by an elastic belt running over a drum, also covered with rubber to prevent the flax from slipping. The flax is turned towards the belt by a wooden arm. As the drum rotates it carries the flax out of the ground and over upon the platform of the machine.

Claim.—First, the use of one or more elastic belts or bands, made of India-rubber or gutta percha, or of any of their respective elastic compounds, or of any other suitable elastic material, for the purpose specified.

Second, coating the drum between which and the belt the plants are clasped, as described, with a sheet or surface of India-rubber or any other suitable elastic material, for the purpose specified.

Third, the use of the covered bar X, attached to or forming a part of the platform of the machine, and arranged with regard to the drum thereof by which the plants are pulled, substantially as herein described and for the purposes specified.

Fourth, passing the elastic belt around a pulley or pulleys, when fixed within the frame *a*, and adapted to be turned by means of the shaft *b*, and retained in the desired position by the ratchet wheel *c*, and pawl *a*, whereby the tension of the said elastic belt may be varied, as described.

No. 48,732.—HAMILTON E. SMITH, Cincinnati, Ohio.—*Petroleum Stove.*—July 11, 1865.—In the oven and boilers, which are situated directly over the lamps, are separate hot-air chambers with ventages for spent air at their bottom only. The oven can be subdivided by a vertical partition so as to call for the employment of but one burner. On this partition are cleats corresponding with those on the side of the oven, on which shelves can be placed.

Claim.—First, the series of petroleum or coal-oil burners B B' B'' B''', in connection with a corresponding number of separate hot-air chambers or series G and N, having ventages for spent air at their bottom portions only, substantially as set forth.

Second, in connection with two or more independent burners B B', the oven G, capable of vertical subdivision in the manner and for the purpose explained.

Third, in the described combination with a petroleum stove, in this connection, the tubular hot-air chambered boilers, whose ventage for the spent air is at the bottom of the air-chambers, as set forth.

No. 48,733.—ADAM SNYDER, Clyde, Ohio.—*Fruit Dryer.*—July 11, 1865.—This device consists of a series of chambers made of sheet metal with perforated bottoms and placed one above the other, in any number required. The lower chamber is fitted upon a stove which is divided nearly in the middle by a horizontal diaphragm, in the centre of which are apertures for the flow of heat controlled by dampers.

Claim.—The employment of one or more fruit-drying sections in combination with the regulating diaphragm, substantially in the manner and for the purpose herein shown and described.

No. 48,734.—ALFRED F. SPAULDING, Winchendon, Mass., and SALMON M. SCOTT, Worcester, Mass.—*Meat Chopper.*—July 11, 1865.—This invention is explained by the claim and engraving.

Claim.—In the above-described meat-chopping machine the combination of the four cranks *k l m p*, and the connecting rod *a*, or the mechanical equivalents thereof, with the remainder of the mechanism or its equivalent, for operating the knives, the whole combination being productive of a compound motion of each knife, substantially as described.

Also, the combination of the plough *g*, or the same and the guard *v*, with the rotary tub and one or more knives provided with mechanism for moving such knife or knives up and down in the tub.

No. 48,735.—A. STEINBACH, Evansville, Ind.—*Horse Collar Fastener.*—July 11, 1865.—This invention consists in the application of two plates at the two ends of the upper part of the collar, one of these being a projection to enter into a slot made in the other, the said slot being provided with a ledge at each side.

Claim.—The plate A, attached to one side or part of the upper part of the horse collar, and provided with the slot C, having an enlarged part, and an inclined ledge *e* at each side as arranged with the plate D, attached to the other side or part of the collar, and having a bar or arm E, provided with a projection or lip *g*, at each side of its outer part, substantially as and for the purpose set forth.

No. 48,736.—ISAAC STEPHENSON, Marietta, Wis.—*Sleighs.*—July 11, 1865.—In this sleigh, each runner, instead of being one rigid piece, is divided into two parts, connected by a hinged joint. The forward part of the runners is connected to the body of the sled by an eyebolt; the rear part by guide bars attached to the bottom of the box and traversing pieces attached to the bolster.

Claim.—First, hinging the ends of the runners to each other, substantially as herein set forth and shown.

Second, the guide bars and traversing pieces constructed and operated as herein recited and shown, in combination with the hinging of the runners to each other as herein described.

No. 48,737.—J. E. STEVENSON, New York, N. Y.—*Water Wheel.*—July 11, 1865.—This invention consists of a horizontal wheel, the buckets of which extend about half-way from the periphery to the hub. The bottom of each bucket forms the arc of a large circle, until

near the lower extremity, where it leaves that line and dips. The wheel is attached to a hollow shaft, and revolves around a fixed spindle, resting upon the frame below. Near the top the fixed spindle enlarges to form a socket within an expansion of the hollow shaft, and from the top of this shaft an adjustable pin enters the socket. Upon this pin the wheel revolves within said socket, the edges of a coil of steel forming the step. The flume is a helix of diminishing capacity, its diameter being slightly larger than that of the wheel. In the area within it, and over the hub a cross head serves to sustain and centre the shaft, having an adjustable arrangement regulated by set screws.

Claim.—First, the curving of the lower parts of the buckets K of the wheel, substantially as and for the purpose herein set forth.

Second, the exposing of the lower parts of the buckets by having the rims *m m* of the wheel at their lower ends cast or formed with recesses, substantially as described to admit of a free lateral discharge of the water from the issues.

Third, the spiral or coil-shaped step G, in connection with the tubular shaft E, fixed spindle A and screw H, with or without the bearing J, substantially as and for the purpose specified.

Fourth, the laterally enlarged helix B, provided with the bevelled or inclined plates *l l*, or their equivalents, for the purpose set forth.

Fifth, the employment or use of a screw J, when applied to or used in connection with a wheel provided with a tubular shaft and a helix, in such a manner that the joint or space between the wheel and helix may be regulated as occasion may require.

Sixth, the combination of the wheel *d*, provided with the buckets curved at their lower ends or issues, and laterally exposed, the tubular shaft E, fixed spindle F, screw H and bearing J, all arranged substantially as described.

No. 48,738.—THOMAS L. STURTEVANT, Boston, Mass.—*Coal Stoves*.—July 11, 1865.—The open top chamber in upper part of the stove is surrounded by the space between its cylinder and the outer case in and through which the products of combustion circulate from the fire. Pipes communicating with the external air pass from the bottom plate through the fire-pot, and open into said chamber. Horizontal pipes open at both ends, and pass through the side of the stove into this chamber.

Claim.—The improved stove as constructed, not only with the radiator B and smoke space D about the same, arranged with the fireplace T and ash-pit F, as specified, but as provided with a series of air pipes H H H, leading into the radiator and going through the fireplace, and with respect to the fire-proof lining thereof, substantially as specified.

Also, in combination with the stove so made, the series of lateral air pipes *b b b*, leading out of the lower part of the ventilator and opening through the sides of the case, as specified.

No. 48,739.—WM. A. SWEET, Syracuse, N. Y.—*Furnace for Melting Metals*.—July 11, 1865.—This invention consists of a series of open top chambers with places for setting crucibles, so that in melting metals the crucibles may be gradually moved from the cooler at the bottom end of the furnace. The grate bars are made in the form of a cone inside.

Claim.—So constructing a melting furnace that the temperature of the crucibles can be increased from a minimum to a maximum degree by transferring them from the cooler to the hotter chamber, substantially as described and for the purposes set forth.

Also, the combination and arrangement of the conical grate and feeding aperture, substantially as described and for the purposes set forth.

No. 48,740.—WM. E. TERRY, Wyoming, N. Y.—*Process for Tanning*.—July 11, 1865.—This invention consists in treating the hides which have been unhaired by means of lime and ashes with a bate or liquor, containing acetic acid, the liquor being prepared from the lees of cider or wine, or any fruit or refuse thereof. After bating the hides are soaked in pure soft water, and worked with the fleshing knife on a beam. They are then treated with a tanning liquor, composed of polygonum punctatum or smartweed, mentha viridis or spearmint, and oak, hemlock, sumach, or other bark, with or without the addition of comptonia asplenifolia, or sweet fern, and water.

Claim.—The process of tanning by means of liquors composed of the several ingredients herein named, when combined in the proportions and employed substantially in the manner herein described.

No. 48,741.—JONATHAN H. TIBBETTS, Omaha City, Nebraska—*Piano-forte Action*.—July 11, 1865.—This invention consists in an arrangement of parts with a rotating wheel, for the purpose of obtaining a quicker and easier action than usual.

Claim.—The use in piano-forte actions of a rotating wheel, arranged and operating substantially as and for the purpose specified.

No. 48,742.—A. W. TOOKER, Harvard, Ill.—*Hay Elevator and Stacker*.—July 11, 1865.—This invention consists in so constructing a stacker as to do away with the centre turning post, using a tripod and beam, or arm, so constructed that as the horse walks from the machine the load is elevated and carried to the place of deposit, and in returning the elevator is brought back to the starting point.

Claim.—First, the combination of the crane beams *g g* with a tripod, which is supported upon a foundation frame, when said beams are supported by and applied to their frame substantially as described.

Second, the arrangement of the rope *h* upon a stacker, which is constructed without a central turning post, in such manner that the movements of the horse can be made to effect the raising of the load and the turning of the crane arms, substantially as described.

Third, the use of an adjustable hitching hook *A*, in combination with a crane *g g*, or its equivalent, and the rigging *h*, arranged to operate substantially in the manner and for the purpose described.

No. 48,743.—CYRUS L. TOPLIFF, New York, N. Y.—*Wick Trimmer*.—July 11, 1865.—This invention consists of a fixed cutter and a movable one, placed in parallel planes to trim lamp wicks. Combined with said cutter is a handle so pivoted as to operate in a plane with the knife, and to move and act at right angles thereto.

Claim.—First, the combination of the fixed cutter *m* and movable cutter *f*, arranged in parallel planes, and operating substantially in the manner and for the purposes specified.

Second, in combination with the aforesaid cutters *f* and *m*, the handle when so pivoted as to move in a plane parallel or coincident with that of the knife *f*.

No. 48,744.—GEORGE E. VAN DERBURGH, New York, N. Y.—*Artificial Building Block*.—July 11, 1865.—This invention consists of a composition formed by mixing clean damp sand and powdered quicklime together, in the proportion of one part of lime to ten or twelve of sand. The sand partially slacks the lime, and the whole is then dampened and formed into blocks by means of pressure in moulds.

Claim.—As a new article of manufacture blocks of artificial stone, formed substantially in the manner herein set forth.

No. 48,745.—GEORGE E. VAN DERBURGH, New York, N. Y.—*Silicated Building Block*.—July 11, 1865.—This invention consists of a mixture of sand and lime moistened with liquid silica, and formed into blocks by pressing in suitable moulds.

Claim.—As a new article of manufacture a silicated building block, formed substantially in the manner herein set forth.

No. 48,746.—GEORGE E. VAN DERBURGH, New York, N. Y.—*Artificial Stone*.—July 11, 1865.—This invention consists of a composition made by mixing with the lime and silicious matter, forming the usual bases of artificial stone, sufficient finely pulverized sand, marble or its equivalent material to fill all the interstices between the ordinary sand and coarser ingredient in the composition.

Claim.—The special improvement in the production of blocks, tubes, tiles, and other articles of artificial stone, by the use of finely pulverized sand, marble, or other equivalent analogous substance, in combination with the other materials employed in the formation of such artificial stone, for the purpose of filling the interstices between the individual particles thereof, substantially as herein set forth.

No. 48,747.—GEORGE E. VAN DERBURGH, New York, N. Y.—*Solution for Saturating Natural and Artificial Stone*.—July 11, 1865.—This invention consists of a composition formed by the admixture of liquid silicate with lime-water in the proportions of one gallon of silicate, and from three to six gallons of lime-water. In order to obtain the largest possible amount of lime in solution, the water may be sweetened with saccharine matter before adding the lime thereto.

Claim.—The within-described silicated composition, for the purpose of saturating natural and artificial stones, or as an ingredient in the formation of the latter, substantially as herein set forth.

No. 48,748.—IZAACK VAN KERSEN, Kalamazoo, Mich.—*Stump and Grub Extractor*.—July 11, 1865.—This invention consists of a tilting cart or dray, convertible into a stump-pulling machine. For this purpose at the rear end of the cart frame is inserted, and to it is fulcrumed, what is termed a strut lever, which is usually constructed of oak plank, the side pieces being just far enough apart at the top to admit a pulley block between them, and diverging at the bottom to the width of the cart. This strut lever having been set up at the side of a stump, and suitably fastened thereto, is drawn downward by force applied at its top by the draught cattle, and at the same time the stump is drawn upward.

Claim.—The combination of the grub or stump pulling lever *L* and its attachments with the two-horse cart or dray, the whole being arranged, constructed, and operated substantially as and for the purposes herein specified.

No. 48,749.—SIGOURNEY WALES, Boston, Mass.—*Windows*.—July 11, 1865.—The object of this invention is to enable a sash of a window to be readily removed from the frame, in order that the glass may be easily washed or cleaned. The claim and engraving indicate the application of this device to a window sash.

Claim.—The combination and arrangement of the bar D, and its fastening bolts and catches, or their equivalents, with the window frame and the sash, the same being for the purpose as specified.

Also, the combination of the flange or rib *f* with the bar D and the sash applied together and to the window frame, as described.

No. 48,750.—S. WARD, Lane, Ill.—*Corn and Cane Harvester.*—July 11, 1865.—This invention relates to means for stripping blades from the stalks, gathering stalks to the cutter, and discharging the same when cut in gavels, the tops having been previously cut off by a revolving knife at the rear of the machine.

Claim.—First, the bars or beaters J J, arranged to operate in vertical planes in front of and above the sickle D, substantially as and for the purpose specified.

Second, the arms K K, arranged to operate in horizontal planes, and in the described relation to the sickle D, for the purpose set forth.

Third, the bed G*, composed of the two shafts *g g*, provided with the arms *h*, and arranged with cords or chains H H, for the purpose of discharging the cut cane or corn in gavels from the machine, substantially as described.

Fourth, the arrangement of the bars or beaters J J, arms K K, in combination with the sickle D and bed G*, with or without the guard N, combined and arranged to operate in the manner substantially as and for the purpose set forth.

Fifth, the knife P, arranged to operate at the rear of the bed G*, substantially as and for the purpose specified.

No. 48,751.—M. D. WELLMAN and JAMES OLD, Pittsburg, Penn.—*Coal Stove.*—July 11, 1865.—The lower part of the stove is hemispherical in shape with the grate, which is double reciprocating at the bottom or its greatest diameter.

Claim.—First, making the fire-pot of close stoves with its greatest diameter at the level of the fire-bed or grate, and contracting upwards, substantially as and for the purposes hereinbefore described.

Second, the use in close stoves, in combination with a fire pot constructed as hereinbefore described, of a double-perforated grating, the lower part of which is stationary, the upper part turning thereon for the double purpose of raking the fire and regulating the admission of air to the fire, substantially as hereinbefore set forth.

No. 48,752.—M. D. WELLMAN and JAMES OLD, Pittsburg, Penn.—*Fireplace.*—July 11, 1865.—In this device there are recesses in the back and side walls of the fireplace, or either of them, the top of which is below the level of the top of the fire basket, and also flues or spaces in the side walls to prevent the packing of the coal. There are slots between the grate bars governed by a convenient device, so that they may be opened or closed at will. In the back and side walls and in the throat of the chimney are chambers whence the hot air may be directed as desired.

Claim.—First, the use of recesses in the back and side walls of the fireplace, or in either of them, the top of which is below the level of the top of the fire basket, in combination with flutes in the fire walls, for the purpose of preventing the packing of the fuel at the back and sides of the fire, and thus giving the air access to the back part of the fire, and allowing it to pass up the flutes so as to mingle with the unconsumed gas and smoke, substantially as described.

Second, the combination of a low grate or fire basket *p*, having slats between its bars, with the air spaces or recesses *v* in the back wall, and overhanging back plate *d*, for the purpose hereinbefore described.

Third, the arrangement of a hot-air chamber or chambers in the back and side walls of a fireplace, and the sloping or overhanging back wall and air passages in the rear of the fire chamber, for the purpose of more readily heating the air passing through such chambers to warm the apartment, substantially as hereinbefore described.

Fourth, the use of one or more hot-air chambers, constructed substantially as described, and placed in the throat of the chimney, so that the smoke and hot air passing up the chimney shall play around or upon them, and thereby heat the air passing through them, for the purpose hereinbefore set forth.

No. 48,753.—D. WHITAKER, Roxbury, Mass.—*Construction of Soap Frames.*—July 11, 1865.—This invention consists of a soap frame made in two parts, joined together at their edges by means of bolts. The sides of said frames are strengthened by means of corrugated plates of wrought iron or other suitable material.

Claim.—As a new and improved article of manufacture a soap frame, made of wrought iron, having its side plates corrugated, and formed in two parts or sections, substantially in the manner described and for the purpose specified.

No. 48,754.—N. P. WHITTELEY, West Meriden, Conn.—*Toy Gun.*—July 11, 1865.—This invention is sufficiently described by the claim and drawing.

Claim.—First, the combination of the barrel *b*, enlarged at its inner end, arranged within the stock *a*, having the depression *t* with the ferrule *i*, substantially as and for the purpose described.

Second, as an improved article of manufacture of a toy gun, the combination of the stock *a*, barrel *b*, spring *c*, rod and hammer *d e*, with the ferrule *i*, arranged and operating substantially as described.

No. 48,755.—CHARLES T. YOUNG, Lawrence, Mass.—*Felted Cloth*.—July 11, 1865.—This invention consists of a felted fabric, composed of linen and wool. The fabric is made by enclosing a linen bat between two bats of wool in the process of felting.

Claim.—First, the arrangement and construction of the frame *A a*, with the rubber springs *g g*, disks *B C' h*, and shaft *c*, substantially in the manner described and represented.

Second, the arrangement of the bevel-faced grindstone *B*, with the several parts named in the first claim, as herein described.

No. 48,756.—JOSEPH WOODWARD, assignor to J. S. ULTEY, New York, N. Y.—*Ruler and Paper Cutter*.—July 11, 1865.—This invention is explained by the claim.

Claim.—The ruler and paper cutter herein described, having a straight outer ruling edge *a*, and two united straight inner cutting edges *b c*, forming a continuous rectangular cutting edge.

No. 48,757.—CHARLES T. YOUNG, Lawrence, Mass.—*Felted Cloth*.—July 11, 1865.—This felted cloth is made as follows: the wool or other fibrous substance capable of being felted, after having undergone the usual preliminary processes is wound in a thin sheet or "bat," upon a long bobbin. Any non-felting substance is also prepared in a similar manner, and wound upon a bobbin. Two rollers containing the felting and one containing the non-felting fibre are now so placed in a frame, that as the "bats" are drawn off, the non-felting shall become enclosed between the two felting bats.

Claim.—The felted cloth herein described, the same being a new article of manufacture.

No. 48,758.—L. G. YOUNGS, Wilmington, Ill.—*Cultivator*.—July 11, 1865.—This invention consists in providing a shaft at the rear of the ploughs with bent rectangular loops; revolving this shaft brings up the loops, and with them the ends of the plough beams are raised.

Claim.—The plough-bars *E E E' E'* and shaft *J*, provided with the loops *I I* and arms *f f*, all arranged and applied in connection with the levers *K'*, to operate in the manner substantially as and for the purpose set forth.

No. 48,759.—WILLIAM ZIMMERMAN, Quincy, Ill.—*Revolving Mortise Tool*.—July 11, 1865.—This is a revolving tool for making slots or mortises, upon one or more of the cutting edges of which teeth are made by grooving the surface in the form of a screw thread, whereby it is claimed the tool is enabled to cut faster and more easily than if the cutting edge were straight.

Claim.—The new article of manufacture described, to wit, a rotating mortising or slotting tool with teeth on the cutting edges, substantially as described.

No. 48,760.—J. K. ANDREWS, Antrim, Ohio, assignor to himself and J. C. TILTON, Pittsburg, Penn.—*Lamp*.—July 11, 1865.—This invention consists in the employment of two perforated cylinders, one inside the other, and connected together by wires extending from the inner to the outer cylinder, in combination with an ordinary kerosene lamp burner, in such a manner that by the air admitted through the perforations of the two cylinders and by the draught occasioned by the same the smoke and surplus carbon is consumed, and a burner is obtained which gives a brilliant and odorless light without the use of the ordinary glass cylinders.

Claim.—The application of the two cylinders *C D*, made of perforated sheet metal, or other equivalent material, and secured one inside of the other, on a lamp burner *A*, of the ordinary construction, substantially as and for the purpose herein shown and described.

No. 48,761.—EDWIN BENNETT, assignor to himself and W. T. GILLINDER, Philadelphia, Penn.—*Annealing Furnace*.—July 11 1865.—This invention relates to annealing furnaces for glassware, and consists in placing the furnace so as to have it discharge its heat at such a point between the feed and the ends of the leer, so that the heat shall be graduated towards both ends. Trays are also used for charging and discharging the leer.

Claim.—First, placing the furnace so as to discharge its heat at such a point between the feed and discharge ends of the leer, as that the heat shall be graduated towards both ends, for the purpose described.

Second, the use of the trays *F*, for the purpose of receiving the ware, and for charging and discharging the leer.

No. 48,762.—THOMAS CROSSLY, Bridgeport, Conn., assignor to the AMERICAN WATER-PROOF CLOTH COMPANY, Brooklyn, N. Y.—*Manufacture of Water-proof Fabrics*.—July 11, 1865.—This invention consists of a back of linen or other material, upon which is spread

a coating of India-rubber or gutta-percha. A warp of silk or woollen material is then prepared and fastened to one end of the back. A wire or rod is then placed upon the inside rubber surface, and the warp is carried over said wire and pressed down, and so on until the carpet is completed. The loops thus formed may be cut or allowed to remain, thus forming a velvet or a Brussels carpet as may be desired.

Claim.—First, a fabric composed of a back of linen, jute, or other material, having a coat of rubber or other gum, upon which is fastened a face of yarn, of silk, worsted, woolen, fur, or other material, the same being looped or tufted as described.

Second, a fabric made as described, and colored, dyed, or printed, or colored and dyed and printed, either before or after the face is applied, in the manner and for the purposes herein set forth, as a new article of manufacture.

No. 48,763.—WILLIAM W. DRAPER, assignor to himself and ALONZO PARKER, Greenfield, Mass.—*Tool Stock.*—July 11, 1865.—This invention consists, first, in giving to the brace greater space between the two ends, or axial portions, than is given in the ordinary brace, and to accomplish this the two upper bends are at an angle of about forty-five degrees, by this means giving more room to the wrist and arm when operating the brace. Secondly, in the mode of securing the bit in the socket, by means of clamping jaws pivoted at their middle to a screw-nut playing on a thread around the outside of the socket, and their inner ends against a cone-shaped enlargement of said stock, by which, as the nut is screwed up, the outer ends of the jaws are made to close around the neck of the bit and draw it into the socket.

Claim.—The combination of the screw-shank, constructed as specified, and conical wedge, with the enclosed nut and clamping jaws *f*, the whole arranged to operate as described, for the purpose set forth.

Also, the peculiar shape of the arm-piece B B', as shown, for the purpose set forth.

No. 48,764.—W. E. FROST, assignor to I. WASHBURNE and P. L. MOEN, Worcester, Mass.—*Sizing and Finishing Covered Skirt Wire.*—July 11, 1865.—This invention is explained by the claim.

Claim.—Sizing and finishing covered wire (or covering strips of metal of considerable length) in causing it to pass continuously through a sizing mixture, and over rolls, or their equivalents, while subjected to heat, and thence on to a reel, or other receiver, substantially as described.

No. 48,765.—W. E. FROST, assignor to I. WASHBURNE and P. L. MOEN, Worcester, Mass.—*Sizing and Finishing Covered Skirt Wire.*—July 11, 1865.—This invention will also be understood from the claim.

Claim.—Passing the wire through the starch or size, and thence directly in contact with ironers or polishing surfaces, substantially as described, for the purpose set forth, whence it may be passed over rolls and heaters previous to its being reeled.

No. 48,766.—W. E. FROST, assignor to I. WASHBURNE and P. L. MOEN, Worcester, Mass.—*Sizing and Finishing Covered Skirt Wire.*—July 11, 1865.—The covered braided wire is caused to pass from the supply reel through the sizing medium, and back and forth over drums, and thence back through the sizing medium again to the second coat, and so on as many times as may be desirable, by which means successive coats of size, one over the other, may be applied.

Claim.—Causing the covered or braided wire to pass from the supply reel through the sizing medium, and back and forth over drums, and thence back through the sizing medium again to the second coat, and so on any number of times desired, for the purpose of applying successive coats of size, one over the other, in the manner substantially set forth.

No. 48,767.—ANDREW J. GOVE, San Francisco, Cal.—*Mast Coat.*—July 11, 1865.—This mast coat is made of brass, copper, or other metal, between which and the mast are rings of gutta-percha. This construction is claimed to be a great improvement over the common canvas mast coat.

Claim.—The metallic shield E, and the flexible joint formed by the rings G G', or their equivalents, attached to the shield and the deck respectively by the metallic rings S' S'', or in any other suitable manner, substantially as described, and for the uses and purposes hereinbefore set forth.

No. 48,768.—D. S. GRAY, Onarga, Ill.—*Bee-hive.*—July 11, 1865.—The bottom of this hive is made inclined, and is provided with slides so that the dirt which falls from within the hive upon the bottom may be easily removed. The slides, connected with the inclined bottom, are gotten at through a sliding door in the side of the hive.

Claim.—In combination with the inclined bottom B, and sliding door E, constructed and arranged as described, the slides D, for facilitating the removal of filth, &c., from the hive, as explained.

No. 48,769.—T. F. HAMMER, Branford, Conn., assignor to G. J. HINE, New Haven, Conn.—*Machinery Clutch*.—July 11, 1865.—This clutch is intended to be used in connecting or disconnecting power with or from machinery. It is especially adapted to use in power and other presses employed for punching or swaging purposes, from the fact that the clutch when brought into connection with the pulley performs but one revolution before it is automatically disconnected, and does not engage again with the pulley until made to do so by the operator.

Claim.—First, the combination of the clutch E and bar G, when constructed and arranged with the tongue c, or its equivalent, to operate in the manner and for the purpose specified.

Second, the combination and arrangement described of the clutch E, inclined groove d, and tongue c, substantially as and for the purpose specified.

No. 48,770.—G. B. HILL, assignor to E. S. ARCHER, New York, N. Y.—*Rotary Air Pump*.—July 11, 1865.—A rotary pump consisting of an outer cylinder, and an inner cylinder with arms attached to its inner periphery and terminating near the central shaft, and curved in such a manner that from the time the air enters a slit in the inner cylinder, immediately in advance of the arm, till the air is all passed out by the descent of that end of the arm in the water, the other end of said arm being always under water. The air is thus forced into a chamber at one end of the inner cylinder, which ascends to descend a tube to the line of the central shaft, whence it flows out through a hollow prolongation of the journal.

Claim.—The combination in a rotary air or gas pump of the buckets M, curved as described, so as to gather in the air or gas, with the space or chamber O, substantially as described, and to the effect set forth.

No. 48,771.—G. MARTIN, assignor to himself and WATSON SANFORD, THOMAS M. DAVIS, and L. H. WALTON, Philadelphia, Penn.—*Paddle Wheel*.—July 11, 1865.—This invention consists of a smooth-faced friction roller or slide, on a journal projecting longitudinally from the upper inner edge or corner of the paddle, and of an irregularly curved smooth-faced bearing, suspended from the shaft of the wheel, and fixed rigidly to the side of the vessel.

Claim.—The smooth-faced friction slide or roller d', on each of the floats or paddles D D, and the smooth-faced, irregularly curved bearing E, on the vessel, the said parts being constructed and arranged to operate together, substantially as and for the purpose described.

No. 48,772.—PATRICK MIHAN, assignor to O. P. DRAKE, Boston, Mass.—*Apparatus for Carburetting Air*.—July 11, 1865.—This invention consists in forming the back of the bucket so that it will make an angle more or less acute with the educt of the bucket, and in making the educts triangular in shape and overlapping each other.

Claim.—In the above described air-forcing apparatus the construction of each bucket educt with the pointed triangle or tapering form, substantially as and so as to operate as described.

Also, the arrangement of the back of each bucket, relatively to the shell of the drum and the educt of the said bucket, the said back in such case springing from the base of the educt and being arranged at an acute angle, or substantially so, with such educt, the whole being as and for the purpose specified.

Also, the arrangement of the several bucket educts, viz., so that one may lap or extend by that or those next contiguous to it, substantially as and for the production of results as specified.

No. 48,773.—J. B. CLARKE, assignor to S. H. BURTON & Co., Cincinnati, Ohio.—*Grates for Cooking Stoves*.—July 11, 1865.—A stationary horizontal grate is so arranged in reference to a vertical folding grate, that the fireplace is convertible into either wood or coal burning. This may be done by dropping the folding grate on top of the stationary grate, and thus closing the apertures between the bars, or by keeping said folding grate in a perpendicular position.

Claim.—First, in the described combination, the stationary grated bottom A B C C', and the folding grate E D D', or their equivalents, for a convertible wood and coal fireplace, as set forth.

Second, the stationary grates B and F, and the hinged and folding grate E, combined and operating as set forth.

Third, the parts A B, C C', D D', E F and G, or their equivalents, arranged and combined to form a convertible wood and coal fireplace, as herein described.

No. 48,774.—DAVID L. PETTEGREW, assignor to SYLVESTER DAVIS and JACOB SMITH, Claremont, N. H.—*Fence*.—July 11, 1865.—In this invention there are two posts which are keyed together near the top by a link and key. Between the posts is inserted an adjustable brace, so that the sill which supports the posts can be placed at any desirable angle to suit uneven ground.

Claim.—The double posts B, with the key D, and the adjustable brace C, combined and arranged substantially as and for the purposes specified.

No. 48,775.—LEWIS C. RODIER, assignor to SAMUEL NORRIS, Springfield, Mass.—*Revolvering Fire-arm*.—July 11, 1865.—The nature and object of this invention are explained by the claim.

Claim.—First, the arrangement of a repeating fire-arm, having a many-chambered cylinder hung upon a central axis, in such manner that the said cylinder shall revolve or oscillate between two given points, *i. e.*, between the first and last chamber, substantially as set forth.

Second, combining with an open frame, provided with a projecting stud, a cylinder movable upon its axis and grooved between two points of its circumference, so as to allow of its revolution or oscillation, as herein set forth.

Third, providing the skeleton frame plate or retractor on the end of the sliding pin, when located in the rear of the cylinder, with ratchet teeth, in combination with a pawl actuated by the lock to operate the sliding pin together with the cylinder, as herein described.

Fourth, holding the cylinder and sliding pin within the open frame of the arm by means of a hollow axle upon one end of the cylinder, in combination with a central socket at the other end thereof, and wrought into the skeleton frame of the sliding pin, together with a short movable pin fitting into the said socket, substantially as herein set forth.

Fifth, the combination with a cylinder held in the frame, as set forth, of a spring lever bearing the movable cylinder holding pin, under such an arrangement that the same may be operated from without, for the purpose of releasing the cylinder and enabling it to be disconnected from the hilt or stock of the arm.

Sixth, combining with a cylinder held in its frame, as hereinbefore described, the method of mounting the frame, carrying the barrel and cylinder upon an axle, so as to allow of the disconnecting of the cylinder and barrel from the lock and stock by shifting the same sideways, as herein described.

No. 48,776.—JAS. SANGSTER, assignor to HARVEY BALL and WM. H. BONNELL, Buffalo, N. Y.—*Lubricating Cups.*—July 11, 1865.—A conical cup with a prolonged spout has a thin metal bottom, inside of which a bar or brace limits the springing action of the bottom, by means of which action the oil is ejected in jets.

Claim.—The brace B, when constructed to operate as herein substantially set forth and described.

No. 48,777.—WM. MONT. STORM, assignor to himself and R. C. MITCHELL, New York, N. Y.—*Steam Engines.*—July 11, 1865.—This invention consists in providing two single-acting pistons in one cylinder, with a sufficient space between them for a slotted cross-head, which embraces and operates the crank, which is of the double or two-throw kind, the other wrist of which is embraced and operated by another cross-head similar to the first, but which is operated by the piston rod of an engine placed vertically and centrally upon the horizontal one, so that the power of both is transmitted to the same shaft. The valves are placed in a chest located on the axial lines of the horizontal cylinder and control the induction and eduction of the steam for both cylinders. The steam is exhausted into the space between the two pistons in the horizontal cylinder, with a view to lubricate the machinery contained therein.

Claim.—First, an engine constructed as follows, to wit: Of a cylinder containing two single-acting pistons, rigidly connected by open "cross-heads," substantially as described, to the crank, both the latter (crank and cross-head) being located in the body of such cylinder and between its pistons, the whole being proportioned and arranged to this end, as set forth.

Second, in combination with the above, the superposed cylinder or engine B, to act upon a crank parallel to the first and on the same shaft also, through the mediation of a "cross-head" located in the same chamber, between the pistons of the horizontal cylinder, substantially in the manner and for the purposes described.

Third, the arrangement whereby the stroke of the piston of such superposed engine is made considerably less than those of the horizontal one, so that the length of its "cross-head," as will be understood, may not render necessary an undue separation of the horizontal pistons, thus occupying unnecessary space, while the combined action of the whole device obviates a dead point, &c.

Fourth, making the pistons of the horizontal cylinder with an overhang, for the purpose described.

Fifth, the pin *d* projecting longitudinally with, but eccentric to the shaft, and rotating with it, to operate the valve by fitting slots *X X'* in their tails, at right angles to the lines of their motion, all as explained.

Sixth, the combination of the parts *e f h i' j l*, constituting the reversing gear, as described.

No. 48,778.—S. H. WHEELER, assignor to RICHARD HEDDEN, JAMES T. STILLWELL, C. T. LEE, THOS. J. MARTIN, A. G. TOWNSEND, JAMES SULLIVAN, DANIEL HENDERSON, and S. H. WHEELER, Dowagiac, Mich.—*Measuring Faucet.*—July 11, 1865.—A piston is driven into the vessel beyond a circle of perforations in the tube. By the withdrawal of this piston a definite quantity of liquid is drawn. But previous to this withdrawal the eduction port is opened by unscrewing the contracted cylinder head and thus releasing a spiral spring which passes a valve to its seat immediately within the eduction port. The liquid is thus permitted to flow as the piston is withdrawn, and in any desirable volume, determinable by the degree of relaxation allowed to the spring above-named.

Claim.—First, the adjustable cap *g* and thimble *f* in combination with the valve *d* for tightly closing the discharge orifice *a* of the faucet tube, substantially as described.

Second, the valve chamber *b* provided with a valve *d* which is acted upon by a spring *e*, in combination with a reciprocating valve-piston *D* and the tube *A*, substantially as described.

Third, the combination of tube *A*, piston *D*, valve chamber *b* and nozzle *C*, constructed and operating substantially as described.

No. 48,779.—OSCAR HASE, Mecklenburg Schwerin, Germany.—*Machine for Skinning Vegetables.*—July 11, 1865.—This invention consists in combining a stationary vertical grating cylinder with a central rotating shaft, having a roughened horizontal disk at its lower end operated by gearing and a shaft.

Claim.—The combination in a vegetable or fruit skinner of a stationary cylinder, having an internal roughened surface with a rotating roughened disk to impart centrifugal motion to the commodities to be skinned, substantially in the manner described.

No. 48,780.—EDWARD WADHAMS, assignor to EDWARD ROBERT KENT, Hamilton, Canada West.—*Transmitting Motion.*—July 11, 1865.—The object of this invention is to transmit motion from an oscillating shaft to another revolving shaft, or, in other words, to convert the oscillating motion of one shaft into a continuous revolving motion of another shaft.

Claim.—The double segmental rack *A* on the rock shaft *C*, in combination with pinions *b b'*, ratchet wheels *d d'*, and pawls *e e'*, said ratchet wheels being keyed to the shaft *D*, substantially as and for the purpose set forth.

No. 48,781.—JASON A. ALLEN and ALANSON ALLEN, Oakham, Mass.—*Water Wheel.*—July 18, 1865.—This invention consists of a turbine wheel, the shaft of which is encircled by a collar made adjustable by means of a set screw, the office of which is to sustain the wheel at any desired altitude. On the lower side of the wheel is a grooved flange which straddles a flange ascending from the outer casing. The outer leg of this grooved flange thus revolves in the water confined in the outer casing by which the wheel is partially buoyed.

Claim.—First, providing the lower side of the wheel case with a flanged rim *K*, for the purpose of causing the water to press on the lower side of the wheel, substantially as and for the purposes stated.

Second, in combination with the detachable flanged rim *K* applied to the lower side of the wheel case, the grooved flange *g* on the lower side of the wheel, substantially in the manner and for the purposes described.

Third, the application of turbine shafts and to the lower face of the turbine wheel of the adjustable supporting collar *I*, substantially as and for the purpose described.

No. 48,782.—STEPHEN M. ALLEN, Woburn, Mass.—*Method of Treating Hemp, Flax, Jute, Grass, &c.*—July 18, 1865.—This invention in steeping and rotting the material, after which it is allowed to dry, when the gummy matter crystallizes and is removed by scraping and flossing, in connection with stranding and drawing it down to or like cotton or wool. It is then ready for spinning.

Claim.—First, a fibre composed of flax, hemp, jute, china grass, and other long line substances dew or water rotted, steeped or fermented and submitted to a stranding and flossing process by drawing rollers, scutchers, scrapers, bar beaters, pickers, cards, or any suitable machinery for the purposes of reduction, in the manner and for the purpose set forth.

Second, a yarn, cloth, felt, or paper stock made from long fibre such as flax, hemp, or other like substances which has been line submitted to dew or water rot, steeping or fermentation, in combination with stranding and flossing by mechanical means, substantially as herein set forth.

Third, a yarn, cloth, felt, or paper from long line fibre treated as above and when mixed with any other fibre, substantially as set forth.

No. 48,783.—PARKER H. ALLSTOTT, Jeffersonville, Ind.—*Cultivator.*—July 18, 1865.—This invention consists in the arrangement of the connecting bars, bolts, screws, and slots, for changing the angle between the shares and beams.

Claim.—The relative arrangement of the shares and beam and the construction and arrangement of the connecting rods, bars, bolts, and screws and taps, so far as they assist in effecting the purpose and object of changing at will the angle between the shares and beams and thereby altering the draught of the tiller.

No. 48,784.—A. D. ANSELL, Hartford, Conn.—*Belt Clasp.*—July 18, 1865.—This invention consists in securing the ends of a belt between clamping surfaces by means of inclined planes without using screws.

Claim.—The employment of the inclined planes *b*, in combination with the plate *a* and jaws *c*, substantially as and for the purpose described.

No. 48,785.—WILLIAM BICKEL, Pottsville, Penn.—*Drill for Boring Rocks, &c.*—July 18, 1865.—This invention consists of a chisel-formed drill, with pick-formed wings welded or otherwise fastened to the bit stock, said pick points extending below the point of the chisel.

Claim.—The combination of pick and chisel described, the points constituting the former extending longitudinally beyond the latter, for the purpose set forth.

No. 48,786.—CALEB C. BISHOP, Poughkeepsie, N. Y.—*Churn.*—July 18, 1865.—In this invention the shaft is upright, and the lower end is provided with a hub that works loosely on a collar. This hub is provided with adjustable paddles, which are held in the desired positions by set screws.

Claim.—The adjustable screw blades E, bearings e, arranged relatively to the hub D, and handle C, of a reciprocating churn dasher, substantially in the manner and for the purposes herein set forth.

No. 48,787.—JOHN W. BOUGHTON, Appleton, Wis.—*Car Coupling.*—July 18, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—First, the latch, pivoted and held in place as shown, and for the purposes set forth.

Second, the movable tumbler, working in combination with the latch and pin in the rear, in the several combinations as shown and described, and for the purposes set forth.

Third, the spring box or rod I, located above the tumbler, for the purpose set forth.

No. 48,788.—DANIEL BOWKER, Boston, Mass.—*Carpet Slipper.*—July 18, 1865.—This invention consists in rendering the sole water-proof, and in strengthening the seam and uniting the quarter with the upper by means of a metallic rivet or fastening.

Claim.—As a new article of manufacture, a carpet slipper, provided with a water-proof inner sole, and having the quarter united to the upper by means of a rivet or rivets in connection with the ordinary stitching, as herein described.

No. 48,789.—CHARLES BULLOCK, Cambridge, Mass.—*Inhaling Tube.*—July 18, 1865.—This invention consists in the attachment to the inhaling tube of an inhaling instrument or an auxiliary mouthpiece, so arranged as to slide over the tube.

Claim.—Combining with an inhaling tube an auxiliary mouth-tube, in the manner and for the purpose substantially as set forth.

No. 48,790.—JEROME CALKINS, Hudson, Mich.—*Harness.*—July 18, 1865.—The object of this invention is to enable horses to hold back without employing the ordinary breeching harness. Straps are so arranged as to throw the pressure upon the horse's rump, like the hip harness, with the addition of two straps, which loop in the rings at one end and pass forward and attach at the other end to the martingale under the belly.

Claim.—Arranging and connecting the straps D D with the rings E E, strips C C, ring a, and with the ring F, substantially as and for the purpose specified.

No. 48,791.—JUSTUS CHOLLAR and CHARLES W. CUNNINGHAM, Washington, D. C.—*Cooler for Beer and Other Liquids.*—July 18, 1865.—This invention consists of an annular vessel formed of galvanized iron or other suitable material, and of such size as to fit into a bucket. The said vessel is provided with a flexible tube which is connected with the beer vessel, and a tube and stop-cock, the latter tube being perforated at its lower end in order to filter the beer.

Claim.—The above-described cooler B, provided with the ice space C and discharge tube F, in combination with the outer vessel A, when arranged and operated substantially as set forth.

No. 48,792.—JOHN CONDELL, Morristown, N. Y.—*Artificial Leg.*—July 18, 1865.—This artificial limb is intended for amputations below the knee, and is supported by straps secured to the sides of the socket, and an elastic band secured to the front of the socket, the said straps and band uniting in a stronger elastic strap which passes upward, and is suspended from a yoke strap over the shoulder. The foot piece has a socketed axial bolt passing transversely through its rear portion, which, being secured to a bar projecting up into the leg, forms the ankle joint.

Claim.—First, the supporting appendage, consisting of the straps K K and elastic straps N L, substantially as and for the purpose described.

Second, the central bar a a b in combination with a socketed axial bolt or bolts c, substantially as described.

No. 48,793.—DANIEL G. COPPIN, Cincinnati, Ohio.—*Shaft for Boring Tools.*—July 18, 1865.—This coupling is of solid metal, one section having a slot across its end extending back in the direction of the length of the rod about one and a half inch, and at the bottom of this slot, coincident with the axis of the section or rod, is a cylindrical hole having a depth of about three quarters of an inch. The other section is provided with a tenon, and

projecting from the end of the latter a dowel pin, which respectively correspond with the slot and cylindrical hole. A screw-tapped bolt passes transversely through the two sections to hold them together.

Claim.—The improved coupling for the sections of a well-boring rod, consisting of the collars C and F, the tongue D, jaws E and E', dowel G, socket H, and the countersunk screw key I, or their equivalents, combined and operating as set forth.

No. 48,794.—C. O. CROSBY, New Haven, Conn.—*Cover for the Exhibition of Samples.*—July 18, 1865.—This invention consists in forming a depression in the cover to place a sample therein, so that the boxes may be placed one upon another without interfering with the sample.

Claim.—Making a depression in the cover of boxes for the purpose described, when the said depression is formed from the same material as the cover, substantially as and in the manner described.

No. 48,795.—JOHN P. CURRY, New York, N. Y.—*Construction of Vessels.*—July 18, 1865.—In this invention the vessel is formed of tubular iron. The improvement consists in the means of fastening the wood to the iron. This is accomplished without punching the iron by the use of clasps and straps. This mode of fastening gives "room or play" for the contraction and expansion of the tubular iron frame caused by atmospheric changes.

Claim.—A combined tubular iron and wood frame for vessels so united as to conjointly receive, resist, or transmit the strain throughout the whole, while the tubular iron frame is free to expand or contract by atmospheric changes without injury to itself or to the fastenings of the wooden frame, as herein described and represented.

No. 48,796.—JAMES DOWNIE, Paterson, N. J.—*Machine for Preparing Woof for the Manufacture of Hair and Grass Cloth.*—July 18, 1865.—By this machine the short lengths of hair or grass are fed upon endless aprons in such a manner that their smaller ends shall slightly overlap their larger ones, and that they shall be parallel with and surround a central guiding thread or core, and the whole is then spirally and slightly wound with a binding thread by means of flyers. The product thus formed is used as weft, and in weaving gives a selvedge, instead of having the ends of the hair, as usual, project at both edges of the woven fabric.

Claim.—The combination of the hollow shaft or spindle *s* with the flyers *x* and the feeding apron *W*, the whole operating substantially as described and for the purpose stated.

No. 48,797.—WILLIAM DUTEMPLE, Malden, Mass.—*Pipe Coupling.*—July 18, 1865.—In this coupling the two sections are held together by screw threads in the usual manner; the principal peculiarity consisting in forming the socket of the female section with an outer and inner wall, the male section being screwed up in contact with the former, and an oval space intervening between the male section and inner wall, which is filled with cement.

Claim.—The recess *i* and lip or ring *k*, for reception of the male end of the coupling, and the cement by which the parts are packed.

Also, giving to the lip or flange *h* an inclination, in the manner and for the purpose substantially as set forth.

No. 48,798.—LUCIUS H. DWELLY, Dorchester, Mass.—*Horseshoe Nail.*—July 18, 1865.—This invention consists in a combination and arrangement of several devices for making horseshoe nails, too complicated to be described in brief.

Claim.—The former *F*, having a progressive motion, substantially as set forth.

Also, the vibrating cutters *a' b'*, operating substantially as described.

Also, causing one of the cutters, by the act of carrying the rod forward to the other cutter, or by any other moving part of the machine brought up against the bent portion of the rod, to feed in a sufficient length of rod for the next succeeding nail.

Also, feeding in the rod previous to the nail already formed on its end being cut off.

Also, gauging or determining the length of rod fed into the machine by means of the cutter *b'*, substantially as described.

Also, making the cutter *b'* adjustable, so as to allow more or less of the rod to be drawn forward previous to cutting off, substantially as described.

Also, equalizing the throw of the hammers *G*, by means of the belts *q*, arm *s*, and spring *u*, so as to cause them to strike at the same instant upon the nail, substantially as set forth.

Also, the revolving arm or segment *E*, carrying a succession of rolls placed at unequal distances from the centre around which they are carried, in combination with a movable former, substantially as described.

Also, the revolving arm or segment *E*, carrying a succession of rolls placed at unequal distances from the centre around which they are carried, in combination with the hammers *G* and a movable former, substantially as described.

Also, attaching the springs *o* which operate the hammers *G* to movable carriages, as set forth, for the purpose specified.

No. 48,799.—E. A. EDDY, Racine, Wis.—*Stake-holder for Platform Car*.—July 18, 1865.—This invention consists in a novel mode of attaching and securing the stake to the side of a platform car, whereby, while said stake is immovably attached to the car, and therefore cannot be lost, it may by a novel arrangement be firmly and rigidly fixed in an upright position, and may also be adjusted or turned down in a horizontal position when required.

Claim.—In combination with the stake B and holder C, the employment of the latch A, arranged and operating substantially as herein shown and described.

No. 48,800.—E. A. EDDY, Racine, Wis.—*Stake-holder for Platform Car*.—July 18, 1865.—This invention consists in so constructing the casting or socket into which the lower end of the stake is placed and in so attaching the stake thereto that, while it cannot be thrown out, it remains firmly in a vertical position when required, and by a simple and easy adjustment it may be turned down in a horizontal position, either to the right or left, as required.

Claim.—First, the casting A A', constructed substantially as shown and described, and provided with one or two recesses *a*, for the purposes specified.

Second, the combination and arrangement of said stake-holder A A' with the slotted stake D, centre-bolt C, and projection *b*, operating substantially as and for the purposes set forth and shown.

Third, the combination of the stake D, provided with the projection *b*, with the stake-holder A A', provided with the recesses *a*, arranged and operating as and for the purposes specified.

Fourth, the combination of the stake D, provided with the slot *d*, and the pin or bolt *e*, arranged and operating substantially as described.

No. 48,801.—JAMES ELLISON, Boston, Mass.—*Boot and Shoe Holder*.—July 18, 1865.—This invention consists in a curved arm reaching from the sole of the foot to the top of the leg, and permanently attached to a fixed article, in combination with a lever, provided with a last-shaped foot, a handle, and ratchet, to operate with a pawl. Both arm and lever, after being inserted into the boot, are expanded so as to hold it firmly.

Claim.—A boot and shoe holder, consisting of the fixed arm A, pivoted lever B, handle K, ratchet C, and pawl D, or their equivalents, constructed, combined, and operating substantially as set forth and for the purpose described.

No. 48,802.—A. A. EVANS, Boston, Mass.—*Shirt Collar*.—July 18, 1865.—This invention is fully set forth in the claim.

Claim.—Rounding and narrowing the lower corners of turn-over or stand-up shirt collars, when constructed with concave bottoms, substantially as set forth and for the purposes described.

No. 48,803.—JOSEPH EVANS, Newark, N. J.—*Pruning Shears*.—July 18, 1865.—This invention consists in operating the shears in a way that dispenses with the knuckle joints, the projecting ends of which are apt to be inconvenient, and in providing a drawing cut in the place of a direct pressure cut.

Claim.—The arrangement and combination of the parts of the shears in the manner and for the purpose specified, when used in combination with the already patented pole or holder, said patent bearing date July 16, 1861.

No. 48,804.—JOSEPH FECKER, Cavetown, Md.—*Saw-mill*.—July 18, 1865.—In the lower end of the pitman is a long mortise, in which are two changeable blocks, in one of which is fitted the wrist pin of the crank; these blocks can be changed in their position, and by this means the saw is caused to wear away uniformly throughout its length, without the necessity of much filing.

Claim.—In combination with a saw pitman, the changeable crank, pin-block and follower, with the keys or wedges, for the purpose of shifting the working part of the saw, and thus causing it to wear away uniformly through its length, and avoid the necessity and loss of so much filing, as herein described and represented.

No. 48,805.—HENRY GERNER, New York, N. Y.—*Steam Boiler*.—July 18, 1865.—This invention consists in arranging the steam dome of a boiler, within its shell and water space, in such a manner that the shell of the boiler may be filled with water, or nearly so, and the fire made to strike the same around its entire circumference. The steam dome is surrounded by water, which, when heated, prevents the radiation of heat from the dome, and the condensation and loss of steam consequent thereupon.

Claim.—The combination and arrangement of the cylindrical steam reservoir B, located within the boiler A, the tube *b*, and the eduction steam pipe *e*, substantially in the manner and for the objects specified.

No. 48,806.—HENRY GERNER, New York, N. Y.—*Hydro-Carbon Blower for Furnace of Steam Boiler, &c.*—July 18, 1865.—This invention consists of a vessel divided into two

compartments, one of which is provided with a funnel and communicates with a steam generator by means of a pipe. The vapors generated in this compartment pass into the other compartment through a tube, and escape through other tubes into a tube the end of which is bell-shaped, and is situated directly under the grate bars of a furnace.

Claim.—First, superinducing the combustion of fuel by introducing directly thereto a hydro-carbonaceous vapor, when the same is produced by forcing steam into and through a body of petroleum or other hydro-carbon liquid, and when said vapor, together with the atmospheric air, is made to constitute the draught medium, in the manner herein described.

Second, the hydro-carbon chamber E, provided with a steam supply-pipe C, and vapor discharge pipe D, in combination with the chamber F, jets H H, and air-induction pipe L M, constructed and operating substantially as and for the purpose described.

Third, making the air-induction pipe L adjustable, substantially as and for the purpose specified.

No. 48,807.—S. D. GOODALE, Cincinnati, Ohio.—*Stereoscope.*—July 18, 1865.—In this stereoscope the pictures are previously brought within the range of vision by the rotation of an endless carrier. The carrier is provided with a series of two-faced, wedge-formed picture holders, by means of which the scenes are caused to come into view at a more convenient angle for inspection than is the case with those having the customary vertical presentation, and render possible the use of eye tubes inclined slightly downward toward the scenes, by means of which a lower and more compact case than usual may be made use of.

Claim.—First, a continuous scene carrier, having the series of two-faced, wedge-formed holders N, strung upon elastic ribands M M', substantially as set forth.

Second, a continuous scene-carrier, having the series of two-faced, wedged-formed blades N, when combined with the pair of depressed lens-holders or eye-tubes O O', substantially as set forth.

Third, the scene holder N P, formed and operating as described.

Fourth, the combination of the bent elastic pintle *d* with the reflector B, as and for the purposes set forth.

No. 48,808.—JOHN GRIEVES.—Brooklyn, N. Y.—*Portable Derrick.*—July 18, 1865.—This is a portable derrick for operating the tools used in drilling artesian wells, and consists of a somewhat complicated arrangement of mechanism, not easily explicable in a small compass. The main features of the machine, however, are a perpendicularly sliding frame, to which a reciprocating motion is imparted. The drill rope, passing over a pulley in the top of this frame, partakes of this motion and communicates it to the drill, which thus has a percussive action upon the strata through which it passes.

Claim.—The sliding frame D D, lifting wheel R, arbor H, large wheel H2, in combination with the arbor M, pinion M2, spool O, lever S, ratchet Q, and pawl Q2, in the manner and for the purpose set forth.

No. 48,809.—JOHN GRIEVES, Brooklyn, N. Y.—*Well Borer.*—July 18, 1865.—This invention consists of a cup applied to the drill rope, just above the drill bar, for the purpose of receiving any detritus or other matter that may fall into the bore, and might otherwise obstruct the action of the drill. The drill bar is also a sand pump, and is provided with a removable cap at its top for the discharge of its load.

Claim.—First, the cone-shaped cap P, with the collar R, for the purpose set forth.

Second, the safety cup U, as specified.

No. 48,810.—CHARLES H. GUSTIN, Worcester, Mass.—*Car Brake.*—July 18, 1865.—This invention consists in the employment of laterally-adjustable friction clamps upon the axis of car truck wheels, and sustained by the truck frame independently of the means employed for actuating them, thereby transferring all the strain upon the friction clamps (consequent upon breaking up the train) directly to the truck frame, and thereby enabling light rods to be employed for connecting together and acting upon the clamps.

Claim.—First, the employment of laterally-adjustable friction clamps E E', which are suspended from the truck frame, in combination with intermediate friction plates D, which are secured to the axles of the car wheels, substantially as described.

Second, the construction of the friction clamps with wings on them, substantially as described.

Third, suspending the friction clamps by means of hangers *d d'*, staple guides *f f*, and pins *g g*, substantially as described.

Fourth, the removable friction plates S S, applied to the laterally-adjustable clamps, substantially as described.

Fifth, the connecting rods G G', applied to the hubs of the friction clamps, in combination with the loose pulley *j*, chain *k*, and lever H, arranged substantially as described.

Sixth, so applying the laterally-adjustable friction clamps that the strain which is received by them will be sustained by the truck frame instead of by the connecting rods G G', which are used to adjust said clamps, substantially as described.

No. 48,811.—L. B. HARTT, Detroit, Mich.—*Washboard*.—July 18, 1865.—This invention consists in adapting the two sides of the board to different kinds of work, by making the corrugations on one side coarse, and on the other fine. Longitudinal grooves are also let into the corrugated surfaces, forming channels with flattened bottoms in which the clothes are manipulated.

Claim.—The washboard, constructed with longitudinal grooves on its corrugated surface, forming channels with flattened bottoms, in which the clothes are manipulated.

No. 48,812.—HENRY H. HEMPLER, Washington, D. C.—*Pocket Sun Dial*.—July 18, 1865.—This invention consists of two small plates of brass hinged together and marked on one side with the divisions of a dial. Attached to the said plates is an index in such a manner, that when the plates are unfolded, it assumes a vertical position; on one of these plates is a small compass by which the proper position of the dial is ascertained. The instrument when not in use can be carried in the vest pocket.

Claim.—A portable sun dial, with hinged or folding plates, and central index, in combination substantially in the manner herein described.

No. 48,813.—SAMUEL F. HODGE, Detroit, Mich.—*Rock Crusher*.—July 18, 1865.—This rock crusher has a vibrating motion, and is partly surrounded by an adjustable bed pivoted at its upper end, and made to yield by the lower end resting on a lever, on the opposite end of which is a weight, so that any hard substance that could not be crushed will not injure the machine, for the reason that the bed would raise the loaded lever and thus relieve itself.

Claim.—First, the lever and adjustable bed, in combination with the crusher, substantially as and for the purposes set forth.

Second, a stone or rock-breaking machine, with a yielding jaw B, in combination with a loaded lever, substantially as described.

No. 48,814.—JOHN A. HOTCHKISS and RICHARD EAVES, Derby, Conn.—*Dish-washer*.—July 18, 1865.—This invention consists of two disks placed one above another at a suitable distance apart, each provided with alternating bristles and sponges. Rotary motion is communicated to these disks in opposite directions, and the dishes inserted between them are consequently cleaned. These disks are placed in a tub which is partially filled with water, and are set upon a spiral spring in such a manner that whenever it is desired they may be plunged with the dishes below the surface of the water and thrust out thence again by the spring upon the removal of pressure.

Claim.—First, the arrangement of the alternating bristles and sponges *d d'* with the disk D of a dish-washing machine, in the manner and for the purposes substantially as herein set forth.

Second, the spring C arranged relatively to the wheels B D, and suitable means for depressing D, substantially as and for the purpose described.

No. 48,815.—HENRY HUTCHISON, Three Rivers, Mich.—*Churn*.—July 18, 1865.—In this machine there is a four-armed crank, and four dashers are arranged quadrilaterally, so that by the revolution of the crank the dashers will approach and recede from each other.

Claim.—First, the combination in a churn of the four-armed crank A, with four sectional dashers arranged quadrilaterally, substantially as and for the purpose specified.

Second, the combination with the four-armed crank, the pitmen rods and dashers, or the stationary guide E arranged within the churn, substantially as described for the purpose set forth.

No. 48,816.—JAMES IVES, Mount Carmel, Conn.—*Lamp*.—July 18, 1865.—This invention consists in certain devices constituting a combined hinged shade and chimney base, with a hinged guide and stop.

Claim.—First, a combined hinged shade and chimney base for lamps, substantially as herein described.

Second, the construction of the hinge with a guide and stop, substantially in the manner and for the purpose described.

Third, the combination of a combined shade and chimney base, a lamp or burner cap, and a hinge joint, all constructed and operating substantially as described.

Fourth, the combination of the set screw seat ring of a lamp fountain, and the bowl or lamp fountain, substantially as and for the purposes set forth.

No. 48,817.—C. M. JENNE, Young America, Ill.—*Cultivator*.—July 18, 1865.—The axle is applied to the draught pole in such a manner as to admit of a forward and backward play of the former, for the purpose of preventing the implement from straining or breaking in case the ploughs meet with obstructions. Two stay rods project one from each side of the draught pole and pass through the axle. These rods are provided with spiral springs between their rear ends and the back side of the axle, so as to admit of a forward and backward play of the axle at either side of the draught pole. The plough beams are connected with the axle in such a manner that a universal joint attachment is obtained and the ploughs may be raised, lowered, or moved laterally as required.

Claim.—First, the axle A arranged or applied to the draught pole C, substantially as shown, to admit of a forward and backward play thereon, for the purpose set forth.

Second, in combination with the above, the rods D D attached to the draught pole C, and passing through the axle A, with springs *a* on their rear ends, to operate substantially as and for the purpose herein set forth.

Third, the stirrup H applied to the draught pole C, in combination with the bars I I, rods *f*, links *g*, and axle A, all arranged substantially as and for the purpose specified.

Fourth, the rods M M attached to the plough beams J J and connected by links N N with the adjustable plates O O on the draught pole C, substantially as and for the purpose set forth.

Fifth, the bar E connected by a hinge or joint *b*, with the rear of the draught pole C, in combination with the rod F and adjustable plate G, for the purpose specified.

No. 48,818.—CHARLES A. KIRKPATRICK, Somerville, Mass.—*Roofing Bracket*.—July 18, 1865.—This invention consists in part of a bracket to be used upon a staging of ordinary construction at the side of a building. It is composed of two foundation pieces at right angles to each other, from the point of intersection of which projects upward a post suitably braced. This bracket is provided with a screw bolt and nut, so connecting the upright post and the two cross pieces that when loosened they may be easily taken apart, and when it is tightened they are firmly bound together. The invention also consists of a roof bracket to be used when required, and to be supported by its lower end against the side bracket on the staging.

Claim.—A bracket or machine constructed substantially as above described, and for the purpose set forth.

No. 48,819.—LOOMIS G. MARSHALL, Mokena, Ill.—*Drill*.—July 18, 1865.—This invention consists of a divided drill so formed that when the drill strikes the bottom of the well, or any obstruction placed in the bore at any desired point, the drill will be forced open and the divisions thrust outward. The outer edges are formed as cutting edges, so as to cut the rock outward and upward. When the drill is raised the divisions close of themselves, and the operation is continued until the desired effect is produced.

Claim.—The construction and combination of the pivoted drills, having front and back cutting edges and flat inclined bottoms for chamfering and cutting outward and upward, as herein described.

No. 48,820.—EDWIN MARTIN, Springfield, Mass.—*Priming Metallic Cartridges*.—July 18, 1865.—Within the base of a metallic cartridge case a perforated or annular disk is placed for supporting within it a glass percussion cap, which is discharged by a blow delivered centrally upon the base of the cartridge.

Claim.—Enclosing the fulminate of mercury or other substance to ignite the powder in a cartridge box by its explosion in glass or other vitreous substance, substantially in the manner and for the purpose described.

No. 48,821.—ORVILLE MATHER, Newport, Ky.—*Children's Carriage*.—July 18, 1865.—This invention consists in suspending the body of the carriage from a pair of C springs formed of a single strip of ash, hickory, or other tough and elastic wood.

Claim.—First, the mode of supporting the body of children's carriages from points of suspension above the centres of gravity of the same when loaded, substantially as set forth.

Second, in combination with the above mode of hanging the body of children's carriages, the check brace D D, or its equivalent, substantially as and for the object stated.

No. 48,822.—JOHN MATTHEWS, JR., New York, N. Y.—*Method of Closing Bottles*.—July 18, 1865.—This invention consists of a bottle with a cork inside, the said cork having a rod of iron passing through it. The cork is drawn into the neck of the bottle by means of a magnet.

Claim.—First, constructing a bottle-stopper with a core of metal, either magnetic or capable of being attracted by a magnet, as and for the purpose specified.

Second, the employment of a magnetic plunger M M, or its equivalent, substantially as and for the purpose specified.

Third, the bottle B, stopper F, and plunger M, when operating by magnetic attraction, as described, for the purpose specified.

No. 48,823.—JOHN M. MAY, Janesville, Wis.—*Rock Drill*.—July 18, 1865.—This invention consists in the construction and arrangement of the several members of a drill, in order to form a strong, compact, and efficient tool for drilling and reaming an artesian well at one and the same operation.

Claim.—First, apertures or mortises *c* and *d* in thimble A, or their equivalents, to receive tenons *a* and *v*, or their equivalent, extending from members C and D, when used to connect thimble A and members C and drill, substantially as and for the purposes described.

Second, aperture or mortise *e* in member B, to receive tenons *g* and *f*, or their equivalent,

extending from members C and D of a drill, when used to connect members B, C, and D of a drill, substantially as and for the purposes described.

Third, an angle and bearing at *m* and at *n* in members C and D, either with or without pieces *o* and *p*, to give suitable outward pressure against the inside of thimble A, to make, when the several parts are put together, a firm, compact-built tool, substantially as described.

Fourth, combining members B, C, and D with thimble A, substantially as and for the purposes described.

Fifth, a general arrangement of members B, C, and D, thimble A and band E, when the whole are constructed and operated substantially as and for the purposes described.

No. 48,824.—RUFUS S. MERRILL, Boston, Mass.—*Lamp Burner*.—July 18, 1865.—This invention consists in attaching to an adjustable tube, sliding on the wick tube, an annular concentric collecting chamber at or near the top of the burner, with a perforated disk. With the above is combined a concentric outer jacket open at its under side to admit of air entering the same.

Claim.—First, the employment of annular concentric collecting chambers at or near the tip of the burner, when the same are made adjustable in relation to the burner, substantially as hereinbefore set forth.

Second, the attachment of the annular collecting chamber or chambers concentrically with the wick tube to an adjustable sliding tube or friction sleeve, whereby the flame of the burner may be regulated without interference with the wick itself.

Third, in combination with the above, the concentric outer jacket, open at the under side so as to allow air entering the same in the manner and for the purpose substantially as set forth.

Fourth, in combination with the above, the perforated disk or flange, for the purpose specified.

Fifth, the method described of attaching the outer jacket to the adjustable slide by indentation, substantially as set forth.

No. 48,825.—WM. T. MERSEREAU, Newark, N. J.—*Stair Rod*.—July 18, 1865.—This invention consists in forming stair rods so that their attachments to the stair are made to have the appearance of part of the rod, and may be ornamented in any suitable manner.

Claim.—First, continuing the metal in the manufacture of the button, so that an ornamental device may be formed upon the same, for the purpose specified.

Second, continuing the metal in the manufacture of the sliding catch so that an ornamental device may be formed upon the same, for the purpose specified.

Third, combining with the button and sliding catch, whether the same be ornamented substantially as shown, or not ornamented, the stair rod H, for the purposes specified.

No. 48,826.—GEORGE E. MILLS, New York, N. Y.—*Pump*.—July 18, 1865.—In this invention the pump rod is guided by a cross-head moving between two guide rods, which guide rods are attached to the head of the pump cylinder and stuffing box, so that they may be turned to admit of the operation of a crank at any side of the pump.

Claim.—The mode of attaching guide rods *m m* to the head of the pump cylinder and stuffing box *k*, so that they will turn to allow the cross-head I to be worked by a crank in any position, as set forth.

No. 48,827.—S. A. MOORE, Bloomfield, Iowa.—*Horseshoe*.—July 18, 1865.—This invention consists in making first a plain shoe, without calks, that is nailed to the foot, then two plates having each a toe and heel calk, and which represent nearly half of a shoe, and secured to the shoe by means of a tenon upon each of their ends, which enter corresponding mortises in the under side of the shoe; and in the middle of each plate is a hole, admitting a screw which screws into the shoe, the head of which screw also forms an intermediate calk.

Claim.—First, the auxiliary calked plates A A, constructed with inclined locking tenons *g g*, and offsets *e e*, substantially as described.

Second, the construction of calk plates A A, with toe and heel calks and locking tenons *g g*, in combination with the calked head screw fastenings *d d*, substantially as described.

Third, securing plates having calks formed on them to horseshoes by means of inclined tenons *g g'*, and intermediate screw fastenings *d d*, substantially as described.

No. 48,828.—EVAN MORRIS, Philadelphia, Mass.—*Hat*.—July 18, 1865.—This invention is fully described by the claim.

Claim.—A hat having a body or foundation of felt and cover of woven fabric, with gutta-percha interposed between the two, the whole being united by the application of heat and pressure, substantially as set forth.

No. 48,829.—GEORGE G. MUDGE, Pittsburg, Ind.—*Carpet Stretcher*.—July 18, 1865.—This device consists of parts made extensible, so that it may reach from wall to wall of different sized rooms, and with an armed rocking lever for forcing the carpet to the place desired.

Claim.—The frame, consisting of extensible hinged sections, and provided at one end with an armed rocking lever, by which the edge of the carpet is drawn to the position required.

No. 48,830.—LAWRENCE MYERS, Philadelphia, Penn.—*Freight Car.*—July 18, 1865.—This invention consists of a cylinder, divided into compartments, attached to the axle of railroad cars for the purpose of carrying freight, and is surrounded by an elastic covering that will yield when the wheels come in contact with slight obstructions, thus preventing the jar from the inner cylinder, and the displacement of freight therein.

Claim.—The casing *d*, in combination with the tires *D*, and the intervening slats or cylindrical casing, or their equivalents, for the purpose specified.

No. 48,831.—GABRIEL NATCHER, Sidney, Ohio.—*Millstone Dress.*—July 18, 1865.—This invention is explained by the claim and engraving.

Claim.—First, a double inclined plane on that side of the furrow on which the grain rises. Second, marking with lines, substantially as described, the first inclined plane, extending from the base line of the furrow to the first step.

Third, marking with lines of the angle described, or thereabout, the outer portion of the face of the stone, as described.

No. 48,832.—EDMUND S. NICHOLS, assignor to himself and FRANCIS M. NICHOLS, Joliet, Ill.—*Marble Polishing Machine.*—July 18, 1865.—This invention consists in a polishing bed, having a reciprocal movement, in a device for supplying sand, and another whereby the water which has been once used can be returned to the reservoir, whence it is conveyed to the machine, and finally into a revolving bucket.

Claim.—First, the employment of a reciprocating inclined polishing bed *K*, arranged and operating substantially as and for the purposes specified and shown.

Second, in combination with said reciprocating polishing bed, the employment of the anti-friction rollers *R*, and adjustable bearings *S*, arranged as and for the purposes described.

Third, in combination with the sand-box *C*, the hinged bottom *D*, spring *b*, and slides *a*, all arranged and operating substantially as shown and set forth.

Fourth, the combination and arrangement of the hinged bottom *D*, spring *b*, chain *c*, and arm *E*, as and for the purposes described.

Fifth, providing the inclined table *I* with the pivoted adjustable leaf *M*, arranged substantially as and for the purposes specified.

Sixth, the employment of a revolving bucket *Q*, arranged and operating substantially as and for the purposes shown and described.

Seventh, the combination and arrangement of the reservoir *T*, the revolving bucket *Q*, inclined table *L*, polishing bed *K*, receiver *U*, and tube or trough *V*, operating substantially as and for the purposes described.

No. 48,833.—E. F. OLDS, New Hudson, Mich.—*Houses for Preserving Fruit.*—July 18, 1865.—This invention consists of a house provided with double walls having spaces between them. Inside of the house a safe is placed, the walls of which may be made double or single; the safe may also be provided with chambers for holding ice, the said chambers being provided with doors, so that the fruit can be exposed to the direct action of the light when necessary.

Claim.—First, the safe *B*, arranged and constructed in the manner set forth, in combination with the ice-house *A*, as specified.

Second, the side ice chambers *c g*, and doors *c' b g*, separate, and in combination with gauge or perforated slides *p*, as and for the purpose set forth.

Third, one or more central chambers *C D*, with or without the gauge or perforated slides in connection with the doors *h h*, substantially as and for the purpose set forth.

No. 48,834.—WILLIAM B. PARSONS, Granger, N. Y.—*Rake Attachment to Harrowers.*—July 18, 1865.—This invention consists in locating the rocking or bell-crank lever, which communicates motion from the crank arm to the rake, upon a vibrating plate or block, which is pivoted to the main frame, and which, when it is desired to have the rake operate, is prevented from vibrating by means of a spring latch placed under the control of the attendant. When it is desired to stop the rake, the spring latch is removed, and the plate vibrates without imparting motion to the rake.

Claim.—First, the block *S*, in combination with the rock shaft *L*, operated and operating substantially as described.

Second, the latch *N*, in combination with the block *S*, substantially as and for the purpose set forth.

No. 48,835.—LOREN G. PECK, Rouseville, Penn.—*Well Drill.*—July 18, 1865.—The object of this invention is to enlarge the diameter of oil and salt wells at their extreme depth, or at any point thereof, either for the purpose of removing obstructions to the free entrance of oil or brine into the well, or in order to loosen and remove any obstruction therein in the nature of a broken tool, &c.

Claim.—First, the hollow stock or socket holder, composed of the parts A A, so constructed as to be united or held firmly together at the top, but expanding sufficiently below to receive the boxes d d, in combination with the reaming bits B B, bands f f, and adjustable wedge G, the whole arranged and operating substantially in the manner and for the purposes set forth.

Second, the arrangement of the wedge G, in relation to the points of the bits or reamers B B, and stock A, whereby said reamers are enabled to work around and beyond tools or other impediments which accidentally obstruct the well, substantially as shown and described.

Third, constructing the bits or reamers B B with equally inclined faces on their adjacent sides within the stock A, in combination with said stock and the wedge G, so arranged that when said faces by approaching come in contact the motion of the wedge and the expansion of their cutting parts are limited, and the parts are firmly held together, and act as one reamer, substantially as shown.

No. 48,836.—CHARLES PERLEY, New York, N. Y.—*Deck and Side Light for Vessels.*—July 18, 1865.—This invention consists in the use of a conical ring, in combination with which there are screws. The glass is retained in the metallic frame by pins and notches in the edges of the glass, in order to prevent motion of the glass before the hardening of the cement.

Claim.—First, the fixed conical ring a b, in combination with the conical deck or side light fitted and acting substantially as specified, and in combination therewith the packing groove 3, for the purposes specified.

Second, in combination with the deck or side light and ring a, the screws 3, and groove 4, as set forth.

Third, retaining the glass in the metallic frame by pins passing into notches in the edges of the glass, in combination with a cement surrounding said glass, whereby any movement of the glass previous to the hardening of such cement is effectually prevented, as set forth.

No. 48,837.—ORRIN REEVES, Greenport, N. Y.—*Washing Machine.*—July 18, 1865.—This invention consists of a metal standard in a wash-tub of the common form, around which a rubber revolves with friction rollers: the other parts of the machine are the same as described in the patent of said Reeves, dated February 7, 1865.

Claim.—The standard and friction rollers g g, in the rubbing board D, in combination with a tub having ribs on its inner perimeter, and radial flutes or ribs on its bottom, the rubbing board having a scalloped perimeter and radial ribs on its under side, as and for the purposes herein described and represented.

No. 48,838.—ASA T. RING, Newtonville, Mass.—*Tree Protector.*—July 18, 1865.—This invention consists in providing an opening which can be closed, by a sliding door, for the purpose of introducing a fluid into the trough that surrounds the tree.

Claim.—The openings f f, and slides g g, in combination with the cases b b, the caps c c, the semi-tubes d d, and, the two troughs a a, the whole being arranged substantially as described.

No. 48,839.—J. F. ROCHOW, New York, N. Y.—*Portable Water Apparatus.*—July 18, 1865.—This invention has for its object the conversion of salt water into fresh, and this it does by first converting the salt water into steam, and then impregnating the steam while on its way from the boiler to the condenser with a sufficient quantity of fresh air to produce, after its condensation, thoroughly aerated and potable water. A double packing is arranged on both ends of the condensing tubes in such a manner that if a leakage takes place the salt water is not permitted to mix with the steam to be condensed, or the water into which it has already been condensed.

Claim.—First, the injector A, applied in combination with the steam pipe t, and condenser C, in the manner and for the purpose substantially as herein described.

Second, the arrangement of a double packing at the ends of the condensing tubes, with open spaces intervening between said two packings, substantially as and for the purpose set forth.

Third, constructing the condenser C with diminishing compartments, substantially as and for the purpose specified.

Fourth, the horizontal partitions between the ends of the condensing tubes, in combination with the sheets n, in the interior of the condenser, constructed and operating substantially as and for the purpose described.

No. 48,840.—PETER RODIER, Springfield, Mass.—*Clutch-pulley for Driving Sewing Machines.*—July 18, 1865.—The object of this invention is to prevent the shaft from being driven in the wrong direction, which is effected by means of a pulley placed loosely on the shaft, with collars on the same shaft and spring pins with corresponding notches.

Claim.—The combination of the pulley C of a sewing machine loose on the shaft D with the collars A and B on the same shaft, and the spring pins b b, and corresponding notches a a, substantially in the manner and for the purpose described.

No. 48,841.—THADDEUS S. SCOVILL, Williamsport, Penn.—*Apparatus for Obtaining Oil from Running Streams*.—July 18, 1865.—In this invention a sunken boom directs the current to the desired channel; a swinging boom on the surface guiding the oil in the same direction into a race having sluice gates at its bottom, to permit the escape of water in the desired quantity, and a chute at its top for the flow of oil into a reservoir; which latter has also sluice gates at its bottom to permit the flow of whatever water may still remain with the oil.

Claim.—The combination of the swinging or movable oil-gathering boom B, oil-collecting race G, with its under gate or gates *o*, and chute *c*, and the oil reservoir H, arranged substantially as and for the purpose herein specified.

Also, in combination with the oil-gathering bar, the sunken channel bar E, arranged and operating substantially as and for the purpose herein set forth.

No. 48,842.—JACOB C. SEELEY, Cambridge, Mass.—*Hinging Coffin Lids*.—July 18, 1865.—This invention consists in applying the hinges of the lid of a coffin in such a manner that the joints or pivots of the hinges are in rear of the joint between the cover and lid, and at such a distance as shall allow the lid to swing back of the inscription plate.

Claim.—Hanging a coffin lid by hinges, the pivots of which are placed in the rear of the whole joint between the lid and the main cover, substantially as and for the purpose set forth.

No. 48,843.—HIRAM C. SHERMAN, Buffalo, N. Y.—*Machine for Driving Hoops on Casks*.—July 18, 1865.—Attached to a screw shaft revolved by gearing is a head to which are pivoted pendant drivers, which are adjusted to the side of the cask by a cam disk with projections on the periphery that force the drivers outward as it is turned, and by revolving the screw shaft, the head is depressed and drives the hoops upon the cask.

Claim.—First, attaching the driving bars H H to the direct acting non-revolving screw shaft E, by means of the head K, or its equivalent, so that said bars are suspended above and in a position to engage with the hoops on the barrel L, the whole arranged and operating substantially as and for the purpose set forth.

Second, pivoting or loosely hanging the bars H to the head K, by means of the joint *b*, or its equivalent, so that said bars may gravitate freely, substantially as set forth.

Third, in combination with the suspended driving bars H, the disk M, with its series of cams *f f*, and springs *d d*, or their equivalent, arranged and operating substantially as and for the purposes set forth.

No. 48,844.—ANDREW SHOGREN, Sandwich, Ill.—*Plough Clevis*.—July 18, 1865.—This invention consists in arranging in that part of the clevis exposed to wear, hard cast iron, in such a manner as to be easily detachable, when required to be removed.

Claim.—Providing a clevis with a cast-iron lining or jacket, substantially as set forth and specified.

No. 48,845.—THOMAS SKELTON, Rockford, Ill.—*Horseshoe*.—July 18, 1865.—This invention consists of a shoe hinged at the toe, and having flanges upon its upper side to fit the shape of the hoof, and hold it on; a rigid bar is secured to the heel points, by means of calks which pass through the bar and screw into the shoe. A plate of the shape of the bottom of the shoe is also secured to it by the calks, to give greater strength when required; to the centre and upper side of the cross-bar, at the heel, is secured by a rivet a spring, the ends of which project upward against the heel of the horse, and bear lightly so as to gradually expand the hoof.

Claim.—First, a jointed flanged shoe combined with a bottom plate and bar, when arranged substantially in the manner described for the purpose set forth.

Second, a jointed flanged shoe combined with a bottom plate, rigid bar, and spring, arranged substantially in the manner described for the purpose set forth.

No. 48,846.—JAMES B. SKINNER, Rockford, Ill.—*Gang Plough*.—July 18, 1865.—This invention consists in arranging the ploughs before and behind an adjustable axletree, and on a rigid frame; in such an adjustment of the tongue that it can be made rigid or flexible at will; in providing for placing three or more horses abreast; in an adjustable gauge wheel forward of the ploughs; and in devices for raising the main frame from the ground, or to regulate the depth of the ploughing.

Claim.—First, the combination in a gang plough of one or more ploughs before and one or more ploughs behind the supporting axle where the ploughs are firmly attached to a rigid frame which is itself adjustable upon and in relation to the axle, substantially as set forth.

Second, the combination of the tongue with the main frame by a hinge and lock, substantially as described to render it rigid or flexible at the will of the driver.

Third, the combination of a clevis with the main frame of a gang plough and the tongue whether rigid or flexible, substantially as described to, work three or more horses abreast and equalize the draught between them.

Fourth, the attachment of the left supporting wheel of a gang plough to a crank axle to

preserve the desired parallelism of the axle to the ground, substantially in the manner set forth.

Fifth, the combination of an adjustable gauge wheel with the rigid main frame of a gang plough, when arranged forward of the ploughs, substantially as and for the purpose set forth.

Sixth, the combination in a gang plough of a rigid main frame and an adjustable axle with a mechanism for raising and lowering the frame, substantially in the manner described for the purpose set forth.

Seventh, the combination of the main frame, the axle, and standards by the draught rod and reach or guides, substantially in the manner described for the purpose set forth.

No. 48,847.—R. A. SMITH, Philadelphia, Penn.—*Vessel for the Reception and Transportation of Night Soil*.—July 13, 1865; antedated July 6, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—The box G, rollers *f*, tight-fitting detachable cover H, having the tubular projection *h*, and its cap *i*, the whole being constructed and adapted for the reception and transportation of night soil and garbage, as set forth.

No. 48,848.—G. K. SNOW, Watertown, Mass.—*Paper-Collar Packing Envelope*.—July 13, 1865.—In this invention a cylindrical box of stiff paper, or paper board, has a thin covering so prolonged as to afford a packing at the ends.

Claim.—As a new manufacture, the said envelope, substantially as described and for the purpose specified.

No. 48,849.—M. A. SPINK, De Kalb, N. Y.—*Stubble Coulter*.—July 13, 1865.—This invention consists in making a shank with a curvature near the lower part and terminating at its junction with the blade. The blade projects upward near the plough beam, and has a curved point.

Claim.—The herein described coulter, consisting of the shank A, and blade B, the same being constructed as and for the purpose set forth.

No. 48,850.—J. W. STEVENS, South Danvers, Mass.—*Steam Blower*.—July 13, 1865.—The object of this invention is to maintain, urge, and increase combustion of fuel in furnaces employed for generating steam, and for other purposes. It consists in the combination of the steam blower, pipe, jet holes, and cock.

Claim.—Combining with the steam blower pipe *b c* and its jet holes a cock *d*, in the manner and for the purpose substantially as set forth.

No. 48,851.—NATHAN P. STEVENS, Boston, Mass.—*Piston for Steam Engine*.—July 13, 1865.—This invention consists in arranging the cut portion of a single packing ring upon the lower side of the piston, when the flanges of such piston are made to fill the bore of the cylinder, and when a pin is secured to the piston and passes through the cut portion of the ring for the purpose of securing the ring in the proper position.

Claim.—Arranging the joint of the expansion ring at the lower part of the piston head and on the bottom of the bore of the cylinder, and providing such ring and piston with a means of preventing the ring from revolving in its groove, the whole being substantially as and for the purpose set forth.

No. 48,852.—NESBITT D. STOOPS, Newark, N. J.—*Carriage and Caster for Sewing Machine*.—July 13, 1865.—The object of this invention is to supply the means of moving a sewing machine from place to place without lifting, and at the same time to secure the machine from rolling or slipping away from the operator when in use.

Claim.—First, the apparatus described for mounting a skeleton-frame sewing machine upon a carriage, substantially in the manner and for the purposes explained.

Second, constructing a caster so as to lock and unlock, substantially in the manner and for the purpose described.

Third, socket J, when used for the mounting of a skeleton-frame sewing machine on a carriage, to prevent undue elevation of the machine.

Fourth, caster frame H, so constructed as to support the caster above the top of the platform, and also to prevent undue elevation of the machine, by letting the caster up into the platform.

Fifth, the combination of platform A, caster B, pawl F, socket J, and caster frame H, or their equivalents, constructed and operating together, substantially as described.

No. 48,853.—A. W. TODD, Chicago, Ill.—*Steam Pump*.—July 13, 1865.—This invention consists in a peculiar combination and arrangement of a steam cylinder, its piston, valve rod, inlet pipe, cross-head, &c., whereby the tender of a locomotive engine or other reservoir may be filled with water or other liquid at one stroke of the piston of the said steam cylinder.

Claim.—The combination and arrangement of the cylinder K, levers 4 4, piston T, valve rod F, inlet J, pipe L, cross-head C, rod H, pipe P, fulcrum M, and ropes I I, substantially upon the principles and in the manner herein set forth.

No. 48,854.—STEPHEN USTICK, Philadelphia, Penn.—*Table for Invalid.*—July 18, 1865.—The top of the table is constructed with several principal compartments for work, visiting, and dressing cases. On the under side of the cover are placed a portfolio and a looking-glass, which are arranged to be reversed for use. A movable rest is provided for the support of these reversible covers. By the side of the portfolio is arranged a screen on a perpendicular stem. This screen may, however, be placed on any part of the table and at any height required. At each end of the table is arranged an adjustable upright, and these uprights being connected by a rigid rod, form a rack for the support of a newspaper or book.

Claim.—First, the combination of the foot pieces *b* with the legs *a* of the table C, when constructed, arranged and operating substantially as described.

Second, combining and arranging the cord *m'*, and clamps *o o*, with the table C, by means of the uprights *m m*, substantially as and for the purpose set forth.

Third, combining the longitudinal guides or ways F F with the table C, substantially in the manner and for the purposes above described.

Fourth, the combination and arrangement of the box G, rest H, pen rack I, pincushion J, clamps K, and screen L, with the table C, by means of the longitudinal guides or ways F F, substantially in the manner described and for the purposes specified.

Fifth, combining and arranging the endless apron P, with the table C, by means of the frame O and guides F F, substantially as and for the purpose specified.

No. 48,855.—HENRY WENGER, Farmersville, Penn.—*Water Wheel.*—July 18, 1865.—This invention consists of a horizontal wheel having a disk upon the top, which disk has openings to admit a free flow of water through corresponding openings or chutes in the upper part of the wheel, near the periphery thereof. A ratchet arrangement attached to the exterior case serves to move the auxiliary disk, and thus to open and close the chutes.

Claim.—The arrangement and combination of the water wheel K, with its buckets *m*, on its vertical periphery M, within the vertical casing A, chutes *a*, on top, disk B, with its valve *b*, and cogged valve *b'*, operated in the manner and for the purpose set forth.

No. 48,856.—AMOS WESTCOTT, Syracuse, N. Y.—*Sash Fastener.*—July 18, 1865.—In this invention a knob, which is arranged to slide vertically, has a stud projecting into an opening in the sash frame, and through a horizontal slot in a triangular piece which is pivoted to the sash frame, in line with its horizontal slot. This pivot projects further inward and supports a slotted slide, to which is attached the spring-actuated stop; the triangular piece has two cams, one above and one below the pivot; these cams work against corresponding stops upon the slotted slide, so that when the knob is moved either up or down it will draw the stop, and allow the sash to be moved in either direction.

Claim.—First, the manner of connecting the bolt D to the slotted piece I, Fig. 5, as and for the purpose substantially as above described, in combination with the triangular piece J, and the shank M, Fig. 2, of the knob C, Fig. 1, essentially as above described.

Second, the arrangement, consisting of the straight moving slide K, oscillating device J, and bolt D, the said parts operating together substantially in the manner and for the purpose described.

Third, the manner of sustaining and guiding the slotted piece I, Fig. 2, substantially as above described, in combination with the bolt D, triangular piece J, Fig. 2, and knob C, and plate B, Fig. 1, substantially as above described.

No. 48,857.—G. WESTINGHOUSE, Schenectady, N. Y.—*Sawing Machine.*—July 18, 1865.—This invention consists in the employment of a movable weight, arranged upon a lever so as to be made to balance the saw and its connections, or so much thereof as is desired; also, in a stop to gauge the length of the log to be cut off, by which the feed gear is thrown out when the log has been moved to the required point.

Claim.—First, the combination of the lever L and adjustable weight Z with the beam G, for raising, lowering, and counterbalancing the saw, as set forth.

Second, the pivoted bar V, when provided with the projection W, and connected by means of the bar X and lever Y to the lever T, substantially as and for the purpose specified.

Third, the log-carrier or log-feeder, composed of two heads U U, made separate or detached from each other, and placed on the shaft O permanently, or so that either or both may be adjusted thereon, for the purpose specified.

No. 46,858.—WILLIAM WESTLAKE, Chicago, Ill.—*Lantern.*—July 18, 1865.—The lamp pot and flanges are constructed in such a manner as to allow the guard to be attached to the bottom and readily separated; also, in a combination of a hole for lighting, a sliding door, and a recess cut in the bottom of the glass globe, corresponding with the same.

Claim.—First, the construction of a lamp pot *e* in connection with the flanges *d* and *g*, substantially as recited, allowing the guard to be attached to the bottom, and the lamp and

the bottom to be readily separated from the glass or globe and guard and dome, as herein set forth.

Second, the hole *h* with the sliding door *i* in combination with the recess *j* of the globe for lighting of the lamp, as herein recited.

No. 48,859.—WM. WHARTON, Jr., Philadelphia, Penn.—*Railway Frog*.—July 18, 1865.—This invention consists of a frog, having a recess for the reception and lateral and vertical retention of a continuous rail of a main track; all so constructed and arranged in respect to a rail of an intersecting track as to afford a medium for permitting wheels of cars traversing the latter track to pass across the rail of the main track.

Claim.—A frog *H*, having a recess for the reception and lateral and vertical retention of a continuous rail of the main track, and so constructed and arranged in respect to a rail of the intersecting track as to afford a medium for permitting the wheels of cars traversing the latter track to pass across the rail of the said main track, all substantially as described.

No. 48,860.—S. G. WILMOT, Brooklyn, N. Y.—*Kerosene Burner*.—July 18, 1865.—This invention consists in making the burner of pieces of sheet-metal, cut and formed as set forth in the claim.

Claim.—First, the arms *D3*, or their equivalents, on the seamless dome *D*, made from the same piece of metal and serving to unite it with the bottom *A* along short lines *A4*, substantially in the manner and with the advantages herein set forth.

Second, bending outward the ears *D2* formed from the metal cut out of the dome itself, substantially as and for the purposes herein set forth.

Third, the wick tube *B B'* soldered along the edge, substantially as and for the purposes herein specified.

Fourth, the seamless and legged dome *D D3*, as a new article of manufacture, adapted to be cheaply made by the means set forth, and to be afterwards connected to the parts *A B*.

Fifth, the method herein described of manufacturing the seamless skeleton dome *D* by forming the same from a blank cut in shape before forming, and afterwards striking or swedging in dies, so as to produce the legs *D3*, having between them the openings required for the admission of the air, without further cutting, all substantially in the manner and with the economy of material and of labor herein set forth.

No. 48,861.—JOSEPH WOOD, Red Bank, N. J.—*Fluid Ejector*.—July 18, 1865.—This invention consists of a curved pipe, each leg of which is composed of any number of sections that may be necessary, and joined together in any convenient manner, the first and straight section being connected with the lower curved section by means of a smaller pipe; just at the lower end of which there are apertures cut in the curved pipe for the ingress of the fluid to be ejected. The steam or air is admitted into the straight section, and passes through the small pipe with sufficient velocity to induce an influx of the fluid, which is carried forward to the point of delivery by the force of the agent employed.

Claim.—The employment of a curved pipe, provided with an aperture *C* or several similar apertures, placed at a point in the pipe where it or they shall be below the surface of the fluid to be elevated, and in advance of the point in the pipe where the steam or air, which is the propelling power, is admitted, in the manner and for the purpose substantially as described.

No. 48,862.—WM. W. W. WOOD, Philadelphia, Penn., and J. L. LAY, Buffalo, N. Y.—*Submarine Steam Gun*.—July 18, 1865.—This invention consists in providing in one side of the ship and below the water-line an aperture, which is closed by a ball and socket joint. This joint has connected with it a tube, which extends inward, and terminates in a box in which is a trunk with two compartments for containing the shells. This trunk is capable of being moved in the box, so that while one shell is being discharged another can be placed therein. To the rear end of this box a steam cylinder is placed, having a piston therein, which, when the shell is placed in the trunk, has steam admitted in the rear by means of suitable valves, and is pressed forward with such force as to eject the shell and force it to a considerable distance. The piston rod is hollow, and a cord is passed through it, and is wound around a spool upon its outer end. The opposite end of this cord is secured to the shell, and thus, when the shell has travelled any determined distance, the cord is made to discharge it.

Claim.—First, projecting submarine shells from vessels by means of a steam cylinder and piston and piston rod acting against the rear of the shell, substantially as described.

Second, the cylinder in combination with the tube *F* through which the shells are forced by the piston rod of said cylinder, substantially as specified.

Third, the combination of the tube *F* with the pipe *E* and the ball joint, substantially as set forth.

Fourth, the movable trunk *H*, constructed and arranged in respect to the steam cylinder and discharge tube *F*, substantially as set forth.

Fifth, the combination of the said movable trunk with the box *G* and its doors *j*, substantially as specified.

Sixth, the combination of the pipe E and its spherical end *a*, the pipe F, the box G, its trunk H, and steam cylinder K, with the truck L and elevating screws M M.

Seventh, the spool or roller *a*, arranged at the end of the external piston rod, for receiving the discharging cord.

No. 48,863.—CARL L. ZEIDLER, Cincinnati, Ohio.—*Mortising Machine*.—July 18, 1865.—This invention consists in so attaching the chisel to a disk that it can, by the action of a treadle upon a sliding box which is around a revolving shaft, and a toggle arm which passes through an eccentric slot in the driving wheel and is connected with a cam with a similar slot, so that as the wrist pin, which is fast to the cam, is thrown out towards the periphery of the cam, give a greater length of stroke to the chisel, or, when the cam revolves concentrically to the shaft, it imparts no motion to the chisel.

Claim.—First, the sheave or wrist F, pivoted eccentrically upon its driving shaft, and employed to give motion to a mortising chisel or analogous tool at the will of the operator.

Second, the toggle arm J and sliding box I in combination with a treadle lever or its equivalent, and with an eccentric sheave or wrist for throwing the tool into and out of action, substantially as set forth.

No. 48,864.—T. C. ANDREWS, assignor to himself and PETER GORDON, Jersey City, N. J.—*Machine for Cleaning Boots and Shoes*.—July 18, 1865.—This invention consists of a machine for cleaning and polishing boots and shoes, which may be operated by a hand lever or by a foot treadle, at pleasure, while the boot is on the foot of the operator, either in a standing or sitting position.

Claim.—The arrangement of the hand lever G and treadle H upon the same fulcrum *c*, in combination with the crank *f*, fly-wheel shaft D, and pin wheel *d*, pinion *c*, and rotary brush shaft C, substantially as and for the purpose herein specified.

No. 48,865.—V. R. DAVID, assignor to himself, H. R. FOWLER, and N. G. DAVIDSON, Newark, Ill.—*Washing Machine*.—July 18, 1865.—This invention will be understood by reference to the claim and engraving.

Claim.—First, the combination and arrangement of the drive wheel D, the support or standards C, the frame B, and the pinion H, provided with the hollow journal, when all constructed and operating substantially as described.

Second, the combination and arrangement of the pinion H with the hollow journal, the iron head, and the arms K, when constructed and operating substantially as and for the purposes herein set forth.

No. 48,866.—L. S. FAIRCHILD, assignor to himself and G. F. FRENCH, Cleveland, Ohio.—*Water Wheel*.—July 18, 1865.—This invention consists of a horizontal wheel, composed of three buckets radiating from the hub, and having no other attachment or connection. It is operated by water passing through two curved flumes, each flume having a gate pivoted centrally, and both gates being so geared as to be opened and closed simultaneously, the wheel moving a little below the level of the bed or floor on which the flumes are constructed. A descending annular flange serves to prevent the escape of the water otherwise than through the concavity of the buckets.

Claim.—The herein-described water wheel, consisting of the bed A, chutes C C, wheel H I J, gates E, connected as described, when the several parts are constructed and arranged as and for the purpose herein set forth.

No. 48,867.—EMMA HILL, assignor to THOMAS DOLAN, Philadelphia, Penn.—*Lady's Hood*.—July 18, 1865.—This invention is explained by the claim and engraving.

Claim.—A lady's hood, composed of the four pieces A B B' and C, formed, arranged, and stitched together, substantially in the manner described.

No. 48,868.—JOSIAH HOLMES, Pittsburg, Penn., assignor to HUSSEY, WELLS & COMPANY.—*Machinery for Rolling Tapering Bars or Plates*.—July 18, 1865.—This invention consists in forming in the pressure screw of the housing of rolls a cylindrical chamber, in which fits and plays a plunger, the lower end of which rests upon the rider or top bearing of the upper roll. The taper is given by the gradual widening apart of the rolls, the upper end being permitted to rise by the pressure when in operation, causing the plunger to force the water in the chamber out through a valve at the top, the opening through which is adjusted to regulate the speed of the ascent of the upper roll to suit the work to be accomplished thereby.

Claim.—The use of the plunger, water chamber, and valves, constructed and arranged substantially as hereinbefore described, situate in and forming part of the pressure screw of rolling mill housing, for the purpose of rolling tapering metallic bars or plates.

No. 48,869.—EDWIN A. JEFFERY, assignor to the AMERICAN BASKET COMPANY, New Haven, Conn.—*Machines for Forming Baskets*.—July 18, 1865.—This invention consists of a former, over which the material is placed and bent into shape. The basket is made of thin veneering, and is cut in sheets of the proper size, so that two sheets are used, and the grain of

the wood crossed. A clamp is brought forward by means of a treadle, having hinged winged clamps upon all sides to fit the former, which, as the treadle is set down, clamps the stuff over the former, where it is held until the basket is finished.

Claim.—First, the combination of a former B with a head H and folders *a a*, constructed to operate substantially in the manner and for the purpose specified.

Second, closing or folding the sides of the basket by means of the folders *a a*, substantially as specified.

No. 48,870.—THOMAS J. JONES, assignor to himself, GEORGE WETTENGELL, and JOHN D. RICHARDS, West Pittsburg, Penn.—*Steam Boiler*.—July 18, 1865.—This invention consists of a scraper attached to a rod, inserted through a stuffing box in one end of the boiler, by which the operator is enabled to move the same along in contact with the bottom surface of the boiler, and thus remove any deposit that may be collected there, and cause it to fall into the draw below. In order to prevent the scraper from being obstructed by the seams and rivet heads of the boiler, shoes are placed under each end of the scraper, which have a curvature sufficient to carry the scraper over these obstructions.

Claim.—The combination with a steam boiler of a scraper attached to a rod, inserted through a stuffing box in one end of the boiler, for the purpose of removing the sedimentary or residual deposit from the bottom of the boiler, substantially as and for the purpose hereinbefore described.

Also, the shoes in the edge of the scraper, to enable it to pass the overlapping ends of the boiler plates, substantially as hereinbefore set forth.

No. 48,871.—SEBASTIAN KELLER, Elizabethtown, Penn., assignor to himself and JACOB L. GOOD, Lancaster county, Penn.—*Combined Seeder and Cultivator*.—July 18, 1865.—This invention consists in the combination and arrangement of a five-pointed star crank, with pins placed around the wheel on one side at equal distances apart, the said wheel being supported by brackets in the hopper frame. It also consists in the connection of the valves with the double crank by means of connecting rods, whereby the seed is discharged from the hopper.

Claim.—First, the construction of the semi-circular crank U, and crank *e'*, forming the top of the pulley shaft *e*, in combination with the friction pulley *d*, saddle step and spring brace connection *f*, arranged and operating substantially in its adjustability in the manner and for the purpose specified.

Second, the five-pointed star crank V, for operating the valve 1, in combination with the pin or pins *h*, on the face of the driving or roller pulley D, constructed and operating in the manner set forth.

Third, the flat-sided roller pulley D, supported in the brackets *a a*, for the vibrating hopper frame B B, in combination with the pivot rod attachment to the cultivator, in the manner and for the purpose specified.

Fourth, the construction and operation of the valves 1, 2 and 3, in combination with the connecting rods R S T, and the double crank U *e'*, and star crank V, operated in the manner described.

No. 48,872.—LOOMIS G. MARSHALL, Mokena, Ill., assignor to himself and F. W. HUGHES, Pottsville, Penn.—*Drill*.—July 18, 1865.—This invention consists in an arrangement of levers operated by cams, for working the drills, and in arranging certain gearing and rolls for raising and lowering the drill. Also, in the combination of the various parts of the drill, as designated in the claim.

Claim.—First, the arrangement and combination of the devices D E G J and K of the machine, as herein described and for the purposes set forth.

Second, the arrangement and combination of the devices 2 R T V and W of the drill J, when constructed and combined as herein described, and for the purposes set forth.

No. 48,873.—BENJAMIN T. MILLBURN, Wilmington, Del., assignor to himself and JOSEPH RIGBY, Brandywine, Del.—*Railway Car*.—July 18, 1865.—This invention consists in so constructing railway chairs that they will readily yield to the expansion and contraction of the rails.

Claim.—The combination of the chair pieces A and B, the stirrup C, and the rails D D, constructed and operating substantially as described, for the purpose set forth.

No. 48,874.—W. T. MUNGER, Bradford, Conn., assignor to himself and JAMES GRAHAM, New Haven, Conn.—*Extension Door-knob*.—July 18, 1865.—In this invention the rose is formed with an opening in the centre, made semicircular at one end, and at the other end square, and elongated from the centre one diameter in order to admit the square spindle, which in this case has the corners notched or grooved, in which grooves the semicircular end of said opening fits. In the top of the rose which receives the end of the shank is an inwardly projecting lip or stud, which passes through a notch or opening in a collar on the end of said shank. The spindle is first introduced in the rose, with its collar in the proper groove to suit the thickness of the door; the knob is then slid upon the spindle, and inserted

in the recess of the rose, which is so placed that the lip therein will pass through the notch in the collar on the end of the shank, and is then turned so as to pass behind it and secure all the parts together. Instead of the oblong opening and a notched or grooved spindle, screw threads may be formed on the spindle, and in a circular opening in the inner face of the rose, to fit each other, and the shank may be secured thereto in the manner described.

Claim.—The combination of the grooved shank *f* with a lip *e*, or its equivalent, in the socket of the rose, in the manner and for the purpose described.

No. 48,875.—MARTIN NEWMAN, assignor to himself and CLARK J. HAYES, Unadilla, N. Y.—*Sawing Machine.*—July 18, 1865.—This invention consists in arranging the feed rollers so as always to have them in a position to prevent either end of the rollers from rising or falling without the other, through the medium of the upper feed roller being hinged to a fixed frame, under which is a fork that is attached to a lever, by moving which the fork is raised against the roller arm, and thus raises the roller.

Claim.—First, combining with the yielding rolls of a pair or pairs of feed rolls, a lifting piece and a lever, so that the operator from his stand may rise up, hold up, or let down said yielding rolls at will, substantially as described.

Second, in combination with yielding rolls, hung at both ends, the connecting of said end supports by a rigid roller cap, to prevent one end of said roll from rising or falling independent of its other end, and to make the pressure on the board uniform at both edges, and thus cause it to move in a direct line, substantially as described.

Third, shifting the movable saw upon its shaft by means of the levers and link connection herein described and represented, whereby a quicker motion is got, and thus economizing time, substantially as described.

No. 48,876.—GEORGE W. PRATT, assignor to himself and WILLIAM P. MARTIN, Salem, Mass.—*Mode of Embossing Leather.*—July 18, 1865.—This invention consists in pebbling or embossing leather by placing the grain side in contact with a flat surface, having the design formed in it, and applying the rolling or rubbing tool under pressure to the flesh side of the skin.

Claim.—Pebbling or embossing leather or other treated skins, by placing the face or grain side in contact with a flat or nearly flat surface, having the design formed in it, and applying the rolling or rubbing tool under pressure to the flesh side of the skin, substantially as described.

No. 48,877.—RICHARD C. ROBBINS, assignor to J. M. and G. W. KEEN, New York, N. Y.—*Diaphragm Pressure Gauge.*—July 18, 1865.—This invention consists in securing the diaphragm between the bar and the binding ring, by means of a screw thread cut in the interior of an upward projecting flange on the former, and a corresponding thread on the periphery of the latter, forming a male and female screw, by which the two are secured together; instead of the employment of a number of small screws passing through the ring and diaphragm, and into a screw threaded hole in the bar.

Claim.—A diaphragm holder, having a female screw on one part and a male screw on the other part, by which the diaphragm is firmly secured and held in its place, thus dispensing with bolts or screws, and obtaining a more perfect diaphragm, as herein fully described and set forth.

No. 48,878.—NATHANIEL W. WESTCOTT, Providence, R. I., and HENRY L. WALCOTT, Charles River Village, Mass., assignors to JAMES G. PAYSON, Foxborough, Mass.—*Machine for Knitting Shoe Lacings, &c.*—July 18, 1865.—In this machine a number of strands of yarn coming directly from the spun cops, and without being twisted together, are supplied to a common spring barbed needle, and knitted into a chain by the usual knitting or crochet stitch. The barb is lifted positively by an inclined foot on the thread carrier, to allow of the certain introduction under it of the several strands, and the barbs are closed by a rigid presser; the presser and thread carrier both being firmly secured to a reciprocating slide bar.

Claim.—First, the combination of the needle bar *E*, carrying one or more needles, with the rest bar *E*, constructed, arranged, and operating substantially as described.

Second, the looping pin *d*, or its equivalent, in combination with the needle *A*, and operating substantially as and for the purpose described.

Third, the shear or guard *n*, or its equivalent, operating substantially as and for the purpose described.

Fourth, the depressor *h*, or its equivalent, in combination with the needle *A*, and operating substantially as described, for the purpose specified.

Fifth, the mode of operation described, by which the point of the needle tongue is first positively raised and carried over the loose yarns which are to form the succeeding loop, by the interposition of a suitable instrument, and afterward immediately depressed to the requisite extent to permit the loop already formed to be cast off, substantially as described.

No. 48,879.—CHARLES P. WIGGINS, assignor to CASE, MARSH & WIGGINS, Indianapolis, Ind.—*Sawing Machine.*—July 18, 1865.—This invention consists of a guide frame with two

arms to which the crotched guide is fastened, the arms of which brace to each other, and are attached to a pivot bar which is so fastened to the frame that it will admit of a rocking motion.

Claim.—The arrangement of the saw guide J, set screw L, guide frame K K, with slotted foot or pivot bar S S and M, when constructed and operated substantially as set forth.

No. 48,880.—LEVI WILSON, assignor to J. NELSON BUELL, Middletown, Conn.—*Protection for Pump and other Oscillating Rods.*—July 18, 1865; antedated July 14, 1865.—In this invention a pump or other rod operated by a lever is encased within a cover oscillating with it, the case or cover being narrow at the top and expanding toward the bottom, where it is pivoted at its centre to the top of the cylinder, down which the rod is continued.

Claim.—First, the coaming E, and top piece G, so arranged relatively to the reciprocating and vibrating rod D, as to allow the top piece to cover and enclose the coaming, and to move thereon to accommodate the lateral portion of the rod, substantially as and for the purpose herein set forth.

Second, the central pivots or axes I, arranged relatively to the coaming E and G, and rod D, substantially in the manner and for the purpose herein set forth.

No. 48,881.—JAMES GILMOUR, Glasgow, North Britain.—*Harmonium.*—July 18, 1865.—This invention has for its object, among other things, the softening and swelling of the bars and treble divisions of the instrument independently of each other; the production of a more refined tone than has hitherto been obtained, by causing the sound from the reeds to travel to a greater distance than formerly before emitting, so as to produce a sound as nearly as possible like that of an organ; the production of a greater and more effective variety of sound and finer toned instruments than heretofore, at a considerably reduced cost.

Claim.—The arrangement and construction of musical instruments, substantially as herein before described, or any modification thereof.

No. 48,882.—PIERRE HUGON, Paris, France, assignor to EMIL JUSTH.—*Apparatus for Carbonizing Wood.*—July 18, 1865.—This invention consists of a furnace capable of being moved in either a horizontal or vertical direction. The furnace is connected to a blast apparatus by means of a flexible tube and a pipe; a fine stream of water flows into this tube from a tube connected with a water reservoir, and the pipe is surrounded by a water chamber to prevent the heat from affecting the flexible tube. The wood to be acted upon is passed before the nozzle, being supported on rollers attached to a suitable frame.

Claim.—First, the method herein described of charring or carbonizing wood, disintegrating rocks, roasting or fusing ores and metals, by direct application in the form of a jet of inflammable gases generated in and directed by a movable apparatus, substantially in the manner herein shown and set forth.

Second, an apparatus for carbonizing wood, disintegrating rocks, &c., composed of a furnace or fire chamber, movable upon a stationary frame, both vertically and horizontally, and provided with a nozzle, in combination with a suitable blowing apparatus, substantially as set forth.

Third, in combination with a movable furnace and blowing apparatus, under an arrangement for operation substantially as described, an apparatus for injecting water or steam, in the manner described, so as to mix with the air previous to its passage through the furnace, for the purpose set forth.

No. 48,883.—D. D. ALLEN, South Adams, Mass.—*Valve.*—July 25, 1865.—This invention consists in a flat disk valve with two or more passages running through it on a flat seat provided with two or more ports which communicate with the receiving and discharge pipes. When the valve is turned, and its passages made to register with the ports in the seat, a free and unobstructed communication is effected between the pipes which connect with the several ports in the seat, and a valve is obtained which is said not to be liable to leak, and to be readily accessible when required.

Claim.—The valve A C in combination with the spring h, and tongue i, and belt d, substantially as and for the purpose described.

No. 48,884.—W. D. AMENT, Muscatine, Iowa.—*Cultivator.*—July 25, 1865.—This invention consists of a metallic adjustable plate cast in one piece for operating the adjustable plough beams.

Claim.—The adjustable metallic plate G formed or cast in one piece, with the bearings I, substantially as described.

No. 48,885.—SHERMAN E. ANTHONY, Stillwater, N. Y.—*Shingle Machine.*—July 25, 1865.—This invention relates to a shingle machine which employs two circular saws for sawing the shingles, and the invention consists in placing the saws so that they will occupy an angular position relatively, and that when the bolt is passed to the saws they will cut alternate bolts and points.

Claim.—The circular saws C C when arranged and operating as described, in combination with the endless toothed chains, for the purposes substantially as set forth.

No. 48,886.—WILLIAM ARTHUR, Brooklyn, N. Y.—*Apparatus for Compressing Air.*—July 25, 1865.—An air pump is combined with a series of air vessels by means of pipes and stop-cocks, or valves, in such a manner that the air compressed into one air vessel may be used to supply the pump when compressing air into one or more other air vessels to a higher tension, the air entering the pump barrel being thus already compressed to a certain tension. The amount of increase in tension which the pump is required to produce need not exceed that at which it will work advantageously. In the last reservoir in the series the air is further compressed by forcing water into the lower part thereof by means of another pump.

Claim.—The combination of the air pump employed to compress air with a series of air vessels by means of pipes and stop-cocks connecting the air pump and air vessels, substantially as herein before set forth, in such manner that the air which has been compressed into one air vessel may be used to supply the air pump when compressing the air to a greater extent in another air vessel, substantially as herein set forth.

Also, the combination of the said apparatus with a water force pump to increase the pressure of the air in the last vessel, substantially as herein set forth.

Also, the conical construction of the vessel of the series into which the air is ultimately compressed when such vessel is combined with a water force pump, substantially as set forth.

No. 48,887.—JOHN B. ATWATER, Chicago, Ill.—*Amalgamator.*—July 25, 1865.—This invention consists of a revolving cylinder closed at both ends and provided with a case, and around the circumference of the cylinder are arranged a series of plates. These plates are supported at each end of the cylinder by the bearings, and are made to change their positions as the cylinder revolves by means of the pins and a cam.

Claim.—First, the application of oscillating plates, or their equivalents, to the circumference of a cylinder which is arranged to rotate within a vessel A, substantially as described.

Second, so applying movable plates to a rotating cylinder, or its equivalent, which is arranged within a vessel adapted for containing melted lead or mercury, that said plates will operate automatically for receiving and discharging the quartz, substantially as described.

No. 48,888.—JOHN B. ATWATER, Chicago, Ill.—*Lady's Work Stand.*—July 25, 1865.—The object of this invention is to provide a table with one or more trays in such a manner that they can be elevated and supported above the top of the table when in use, and depressed beneath the table top, at pleasure.

Claim.—Providing a table with one or more trays, or their equivalents, which can be elevated above the top of the table or depressed beneath said top, substantially as described.

No. 48,889.—J. R. BAKER, Kendallville, Ind.—*Device for Operating Window Sash.*—July 25, 1865.—This invention consists in balancing the sash by means of racks upon each sash and a pinion between; but the rack upon the upper sash is only about half the length of the sash. The pinion is adjustable vertically, and when the upper sash has been covered half way, where it rests upon stops projecting from the frame, the pinion may be pushed up so as to disconnect it with the upper sash, and the lower sash operated independently of the upper one.

Claim.—The employment of one or more vertically adjustable spur wheels applied to a window frame, in combination with toothed racks applied to the sashes, said parts being so arranged that the sashes can be connected together, and made to counterbalance each other, or the lower sash operated independently of the other, at pleasure. substantially as described.

No. 48,890.—H. A. BARNARD, Marine, Ill.—*Grain Separator.*—July 25, 1865.—A suction fan is so arranged between the air trunk and the screen and shaking shoe, and in relation to the inlet and outlet passages of the same, that two separations of the grain shall take place while it has one continuous path through the machine. A rapid shake motion is imparted to the sieves by means of an open cam or eccentric. The pipe or trunk which carries the feeding spout is made adjustable, so that it may be turned in either direction in order to facilitate the feeding in of the grain to be cleaned.

Claim.—First, the arranging of a suction fan B between the air trunk P and the screen and shaking shoe, and in relation to the inlet and exit passages thereof, so that two separations of the grain from its impurities shall take place, while the grain has one continuous path through the machine, substantially as herein described and represented.

Also, the combined use of an open cam or eccentric, and a coiled spring, for giving a light but rapid shake motion to the sieves, substantially as herein described and represented.

Also, making the pipe or trunk which carries the feeding spout *d* adjustable, so that it may be turned in either direction to facilitate the "spouting" or feeding in of the grain to be cleaned and separated, substantially as described.

No. 48,891.—J. W. BARNUM and PETER M. MCNOAH, Detroit, Mich.—*Vessel for Holding Petroleum.*—July 25, 1865.—This invention consists of a barrel composed of sheet-iron, coated on one or both sides with lead. The joints are secured by means of rivets and made air-tight by soldering.

Claim.—The employment or use of sheet-iron, coated wholly or in part with lead, for making vessels for holding petroleum or other volatile liquids.

No. 48,892.—CALEB BATES, Kingston, Mass.—*Drill for Boring Wells.*—July 25, 1865.—This invention consists of a drill for boring artesian wells, in which the cutters are placed at an angle with the axis of the stock, so as to give an angular stroke. The said stock is provided with vanes, also set angularly, for the purpose of giving partial rotation to the drill by means of the resistance of debris. Said vanes are also armed with surfaces of glass or other suitable material to protect the sides thereof.

Claim.—First, in drills for boring oil and other wells, protecting their sides from abrasion by means of a vitreous or equivalent surface placed in the ends of the arms or vanes on the drill stock, or elsewhere on the stock, substantially as above described.

Second, the use of leading cutters S, for splitting the rock, in combination with the wide-cutting surface R R, substantially as described.

Third, setting the cutters of the drill at an angle with the axis of the drill stock, substantially as and for the purpose described.

Fourth, in combination with a drill, adapted to operate as described, the swivel M, constructed and applied in the manner and for the purposes specified.

Fifth, feeding the rope of the drill automatically, by means substantially as above described.

No. 48,893.—ISAAC A. BEALS, Middleboro', Mass.—*Washing Machine.*—July 25, 1865.—This invention consists in the combination of two reciprocating and connected dashers and an upright grating, and a rack and segment gear for operating the dashers.

Claim.—The combination and arrangement of the two reciprocating and connected dashers C D, and the upright grid B applied to the tank.

Also, the combination of the same, and mechanism, as described, for operating the two dashers.

No. 48,894.—WILLIAM BEATON, Grinnell, Iowa.—*Washing Machine.*—July 25, 1865.—This invention consists in applying the power of a spring with other gearing similar to clock-work, in combination with rubbers, for washing clothing.

Claim.—The combination of the reciprocating rubber B, presser bar C, springs D, pitman E, crank shaft F G, gearing H I L M, shafts J N, spring Q, and escapement R S T, all constructed, arranged, and operating as and for the purposes specified.

No. 48,895.—WHEELER BEERS, Bridgeport, Conn.—*Axles for Vehicles.*—July 25, 1865.—This invention consists in the application of spiral springs to the axle, whereby the wheel is allowed to yield or give on the axle in either direction, towards or from the body of the vehicle.

Claim.—The application of the springs to an axle, in connection with the tube or thimble, the circumferential projection in the interior of the box, and the nut on the outer end of the axle, substantially as and for the purpose set forth.

No. 48,896.—JOHN BIBBY and ALLEN LAPHAM, Brooklyn, N. Y.—*Stills for Distilling Petroleum.*—July 25, 1865.—This invention consists of a still, through the centre of which passes the chimney. Inside the still are two perforated conical plates, the edges of which reach nearly to the sides of the still, and are suspended directly over the annular gutters. The lighter vapors pass over through the goose neck into the condenser, and the heavy vapors are condensed on the plates and drawn off through pipes.

Claim.—First, the elevated exit chamber C, in combination with the chimney or flue B, which passes through the centre of the still, substantially as and for the purpose herein set forth.

Second, the perforated cone or dome-shaped plates E, and gutters F F, applied in combination with each other within a still, substantially as and for the purpose herein specified.

No. 48,897.—F. M. BLODGETT, Boston, Mass.—*Spring Gaiter.*—July 25, 1865.—Springs are attached in the usual manner to the flaps of gaiters, after which the staple is forced through the cloth and through proper openings on the springs and fastened on the under side, preserving the cloth intact, except the small holes on both sides for admitting the prongs of the staple.

Claim.—The mode herein described of applying the staples of gaiter fastenings to the flaps of the gaiters.

No. 48,898.—MAURICE BRUNE, New York, N. Y.—*Apparatus for Preserving Food for Transportation.*—July 25, 1865.—This invention consists of a box composed of sections, each section being made hollow and filled with saw-dust or charcoal. The sections are joined together by tongues and grooves, a piece of rubber or other material being placed between each tongue and groove to make the joint tight. The sections are secured together by means of screw bolts. Within the box thus formed and supported by the framework

are boxes which are to be filled with ice. The parts are put together in such a manner that they may be readily separated and packed away when not in use.

Claim.—The combination and arrangement of the several parts, substantially as and for the purposes described.

No. 48,899.—C. H. BRYAN, Racine, Wis.—*Car Platform Stake Holder*.—July 25, 1865.—This invention consists in a mode of attaching car stakes to cars whereby the same may be easily turned down when desired without being raised up out of their sockets, a thing difficult to do when the load upon the car presses hard upon the stake.

Claim.—First, the combination of the stake A, provided with the hole *a*, with the bolt D, and nut E, arranged and operating substantially as and for the purposes specified.

Second, in combination with the above the employment of the jaws *c*, arranged and operating as shown and described.

Third, the combination of the stake A, socket B, jaw C, bolt D, and nut E, arranged and operating substantially as and for the purpose specified and shown.

No. 48,900.—W. W. BURSON, Rockford, Ill.—*Grain Binder*.—July 25, 1865.—This invention does not admit of a brief description. The claim indicates the nature of the improvements.

Claim.—First, the arrangement of the jointed arm A with the groove O, to hold the band material perpendicular and out of the way of the gavel, substantially as described and for the purposes set forth.

Second, the combination and arrangement of lever T with cam groove P and spool R, substantially as described and for the purpose set forth.

Third, the combination of lever U, cam collar S, and pitman W, with tightening cord J, substantially as described and operating for the purpose set forth.

Fourth, the combination of the hook *a* with shaft D and groove E, constructed substantially as described and operating for the purpose set forth.

Fifth, the combination of hook *a* and *b*, constructed and operating substantially as described.

Sixth, the combination of hook *c*, provided with the cutting point *d'*, with the receptacle plate *m*, having the cutting edge *b'*, operating substantially as described and for the purpose set forth.

Seventh, the combination and arrangement of the belaying point *h*, and recess of receptacle plate *m*, with hooks *a* and *b*, operating for the purpose set forth.

Eighth, the projecting blocks *f* and *f'*, on alternate sides of the opening in the platform M, operating for the purpose set forth.

Ninth, the combination of latch *n*, lever *o*, and forearm A', constructed substantially as described and operating for the purpose set forth.

No. 48,901.—A. S. CAMERON, New York, N. Y.—*Balanced Slide Valve*.—July 25, 1865.—This invention consists in combining with the valve one or more rollers and a diaphragm which is exposed to the action of the steam and curved by the steam to bear on the rollers and to hold them down upon the back of the valve, thus preventing the steam as it enters upon the under side of the valve from raising it from its seat. The chamber above the diaphragm is supplied with steam through a passage made through one of the walls of the steam-chest which communicates with the induction port.

Claim.—First, the combination of the diaphragm C, and rollers D, and valve B, constructed and operating substantially as and for the purpose set forth.

Second, the arrangement of cogs or their equivalents at the ends of the rollers and corresponding toothed racks on the backs of the slide valve, substantially as and for the purposes described.

No. 48,902.—J. W. CARHARD, Cohoes, N. Y.—*Valve for Steam Engine*.—July 25, 1865.—The object of this invention is to render a conical plug valve balanced irrespective of a variable pressure of steam. Its novelty consists in a projection extending from the small end of the valve, a recess located in the head of the valve, a chamber located in the socket above the thick end of the valve, and recesses in the socket in combination with the valve.

Claim.—First, the lip or projection *e*, extending from the small end of the valve as and for the purposes set forth.

Second, the recess *f*, located at the head *b* of the valve, and communicating with the steam space of the valve through suitable channels, substantially as and for the purpose described.

Third, the chamber *h*, located in the socket A above the thick end of the valve, substantially as and for the purpose specified.

Fourth, the unequal thickness of the abutments on the steam and exhaust sides, whereby to give lead to the exhaust.

Fifth, the recess or recesses *k* in the socket, in combination with the valve, substantially as and for the purpose described.

No. 43,903.—JOHN CARROLL, Longacoming, N. J.—*Glass Furnace*.—July 25, 1865.—This invention consists in the construction and arrangement of three fire chambers for the purpose of exposing the parts to a more uniform heat, and in respect to two benches and side walls of a glass furnace; the upper surface of each bench being inclined downwards so that the pots may lean towards the wall.

Claim.—The combination and arrangement described of the three fire chambers H H and G in respect to the two benches B B and side walls D D of the furnace, for the purpose specified.

No. 43,904.—HENRY T. CARTER, Portland, Me.—*Valve Gear for Oscillating Engines*.—July 25, 1865.—This invention consists in the arrangement of a stationary link screwed to one of the columns in which the cylinder oscillates in combination with an arm extending from the valve stem in such a manner that, by the combined effect of this stationary link and the oscillating motion of the cylinder, the requisite reciprocating motion is imparted to the valve stem, and the valve is changed at the proper intervals to control the induction and eduction of steam to and from each end of the cylinder.

Claim.—The arrangement of the stationary slotted link *b*, projecting laterally from the standard *c*, arm *J*, valve stem *I*, and oscillating cylinder *A*, all as and for the purposes specified.

No. 43,905.—WILLIAM F. CASWELL, Raynham, Mass.—*Animal Trap*.—July 25, 1865.—A box open at the bottom and closed on top contains within it a spring-forked jaw held up by a suitable detent and bait trigger, which, when sprung, closes down just within the entrance, piercing and killing the animal on entering.

Claim.—The spring-jaw setting mechanism as constructed, with the wheel *t* and the rail or projection *m*, combined and arranged with the tripper *D'*, the latch *e*, and the bait trigger, applied together as set forth.

No. 43,906.—LEWIS A. CAUVET, New York, N. Y.—*Insulators for Telegraph Wires*.—July 25, 1865.—This invention consists in constructing glass insulators for use on telegraph poles in such a way as that they can be secured to the poles in any position without the use of metallic or other attachments.

Claim.—Constructing glass insulators for telegraph wires with an internal screw thread, and securing them thereby to the bearings, bars, or pins of telegraph posts, substantially as above set forth.

No. 43,907.—GEORGE J. COLBY, Waterbury, Vt.—*Flooring or Dust Rack for Carpets*.—July 25, 1865.—This invention consists in making a framework of slats of wood in sections, with openings between the slats to allow the dust to fall below the carpet on to the floor.

Claim.—A portable flooring *A* to be laid under carpets, the same being made of bevelled slats secured together in sections, with suitable openings to allow the dirt and dust to pass through, as herein specified.

No. 43,908.—GEORGE J. COLBY, Waterbury, Vt.—*Window Shutter*.—July 25, 1865.—This invention consists in the employment of a curved, corrugated spring acting on the edge of a slat for the purpose of holding the section of movable slats in any desirable position.

Claim.—A curved, corrugated spring acting on the edge of a slat to hold the section of movable slats in any desirable position, as set forth.

No. 43,909.—GEORGE J. COLBY, Waterbury, Vt.—*Knob Latch*.—July 25, 1865.—The knob shaft is provided with a cam and combined with the convex plates on both sides of the door, and so constructed as to form the lever and fulcrum to operate the latch and bolt.

Claim.—The knob shaft and cam in combination with the convex plates on both sides of the door, so constructed as to form the lever and fulcrum to operate the latch or bolt as herein described.

No. 43,910.—SYLVANUS COLE, Pawtucket, R. I.—*Clothes Dryer*.—July 25, 1865.—This invention relates to a clothes-horse in which a series of vertical hanging frames are hinged to and revolve upon a common centre post or standard, and it consists in a method of hinging the same thereto so as to render it more substantial and not liable.

Claim.—The combination with the leather or other suitable flexible bands *h*, by which the cross rods of the swinging clothes frames are hung upon their common centre-post or standard, of the intermediate collar-plates *m*, made of metal or other suitable material, arranged together substantially as and for the purposes specified.

No. 43,911.—J. S. CORBIN, Ann Arbor, Mich.—*Bag Holder*.—July 25, 1865.—This invention consists of a fixed metal band bent in nearly a half circle, the ends being fast to the table, over which is a wire bail with a brace: the bail is also fastened to the table and above the band, and large enough in diameter to go over the band, and a space for the bag between it and the band. To the centre of the bail is attached a catch spring, which, when pushed down over the band, catches under the band and holds the bag fast.

Claim.—The combination with the fixed band *a* of the swinging frame *f*, when the latter is provided with the bent spring or arm *n*, and arranged to operate in the manner described.

No. 48,912.—S. W. CURTIS, Stoughton, Mass.—*Machine for Cleaning Flower Pots.*—July 25, 1865.—The nature and object of this invention are set forth in the claim.

Claim.—The mechanism for grasping and holding the pot, the same consisting of the movable jaws *d d*, their slide-bar *B*, the levers *e e*, the toggles *g g*, the lever *f*, the rack *h*, as specified.

Also, the combination of the water tank or tub *A*, with the apparatus for holding the pot and with that for cleaning it, as described.

Also, the combination of the slider *p*, its clamp *g*, with the slider *u*, the brush-lever *r*, and its pressure-spring *t*, and the cammed lever *4*, the whole being arranged and so as to operate together, substantially as specified.

Also, the combination of the longitudinal adjusting carriage *D* and its clamping devices *k k l m* with the spindles *C*.

Also, the combination of the conical holder *b'* and the spring *c'* with the spindle *C* and the holding jaws *d d* and the brush *s*, and the mechanism for revolving the brush, as specified.

No. 48,913.—GIDEON G. DENNIS, Dover, N. H.—*Manufacture of Friction Matches.*—July 25, 1865.—This invention consists in applying the friction composition to both ends of the matches, and in cutting the matches in such a manner that they will be joined together in the middle by a partition of wood so narrow that it may be easily split when the matches are to be used.

Claim.—Arming or applying the igniting materials or composition to each or both ends of the match stocks or splints, so as to make each splint or stick serve for two lightings instead of one.

Also, making matches by cutting or sawing into each end of a block, card, or sheet of match material so as to leave the splint jointed at the middle, substantially as described, and then applying the igniting material or composition to both ends of the stocks or splints so made or formed.

No. 48,914.—J. C. DICKEY, Saratoga Springs, N. Y.—*Rock Drill.*—July 25, 1865.—This invention consists of one or more drill bits, of a length nearly equal to the diameter of a circular reamer, and by which they are surrounded, and from which they are made detachable.

Claim.—The combination of the drill *A* with the reamer *C*, substantially as described and set forth.

No. 48,915.—JAMES DODGE, Waterford, N. Y.—*Machine for Rolling Irregular Forms.*—July 25, 1865.—In this machine the varying distance of one roll from the other is governed by one of two or more cams which bear upon the upper roll and move over it with a positive and uniform velocity precisely equal to that of the surface of the roll itself. The particular improvements claimed are, certain arrangements of mechanism, by virtue of which the insertion between the rolls of the bar to be wrought is the means of setting the cam in motion, while an adjustable stud upon the side of the cam, in combination with other devices, stops the movement of the cam at any predetermined moment.

Claim.—The mechanism for driving the said pattern or cam rollers or segment with a positive motion, that is, by gear, for starting the patterns or cams by the introduction of the article to be shaped, and for stopping the movement by the action of the machine itself, all substantially in the manner herein described.

No. 48,916.—JOHN EARNSHAW, Lowell, Mass.—*Flour Sifter.*—July 25, 1865.—This invention consists in the employment of a scoop, having a portion of its rear part made of wire gauze for a sieve, and a shaft with rubbers for forcing the flour through the sieve, the shaft being turned by a suitable crank.

Claim.—The combination of a sifting device with a flour or meal scoop, substantially as set forth.

No. 48,917.—WILLIAM EBERHARD, Sigourney, Iowa.—*Spinning Machine.*—July 25, 1865.—The funnel-shaped head has within it adjustable springs tapering down to the throat, their adjustment by screws graduating the size of the opening to that of the material to be fed through. The draw rollers are vertical, the spool is loose on its spindle, to which a flyer is attached, and a sliding rod and fingers give a traverse to the spool in winding.

Claim.—In combination with the feeding head and the drawing rollers, the spindles and spire, arranged and operated as set forth.

No. 48,918.—J. W. ELLS, Pittsburg, Penn.—*Annealing and Polishing Sheet Iron.*—July 25, 1865.—This invention consists in placing the sheets of metal to be operated on in an iron box or muffle, with layers of oxide of iron, lime, and animal charcoal between them, heating the whole to about eight hundred degrees in a suitable furnace, meanwhile subjecting the box to a rocking and rotating motion.

Claim.—Annealing and polishing sheets of iron by placing them in a tight cast-iron box or muffle, with scales or oxide of iron, animal charcoal, coke, lime, or other decarbonizing and cutting agents, and imparting sufficient motion to the box or muffle while in the furnace to agitate the sheets of iron to such an extent as will polish them by the attrition of the annealing and cutting agencies during the operation of heating and cooling, whereby they are given the peculiar mottled and polished appearance of Russia sheet iron.

No. 48,919.—JOHN FARRELL, New York, N. Y.—*Safe Lock.*—July 25, 1865.—The inner end of the knob arbor in this lock carries a flat disk which has a mortise in its edge for the reception, when in the right position, of an auxiliary bolt projected from the end of the lock bolt, and also an elongated slot, which embraces the pin projecting from the face of a sliding plate, to which the main locking bolts are attached. In operating the plate with its bolts it is first thrown out to lock the door of the safe by simply turning the knob, then the key is inserted in the lock and the bolt of the latter thrown out, which forces the end of the auxiliary bolt into the mortise in the edge of the disk, and thus the latter is locked and cannot be turned, and consequently the main bolts cannot be withdrawn until the auxiliary bolt shall have been withdrawn from the mortise.

Claim.—Combining the bolt or bolts by which the door is secured with the bolt of the lock, by a mechanism substantially such as described, operated by the lock bolt to lock the door bolt or bolts, and which, when violence is applied to the lock, will permit the lock bolt to separate from it without unlocking the door bolt or bolts, as set forth.

No. 48,920.—EDWARD A. FIELD, Sidney, Maine.—*Road Scraper.*—July 25, 1865.—This invention consists in the use of levers, to which wheels are attached to the hinder ends thereof, operated by the person sitting upon the scraper, in order to regulate the deposit of dirt at any desired spot upon the road.

Claim.—The combination and arrangement of the levers *i i* in, or the said levers and the wheels *t t* with, the road scraper composed of the sled and the scraping bar, or their equivalents, substantially as described.

No. 48,921.—ABRAHAM FITTS, Worcester, Mass.—*Steam Whistle.*—July 25, 1865.—This invention consists in the combination of two bells with an intermediate chamber, having an annular passage opposite the edge of each bell in such manner that, by admitting steam or compressed air to the chamber, both bells are sounded simultaneously, the object of which is to produce a sound of increased intensity. The bells are both upon one stem, and the steam chamber is located midway between them, the pipe for conveying the steam to the hamber passing through the lower bell.

Claim.—First, the combination of two bells with an intermediate chamber having an annular passage opposite the edge of each of the bells, substantially as and for the purpose set forth.

Second, combining in a whistle operated by steam or compressed air, two bells tuned so as to produce musical chords, substantially as herein described, for the purpose of increasing the intensity of the sound.

No. 48,922.—ADDISON C. FLETCHER, New York, N. Y.—*Bag Fastener.*—July 25, 1865.—This invention consists in a plate of metal with a projecting arm so formed as that the upright part of the arm is parallel with the body of the plate, and forming a slot between the plate and arm, the lower end of the plate curving out. There are two holes through the plate; the upper fastens the plate to the bag, and the other receives the cord when it is passed around the neck of the bag underneath the projecting part of the arm into the slot, and down and under the curved part of the plate at the bottom, securely fastening the neck of the bag.

Claim.—The fastening for bags and sacks constructed as herein described, and operating in the manner substantially as herein set forth.

No. 48,923.—D. P. FOSTER, Shelburne Falls, Mass.—*Cooking Stove.*—July 25, 1865.—This device consists of a movable frame provided with a horizontal shaft, upon which is placed a fire grate, which may be lowered or raised at will by the crank attached to the shaft.

Claim.—First, the fire box or grate *A* provided with the holes *c c c*, or their equivalents, in combination with the slotted frames *B*, constructed and arranged to operate substantially as and for the purpose herein set forth.

Second, the movable stand composed of the end pieces *B B*, united by the bar *J*, in combination with shaft *F*, pinion *E*, ratchet *H*, and pawl *I*, for the purpose of supporting and adjusting the grate *A*, as and for the purpose described.

No. 48,924.—HENRY FRENDEBERG, New York, N. Y.—*Hoop Skirt.*—July 25, 1865.—This invention will be understood from the claim.

Claim.—The spiral wire in combination with the tubular web, substantially as and for the purpose described.

No. 48,925.—SAMUEL S. GARVER, Hamilton, Ohio.—*Shutter Lock*.—July 25, 1865.—This invention consists principally in the combination and arrangement of well-known devices, the bolt being operated by a toothed wheel or segment thereof playing in rack teeth in the lower edge of the bolt. The wheel is turned by means of a key inserted in a hole in the centre or hub thereof.

Claim.—The door or shutter lock herein described, consisting of the case A, rack bolt B, pinion or segment C, projection *e*, notch *f*, and friction spring D, all constructed and arranged substantially as and for the purpose specified.

No. 48,926.—HENRY A. GILMAN, Buffalo, N. Y.—*Railroad Car Rail Coupling*.—July 25, 1865.—This invention consists in the combination of a base plate with a clamping bar and tightening wedges, by which the contiguous ends of two railroad rails may be coupled together in a manner to give them both a vertical and lateral support, and prevent the possibility of one rail getting out of line with the other.

Claim.—The combination of the base-plate A and clamping bar C, and tightening wedges D, or equivalents thereof, for the purposes and substantially as described.

No. 48,927.—VICTOR GIROUD, New York, N. Y.—*Register for Counting Revolutions*.—July 25, 1865.—This register is intended to subserve the function of denoting the number of revolutions made in a given time by any shafting of machinery. It is more especially designed for marine engines. The shaft, when revolutions are to be counted, is provided with an eccentric which oscillates a lever which actuates certain pawls which operate similarly to the escapement of a clock, turning toothed wheels by the space of one tooth at each revolution of the shaft. These wheels register the number of revolutions.

Claim.—The arrangement and combination of the ratchets *b*, pawls I, toothed wheels *a* *d*, notched wheels *c*, and the single toothed disks *e*, applied respectively to the heads or collars E, wheels F G, and shaft I', to operate in the manner substantially as and for the purpose specified.

No. 48,928.—JOHN GORTON, Providence, R. I.—*Gauge for Setting the Pitch to Wagon Axles*.—July 25, 1865.—This invention consists in a frame upon which are raised two standards that support the axle in a horizontal position. At one end of the frame, and attached to an upright, is an adjusting device, consisting of a top bar, a sliding set with a set screw, and an adjusting screw at the end of the bar, so that by the use of another gauge, which has a bar that will fit to the line of the boxes in the hub touching the upper sides and an arm with a pivoted plate to set to the face of the vertical spoke, and then transfer this gauge thus set to the frame, and adjust the bearings of the axle rest to suit this gauge, which will determine the set of spindle of the axle.

Claim.—The adjustable gauge, described as figure 2, or its equivalent, in combination with the machine described as figure 1, or its equivalent, the whole substantially as described, for the purposes as set forth.

No. 48,929.—W. P. GREGG, Boston, Mass.—*Roller Skate*.—July 25, 1865.—This invention consists in a stock having a small supporting roller under each end, and a large driving roller on each side.

Claim.—A roller skate constructed with a stock having a small supporting roller under each end, and a large driving roller on each side, substantially as described.

No. 48,930.—IRA T. HALSTEAD, Fredonia, N. Y.—*Amalgamator*.—July 25, 1865.—This invention consists of a tub, within which revolves a muller, which is attached to the yoke. A concave disk fits loosely around the yoke, and is supported by a shoulder in the side of the tub. The disk is provided with apertures, and settles upon the top of the concave disk, whence it is returned again to the tub through the centre.

Claim.—A concave disk, provided with openings at the sides and in its centre, in combination with a muller revolving in a tub with a flat or concave bottom, substantially in the manner and for the purpose set forth.

No. 48,931.—F. G. HARDING, Boston, Mass.—*Boot-blackening Case*.—July 25, 1865.—This invention consists in arranging within the seat of a chair a foot rest, and a receptacle for brushes and blacking for cleaning boots and shoes.

Claim.—The combination of the chair *a*, hinged seat *b* and foot rest *g*, arranged as herein specified, for the reception and use of boot-blackening appliances.

No. 48,932.—JOHN G. HARPER, New York, N. Y.—*Gas-lighting Device*.—July 25, 1865.—This invention consists of a case or jacket, provided with a lamp for burning oil or other suitable material, and having an aperture made in it in such a relative position with the wick tube of the lamp as to admit of the said case being applied to a gas burner to ignite the gas issuing from the same.

Claim.—A case or jacket provided with a lamp for burning oil or other suitable material, and having an opening or aperture made in it, in such a relative position with the wick tube of the lamp as to admit of the case or jacket being applied to a gas burner to ignite the gas issuing therefrom, substantially as set forth.

No. 48,933.—M. HARRIS and R. G. BUSH Jamestown, N. Y.—*Wringing Machine*.—July 25, 1865.—Rubber rollers are arranged upon shafts which have their ends extended and constructed in such a manner that the handles can be applied to each or both, when the said rollers or shafts are used in a frame, for the purpose of wringing clothing.

Claim.—The arrangement of rubber rollers upon shafts which have their ends extended and constructed so that handles can be applied to each or both when said rollers and shafts are used in a frame, for the purpose of wringing clothing, as is herein fully set forth.

No. 48,934.—BARNEY HART, Washington, D. C.—*Apparatus for Washing Tumblers*.—July 25, 1865.—This invention consists in the arrangement of perforated pipes supported by brackets. A suitable grating is arranged above the pipes, on which the tumblers are placed bottom upwards; water is forced into the pipes, and jets of water are thrown up for washing the tumblers over a proper trough or tub.

Claim.—The arrangement and combination of the apparatus with the water pipes and grating above, by which a continual jet of water is projected into each tumbler or glass so as to cleanse and rinse the glass completely as herein described.

No. 48,935.—HERMAN HAUPT, Cambridge, Mass., and J. Y. SMITH, Alexandria, Va.—*Construction of Flat-bottomed Boats*.—July 25, 1865.—This invention consists in the construction of flat-bottomed boats of straight timber, running longitudinally, for the bottom and sides.

Claim.—The construction of boats or barges, substantially in the manner and for the purposes herein set forth.

No. 48,936.—F. X. HAZMAN and L. L. ARNOLD, New York, N. Y.—*Cigarette Paper*.—July 25, 1865.—This invention consists in applying to one side of the paper a composition of gum-arabic, dextrine, gluten, starch flour, and saltpetre. This composition causes the paper to shrink and curl up, and also serves to hold the cigarette together.

Claim.—First, the manufacture of cigarette paper coated on one side with an adhesive substance, dried, and whether the same is applied to the whole surface or to the margin only.

Second, the manufacture of cigarette paper coated on one side with a substance which, when dried, shall shrink so as to give the paper a tendency to curl.

Third, the employment of the ingredients compounded in the proportions and manner herein described, for a mucilage or paper coating, for the purpose set forth.

No. 48,937.—WM. O. HEADLEY, Newark, N. J.—*Trunk Caster*.—July 25, 1865.—This invention consists in combining a trunk, a caster and a bracket, so that the device may be cheaply manufactured, and be very strong and durable, and serve as an efficient protection for the angles of the trunk, and at the same time admit of the trunk being readily moved or rolled about.

Claim.—A combined bracket and caster for trunks, when the former is cast with an exterior projection or projections *e*, and with lugs or projections *d d* at the inner surface of one of its arms *a* by the side of the opening *b*, which receives the caster or roller *B*, and on lugs or projections the axis of the caster or roller is fitted, substantially as described.

No. 48,938.—G. W. HEALD and L. D. CISCO, Baldwinville, N. Y.—*Rotary Pump*.—July 25, 1865.—The water is drawn in and forced from the centre to the periphery by centrifugal action, the arms through which it passes being united at their outer enlarged delivery ends a complete circle, thus excluding water from the hub, and thereby relieving the arms from such resistance.

Claim.—The construction of the piston *B*, consisting of the rim *b*, and hollow arms *c c*, arranged and operating substantially as and for the purpose herein set forth.

No. 48,939.—WM. HEMMER, Newark, N. J.—*Table or Desk*.—July 25, 1865.—The object of this invention is to construct a table whose top can be raised at various angles and heights, so as to provide a desk on which to write or draw that will suit different persons either sitting or standing, and it consists in the use of a number of supporting frames or legs, so arranged that each will give to the top of the table a different height and inclination.

Claim.—First, connecting the boards *D C* and *B* together, as described and for the purpose specified.

Second, the arms or frames *E F* connected to the board *C*, substantially in the manner and for the purposes herein specified.

Third, the frame or rest *a*, in combination with the frame *E*, substantially as described.

Fourth, thumb-screws or screw rods *b* and *d*, in combination with the frames *E* and *F*, substantially as described.

Fifth, the combination and arrangement of all the parts, substantially as herein shown and described.

No. 48,940.—JONAS HIGBEE, Northport, N. Y.—*Rudder*.—July 25, 1865.—A recess is provided in the ship at the head or stern, or both. The rudder is so constructed and shaped.

that it can be turned freely into its recess, completely filling it and preserving unbroken the water lines of the vessel; for further use the rudder can be turned out, then acting as a common rudder.

Claim.—The applying of rudders to vessels either at the bow or stern, or at both said places, in the manner substantially as shown, so that the rudders will be capable of being reversed, turned outward from the recess or openings *a* when necessary, as when used as a stern rudder, or turned inward so as to fit in said openings when used as a bow rudder, as set forth.

No. 48,941.—PETER and FREDERICK HINKEL, New York, N. Y.—*Apparatus for Cooling Liquids.*—July 25, 1865.—This apparatus consists of a pipe of suitable metal, which is introduced through the bung hole of the vessel containing the liquor to be cooled, and serves also as a stopple. The lower end of this pipe is closed. At its upper end it is connected with a vessel containing crumbled ice. This vessel is surrounded with charcoal or some other non-conductor of heat, and is so constructed as to allow of a regular sinking of the ice into the pipe, whereby the cooling of the liquor surrounding the pipe is effected.

Claim.—The mode of refrigerating beer and other beverages herein fully described, and for the purpose set forth.

No. 48,942.—SAMUEL LITTLE, Detroit, Mich.—*Watch.*—July 25, 1865.—This invention consists in the use of a movable hairspring stud, in combination with the hairspring of a watch, in such a manner that the watchmaker is enabled to get a correct beat in a short time, and with little trouble. In connection with this movable hairspring stud an undulating spring is used for the purpose of overcoming the effect of the atmosphere on the hairspring, and of keeping the watch in beat. This invention consists finally in an undulating spring attached to the regulator in such a manner that the effect of the atmosphere on the balance is overcome, said regulator being connected directly to the hairspring.

Claim.—First, the curved spring *d*, in combination with the movable studs *a* and hair spring *b*, constructed and operating substantially as and for the purpose described.

Second, the curve spring *k*, in combination with the regulator *j*, spring *b* and balance *h*, constructed and operating substantially as and for the purpose specified.

No. 48,943.—SAMUEL HODGINS, St. Louis, Mo.—*Boot Heel.*—July 25, 1865.—The object of this invention is to obviate the running down of the heel of a boot or shoe, caused by the wearing away of one part sooner than the other, and it consists in the employment, in the heel of a boot or shoe, of a metallic plate, extending, either wholly or in part, down to the treading surface of the heel, said plate being bent round so as to correspond with the shape of the heel, and the said plate having its inner or upper end bevelled in such a manner that a correspondingly bevelled plate, arranged over the same in the heel of the boot, may be caused to force it out by means of a set screw, or any other suitable device, and which may be retained in position when set.

Claim.—The adjustable plates B and C in combination with the heel of a boot or shoe, arranged to operate in the manner and for the purpose herein specified.

No. 48,944.—J. HOLLINGSWORTH, Chicago, Ill.—*Horse Rake.*—July 25, 1865.—This invention consists in constructing the tooth with a transverse eye arranged at right angles to the plane of direction of the tooth, and also in the arrangement and combination of various other parts, indicated in the claim.

Claim.—First, a scroll rake tooth, constructed with the transverse eye *c* arranged relatively thereto, substantially as herein described and represented for the purpose set forth.

Second, the arrangement of the scroll teeth upon a continuous head or bar E, which is hung to the axletree A in such manner that they enter grooves in the head E, so as to be stayed laterally and pass under the head E, and at the same time are susceptible of being removed and replaced independently of one another, substantially as herein described and shown.

Third, the arrangement of the foot and hand lever G G, adjustable goose-neck brackets *a a*, oscillating head E, and axletree A, in the manner and for the purpose described.

Fourth, the arrangement of the rod J, forked lever *l*, spring *s*, pulley *k*, chain or cord *i*, goose-neck brackets *a a*, head E, and foot and hand levers G G, substantially in the manner and for the purpose described.

Fifth, the arrangement of the hand and foot lever directly on the rake head E, which is hung in goose-neck brackets *a a*, substantially in the manner described.

Sixth, the combination of the goose-neck brackets *a a*, slide rod J, and rake-head E, in the manner and for the purpose described.

No. 48,945.—J. W. HOLLOWAY, Akron, Ohio.—*Piston Packing.*—July 25, 1865.—This invention consists in the combination of a central solid ring with two cut side rings and a circular spring placed under the outer edge of the cut rings, and having at the same time against the piston head a follower. The office of the circular spring is to keep the cut ring

at all times in contact with the inner surface of the cylinder, while the rings are held in contact with each other by steam, which enters the space between them and the follower or piston-head.

Claim.—The bevelled rings *b b* and circular springs *c c* in combination with the solid ring *D D*, when arranged and operating substantially as and in the manner described.

No. 48,946.—W. C. HOOKER, Abingdon, Ill.—*Machine for Trimming Hedges*.—July 25, 1865.—This invention consists in constructing a suitable frame, intended to stand over or straddle the hedge, and in arranging on said frame a cutter on the one side and a block, against which to cut, on the other side, both having a swinging motion, and capable of being moved forward and backward the length of the frame, as occasion may require, during the cutting operation.

Claim.—A machine for trimming hedges, constructed substantially as herein shown and described.

No. 48,947.—JAMES A. and HARRY A. HOUSE, Bridgeport, Conn.—*Lawn-mowing Machine*.—July 25, 1865.—This invention consists of a finger beam of a sled-shape, so as to run easily over the ground, to which is attached a scalloped cutter. From the rear of the finger beam projects a single beam, and on this is mounted a cam wheel, operated by a crank. This cam wheel is embraced by a bar connecting with the scalloped cutter, and thus a vibrating motion is imparted to the latter.

Claim.—The combination of the finger beam frame, vibrating cutter, cam gear, and breast piece, arranged and operating substantially in the manner described for the purpose set forth.

No. 48,948.—JOSEPH J. ILLINGWORTH, Brooklyn, N. Y.—*Cleaning Tubes in Boilers*.—July 25, 1865.—The object of this invention is to clean the flues and tubes of steam generators by a current of steam being passed through them. Its novelty consists in the employment of a nozzle and flexible pipe applied to the said flues and tubes.

Claim.—The nozzle *E b* and flexible pipe *D*, applied substantially as herein described, for cleaning flues or tubes of steam boilers.

No. 48,949.—E. S. JEWETT, Lima, Mich.—*Broadcast Seeding Machine*.—July 25, 1865.—Upon the axle, carrying a rotary cylinder with seeding slides, is arranged a sleeve, connected by pivoted arms to each seed slide arm, all operated by means of a hand lever.

Claim.—The adjustable sleeve *E* in combination with the seed slides *D*, revolving cylinders *A*, and hand lever *F*, constructed and operating in the manner and for the purpose substantially as herein shown and described.

No. 48,950.—E. JOHNSON, Jr., Cleveland, Ohio.—*Skate*.—July 25, 1865.—This invention consists in a special arrangement of devices, by means of which vulcanized rubber springs are interposed between the runner and stocks. The inventor does not claim broadly the use of springs, but merely the arrangement of devices for confining and operating the springs, so as to give an easy and natural movement to the wearer.

Claim.—The standards *A A' a a'*, plates *C G*, springs *F f*, flanges or guides *h h*, and shank *e*, when the several parts are arranged as herein described and operating as specified.

No. 48,951.—WILLIAM W. JOHNSON, Harrison, Me.—*Road Scraper*.—July 25, 1865.—This invention consists in the adjustability of a road scraper by means of levers, which hold in position, and upon elevating it, release the dirt contained in it. The claims and drawings illustrate clearly the mode of operation.

Claim.—The combination and arrangement of the vibratory scraping board with the axle and its wheels, the furcated tongue, and the mechanism for regulating the inclination of the scraping board, as specified.

Also, the combination of the side wings or plate *c c* with the vibratory scraping board, applied to and arranged with an axle to its wheels and tongue, as specified.

Also, the combination of the stop *g* and the bar *d* with the furcated tongue and the vibratory scraping board, applied to an axle and wheels, and having a mechanism, as described, or equivalent, for varying the inclination of the board, as set forth.

No. 48,952.—CHARLES KATHAN, Hardin, Iowa.—*Stove-pipe Damper*.—July 25, 1865.—Two revolving disks, with similar apertures through them, are arranged one on each side of the central frame, and moved by a lever, with handle on outside of pipe, so as to regulate the size of the openings. The whole damper revolves on a central axis, and may be set horizontally or at any desired angle.

Claim.—The revolving disks *B B*, arranged to operate in connection with the central portion or frame *A*, of a damper for stoves and other heaters, substantially as herein specified.

No. 48,953.—EDWARD KELSEY, Centre Brook, Conn.—*Paper-knife Handle*.—July 25, 1865.—This invention consists in securing the handles to the blades of paper knives by means of a dowel pin inserted within and across the joint of the contiguous ends of the handle and the knife-blade shank of the inclined grooves or channels.

Claim.—The combination with a dowel pin, inserted within and across the joint of the contiguous ends of the handle and the knife-blade shank, of the inclined grooves or channels, substantially as herein described and for the purpose specified.

No. 48,954.—W. J. KETCHAM, Washington, D. C.—*Mode of Receiving and Delivering Mails, &c.*—July 25, 1865.—The object of this invention is to deliver, and at the same time receive, a mail bag or package at the station without requiring the agency or attention of any one at the time the change takes place.

Claim.—Receiving and delivering upon lines of railroad communication mails and packages by means of devices connected to the railway car, and operated at the several points of delivery, in the manner herein described.

No. 48,955.—J. D. KING, Cincinnati, Ohio.—*Machine for Pressing Tobacco.*—July 25, 1865.—This invention consists in the employment of a series of rollers placed loosely upon a shaft, provided with adjustable bearings, in combination with a reciprocating bed, provided with removable boxes or troughs of the same width as the rollers.

Claim.—The employment or use of a series of rollers K, placed loosely on a shaft I, provided with adjustable bearings, in combination with a reciprocating bed C, provided with a series of removable boxes or troughs G, corresponding in width to the rollers, substantially as and for the purpose set forth.

No. 48,956.—C. A. KIRKPATRICK, Somerville, Mass.—*Paddle Wheel.*—July 25, 1865.—This invention relates to a paddle wheel, the buckets of which are made each of a series of movable shutters or slats, similar to an ordinary window-blind, in such a manner that the said slats can be turned edgewise as they descend in and rise out of the water, and to close up while passing through the water in a position to offer a very extended working surface to the water.

Claim.—First, the combination of the movable slats with the cam slot, when arranged and operating as and for the purpose specified.

Second, the adjustable gates, applied in combination with the cam slot and movable slats, in the manner and for the purpose described.

Third, the combination of the double ratchet, double cam, and movable gates, all constructed, arranged, and operating as herein described, to constitute an automatic reversing gear.

No. 48,957.—HOMER W. KNOWLTON, Saratoga Springs, N. Y.—*Horse Chain.*—July 25, 1865.—This invention relates to an improvement in the T-end of a horse chain, which is fitted in a ring of the latter in order to attach the chain of a halter to a post or other fixture, or which is fitted in the ring of a bit, in order to attach the horse to the post.

Claim.—Constructing the T-ends of horse and other chains with a joint in their shanks, to operate substantially as and for the purpose herein set forth.

No. 48,958.—TOBIAS KOHN, Hartford, Conn.—*Device for Finishing Threads.*—July 25, 1865.—By making the rollers of decreasing diameters towards their centres the coil of thread is forced more effectually into rubbing contact with itself, and the alternately opposite inclination of the rollers overcomes and neutralizes any tendency of the thread to run to either end of the roller.

Claim.—First, the described concave-faced rollers, on which to wrap the threads to be finished by the longitudinal motion of the carriage on which the rollers are mounted.

Second, placing the alternate rollers on axis at or nearly at right angles to each other, so as to partially counteract the tendency of the thread to traverse lengthwise the rollers.

No. 48,959.—FREDERICK C. LEFFLER, Highland Township, Iowa.—*Cultivator.*—July 25, 1865.—In this machine the draught is applied to a rectangular frame, pivoted at the rear to the rear cross-bar of the cultivator, and in front it is pivoted to the upright parts extending from the wheels. The fastening is adjustable vertically.

Claim.—The draught bars L, attached to the rear bar E by pivots *e* and uprights *f*, and secured to the upright bars A by a rod G, substantially as and for the purpose set forth.

No. 48,960.—GEORGE LIMING, Roxbury, Mass.—*Sash Fastener.*—July 25, 1865.—This invention consists in arranging upon the side of the window frame a cam with a pointed end, which pointed end when turned downward will prevent the window frame from being raised, and when turned upward the cam holds the sash from falling down.

Claim.—The improved sash fastener, with the cam and spur, formed and operating as described.

No. 48,961.—A. LEITCH, Ryegate, Vt.—*Sap Spout.*—July 25, 1865.—This invention consists in lining the spout with metal, so as to obviate the injurious effects of the metal on the trees.

Claim.—A sap spout, made of an outer wooden tube, enclosing a metallic tube, substantially as and for the purpose above described.

No. 48,962.—F. C. LEYPOLDT, Philadelphia, Penn.—*Button-hole Cutter*.—July 25 1865.—A detachable bed plate, held in position by lateral guards, is rendered adjustable in relation to the line of the descending knife by means of a convexity beneath it, on which it vibrates, to adapt itself to the knife from the first moment of contact until the complete incision is made.

Claim.—The described improvement in instruments for cutting button-holes, consisting in the use of the self-adjusting block B, when the same is constructed in relation to the knife C, substantially as and for the purpose herein set forth.

No. 48,963.—D. S. LOY, Graceham, Md.—*Tuyere*.—July 25, 1865.—This invention consists in furnishing the cover of the tuyere box with an opening, on which is a cap, closed at the top and three sides but open on the fourth side, causing the blast to be deflected towards that side in passing therefrom, and by this means, and by changing the position of the cover, the blast can be thrown in any direction required.

Claim.—The blast plate C, having a deflected slit opening, and capable, by change of position, of directing the blast in the direction required, as described and represented.

No. 48,964.—W. S. MARSH, Indianapolis, Ind.—*Skiving and Splitting Machine*.—July 25, 1865.—This invention consists of a series of devices, indicated in the claim and shown in the engraving.

Claim.—The inclined slide plate D, the adjustable roller L, placed over the knife, with its boxes K K and rods P P, and the springs J J, all in connection with the knife B. Also, the check rib O and set-screw H, all arranged and operating substantially as and for the purpose set forth.

No. 48,965.—JOHN MASSEY, New York, N. Y.—*Meat Chopper*.—July 25, 1865.—This invention consists of a horizontal reciprocating travelling platform or box, in which the meat or other material to be chopped is placed, in combination with cutter blades, operated by suitable gearing.

Claim.—The combination of the horizontally reciprocating platform *f f* and driving devices, consisting of the shaft *g*, cog-wheel *p*, pins *n* and groove *m*, with the knives *n' n'*, jointed connecting rods *g' h'*, and crank shaft *b*, arranged to operate in the manner and for the purposes specified.

No. 48,966.—EDWARD MAYNARD, Washington, D. C.—*Cartridge Retractor for Breech-loading Fire-arm*.—July 25, 1865.—This appendage is applicable only to those breech-loading arms which have the barrel pivoted to the stock and tilted upward at the breech by the action of the trigger guard lever, and the device consists in having the link connecting the lever to the rear end of the barrel provided with a small shoulder or projection, which engages with a sliding retractor, when the barrel is sufficiently tilted to allow the cartridge freely to escape from its chamber.

Claim.—The combination of a retracting slide B with the barrel A and curved link C, of an improved breech-loading fire-arm, substantially in the manner and for the purpose herein set forth.

No. 48,967.—E. MCKINNEY, Middletown, Penn.—*Apparatus for Burning Petroleum*.—July 25, 1865.—The petroleum, crude or refined, is introduced through pipes controlled by stop-cocks, passing through any proper refrigerating medium into the place of combustion, and there mixed with a refractory material, pulverized plumbago or the like, and drawn to its surface by capillary attraction, and then burned.

Claim.—The method herein described of generating heat and light from the combustion of petroleum or other hydrocarbon, crude or refined, by introducing it through pipes controlled by stop-cocks passing through any proper refrigerating medium, to keep said pipes cool, and prevent the transmission of the generated heat to the reservoir of oil into the place or places of combustion, and there mixing it with a refractory material pulverized, so that the pipes are protected from the fire, the oil being supplied in such quantity as merely to saturate the mass of material with which it is mixed, and being drawn to its surface by capillary attraction, substantially as above set forth.

No. 48,968.—HENRY A. MEAD, Cuba, N. Y.—*Carpet Stretcher*.—July 25, 1865.—This stretcher consists of a hand lever, having teeth in one of its ends of proper size and shape to take hold of the carpet, and of a toothed foot-plate, attached to the lever by means of a connecting rod or chain, so that by pressing upon the foot-plate with sufficient force to insert its teeth into the carpet, and then placing the lever by its toothed end upon the same as far from the plate as the connecting chain will allow, and pressing the lever away from the foot-plate, the latter will be drawn toward the former, drawing the carpet with it. When the carpet has been drawn far enough, the foot-plate is fastened to the floor by means of its teeth, and the carpet may then be nailed.

Claim.—The combination of the hand lever *b* and foot-plate *n*, constructed, arranged, and operating together, substantially in the manner described and for the purpose specified.
